guiding them. The best trained dogs are used as leaders; and as the quick and steady going of the team, usually of twelve dogs, and the safety of the traveller, depend on the sagacity and docility of the leader, no pains are spared in their education—so that they may always obey their master's voice, and not be tempted from their course when they come on the scent of game. This last is a point of great difficulty; sometimes the whole team, in such cases, will start off, and no endeavours on the part of the driver can stop them. On such occasions, we have sometimes had to admire the cleverness with which the well-trained leader endeavours to turn the other dogs from their pursuit; if other devices fail, he will suddenly wheel round, and by barking, as if he had come on a new scent, try to induce the other dogs to follow him. In travelling across the wide tundra, in dark nights, or when the vast plain is veiled in impenetrable mist, or in storms or snow-tempests, when the traveller is in danger of missing the sheltering *powarna*, and of perishing in the snow, he will frequently owe his safety to a good leader; if the animal has ever been in this plain, and has stopped with his master at the powarna, he will be sure to bring the sledge to the place where the hut lies deeply buried in the snow; when arrived at it, he will suddenly stop, and indicate, significantly, the spot where his master must dig.

Nor are the dogs without their use in summer; they tow the boats up the rivers, and it is curious to observe how instantly they obey their master's voice, either in halting or in changing the bank of the river. On hearing his call, they plunge into the water, draw the towing-line after them, and swim after the boat to the opposite shore; and, on reaching it, replace themselves in order, and wait the command to go on. Sometimes, even those who have no horses will use the dogs in fowling excursions, to draw their light boats from one lake or river to another. In short, the dog is fully as useful and indispensable a domestic animal to the settled inhabitant of this country, as the tame reindeer is to the nomade tribes. They regard it as such. We saw a remarkable instance of this during the terrible sickness, which, in the year 1821, carried off the greater part of these useful animals. An unfortunate Juhakir family had only two dogs left out of twenty, and these were just born, and, indeed, still blind. The mother being dead, the wife of the Juhakir determined on nursing the two puppies with her own child, rather than lose the last remains of their former wealth. She did so, and was rewarded for it, for her two nurselings lived, and became the parents of a new and vigorous race of dogs."

Notwithstanding the length to which these notices and extracts have run, we find that we have yet given but a very imperfect idea of the uncommon and abundant interest of the contents of this volume, which reflects honour on the Russian service. We can but point it out, however, to those who would know more of the subject, and feel assured that the indication will be held as a favour by those who avail themselves of it.

TOPHAM, AND OTHER STRONG MEN.

Thomas Topham, "the Strong Man," as he was usually called, was born in London about the year 1710. He was bred to the trade of a carpenter, and, although his stature never exceeded five feet ten, soon became remarkable for the extraordinary vigour of his muscular powers. His passion for athletic exercises led to his deserting his regular trade, and adopting that of an innkeeper. At his house of the Red Lion, on the City Road, he gave the first public display of his astonishing powers, by pulling against a horse, with his feet placed on a low wall for support. He next tried his strength against two horses, but received a lasting injury in one of his legs, though to a certain extent successful in the accomplishment of the proposed feat. These exertions were made by way of rivalling those of a German performer who came to this country, and drew against two horses with success. But, as is shown in Sir D. Brewster's Treatise on Natural Magic, the German executed the feat not by sheer strength, as in Topham's case, but by a skilfully arranged piece of mechanism, which disseminated the strain through the lower part of the trunk. Other performances of the German, such as his allowing stones to be broken on his body, and the like, were managed in a similar way, by artifice more than strength.

Topham trusted only to his unaided muscular powers, and by their means he effected the following very wonderful tasks. With his fingers, he rolled up a very large and strong pewter dish. Thrusting the bowl of a very thick tobacco-pipe under his garter, his legs being bent, he broke it to pieces with the tendons of his ham. He broke a similar bowl between his first and second finger, by pressing them together sideways. A table, six feet long, with half a hundredweight fastened to the end of it, was lifted by him with his teeth, and held for a considerable time in a horizontal position. He struck an iron poker, a yard long and three inches thick, against his bare left arm, between the elbow and wrist, till the instrument was bent so as nearly to form a right angle. Taking another poker of the same kind, he held the ends of it in his hands, and placing the middle against the back of his neck, made both ends meet before him, after which he pulled it almost straight again. He broke a rope two inches in circumference, though he was obliged to exert four times the strength requisite for the purpose, in consequence of the awkward way in which he applied his powers to the task. He lifted a stone roller, weighing eight hundred pounds, by means of a chain fastened to it, using his hands only, and standing on a frame above the roller. But, perhaps, of all Topham's feats, the most surprising was his lifting of three hogsheads of water, weighing in all one thousand eight hundred and thirty-six pounds, in the presence of multitudes of spectators assembled to witness the exertion.

The attention which Topham devoted to athletic exhibitions, and the habits to which these exhibitions naturally led, had the effect of withdrawing his mind from serious business, and he became a bankrupt. After this event he travelled over the country, and gave regular displays of his muscular strength in the majority of the provincial towns. The famous William Hutton of Birmingham, when resident in his native Derby, witnessed Topham's feats, and has not disdained to give an admiring record of them in his writings. Hutton's statement is characterised by his wonted clearness and accuracy. "Topham, being obliging enough to allow his person to be examined, was found to be extremely muscular; what were hollows under the arms and hams of others, were filled up with ligaments in him." After mentioning that Topham was above thirty years of age, and had a slight limp in consequence of the fracture of his leg, caused by drawing against the horses, the writer proceeds: "The performances of this wonderful person, in whom was united the strength of twelve men, consisted in rolling up a pewter dish of seven pounds, as a man rolls up a sheet of paper; holding a pewter quart at arms' length, and squeezing the sides together like an egg-shell; lifting two hundredweight with his little finger, and moving it gently over his head. The bodies he touched seemed to have lost their power of gravitation. He also broke a rope, fastened to the floor, that would sustain twenty hundredweight."

Hutton mentions other feats, similar to those previously enumerated here, and continues thus:—"Weakness and feeling seemed fled together. Being a master of music, Topham entertained the company with 'Mad Tom.' I heard him also sing a solo to the organ in St Werburgh's church, then the only one in Derby; but though he might perform with judgment, yet the voice, more terrible than sweet, seemed *scarcely human*. Though of a pacific temper, and with the appearance of a gentleman, yet he was liable to the insults of the rude. The hostler at the Virgin's Inn, where he resided, having given him some cause of displeasure, Topham took one of the kitchen spits from the mantel-piece, and bent it round the man's neck like a handkerchief; but as he did not choose to tuck the ends in the hostler's bosom, the cumbrous ornament excited the laughter of the company till he condescended to untie the cravat. Had he not abounded in good nature, the men might have been in fear for the safety of their persons, and the women for that of their pewter-shelves, for he could instantly double up both. One blow with his fist would for ever have silenced those heroes of the bear-garden, Johnson and Mendoza." His strength not being particularly apparent at first sight, his ordinary and non-professional displays excited the more astonishment. Two strangers, of powerful make and quarrelsome temper, entered his tavern one day, and, after evincing much insolence, would fight with the quiet and patient landlord. He was at length obliged to seize them respectively by the nape of the neck, when, in spite of the most violent struggles, he coolly noited their heads together, till they asked pardon of all present in abject terms. In like manner, on the occasion of a race-exhibition, being annoyed, along with others, by a carter who would force his waggon into the scene of the sport, Topham took hold of the back of the vehicle, and dragged it back, horse, man, and all, till the way was sufficiently cleared; the carter, in the mean while, striving to push his horse forward, yet not daring to lay a finger on the man who was giving this terrible proof of strength.

Annoyed, like Sampson, by a wife of uncongenial dispositions, Topham fell into distresses, and died in the prime of his age.

Topham appears to have been one of the strongest men of whom we have authentic accounts. Yet very striking things are told of the men of antiquity, of which some must be true. Regarding various individuals who filled the throne of the Cæsars, in particular, wonderful stories are told; and these are the more likely to be correct, as the Roman soldiery put their favourites into the imperial chair chiefly for personal and physical qualities. Maximin, the emperor, was so strong in body, that he drew loaded waggons with ease. He struck out the teeth of a horse with his fist, and by a kick broke its thigh. He crumbled stones between his fingers, and cleft young but stout trees with his hands. Caius Marius, another of those nominated to the empire by the soldiers, is said to have stayed with his fourth finger a cart drawn by horses, and to have drawn it backward in the same way. With single fingers of his two hands, acting against one another, he could break strong cords twisted together. The Emperor Aurelian is stated by a credible author, Flavius Vopiscus, to have been of great stature, and of such marvellous strength, that he slew, in one engagement with the Sarmatians, no less than forty-nine men. Similar feats are told of other members of the imperial line, and, from the way in which these sovereigns were selected, many of these anecdotes are entitled to belief.

Froissart, a writer of undeniable honesty, speaks of a companion-knight to the Earl of Foix, one Orlando Burg, who, being hurried for fuel one cold day, went down a long flight of steps, and, finding asses loaded with wood in the court, seized the largest of them, burden and all, and never stopped till he had laid ass and all from his shoulders on the fire—a position, however, not long kept by the ass at least, as may be believed. In the French "Bibliotheque des Gens de Cour," we are told of a man named Barsabas, who was a soldier of Louis XIV.'s guards, and who, on one occasion when the king's heavy coach of state stuck so fast in the road that all the oxen and horses that could be yoked to it were unable to pull it out, applied his single strength to it from below, and lifted it out of the place. A man was about to fight with Barsabas, and when the two were holding out their hands, the strong fellow seized the fist of the other, and, by a gentle squeeze, utterly disabled him from using the limb. Barsabas could map horse-shoes in two as easily as wafers. He went in one day to a village farrier's, and said he wished for horse-shoes. Several were shown to him, and he broke them to pieces one by one with his fingers, saying they were uselessly brittle. The farrier stared, but proposed to make stronger ones. While beginning to the task, Barsabas took up the large anvil, and held it under his cloak. When the anvil was sought for, he set it down, on which the farrier, seeing such miraculous feats, as he thought them, ran off with the exclamation, that the devil in person was in his smithy.

Barsabas, the French work tells, once met his match, however. He went into a rope-shop in Flanders, his native region, and sought to purchase some strong ropes. Several being presented to him, he snapped them like pack-thread, and said "they were very bad." "I will give you better ones," said the woman who was selling the articles, "if you have money to pay for them." Barsabas immediately produced several crown pieces. The woman took them up, and broke two or three of them as easily as Barsabas had snapped the ropes. "Your crowns are as bad as my ropes," said the woman, smiling. The astonished visiter made inquiries, and found a solution of the mystery of the woman's strength, in the fact that she was his own sister! They had not met from infancy, and had both left the place of their nativity.

THE TESTAMENT.

A STORY.

At an early hour of the day, while morning, indeed, was yet struggling with the night for mastery, Horace Morand entered the house of his uncle, and, with the confidence of a privileged relative, proceeded directly to the sleeping apartment of which the old man had been an involuntary tenant for some weeks back. An aged nurse was seated on a sofa in the chamber, half slumbering through long fatigue. The windows were yet closed; but on the table stood a single light, which showed, through the half-open curtains of the bed, the wan figure of the elder Morand, or what had been that person, for the body was now a piece of inanimate matter. The old man had sunk into his last sleep some hours before.

The noise which Horace Morand made on entering aroused the nurse. She rose, and with a melancholy air said, "Good morning, Mr Horace. You come to see your uncle once more. Look at him. He smiles as if he but slumbered pleasantly; but his eyes will re-open no more." "Console yourself, my good Margaret," returned the young man. "You have watched long, and have need of rest; go and take it, and I will remain with my uncle." "But, sir," said the nurse, "I was desired"—— "Go for a little while to rest," replied the youth, interrupting her; "go, my good Margaret, fear nothing; I will not quit the room." And, as he spoke, he pushed the attendant, with gentle violence, from the chamber. He then sat down on the sofa, and, glancing for a moment at the deceased relative, he drew the curtains together, as if unwilling to have any witness of his reflections.

"At last he is gone," said the young man, "and I am rich!"

This opening reflection was followed after a time by occasional glances at the bed. Finally, Horace Morand rose, and drawing open the curtains to the shortest extent possible, he introduced his hand to the head of the bed, and brought it out again, bearing a bunch of keys. Closing the curtains anew, the young man went hurriedly to an escritoire in the room, and applying a key, as if the objects were things familiar to him, opened the repository in question. There was gold in it; there were family jewels; there were title-deeds, and other such papers. These were not what the seeker wanted; but he ultimately found the article in demand. It was a *will*. Stirring up the fire, the youth sat down by it with the precious document in his eager hands, and read thus:—

"I nominate and appoint my nephew, Horace Morand, my general legatee."

"Excellent!" cried the heir, with a degree of joy which he thought it unnecessary to conceal: "I, then, am the inheritor, as the law and the rules of society indicate. By my faith, it was fit time!" As he spoke, Horace, who for two years had dreaded that his uncle would forget family ties in the love borne to strangers,

Digitized by Google

drew one hand across his now cheerful brow, and read on.

"I give and devise twenty thousand francs to Garot and his wife Margaret, who have served me for thirty years with devoted fidelity." "Twenty thousand franks to these people!" was the passing thought of the young heir. "Why," said he, "they are rich enough already with what they have picked up during these same thirty years. Never mind. It is an old man's folly. I will pay this, since I can't help myself." The reading was continued.

"To Pierre, my man-servant, I give ten thousand francs. I leave ten thousand francs, also, to my friend M. Martin, notary; and it is my wish that the sum should be devoted to the dowering of his daughter Eugenie, my godchild."

"Ten thousand francs to Pierre!" thought the young man—"to an old rascal who ought rather to be turned to the door without his wages! Ten thousand francs to M. Martin, an old notary, who has a beautiful villa at Ville d'Avray, and wealth enough of his own! Ah, this is no dower, my worthy uncle, but a remembrance to Madame Martin. Scandal is sometimes right. I won't pay a penny of this. I will see M. Martin, and tell him what a disgrace it would be in him to take money in this shape, and what the world—or at least the scandal-loving part of it—might say of him." The reading was continued.

"I bequeath to Victoire Dubois, daughter of my brave friend, who died for his country, forty thousand francs, and request that M. Martin will do his endeavour to have her well married, and give her the said sum as a dowry." The reader of the will sat silent for a time, with gloomy brow. "To a young workman at Paris," continued the testament, when the reading was resumed, "by name Gustave, whom my nephew Horace knows well, and in whom I am much interested, I give the sum of one hundred thousand francs."

"Give to this stranger lad a hundred thousand francs! Never—he shall never have a fraction of this sum." Horace Morand threw down the will as he spoke, and rose hastily. He took several turns through the apartment, and then, though the morning was a cold one of November, he threw up the window, and gazed abroad. Before him lay an immense park, filled with stately trees, and, beyond them, a wide range of fertile plains, verdant in spite of the season, and spotted with numerous flocks and herds, the best in all Normandy. Through the country rolled the beautiful waters of the Seine. "All this is mine," said the young man; "I am the natural inheritor of it—the only relative of its last possessor. Why should I give away any part of my rights to dower another man's daughter, and pension a young tradesman, for an old man's freak? This will robs me. Without any such document, the law, as it should do, would give me all. No: I will not yield up my family rights in this way." The new heir wrought himself up by these sophistries to a dark frame of mind. He forgot that vast wealth would remain to him after all, and that his own conduct as a nephew had long been scandalously bad, though, during two past years, self-interest had made him seemingly attentive to his uncle, and regardful of his advices. All this the young man forgot, and he showed that he forgot it by an act of a kind scarcely to be characterised in proper language. After moving about for a time in increasing excitement and passion, he suddenly seized the will and threw it into the flames.

He was watching its expiring ashes when a knock came to the hall door. Horace hastened to close the escritoire, and replace the keys, after which he himself went to the door to receive the visiter. This was M. Martin, the notary alluded to in the will, and who, informed by message of the late death, had come to behold his friend Morand once more, and to take counsel relative to the deceased's affairs. The notary was a man almost as old as the defunct, and his manner was peculiarly affecting as he knelt down at his entrance before the bed, and took the hand of M. Morand, kissing it respectfully and tearfully. He then turned to Horace, and, with the ease of a man of business, passed to necessary affairs.

"I am sorry," said he, at the outset, with candid firmness, "to see you alone here, Mr Horace. Such a thing is somewhat contrary to forms, where third parties are interested." "Third parties!" said the other, sharply. "Yes, *third* parties," replied Martin. "You will find a *will*, Mr Horace." "Possibly enough," said the young man. "It is certain, sir," answered the notary. "My late friend told me of its existence yesterday, some hours before his death. The document will be discovered in that escritoire (here the notary pointed to it), and it is your duty Mr Horace, as my late friend's instructions make it also mine, to search for this valuable document without delay. It is proper, likewise, that all the servants of the house, who may be interested, should be present at this search." "Certainly; do what you conceive to be necessary," replied the nephew, in an easy, natural manner. And accordingly, all the domestics then present in the house, were assembled to aid in the proposed examination. The search was most minute, but fruitless. At the close, the old notary sent away all the servants, and, on being alone with Horace, said to him, calmly, "It is impossible that a will should not exist. Your uncle some time since assured me that he would make it, and yesterday he told me that he had fulfilled his intent."

"Can you suspect my honesty?" answered Horace. "I know nothing of all this."

"I found you here alone," said the notary, preserving an air of cold firmness; "but I wish to impugn no one's good faith. Listen to me, however. Your youth has been a dissipated one, nay, as your uncle thought, a vicious one. You know that your conduct drove you from your uncle's house. He intended to disinherit you. I interposed, and reminded him that you were the son of an only brother whom he loved, and of a sister-in-law to whom he had promised to watch over your welfare. I succeeded in reconciling you with your uncle. Since that time, now two years ago, you have been well-conducted, or seemingly so. Heaven only knows if your reformation was sincere—your uncle never believed it."

"Did my uncle do me that injustice?" cried Horace.

"He had the belief to which I refer," continued M. Martin; "and it was with difficulty that I extracted from him a promise, some time back, to appoint you his general legatee, a promise which, as I have said, he informed me of his having fulfilled." After a brief pause, the notary proceeded:—"But, supposing that no will were found, you would be heir-at-law, and would come into possession of all, as the nearest relative. What would you then do?" "Do!" exclaimed the youth—"what should I do but enjoy the fortune left to me?" "True," said the notary, "but your uncle often expressed his resolution to provide for certain persons, his domestics, for example, and to leave them with the means of comfortably enjoying life after his own decease." "If he had really had this desire," returned Horace, coldly, "he would have taken the means to assure its fulfilment." "It is necessary, moreover," pursued the notary, without heeding this remark, "that I should disclose a secret to you, Mr Horace. Your uncle had a child, though never married." "You calumniate my uncle, sir," said the nephew; "I do not believe him capable of having so erred." "The case, nevertheless, is as I say," continued M. Martin; "and you yourself know the child, now an apprentice in Paris. An honest, well-behaved boy poor Gustave is; and your uncle not only meant to establish him in life, but also proposed to disinherit yourself, and leave all to this boy, at the time when you incurred his deserved displeasure."

"All this is absurd, sir," said the young heir; "pass on to other matters, if you have more to say, and let us have done with this useless talk."

"The will!—the will! young man," returned the notary; "I know there is a will!"

"Perhaps, sir," said Horace, sneeringly, "you expected some little token to come your own way!"

The aged notary seemed for a moment to have some little difficulty in restraining himself. But he commanded his temper, and proceeded earnestly to address the heir. "You know well, that, for my own part, I have a fortune sufficient for all my wants; but, in pity to these faithful old servants, conduct yourself generously and honourably, young man, and respect also the blood of your uncle. Assign some small portion of this rich heritage to these domestics, and to your uncle's son. Be humane, be just. Do not make me repent of having revived in your uncle's breast the affection of a relative, and having prevented your disinheritance. Let the boy have a slight share of the vast heritage of his father. Gustave, I know, would have compassioned you, had circumstances been reversed. Come, Mr Horace," continued the old notary, with earnest and kind tones, and even with tears in his eyes—"come, let us search again for this will. Perhaps you may help me to find it. Come, Mr Horace!"

The young heir assumed the appearance of a desire to satisfy the notary, notwithstanding the shade of suspicion implied in his words and manner. Again the parties turned to the escritoire, where M. Martin said the document should be; but the search was, of course, fruitless. "You see, sir," said Horace, "that the thing which we seek does not exist. You must have misunderstood my uncle, or else he himself must have been incapable, when he last spoke to you, of just thought or comprehension."

"No, young man, no," replied the notary. "Oh think, reflect! I know youth is rash. Think well, sir. Are you certain there is no will?" "I only yield, M. Martin, to the evidence before me, and so must you," answered the young man coldly; and, as he spoke, he turned away, with the air of one who has already condescended too far, and will continue his forbearance no more.

"Well, well!" said M. Martin, in severe and altered tones, "I *must* do my duty." He then went to the door, and called on the servants. All of them speedily appeared at his summons; and, while Horace Morand looked on with a cheek now grown pale in spite of himself, through a sense of alarm inspired by the notary's change of manner, the following words fell from the lips of the latter individual. "I have called you all hither to learn that, two years ago, M. Morand deposited a *will* in my hands. By that will, he disinherited his nephew, M. Horace Morand; and, with the exception of legacies to servants and others, devised his whole fortune to a young man, Gustave ——, whom he named general legatee. Authority was formally given to me to produce this will, and see it fulfilled, in the event of no later one being found to exist at the testator's decease. Such being the case, I produce this will as instructed; and my care must now be to see it executed, and to do justice to Gustave and all others concerned."

The whole force of a thunderbolt could not have prostrated a human being so completely as this disclosure did the profligate, who now saw himself stripped of a splendid fortune by his own villanous act. At a period subsequent to these events, M. Martin and the generous boy Gustave bestowed a settlement on Horace Morand, in such a way as to secure to him the necessaries of life; but it was only after he had been brought to confess, in abject terms, the story of his guilt, and to describe the whole train of feelings under which he had acted. These the reader has had pictured forth to him here, and in such away, we hope, as to have interested him in some degree, as well as to have impressed him strongly with a sense of the value of the maxim, "Honesty is the best policy."

COAL-MINES—MODE OF WINNING AND WORKING THEM.

THE first step, preparatory to sinking the shaft of a coal-mine, is to ascertain the depth of the bed or stratum of coal from the surface, and its probable thickness; and this is done by means of the process of *boring*, which we shall describe. If, however, there are already pits in the neighbourhood of the place selected for the site of a new colliery, the necessity of boring is prevented; for in that case, sections of the strata that occur between the surface and the coal are generally obtained from the owners of the existing coal-pits.

The process of boring is usually performed in the following manner. The boring rods are made of iron, from three to four feet long, and about one inch and a half square, with a screw at each end, by which they are screwed together, and other rods added as the hole increases in depth. The chisel which perforates the strata is about eighteen inches long, and two and a half broad at the end, which being screwed on at the lower end of the rods, and a piece of timber put through an eye at the upper end, they are prepared for work. The operation is performed by lifting up the boring rod, thus equipped, and letting it fall again, at the same time turning it a little round, by a continuance of which motion, a round hole is made through the hardest strata. The borers can fix on handles for two, three, or four persons, to work as they find it necessary. After they get down to a certain depth, the rods are worked by means of a bracke, and a triangle is erected over the spot where the boring is going on, for the sake of giving increased facilities to the operations. When the chisel becomes blunt, it is taken out, and a scooped instrument called a *wimble* is put on in its stead, with which the dust or pulverised matter worn off the stratum in the last operation is brought up. By the substance brought up by the wimble, the borers know exactly the nature of the stratum they are boring in; and by any alteration in the working of the rods (of which they soon become sensible by handling them), they perceive the least variation of the strata. The principal part of the art of boring depends upon keeping the hole clean, and observing and registering every change and circumstance in the strata with care and attention.

In the year 1805, Mr James Ryan, an Irish gentleman, took out a patent for an improved method of boring. This consisted in using a cylindrical instrument for boring, by which a core, or solid unbroken piece of each stratum, was cut, and by other tools brought vertically to the surface, in the exact position in which it stood in the strata. By this method, it will be seen, the direction of what coal-miners call the *dip** (a circumstance so essential towards determining the best place to sink an engine-shaft for draining the bed of coals intended to be worked), as well as the quantity and precise nature of the strata or coal measures, are correctly ascertained. Mr Ryan likewise invented a new system of ventilating mines, which was originally tried, in the year 1816, in some of the collieries of Staffordshire, for which he obtained from the Society of Arts one hundred guineas; but Mr Ryan's method of ventilation never came into universal use.

It may readily be conceived, from these observations, that boring is of the most essential use and importance in coal-mining, for by it the adventurers, previously to the sinking of a pit, are enabled to procure the most valuable data on which to proceed—being informed beforehand of the nature of the various strata through which they have to pass before reaching the coal, and knowing, to an inch almost, the depth of the stratum of coal from the surface, and likewise its quality and thickness. The boring notes of collieries are consequently of the utmost value and importance to parties interested in coal-mining.

Having ascertained, by means of boring, the probable depth, thickness, and other attendant circumstances of the bed of coal, the next process is to sink a perpendicular shaft (round or square) from the surface, so as to intersect the various strata containing the coal, and as many of the beds as are considered to be worth working. A steam-engine and shaft are usually at the same time erected, for draining the water from the coal. The site of the shaft of a coal-mine is determined by the inclination and direction in which the bed of coal lies.

* The coal-strata are seldom or never found to lie in an exactly parallel position with the surface, but generally have an inclination or descent to some particular part of the horizon, which miners call the *dip*. If this inclination be towards the east, it is called the east dip, and so on, according to the point of the compass to which the strata incline.

Digitized by Google

"In every mineral plane," says Dr Ure,* "the inclination and direction [of the coal stratum] are to be noted; the former being the angle which it forms with the horizon, the latter, the point of the azimuth or horizon towards which it dips—as west, north-east, south, &c. The direction of the bed is that of an horizontal line drawn in its plane, and which is also denoted by the point of the compass. Since the lines of direction and inclination are at right angles to each other, the first may be always inferred from the second; for when a stratum is said to dip to the east or west, this implies that its direction is north and south."

The process of sinking the shaft and of draining the water is called, in mining language, *winning* the coal; and when the sinkers arrive at the first workable seam of coal, they are said to have *won* it.

Great rejoicings, such as the firing of cannon, &c., usually take place in the neighbourhood of a colliery when a new stratum of coal has been won; at least such is the custom throughout the coal-field of Northumberland and Durham. The following mode of celebrating an event of this kind at Gosforth colliery, near Newcastle, on the 6th of February 1829, may be cited for its novelty. It is from the pen of a correspondent of the Penny Magazine (July 1833). "On the Saturday previous to the circumstance I am about to relate, the miners employed in sinking a pit at Gosforth reached the coal. Two years and a half had been spent in sinking this pit, the shaft of which was cut through 160 fathoms of solid rock; and therefore the event was considered as one of great importance in the surrounding vicinity. Among other rejoicings which took place on this occasion, was a ball, which was held in the mine, at the depth of about 1100 feet below the surface! The ball-room is stated to have been in the form of an L; its width 15 feet, base 22 feet, and perpendicular 48 feet. The company, to the number of two hundred and thirty, of whom about one hundred were ladies(!) began to assemble at the mouth of the mine at half-past nine o'clock A.M., and continued to descend the pit until one o'clock P.M. Immediately on their arrival at the bottom of the pit, each individual proceeded to the face of the *drifts*, and hewed a piece of coal, as a remembrance of this perilous expedition, and then returned to take part in the festivities of the ball-room. An excellent band, composed entirely of miners, was in attendance. As soon as a sufficient number of guests were assembled, dancing commenced, and was continued without intermission till about three o'clock P.M., when they began to ascend the pit, which all of them accomplished in perfect safety, highly gratified with the subterranean amusements in which they had partaken. The colliery at which this novel entertainment took place is now one of the most extensive in Northumberland."

We shall now briefly describe the mode employed in working or excavating the coal. On arriving with the shaft at the bed of coal intended to be worked, the sinking is suspended for a time, and the miners begin to work the coal by driving or excavating an horizontal passage, called a *bord*, through the seam of coal, of from twelve to fourteen feet in width generally, and the whole height of the seam, which varies in the Newcastle coal-field from three to six feet. Another similar passage, or bord, is usually commenced at the same time, in an opposite direction. The first or original bords driven in this way in a seam of coal, are, after the workings have been proceeded with for some considerable distance, called the *mother-gate*, being the passages by which all the workings subsequently made in the mine are approached from the shaft.

The mode most commonly employed for excavating the coal is a simple one. The miners having marked out the width of the bord, or passage, begin to make a narrow vertical fissure in each side of the bed of coal, which they accomplish by means of an instrument called a *pick*; this done, they then make a similar excavation at the bottom, which has the effect of undermining the piece of coal, which being thus partially detached, is made to fall down in pieces, by firing a few shots simultaneously at the top of the seam. Masses of coal, of from sixty to eighty tons' weight, may be brought down at once in this way. This operation is repeated from time to time; and the coals, and accompanying stones and rubbish, thus hewn out of the bed, are put into large baskets, called *corves*, and conveyed on small carriages to the foot of the shaft of the mine; and thence drawn to the surface, or in mining language, *to bank*, by means of a steam-engine, or horse-gin, or capstan.

The reader will now imagine the miners to have proceeded some distance with the bords or passages above described, and that other bords have in the mean time been commenced, and are being driven in a *parallel* direction, at a distance of about eight yards from the first, and on each side of them. As the bords are proceeded with, narrow passages are driven between them, at regular intervals of eight or ten yards, and at right angles with them, so as to connect the main bords with each other. These cross passages are called *headways*. The squares or parallelograms of coal, formed by means of this series of bords and headways, are called *pillars*, and serve to support the superincumbent strata, and to prevent its falling in and suspending the operations, or endangering the lives of the miners. The main shaft is frequently sunk down to other seams of coal, which are worked precisely in the same way as the first one. In this case, besides the main shaft, those different workings are made to communicate with each other by means of other shafts, called *staples*, which are sunk down at intervals between the seams of coal. Thus the reader will perceive, that in the course of time, the bords of the mine, increasing both in number and length, and a communication being kept up from time to time from one bord to another, by means of those transverse passages or headways, the workings begin very much to assume the appearance of a regularly built city or town—the bords, running parallel with each other, at a distance of eight yards asunder, forming so many main streets, and the headways the cross streets by which they communicate. The writer of this paper recently saw a beautiful model, exhibiting all the workings and ramifications of a coal-mine, in the museum of the Newcastle Literary and Philosophical Society.

The persons employed in working a coal-mine encounter a variety of difficulties, dangers, and vicissitudes, which our limits will not permit of our noticing at length at present. The principal evil attending upon coal-mining, that arising from imperfect ventilation, we have already described in a recent number of this Journal.†

PEPITA, THE HEROINE.

[From the New York Mirror, January 25, 1840.]

In the autumn of 1832, the Marquis de Bevenuccho, his daughter Francisca, Don Cæsar, his intended son-in-law, Pepita, Francisca's maid, and two male servants, occupied one of those huge coaches drawn by ten mules which are frequently to be met with on the road from Mexico to Vera Cruz. The destination of the party was Paris; the marquis was a widower, and Francisca was his only child. While the lumbering vehicle in which they started on their journey was descending one of the roughest defiles of the Pinol, a violent jerk put its construction to so severe a test as to threaten its entire ruin, unless repairs were immediately made. What was to be done? The coachman informed the travellers that they could reach, at a short distance from the spot, a *posada*, which, though not much frequented, and greatly dilapidated, was still habitable, and a place where they could pass the night. This plan was accordingly adopted, and the party, bemoaning their misfortune, reached the *posada* at the moment of sunset. It was a desolate habitation, surrounded by broken walls, ruined towers, and gloomy pines, which gave it the air of a chateau of romance. The marquis and his family took possession of a large chamber, Pepita rested as well as she could in a closet, and the servants, wrapped up in their cloaks, slept just where sleep happened to overtake them.

The heroine of our tale, Pepita, had some suspicions that all was not right. In passing before a grated window, which opened upon the court, she fancied she had caught a glimpse of two flashing eyes, which instantly disappeared; and this incident was sufficient to excite her apprehensions. She retired, however, into her cell, and placing her mantle under her head for a pillow, was about to close her eyes, when, casting them towards the ceiling of her little dormitory, she remarked a ray of light glimmering through the chinks of the wooden shutter. Using the utmost precaution, she raised herself upon a table, and half withdrawing a curtain which hung before a window, she saw two men sitting near a table, their faces turned from her, and lighted by a lamp which burned in the corner of the apartment. Pepita had enough of Spanish blood in her veins to give her great pretensions amongst her compatriots. She was intelligent, faithful, courageous, and as resolute as the maid of Saragossa.

With a glance she took note of all things in the chamber. It was impossible to mistake the profession of the men, for Pepita saw before them an open chest, which she recognised as belonging to the marquis, and from which the bandits had drawn out the provisions and plate it contained. Both appeared to have done honour to the marquis's wine, and were so much intoxicated that she felt no apprehension of being detected by them. Continuing to observe their movements with anxiety, she arranged the plan of operation which she determined to pursue. For a moment she felt herself chilled by terror, when the words which she heard informed her that the elder of the two was the famous *Capador* himself. She remembered at once that he was generally described as richly clothed, and carrying an axe; and the man before her had an axe resting between his legs, and wore a magnificently embroidered silk dress.

Pepita learned, or rather half guessed, from their broken conversation, that the band of which they were the leaders awaited in the forest for the signal which was to recall them; that this signal was to be given by a hunting-horn which she noticed in the apartment; and that, upon their junction, the travellers were to be attacked. With joy she saw the wine of the marquis was gradually gaining the mastery over them; and, soon after, observing them buried in profound slumber, she quitted her cell, descended into the court, found out the door of the robbers' chamber, and opening it softly, made good her entry with admirable courage and presence of mind. She gained possession of the cloak, hat, and well-known hatchet of the chief, and also of the hunting-horn, and contrived to effect her retreat without accident. She now fastened the doors of the bandits' apartment with the bolts which are often placed outside of the doors of Mexican houses, then flung over her the cloak of the brigand, placed his hat upon her head, and with the hatchet and hunting-horn in her hands, sallied from the court. The night was utterly dark. She reached the border of the pine-wood, and drawing a few low tones from the horn, was immediately answered by a prolonged whistle. A band of ten men issued from the woods: she retreated before them towards the house, contriving, with much address, to let herself be seen no more distinctly than was necessary to enable the robbers to follow her. When they were sufficiently near, she contrived to exhibit the glare of the axe; and enjoining silence with the motion of her hand, led the band into the court. In obedience to her sign, they entered silently into a large chamber, and closing the door upon them, she drew the bolts so gently that the bandits had no suspicion that they were imprisoned.

Then, without a moment's delay, the intrepid Pepita ran to the apartment of the marquis, and related to him the whole of her proceedings. Guided by the advice of Pepita, the marquis awakened Don Cæsar, who, mounted on one of the best mules, set off instantly for Acayete, to procure the assistance of a detachment of cavalry stationed in that village.

The marquis armed the two domestics, and, listening at the door of the apartment where the two chiefs were confined, ascertained that they had awakened, and were endeavouring to effect their escape. The scene now became one of intense anxiety. Shortly, all in the building were roused, and a confusion of voices arose on all sides. Gomez (the chief) and his lieutenant, uttered shouts of rage, and their appeals were answered by their companions as they exerted themselves to break the doors of their prison. The marquis, Pepita, and the servants, shouted likewise in every tone they could assume, threatening with death the first who should offer himself to their aim, and affecting to present a force far beyond their actual number. But we must leave the *posada* and its inhabitants for a moment to follow the track of Don Cæsar.

This young man, one of the most brilliant among the cavaliers of Mexico, although skilful in the management of a well-trained steed, was but little accustomed to the government of a mule. He was in despair at the slowness of his progress, and overwhelmed with the most fearful presages. What would become of his friends—above all, of his betrothed, the pretty Francisca—if the brigands should escape from their confinement before his return? The day began to break before he could gain the environs of Acayete, but great was his joy when his ears were assailed by the bells of a *conducta*. Don Cæsar presented himself immediately before the commanding officer, told his story in a few words, and implored assistance. The officer and his men set off with him towards the hills, with all the rapidity the wild road would permit. Their expedition was not a little increased by the hope of capturing Gomez, on whose head a price was set, and who had hitherto baffled all the schemes laid to surprise him.

During this time, affairs at the *posada* had reached their most critical point. The robbers had succeeded in shattering the door of their prison so far that it was scarcely held by its hinges. Gomez and his lieutenant had taken the same course, and there was every prospect that the brigands would overcome all the obstacles which had opposed their liberation, when Pepita, armed with a pistol, and concealed behind a pillar in the court, took successful aim at the head of a brigand which showed through the opening. This incident daunted the robbers. It was evident that one of their leaders had fallen, from the deep silence that prevailed. Convinced, however, that they had no time to lose, they once more returned to their attack. The door was on the point of yielding to their blows, when Pepita caught the sound of the galloping of horses on the road from Acayete. Deliverance was now sure. The noise of horses and arms resounded soon in front of the *posada*, and before Don Cæsar had embraced Francisca, the soldiers had made themselves unresisted masters of the band of robbers.

But it remained to secure Gomez and his lieutenant. From the desperate character of the man, it was not supposed he would allow himself to be taken without resistance. It was proposed by some to force the door and enter in a body, while others desired to try the effect of a parley. This latter advice was followed, it being wished, above all things, to deliver him into the hands of the Mexican authorities.

"Open the door to the lieutenant of the republic," cried the commanding officer; for it was found, on withdrawing the outer bolts, that the door was fastened within.

No answer was given.

At this moment the discharge of a pistol resounded from the interior. It was followed by the faint cry of a woman, which seemed to issue from the apartment where the marquis had passed the night. All hastened in an instant in that direction, and in her closet they found the intrepid Pepita bathed in her own blood. But when they approached her, she had strength to point with her finger to the little window. The officer raised his eyes, and perceived there Gomez and his lieutenant, the former armed with a sword, and the latter reloading his pistol. In an instant he fired on the lieutenant, who fell; and, regaining the

Digitized by Google

corridor with his soldiers, the door of the chamber was at once forced. Gomez fought with savage desperation, but was at length secured.

All eyes were now turned towards the intrepid Pepita, and they learned from herself the cause of the event which had nearly proved fatal to her. Luckily her wound was slight, though it had bled profusely; nor was it long before she was able to resume her accustomed duties.

The journey of the marquis was postponed for a time, and the party returned to Mexico. The reward offered for the capture of Gomez was unanimously adjudged to Pepita, who became the object of universal interest. Her intrepidity had so strongly excited the imagination of the young officer commanding the guard, that she became his bride before the end of the year; and the marquis, considering her as the saviour of his family, secured to her a considerable pension during life.

UNINVITED CONTRIBUTIONS.

VERSE.

Our forbidden contributions in verse are still "richer" than those in prose, a fact for which it is not difficult to account. Prose is properly the language of soberness and truth, while verse is the language of folly and extravagance. All the weakest and most absurd minds, therefore, naturally seek for the means of expression in verse. Such, at least, is our theory on the subject. Our verse contributions, however, are of two nearly distinct kinds, the distinction chiefly arising from the accident of the writers being educated or uneducated. In the first case, the authors are persons acquainted with literature: they read poetry in particular, and, from the bent of their own minds, they take peculiar pleasure in the sentimental kind of verse. From admiring to imitating is but a step. With the music of Hemans breathing in their minds, and a great number of her words in their memory, they write; but what is it they write? Only something which resembles Hemans in sound, or in the use of certain words, and has not perhaps one distinct or fully formed original idea from first to last. This is the first kind. The second is the production of nearly unlettered minds—the blind blundering efforts of intellects which only know there is such a thing as literature, and do not possess one natural or acquired qualification for the practice of the art.

The following specimen seems to us a peculiarly suitable illustration of what we have said of the first order of our forbidden verse contributions:—

ON SEEING AN EXTRACT OF MRS HEMANS'S POEMS IN A RECENT NUMBER OF THE JOURNAL.

When female virtue catch celestial fire,
How passing sweet the harmonious numbers roll!
When grace and beauty touch the chorded lyre,
How sweet its breakings vibrate on the soul!

When all the passions in immortal tone
Display the graces that the muse inspires;
Calls up the sacred songs of ages gone,
And wakes the raptures of prophetic fires;

All heaven rejoices when such ardours rise
From modest worth. I see th' assembly throng
In shining crowds, down bending from the skies,
And, listening, catch new matter for their song.

Thou art a stranger to these youthful lays,
Myself a lonely stranger here below;
Thou need'st not mine—thou hast far higher praise,
Than aught can yield thee in a world of wo.

I soon shall pass the trifling scenes of time,
Released from anxious cares, from grief and pain;
But when I soar to those blest heights sublime,
I'll frame a chorus to thy noble strain.

A few others of the same order are subjoined. The first in order is very original in point of grammar. We could point out the particular poem of Moore's, *after reading which* the second has been written.

THE PETREL.

The lightnings flash, the thunders soar,
The petrel on the topsail soar;
The storm set in, the thunder rend,
When soars from heaven the mariner's friend.

Then to their oars the gallant few,
Whene'er the petrel comes in view;
Unwreath the topsails, now they cry,
For Carey chickens on us hie.

She comes with all her twittering train,
Sweet petrel of the boisterous main;
She leaves her dwelling from afar,
To dwell upon the marine-car.

Then, lo! a horrid crash they hear,
The ship's gone down, the petrel's fear;
She hies her flight from pole to pole,
And cheers the mariner's drooping soul.

TO THE QUEEN.

Hail to Victoria! oh, long may that name
Triumphantly sound o'er the lion-ruled main;
May it prophet-like tell of a bright golden dream,
That shall beam o'er our island now thou'rt her queen.

Hail to Victoria! oh, may that name speak
Of deeds that shall add to our glory and might;
Be it tyranny's bane—the hope of the weak—
And millions shall bless it as liberty's light.

"Then, hail to Victoria! of Albion the boast!"
Shouts a proud happy people's loud voice;
"Tis the song of the waters that bosom our coast;
With its echoes our green hills rejoice.

In the example which follows, juvenility is added to the other disqualifications of the author. So much tolerably measured verse, with such disjointed and crude ideas, is really a curiosity:—

FAREWELL TO HOME.

Bright scenes of youth, the seat of pleasure,
And all that's lovely, from you rent;
Oh! cruel fate, is there no measure,
To quench thy thirst, thy sway relent?

Unfetter'd on my natal mountains,
Where undisputed freedoms reign,
Me captive bind from blissful fountains,
To link me to thy galling chain.

Adieu! my friends and bold companions;
My summer's past, my winter's come;
I now brave the desk encounters,
And city life—more awful doom!

Adieu! ye woods and hills majestic;
In vain to me thy heath doth smile;
My flights now curb'd—now more domestic;
No more my heart thy knocks fill.

Adieu! ye dells and murmuring streams,
And dash of cataract's awful roar;
I hear thy sound in joyful dreams,
But wake to feel my thraldom more.

Sweet spot of earth by nature gilded,
I ever will thy charms extol;
My thoughts can ne'er be from thee shifted,
Though the sea between us roll.

Adieu, wild sports! adieu, for ever!
My soul is ravish'd no more by thee!
If to wing my course the earth all over,
No spot I would find so dear to me.

We now come to the division in which the authors are evidently altogether unlettered. The first specimen comes from London.

THE LIBERAL MIND.

The structure that those thoughts do hold,
Is fraught inside, outlined with gold;
A blooming rose it is, indeed;
A twining bower in its evening shade.

A rose, in morning, that so sweetly spread
The hills, the vales, and every mead,
With scented odours fragrance fly,
The groves, the plains, and every way.

A lily in the stream that glade
Beneath her pallid smiling shade;
A bed of daises in the evening dew,
The valleys' pride and meadows' boasting hue.

A blooming grave that decks the verdant plain,
Majestic spreads above the winding stream,
Diffusing wings the soft and soothing smell
Around the bounding rills to raise the rolling swell.

Soft as the down on snowy thistle seen,
A mountain spreading forth in green;
Above, the rich abounding hills,
Clothed with Aurora's shining smiles.

The above may be called *language in a metrical form, without one distinct idea throughout.* To many clever persons, the composition of such a piece would be one of the most difficult of tasks. The next following specimen also comes from London, and seems to have been written soon after the author had perused an article on songs in the present work. The whole communication is, in this case, given.

"FOR CHAMBERS'S JOURNAL.

How oft the spark of youthful genius,
Has been dampt out for want of kindling tillage,
Which might have shone, like the star of Venus,
O'er deserts wild and each rustic village.

Sir,—Having recently seen in your useful and most instructing Journal a Chapter to Song Writers, over which I read with great satisfaction, and I trust with an equal interest; for as you have so clearly described the beautiful specimen of Burns's simplicity, and likewise the great attempt of the living bard, Wordsworth's 'Fair Ellen Irvine,' &c. When I compared them together, I at once saw the object of your intention. This alone, I must confess, has induced me again, as you particularly recommend, to try my hand. Although I have on previous occasions wrote a variety of poems, and several songs, but hitherto have always considered them as being too simple, or rather nonsensical, to venture them on the wayside of the literary world, and as not worthy of public attention. But as you have strengthened my confidence with the encouraging remarks I met with in your Chapter to Song Writers, I have sent you, of my composition, a specimen, entitled 'Poor Fanny's Gown,' which I composed on the following day after I saw the above chapter, and if you should think it worthy of your perusal, please to give your impartial opinion for or against; and if the whole as a song should merit your censure, I shall not feel at all disappointed, but rather pleased, to learn the faults in which your superior criticism may be able to point out, in order to avoid, if possible, the same errors in future. Yours, &c.

POOR FANNY'S GOWN.

When Fanny had her linen wash'd,
And took 'em out to dry,
She spread 'em o'er each thorny bush,
Which round the meadow grew.
And early as the morning dawn,
With lightsome heart and humming glee:
She little thought a change so soon
Would bring such malady.

Bold renard came, for life he speed,
Pursued by huntsman, horse, and hound;
And on they tripp'd, with careless head,
O'er shining shirts and Fanny's gown.
Then out she ran, in sorrow cried,
Your sport to me gives pain;
For some was soil'd, and sadly torn—
Poor Fanny's Sunday gown!"

The next which follows was sent in 1835. The contributor adds in a postscript, "I am afraid it is too late for this week."

THE PARTING.

As I went out to take the air,
Upon an autumn morn,
I fell upon a lovely pair,
And sadly they did mourn.

The one, a lovely maid, I knew
Was weeping sore with grief,
Because her love would go, and then
Where could she find relief?

The other, a handsome, stout young man,
Was bowed down with pain,
Because he thought his lovely Ann
He'd never see again.

Oh! George, she said, oh! say that you
Will very soon return;
Because my thoughts will wandering look
For you at every turn.

Oh! Ann, he said, my heart is sore,
To leave you thus alone;
But, then, my love, when far away,
I'll think of thee alone.

Then, give me one dear parting kiss,
For time calls me away;
Oh! time that runs and no man stops,
Tells me I must not stay.

Another, by a different hand, is on a similar subject.

THE SAILOR'S PARTING.

Air.—"*Oh! no, we never mention her*"

And must I leave my native home,
For ever must I leave?
And must I o'er these wild seas roam,
For ever must I leave?

The raging tempests welcome me,
But how can I be glad,
For though I love the open sea,
Yet still would I be sad.

Still thoughts would usher in my mind,
When just as I'd depart,
That makes me think of one more kind,
The dearest of my heart.

Then can I leave without a tear?
Oh, no! it cannot be;
Such faithful love, so doubly dear,
My eyes can never see.

My joys would fade like falling leaf,
Were I away from her;
Oh! how I'd melt away in grief,
My dreams must be of her.

How can I think that time is come,
The parting hour for me;
To every thing on earth I'm dumb,
But kindest, dearest thee.

Now, must my parting accents swell,
My heart remains with you;
Then, angel, here's my last farewell,
Adieu! adieu! adieu!

We were requested, four years ago, to insert the following in our "earliest paper." To think of any rational creature supposing such verses to be literary composition, affords a curious idea of what the human mind is capable of in this particular direction of absurdity:—

THE FAREWEEL.

Fareweel, auld Eppy, gude auld frien',
That ever wish'd me weel;
Sair is my heart wi' thee to pairt—
Auld Eppy, fare-ye-weel.

I'll ne'er forget thee mony a day,
That we baith, in the fiel',
Bun' up the new cut sheaves o' wheat—
Auld Eppy, fare-ye-weel.

An' owre our heads the lawrock sang,
Fu' bonnily the while,
But noo, wi' tremblin' notes it sings—
Auld Eppy, fare-ye-weel.

When in our hann's we grupp'd the jug
O' whey, an' cake o' meal,
We saw the wheat drap 'neath the scythe—
Auld Eppy, fare-ye-weel.

But, Eppy, we ourscls are wheat,
The worl's the fruitfu' fiel',
An' we'll drap 'neath the scythe o' death—
Auld Eppy, fare-ye-weel.

An' sin' ye're gaun to leave me noo,
Nae mair to roam the fiel',
Sair is my heart, my gude auld frien'—
Auld Eppy, fare-ye-weel.

FLY-FISHING.

The great secret in fly-fishing, after a person has acquired the art of throwing a long and a light line, is perseverance—that is, constant and continuous exertion. Fish are whimsical creatures, even when the angler, with all appliances and means to boot, is placed apparently under the most favourable circumstances. Let him, however, commence his operations with flies, which, upon general principles, he knows to be good—for example, a water-mouse body and dark wing, hare-ear and moorfowl wing, red hackle and teal or mallard wing. It may frequently happen that for an hour, or even two hours, he will kill nothing; but, then, it will as often happen, that for another couple of hours he will pull them ashore with a most pleasing celerity.

Awake but one, and, lo, what myriads rise!

Next comes a pause of another hour or more, during which little or nothing is obtained, so that if the intermediate period is frittered away on green banks, eating biscuits, success is doubtful or impossible. We believe that the appetites and motions of the finny tribes are regulated and directed by certain (to us) almost imperceptible changes in the state of the atmosphere, with which, as they do not proceed from any determinate or ascertained principles of meteorological science, it is not easy for the angler to become acquainted; and, therefore, the only method to remedy the *disagreement* thus arising, is to fish without ceasing so long as he remains by the "pure element of waters."—*The Rod and the Gun.*

Column for Married People.

We find the following benevolent and pithy advices in reference to the mutual conduct of persons in married life, in a work little known in this country, called "The Philosophy of Common Sense, by Mr Carey" (Philadelphia, 1838), and take the liberty of giving them circulation in our paper.

TO HUSBANDS.

"I. Always regard your wife as your equal; treat her with kindness, respect, and attention; and never address her with the appearance of an air of authority, as if she were, as some misguided husbands appear to regard their wives, a mere housekeeper.

II. Never interfere in her domestic concerns, hiring servants, &c.

III. Always keep her properly supplied with money for furnishing your table in a style proportioned to your means, and for the purchase of dress, and whatever other articles she may require, suitable to her station in life.

IV. Cheerfully and promptly comply with all her reasonable requests.

V. Never be so unjust as to lose your temper toward her, in consequence of indifferent cookery, or irregularity in the hours of meals, or any other mismanagement of her servants; knowing the difficulty of making many of them do their duty.

VI. If she have prudence and good sense, consult her in all great operations involving the risk of very serious injury, in case of failure. Many a man has been rescued from ruin by the wise counsels of his wife; and many a foolish husband has most seriously injured himself and family by the rejection of the advice of his wife, stupidly fearing, if he followed it, he would be regarded as henpecked! A husband can never consult a counsellor more deeply interested in his welfare than his wife.

VII. If distressed or embarrassed in your circumstances, communicate your situation to her with candour, that she may bear your difficulties in mind in her expenditures. Women sometimes, believing their husbands' circumstances better than they really are, disburse money which cannot be well afforded, and which, if they knew the real situation of their husbands' affairs, they would shrink from expending.

VIII. Never on any account chide or rebuke your wife in company, should she make any mistake in history, geography, grammar, or, indeed, on any other subject. There are, I am persuaded, many wives of such keen feelings and high spirits (and such wives deserve to be treated with the utmost delicacy), that they would rather receive a severe and bitter scolding in private, than a rebuke in company, calculated to display ignorance or folly, or to impair them in their own opinion, or in that of others.

> 'Be to her faults a little blind;
> Be to her virtues very kind;
> Let all her ways be unconfined,
> And place your padlock on her mind.'

TO WIVES.

I. Always receive your husband with smiles—leaving nothing undone to render home agreeable—and gratefully reciprocating his kindness and attention.

II. Study to gratify his inclinations, in regard to food and cookery; in the management of the family; in your dress, manners, and deportment.

III. Never attempt to rule, or appear to rule, your husband. Such conduct degrades husbands—and wives always partake largely in the degradation of their husbands.

IV. In every thing reasonable comply with his wishes with cheerfulness—and even, as far as possible, anticipate them.

V. Avoid all altercations or arguments leading to ill humour—and more especially before company. Few things are more disgusting than the altercations of the married, when in the company of friends or strangers.

VI. Never attempt to interfere in his business, unless he ask your advice or counsel; and never attempt to control him in the management of it.

VII. Never confide to gossips any of the failings or imperfections of your husband, nor any of those little differences that occasionally arise in the married state. If you do, you may rest assured that, however strong the injunctions of secrecy on the one hand, or the pledge on the other, they will in a day or two become the common talk of the neighbourhood.

VIII. Try to cultivate your mind, so as, should your husband be intelligent and well-informed, you may join in rational conversation with him and his friends.

IX. Think nothing a trifle that may produce even a momentary breach of harmony, or the slightest uneasy sensation:

> Think nought a trifle, though it small appear;
> Small sands the mountain, moments make the year,
> And trifles life. Your care to trifles give,
> Else you may die ere you have learn'd to live.—Young.

X. If your husband be in business, always, in your expenditures, bear in mind the trying vicissitudes to which trade and commerce are subject; and do not expose yourself to the reproach, should he experience one of them, of having unnecessarily expended money of which you and your offspring may afterwards be in want.

XI. While you carefully shun, in providing for your family, the Scylla of meanness and parsimony, avoid equally the Charybdis of extravagance.

XII. If you be disposed to economise, I beseech you not to extend your economy to the wages you pay to seamstresses or washerwomen, who, particularly the latter, are too frequently ground to the earth by the inadequacy of the wages they receive. Economise, if you will, in shawls, bonnets, and handkerchiefs; but never, by exacting labour from the poor without adequate compensation, incur the dire anathemas pronounced in the Scriptures against the oppressors of the poor.

> Ye fair married dames, who so often deplore
> That a lover once blest is a lover no more,
> Attend to my counsel—nor blush to be taught,
> That prudence must cherish what beauty has caught.
>
> The bloom of your cheek, and the glance of your eye,
> Your roses and lillies may make the men sigh:
> But roses, and lillies, and sighs, pass away;
> And passion will die as your beauties decay.
>
> Use the man that you wed like your fav'rite guitar;
> Though there's music in both, they're both apt to jar.
> How tuneful and soft from a delicate touch!
> Not handled too roughly, nor play'd on too much!
>
> The sparrow and linnet will feed from your hand;
> Grow tame at your kindness, and come at command.
> Exert with your husbands the same happy skill,
> For hearts, like your birds, may be tamed at your will.
>
> Be gay and good-humour'd, complying, and kind,
> Turn the chief of your care from your face to your mind:
> 'Tis thus that a wife may her conquest improve,
> And Hymen will rivet the fetters of Love.—Garrick.

TO BOTH PARTIES.

I. Should differences arise between husband and wife, the contest ought not to be, as it unfortunately too frequently is, who shall display the most *spirit*, but who shall make the first advances, which ought to be met more than half way. There is scarcely a more prolific source of unhappiness in the married state, than this *spirit*, the legitimate offspring of odious pride and destitution of feeling.

II. Perhaps the whole art of happiness in the married state might be compressed into two maxims—'Bear, and forbear;' and 'Let the husband treat his wife, and the wife her husband, with as much respect and attention as he would a strange lady, and she a strange gentleman.'

III. I trust much caution is scarcely necessary against flirtations, well calculated to excite uneasiness, doubts, and suspicions, in the heart of the husband or wife of the party who indulges in them, and to give occasion to the censorious to make sinister observations; and it is unfortunately too true, that the suspicion of misconduct often produces fully as much scandal and evil as the reality.

It is a good rule of reason and common sense, that we should not only be, but appear to be, scrupulously correct in our conduct. And be it observed, that, however pure and innocent the purposes of the parties may be at the commencement, flirtation too often leads to disastrous results. It breaks down some of the guards that hedge round innocence. The parties in these cases are not inaptly compared to the moth fluttering around a lighted candle, unaware of the impending danger. It finally burns its wings, and is thus mutilated for life. 'He that loveth the danger, shall perish therein.' 'Lead us not into temptation' is a wise prayer; and while we pray not to be 'led into temptation,' we most assuredly ought not to lead ourselves into it. I know these remarks will be charged to the account of prudery; but, at the risk of that charge, I cannot withhold them.

IV. Avoid all reference to past differences of opinion, or subjects of altercation, that have at a former day excited uneasiness. Remember the old story of the blackbird and the thrush. 'I insist it was a blackbird.' 'But I insist it was a thrush,' &c.

The preceding rules, if as closely followed as human imperfection will allow, can hardly fail to secure happiness. And should only one out of every ten readers profit by them, I shall be richly paid for their concoction.

I cannot conclude this brief essay better than by adding the following admirable advices of Julia de Roubigné to her daughter, shortly previous to her death:—

'Sweetness of temper, affection to a husband, and attention to his interests, constitute the duties of a wife, and form the basis of matrimonial felicity. These are, indeed, the texts from which every rule for attaining this felicity is drawn. The charms of beauty, and the brilliancy of wit, though they may captivate in the mistress, will not long delight in the wife. They will shorten even their own transitory reign, if, as I have seen in many wives, they shine more for the attraction of every body else than of their husbands. Let the pleasing of that one person be a thought never absent from your conduct. If he love you as you would wish he should, he would bleed at heart should he suppose it for a moment withdrawn; if he do not, his pride will supply the place of love, and his resentment that of suffering.

Never consider a trifle what may tend to please him. The greater articles of duty he will set down as his due; but the lesser attentions he will mark as favours; and, trust me, for I have experienced it, there is no feeling more delightful to one's self, than that of turning these little things to so precious a use.

Above all, let a wife beware of communicating to others any want of duty or tenderness she may think she has perceived in her husband. This untwists at once those delicate cords which preserve the unity of the marriage engagement. Its sacredness is broken for ever, if third parties are made witnesses of its failings or umpires of its disputes.'"

LEECHES.

We are at a loss to know why leeches are not made an object of cultivation and improvement in this country. There are surely many bogs, marshes, or ponds in England, Ireland, and Scotland, where they would thrive and be productive. In France, as we observe by the following newspaper paragraph, the cultivation of leeches is beginning to attract attention:—"M. Huzard has presented to the Société d'Encouragement a proposition for granting prizes for the best methods of preserving and increasing the number of leeches in France. He states that about twenty-three millions of these useful creatures are annually consumed in France, but their price is raised to an enormous rate on account of the difficulty of keeping them alive. The objects of the proposed prizes are—The stocking of such pieces of water and streams as are fit for the propagation of leeches, but at present have none in them; for the best means of making them disgorge after an operation, without injuring them or diminishing their powers; and introducing a new and effective species hitherto unknown in France."

THE BLOODHOUND IN FLORIDA.

The people of the United States, as some of our readers may be aware, have for some time been in a state of active warfare with the aboriginal inhabitants, or Indian tribes, of Florida, a large district of country on the Gulf of Mexico. The object of the civilized whites, as a matter of course, is the expulsion or extinction of the red men, and the seizure of their territory; and to accomplish which, they have at length fallen upon the expedient of hunting down and worrying the poor natives with dogs. The animals employed in this most atrocious office are dogs from Cuba, descendants of the bloodhounds introduced to that island by the Spaniards some centuries ago for a similar purpose, and are alluded to as follows, by an anonymous correspondent in a newspaper a few months since:—

"At a period not very remote, the unfortunate negroes in the Spanish settlements were frequently torn to pieces by the Cuba bloodhounds. In fact, under the title of Chasseurs, the Spaniards maintained regular regiments of these dogs and their attendants. In pursuing or hunting the runaway negroes, the chasseur is generally accompanied by two dogs, and armed with a *coteau de chasse*, or straight sword; and we are informed that these bloodhounds, when well and properly trained, on coming up with the object of pursuit, will not kill him unless resistance is offered, but bark at and terrify him till he stops, when they crouch near him, and, by barking, give their keepers notice, who approach accordingly and secure their prisoner.

Dallas, in his account of the Maroon War in Jamaica, mentions an importation of these Cuba bloodhounds, in order to assist the regular troops in reducing the refractory Maroons. It may seem strange that dogs were called to the assistance of well-disciplined soldiers; but, in order to elucidate the subject, it must be observed, that the armed Maroons, under the conduct of various cunning leaders, particularly of Cudjoe, Smith, and Johnson, aware of their own inferiority in point of that organisation which constitutes the strength and essence of a regular army, cautiously avoided meeting their opponents on the plain; on the contrary, they retired to the impenetrable fastnesses of the woods and mountains, and by means of ambuscades, contrived so to harass the troops, that the governor of Jamaica ultimately procured a company of these dogs and their attendants from Cuba, which arrived at Jamaica under the command of Don Manuel de Sejas; and a tolerable idea of these dogs may be formed from a review which took place immediately after their arrival. General Walpole, who conducted the war against the Maroons, being anxious to review these chasseurs, left head-quarters the morning after they landed, accompanied by Colonel Skinner, and arrived in a post chaise at Seven Rivers. Notice of the general's approach having been given, the chasseurs were taken to a distance from the house, in order to advance when he arrived. The Spaniards were drawn up in a line at the end of a gentle declivity, and consisted of upwards of forty men, with their dogs in front unmuzzled, and held by cotton ropes, as it was intended to ascertain what effect would be produced on the dogs if actually engaged under a fire of the Maroons. The Spaniards, upon the word being given, fired their fusees, when the dogs pressed forward with almost ungovernable fury, amidst the shouts of their keepers, whom they dragged along with irresistible impetuosity. Some of these ferocious animals, maddened by the shout of attack, and held in check by the ropes, actually seized upon the gun-stocks in the hands of the chasseurs, and tore pieces out of them.

The unfortunate Maroons, who had successfully opposed all the efforts of regular troops, were panic-struck on the arrival of the bloodhounds, and surrendered without once daring to come in contact with animals which at best could oppose but a feeble resistance to fire-arms."

Such, then, is the kind of ferocious animals employed by the Americans to destroy the red men of Florida, and, as it appears, with all the advantages which they anticipate. In one account which we have seen of the war, the following notice occurs:—"The Cuba dogs have proved quite beneficial. They caught five Indians the other day in Middle Florida, handsomely they say." Could any thing be more offensive, or more worthy of exciting the deepest reprobation?

GEOGRAPHICAL PRIMER.

The want of a simple and general treatise on Geography, at such a price as would bring it within the reach of children belonging to the humbler orders of society, having been repeatedly brought under the attention of Messrs Chambers, they now beg to intimate that they have prepared and issued a work of this nature, with the title of "A Geographical Primer," being part of their "Educational Course," and which may be obtained from any bookseller. In making this announcement, it is necessary to explain, that the Geographical Primer will not obviate the necessity for more extended treatises, and these will shortly appear in the same series of publications. The Primer is designed for the use of those, who, from circumstances, may be able to devote only a small portion of time to the study of Geography—children, for example, who have to commence labour early, and are prevented from studying more extensive works on the subject. By the aid of the small maps which the Primer contains, children may with much ease be taught the elements of geographical knowledge, and the price of the work (9d.) will, it is hoped, place it within the reach of all.

NUMBER 449. SATURDAY, SEPTEMBER 5, 1840. PRICE THREE HALFPENCE.

A FEW WEEKS FROM HOME.

A VISIT TO PARKHURST.

In my second last paper, I referred to the little pains taken in this country to prevent juvenile delinquency. In this respect, we are behind every respectable nation in Europe. The streets of no city in Holland, Belgium, Germany, or France, that I have seen, exhibit such a crew of dirty and miserable-looking little wretches as are to be seen daily in London, Edinburgh, Dublin, Glasgow, and other large seats of population, and whose almost homeless and lawless condition is a positive scandal to the community. Falling, as a matter of course, into the commission of petty delinquencies, they again and again figure before magistrates in the police-courts, and, improving as they proceed, by a vicious system of imprisonment, they in due time "work their way," as it is called, to the bar of the Old Bailey, the Court of Justiciary, or some other of the higher tribunals. The strange thing about all this is, that it is perfectly well known and understood, and yet that no means whatsoever, excepting such as flow from the efforts of private benevolence, have ever been attempted for its melioration. Having at length, by the indifference of the law, reached a court which is empowered to hang or banish, as may seem most suitable, the little ragged good-for-nothing varlet—who is perhaps so low in stature as to require to be mounted on a chair, in order that the jury may obtain a proper view of his shrewd and ill-washed countenance—is ordered to be hanged or banished accordingly; and thus society, with great thankfulness and complacency, has got rid of a being who has been tormenting it for the last half dozen years, and cost the country an immense deal of money one way and another.

For a number of years back, it has not been customary to hang boys. The practice terminated with the reign of George III. Since that period, they have more usually been sent to the prison at Millbank, to the Hulks in the Thames, where they have been compelled to work in a condition worse than that of brutes, or transported to New South Wales, where they were assigned as slaves. In only a few instances, and these of a peculiarly favourable nature, have the convicts been reclaimed, instructed, or improved; the greater proportion having been turned loose on society, at home or abroad, much more deeply sunk in moral depravity than at the commencement of their course of servitude. Latterly, an immense improvement has been effected in the disposal of young male convicts. Instead of being permanently lodged in any penal establishments of the old stamp, they are, according to the judgment of the Secretary of State, sent to a prison or penitentiary in the Isle of Wight, which, as already stated, I visited during my stay in that island, and now propose describing to the reader.

The establishment, which externally resembles a large suite of barracks for soldiers, enclosed with a lofty wall, is situated on the face of a rising piece of ground about a mile and a half north from Newport, on the road to Cowes, and is therefore favourably placed as respects both salubrity and convenience. There is also an advantage in its being placed on an island, as the chance of escape and connivance is by that means very materially lessened. For reasons which require no explanation, there is no indiscriminate admittance of strangers to see the interior, and it was only by an order from the Home-Office communicated to the governor, that I was enabled to make the visit which I desired. On entering by the gateway in the outer wall, we find ourselves in a spacious open quadrangle, surrounded by suites of brick edifices two storeys in height, with the house and offices of the governor in the centre; behind, or farther up the very gentle slope, is a tract of enclosed land, disposed as fields for manual culture. The whole arrangements without and within doors appear to be on a munificent and well-considered plan in reference to the required object; every thing being designed and conducted on a scale of military exactness, cleanliness, and discipline. The officials employed have for the greater part been in the army, and are dressed in a half military costume.

Captain Woollcombe, a gentleman who had for some years retired from active service and engaged himself in benevolent plans of juvenile instruction on a private estate, having been induced to accept the command of the institution, is installed as governor and director; and to this excellent specimen of the frank and intelligent Englishman I was speedily introduced, and conducted with much kindness over the whole establishment; receiving, at the same time, an account of the purposes of the prison, and the mode of carrying them into effect.

The institution, as I learned, was first opened for the reception of inmates in December 1838, and in the course of twelve months the number sent to it was 157. At the time of my visit, there were 180, and the accommodation will eventually admit 320. All the prisoners are boys from nine to sixteen years of age, the greater proportion, apparently, being from about eleven to thirteen, or of that age and appearance usually seen at day schools. Each boy, on entering, is dressed in a coarse grey suit, with his number, and the letters P. P. strongly marked on the breast. The objects sought to be attained by the course of treatment are twofold—the penal correction of the boy, with a view to deter, not himself only, but juvenile offenders generally, from the commission of crime; and the moral reformation of the culprit. To carry the first of these objects into effect, the utmost care is taken to avoid any species of discipline which is inconsistent with the habits and character of youth, or calculated in any degree to harden and degrade. Captain Woollcombe assured me that he should have had nothing to do with the institution, if the old "cast-iron" system of punishment had formed a part of the contemplated design. We must reclaim and instruct, said he, and that by gentle treatment, yet in a manner so little attractive, that none will be tempted to commit crime for the sake of being sent hither.* It is gratifying to find the governor of a great penal establishment breathing such a spirit of philanthropy as this, and the announcement contrasts strangely with what we have previously known of the old and vengeful modes of punishment. It is not less gratifying to find that Captain Woollcombe's exertions in the prosecution of this arduous and important work, have been ably supported by the Rev. Thomas England, who acts as chaplain. In the brief conversation which I was so fortunate as to have with this gentleman, I found him to be inspired with liberal and just sentiments regarding elementary education; and to his honourable and zealous labours, as respects the moral and religious training of the prisoners, much of the welfare of the establishment may doubtless be ascribed.

Respecting every boy admitted into the prison, an account has been taken of the causes of his criminal career, condition of parents and friends, attendance on schools and at public worship, acquirements, books read, occupation, habits, and of his conduct in confinement. From the official report which embodies these criminal statistics, we draw the following very remarkable particulars in reference to 153 boys who were in the prison at one time in 1839. First, with respect to the assigned causes of crime, of which we present a few specimens:—"Indulgent mother; kept bad company—Bad management of parents; vicious acquaintances—Want of early correction; made worse by prison contamination—Bad company; ignorance; beer shops—Bad companions; loss of mother; neglected by father—Parents both drunkards; cruelly used by them—Sent out to beg and steal by mother; forced into crime—Parents vagrants; great ignorance; bred in idleness—Utterly neglected—Stole money to pay for admission to theatres—Parents respectable; bad companions older than himself." In the greater number of cases, want of parental attention, ignorance, and bad company, are given as the causes of early error; and on turning to the table of convictions, we find that most of the children had been several times in custody and imprisoned; 1 had been thirteen times convicted and imprisoned, 1 ten times, 1 six times, 6 five times, 15 four times, 26 three times, 46 twice, and 56 once; 1 unknown. It would therefore appear that the ordinary mode of convicting and punishing boys by short imprisonments, is of little or no value in reclaiming, but that in many instances it hardens the young offender in his vicious course of life.

Nearly one-half the number of boys were from London, and the remainder from the rest of England, with the exception of 11 from Scotland, 1 from the Isle of Man, and 2 from Quebec. Theft by housebreaking, and larceny, were generally the crimes for which they had been ultimately sentenced: 3 were under sentence of fifteen years' transportation, 1 for fourteen years, 14 for ten years, 115 for seven years, and 1 for five years; 1 for three years' imprisonment, 13 for two years, 1 for eighteen months, 2 for twelve months, and 2 for six months. It is not proposed, I believe, to retain any of the prisoners beyond two or three years at Parkhurst, in which period, it is presumed, they will have been reclaimed from their evil propensities.

The next circumstance which seems worthy of notice is, that notwithstanding the neglect of parents, the great bulk of the prisoners attended schools for several years previous to their last conviction and confinement. In a list of 157 inmates, 64 had attended the national schools in connexion with the Church of England; and of these, 10 had been at school under 1 year, 34 from 1 to 5 years, 6 from 5 to 8 years, and 4 from 8 to 12 years. Thirty-five out of the 157 had attended free schools of a different kind, and of these, 12 had been at school under 1 year, 22 from 1 to 5 years, and 1 from 5 to 8 years. Of the remainder of the 157, 4 had been at an infant school, 1 at a factory school, 1 at a workhouse school, 9 at a Sunday school, and 32 at private schools, for several years. Ten had been at no school whatever. It might be inferred from this enumeration, that education was no preventive of crime, but such an inference would be equally rash and erroneous. Some of the boys who had been at the national schools for years, and had learned to read the New Testament and repeat the catechism, were found, on examination, not to know the meaning of a single thing they had been taught; some could not even read any other book: they could read their own Testament, but reading any thing else was beyond their powers. From this and other cir-

* In an article entitled "A Visit to Newgate," in the 397th number of the Journal, it is stated as the belief of an individual, that the opening of the Parkhurst penitentiary had caused an increase of juvenile crime in the metropolis. This notion, having been scrupulously investigated, is proved to be without foundation.

Digitized by Google

cumstances, it appeared that the greater part of the instruction had been purely mechanical. "I remarked," observes Mr England in his Report, "that the amount of acquirement in the mechanical elements of instruction (the art of reading and repetition from memory) formed *quite a contrast* to the degree of actual knowledge possessed either of moral duty or religious principle; the table showing that only *half* the number of readers, and a *third* of repeaters, of the church catechism, could give even a little account of the meaning of the words read, or sounds in use. And of these it appeared to be very often the strength of the intellect exercised at the moment, that, by dint of guessing, led to the meaning of terms, and not the result of prior teaching and reflection. With our present list the proportions stand thus: 85 can in some degree read, 120 repeat some or all of the church catechism, but only 58 can give *even a little* account of sounds used; and of this intelligent class several have had so little instruction as to be included neither among the readers nor repeaters." These are facts which throw a flood of light on the insufficient methods of elementary instruction at the common schools in England. One hundred and ten boys have been day-scholars for 1 year and upwards to 12 years, and of these only 85 are found, on admission to Parkhurst prison, able to read even a little; and only the smallest fraction of them know any thing of the meaning of what they read! Let this fact ring in the ears of the English people, whose indifference to the institution of an improved order of schools on a right national basis, irrespective of sect or party, is one of the most reproachful facts in their history.

It being seen that, whatever has been the previous degree of schooling of the young convicts, they are all pretty much on a level of ignorance and moral depravity, one of the first steps towards their improvement is to set them to school in the institution, commencing afresh with the alphabet, and so on to reading, writing, arithmetic, along with general instruction. To afford me an idea of the mode of teaching, I was conducted to the school-rooms, which adjoin the governor's residence. These consist of a series of airy apartments, fitted up with forms and benches, and having the walls to a certain height smoothly coated with black-coloured mastic, to resemble slate or black-board. The business of instruction, which is committed to two masters, may be defined as consisting altogether of speaking by the master to the pupils, while they are placed in a gallery before him, and of causing the pupils to write with chalk upon the wall, and in their own words, that which has been told them by the teacher. Each boy learns his alphabet by drawing it with his own hand letter by letter on the wall, in imitation of large printed letters held up to him by the master. The faculty of designing figures is thus at once brought into operation, and impresses the form and name of the letter on the memory. With a piece of chalk in his hand, and facing the stripe of black-wall, the pupil enters with alacrity upon his course of self-instruction. He has something to work with and handle, and we all know the delight which youth experiences in being allowed to labour in this manner. The result, I was informed, is surprising. The alphabet is mastered in a few days; then follows the chalking of words and sentences; next comes the formation of letters used in penmanship; and in six months the boy is not only a good reader, but a tolerable writer of a copy-book. Remarkably well-written pages, in a small hand, were shown to me as having been the work of boys who, only a very few months previously, could barely stammer over the alphabet, or name words of the simplest character. Both Captain Woollcombe and Mr England spoke in terms of high approbation of this mode of teaching, which I believe is quite new. "The black wall," says Mr England in one of his reports to Lord Normanby, "presents a never-failing fund of interest to a boy. We find it able to tempt onward even the most indolent and dull, who, placed stiffly in a class, with a spelling card and slate, would incur continual punishment for listlessness, and scarcely make any progress. There appears to be something peculiarly attractive in the quiet freedom for mind and body which wall-writing at once allows and prompts. No sooner does the young hand grasp the chalk, than the play upon the features indicates that much has been, through the medium of the *gallery*, implanted, and is working in the mind, and that much also will, ere long, be drawn out by the instrumentality of the wall; and the interest, my Lord, is kept up till the close. Often have I watched the tone of the school; and in place of restless countenances, anxious for the clock to strike, I have seen the prisoners still busy, with their composition ever extending as they write; or else comparing, with an interest that cannot be mistaken, their own and their neighbour's work."*

In carrying forward the business of instruction, perfect silence is enjoined, and, except at periods of out-of-door exercises, the prisoners are not allowed to speak to each other. All are taught to sing, and, as appears from the Report, "singing is found to have a most beneficial moral effect, and to be a powerful auxiliary in softening and preparing the mind for instruction." This corroborates what is stated by an enlighted edueationist in reference to a manual-labour school for reclaiming juvenile offenders at Berlin, under the care of Dr Koff. "When I was there," says he, "most of the boys were employed in cutting screws for the railroad which the government was then constructing between Berlin and Leipsic; and there were but few who could not maintain themselves by their labour. As I was passing, with Dr Koff, from room to room, I heard some fine voices singing in an adjoining apartment, and on entering I found about twenty of the boys, sitting at a long table, making clothes for the establishment, and singing at their work. The doctor enjoyed my surprise, and on going out, remarked, 'I always keep these little rogues singing at their work, for while the children sing, the devil cannot come among them at all; he can only sit out of doors there and growl; but if they stop singing, in he comes.'" Singing ought to be introduced, as a branch of elementary instruction, into every school in the country.

The means taken by the Rev. Mr England, in conjunction with the teachers, to instruct the boys in religious knowledge, both through the week and on Sundays, need not be particularised; and the degree of moral advancement will be understood from some subsequent details. From the schools we were conducted to the large mess-room, where the whole inmates were at dinner, which consisted of boiled meat, bread, and potatoes; and was eaten standing and in silence, under the eye of the sergeant attendants. The offices adjoining are disposed as a kitchen, washing-house, &c., and I was told that all the boys are obliged to wash their own clothes, and, in fact, to execute all the servile offices in the establishment. The sleeping rooms are in two or three distinct buildings, of two storeys. The rooms are disposed in rows, each opening to the outer air, by which means there are no passages in the building; the upper rows of rooms are entered by a hanging gallery half way up the outside. Besides saving space, this arrangement prevents all communication by speech between the rooms, and renders each apartment airy and readily open to inspection. Light is admitted by a small window over the door. Each room contains a small bed, and on the wall hang a printed card with a short prayer and a few religious admonitions, also a small bag containing a comb, for the use of the inmate. Good behaviour entitles each boy to the use of a book from a library of well-selected works, and it was pleasing to observe that in most of the cells there was a volume lying upon the bed. These books are sought for and perused with increasing interest, and therefore the procuring of them is a powerful motive to good conduct. From evening to morning, each boy is locked up in his separate apartment, all the rest of the day being devoted to some useful employment in school, in the work-rooms, and in the open ground.

The teaching of the boys some useful kind of trade, or labour, by which they may earn an honest subsistence on returning to society, is one of the most admirable arrangements connected with the institution. The trades now in regular course of teaching in the prison, are those of tailors and shoemakers. Such painting and whitewashing as have been required, have been done by the prisoners; as also some carpenter's work; but the latter occupation, as well as that of the smith's work, presents many temptations to criminal boys, in the use of tools for improper purposes, and if carried to any extent, might cause much difficulty, by want of a regular supply of work. Tailoring and shoemaking are not open to these objections, and at these trades eighty-four boys are now (or were lately) employed for a few hours daily. The time allotted to out-door labour, either on the land attached to the prison or within the walls, as occasion may require, is about two hours every afternoon, except in wet weather, when the boys are employed in such work inside the prison as can be provided, such as cutting and tying weed for lighting fires, making mops from old junk for prison uses, &c. In 1839, about four acres of land were sown with oats, and produced a profit of L.24, 5s., independently of the straw retained for the use of the cattle. About 1100 bushels of potatoes were also raised for the use of the prison, and about 1500 were planted for consumption. At the end of the same period, the quantity of hay made by the prisoners, and on the premises, was estimated at 30 tons. The total value of work done in 203 days in 1839, at both in and out door labour, was L.194, exclusive of what was gained by mending all the clothing and shoes which were in use, and casual labours. Being conducted into the work-rooms, I was shown a pile of jackets and other articles of attire, and also a quantity of shoes, all which had been made by the boys, and seemed of good workmanship. Captain Woollcombe expected shortly to be able to undertake a contract for clothing for the army.

The institution having been in operation only a year and a half, there is as yet little opportunity of judging of the moral and intellectual advancement of the inmates; but from what is seen, the best results are expected. One thing is remarkable; all the boys who have been conversed with on the subject, beseech that at the expiry of their period of confinement they may not be sent home to their parents, or place of birth, where they say they could not, with the best resolutions, avoid falling into the hands of their early associates. What is to be done with these unfortunate children, is the most difficult matter of consideration connected with the plan of the penitentiary; it is only intended, as I have said, that they should individually remain in the prison two or three years, and I should anxiously hope that, before their removal, the government will have discovered some humane and advantageous mode of transplanting them to those districts in our colonies where their services at some honest labour will be in regular request. Be this as it may, and taking the establishment at its present stage of progress, I have no hesitation in naming it as one of the most beneficial institutions of the age, and reflecting the highest honour on the government who designed and supports it.

* Parliamentary Report: Parkhurst Prison. 1840.

STORY OF THE RUNAWAY SLAVE.

George St Clair, the descendant of a respectable English family, succeeded in early youth to a considerable property in one of our West Indian colonial settlements. His parents resided in England, but, at the age of sixteen, having been attacked by some unpleasant pulmonary symptoms, he had been sent out to try the sanatory influence of a more genial clime than that of his nativity. Three years afterwards, he became, by his father's death, proprietor of the estate upon which he was then resident, and, having acquired a liking for the country, he took the resolution, although now perfectly well, of making it his permanent abode. Shortly after this determination was adopted, an incident befell him, the ultimate consequences of which, we imagine, will have some interest for our readers.

At the time to which we refer, the slave-trade existed in full vigour in the tropical colonies of Britain. Mr St Clair, though of a warm heart and generous feelings, and noted, moreover, for his kindness to those whom circumstances had made his bondsmen, acted like his neighbours in regard to the sale and purchase of these unfortunates, when occasion required. It chanced, that, about the date alluded to, he had occasion to go to the slave-market of the town adjoining his estate, being requested by his overseer to procure an additional worker. Mr St Clair was not so far seared by habit as to like the scenes which a slave-market usually exhibited; but, in the present instance, there were but a few negroes to be disposed of, and nearly all of them were single men, who were comparatively cheerful, or at least resigned to their fate. Our young proprietor soon fixed upon a tall, stout, well-formed young negro, as a proper person for his purpose. On inquiry, he found that the man had been for some time in the colony, but by his side stood a young negress, more recently arrived, and who was his wife, or, it may be, but his bride. The same hard fate had brought her from her native land, which had previously caused his exile. They met in the market, and received one another with tears of mingled joy and grief. Mr St Clair had not witnessed this scene, but he was informed of the particulars by others.

The two slaves belonged to different masters, and Mr St Clair became in the first instance the legal owner of the negro. Pitying the poor coloured pair, he immediately sought, against the counsels of his overseer, who was along with him, to purchase the negress, and prevent their separation. To this he was urged at once by his own feelings, and by the entreating looks of the unfortunate Africans. But Mr St Clair allowed his wishes to become too clearly apparent, and those persons into whose temporary possession the young negress had fallen, took advantage of the circumstance to ask an exorbitant price. The overseer, a man familiarised to the ways of the country, remonstrated with his master against such a payment. Mr St Clair hesitated, and, while he did so, the female slave became the property of another.

It is disagreeable to have even to mention such a thing as the *sale* of human beings, but it is essential to our story that the particulars of this event should be understood. Mr St Clair, to use a common expression, never repented of not completing this bargain but *once*, and that was always. More particularly did he feel disposed to regret his indecision, when his new negro worker fell under his eye on the estate. He had given especial orders that the poor African should be well treated every way. The man proved an excellent worker, and was most diligent in his duties, but he associated little with his companions, and always exhibited a degree of sadness and reserve, which either indicated a mind above his condition, or evinced his sorrow for the loss of the mistress of his affections. Mr St Clair, when he looked at the man, could not help imagining that both causes operated on his mind, and at last began to take so deep an interest in him as to resolve upon purchasing his wife at any cost, and reuniting the two. The female slave had been taken to the neighbouring estate of Mr Lightburn, and thither Mr St Clair betook himself, with a view of sounding his neighbour proprietor upon the subject of a purchase or exchange. He found his friend Mr Lightburn not unwilling, for a sufficient price, to part with the negress, and that price Mr St Clair was willing to give. The matter was not finally settled on that occasion, but our young and generous colonist held the compact to be perfectly understood, and rode home with feelings of great satisfaction, anticipating the pleasure of bringing the separated pair together on the morrow.

His views were doomed to be frustrated. On that very night, Gomez, as the negro had been named, disappeared from the St Clair estate, and at the same time the female slave also fled from the adjoining one of Mr Lightburn. Of the latter circumstance Mr St Clair soon heard, for his neighbour held by the bar-

gain as a thing virtually completed, and the other, not being able conscientiously to deny this, found himself bound to make his engagement good. A search was ordered for the fugitives, but it proved fruitless; and all that came out on inquiry was, that the other negroes on the two estates suspected two or three secret meetings to have taken place between the missing parties, notwithstanding all the intervening obstacles.

Considering the purposes which he had had in view, it was natural for Mr St Clair to regret this event, and he did so the more, as the interminable woods and wilds of the interior, which must have given shelter for the time, he thought, to the fugitives, were but too likely to prove their grave. It was not that starvation could readily overtake them, for, in that rich clime, the earth produced fruits of itself in abundance, as fabled to do in the golden age, and even clothing was a work requiring little labour or skill; but then the greater part of the country was infested by animals deadly to man. These reflections increased Mr St Clair's regret at the flight of Gomez. But time, that throws its pall over all mortal things and feelings, banished ere long the remembrance of the fugitive. Mr St Clair saw many summers and winters pass away after the date of this event. He married, had children, and became a widower. Of his children, one daughter alone survived to mature years. She, however, was a creature fitted to supply the place of many children, being singular alike for her beauty and excellence of disposition. It was the more fortunate for her father that such was the case, as in his advanced years, or, at least, when he had reached the age of fifty, misfortunes began to fall thick and sore upon him, and he greatly needed a domestic comforter. His mishaps were partly to be ascribed to the weather and climate, and partly to the law. A litigious neighbour—one of the severest pests that can befall a little community—involved Mr St Clair in contests which his open and unsuspecting character but little fitted him to conduct with success, or even to escape from without great disadvantage. It is needless to enter into the details, however, of Mr St Clair's misfortunes. It is enough to mention that his patrimonial property dwindled away very considerably in his hands, and even the portion which remained became comparatively valueless to him. His slaves, being property of a peculiarly available kind in these countries, were parted with by degrees, to an extent that materially impaired the productiveness of the small landed estate saved from the wreck. Mr St Clair bitterly lamented the separation, as much from kind feeling towards his people, as from a regard to his own diminishing fortunes; nor was the regret less on their part, for to him they had been bondsmen only in name. In short, the latter years of Mr St Clair were full of new and painful privations. He was reckoned by his neighbours a falling man, and many prophesied that his all would go from him, and his final days be penniless.

"My poor Helen," said he one day to his daughter, "I can scarcely bear to see you so cheerful. Do you know what you have lost? I fear you cannot comprehend it, or you would be more downcast." "I know—I comprehend it well, dear father," was the daughter's reply; "but I can look it all in the face and yet be cheerful. Besides, I know that much of your care and vexation is about me, and I wish to show you that it is uncalled for. I do not vex and fret myself because I am no longer an heiress. If we have but enough to live upon, and while you are with me, I am contented and happy—yes, happy." The father was silent for a moment, and then continued the conversation. "Ah! I question if we shall even have enough long, my poor girl. The remnant of our property is falling to wreck for want of proper cultivation, and more of it must be sold, I fear, to save the rest. But, Helen, my love," proceeded he, after a pause, "have you thought how this must affect you otherwise? Can you bear up against the cruel blow which must come upon you in another way than by pecuniary losses—though caused by them?" "You allude to my engagement with Captain Lightburn, father," said Miss St Clair, with a light and flitting blush, yet such a one as is called to the cheek of youthful maiden by one subject alone. "Yes, I do, my dear," replied the father. "My poor Helen, be prepared for the worst. Mr Lightburn, too, has at length become cold, or rather inimical, to your sinking father; the son will do the same, or will not, at least, be permitted to do otherwise." "No, no, you wrong *him*," said the young lady hastily. "Captain Lightburn has written to me; he is to be home in a few days, and he has pressed me to consent to the immediate fulfilment of our engagement, though his father, by letter, had requested him to break it off at once, as he best may. Do him justice, dear father; such is the purport of his letter. I received it yesterday, but did not wish to vex you by disclosing it." "And have you answered it, Helen?" asked Mr St Clair. "I have, sir," said the young lady; "I fulfilled his father's wish by setting him formally at liberty, and expressed my intention never to consent to any step of which his father was not cognisant." "That is my own, my good Helen," exclaimed Mr St Clair, folding her in his arms. "And can you bear up against this shock, my sweet child?" Miss St Clair was silent for a few moments, and her tears fell fast in the meanwhile. "Yes, dear father, I will try. And fear not," continued she more cheerfully, "it is my duty, and I will be supported in the struggle!"

The partial sale of Mr St Clair's properties, and his generally declining condition, could not fail to be widely known. He had ever been well liked, and his misfortunes were the subject of general talk and general commiseration. The latter feeling was greatly strengthened when it became known that the marriage of two young people who had loved one another from their infancy, namely, Captain Lightburn and Miss St Clair, was decisively broken up from the same cause, the father of the lover having forbidden the union. Mr Lightburn, it was known, was not a bad man, but he was avaricious, and had formed the hope, it was supposed, of getting a great bargain of the remaining St Clair property through his neighbour's necessities. This expectation had led him to break his promise.

The very negroes of the neighbourhood were enraged at this conduct of Mr Lightburn. A group of them were standing in the street of the district village one day, and showing teeth at a great rate against him, when one of them suddenly said, "Massa Sanclare nebber do berry well after him no buy Gomez' wife. Ah, you no mind Gomez. Nebber mind, me am old. Me mind dem well." One of the others present, also an old negro, turned upon the speaker at these words, and exclaimed, "What you say! Massa Sanclare berry good man—dat is, good for white man. Him buy Gomez' wife dat indonticklo night Gomez run away, and him nebber know noting at all about it." Here a second interruption took place. Unnoticed to any of the others, this conversation, with all that had preceded it, had been overheard by an elderly stranger negro, a wild-looking being, with a head of white wool, and a garment of the rudest and scantiest description even for the tropics. This man called on the talkers to repeat their words. They did so, and having listened to it with an air of suppressed eagerness, he turned away, and disappeared.

Scarcely a week afterwards, a strange scene took place at Mr St Clair's dwelling. The proprietor was seated along with his daughter in the cool of the evening at an open balcony, the father more depressed in spirits than ever, and the daughter labouring with the tenderest patience to soothe and cheer her parent. "All will be well yet, dear father," said she repeatedly; "all will be well. Do not give way. Something will occur to befriend us, if you will but be cheerful and active." The duteousness of the speaker deserved such befriending, and at that very moment it was not far off. Great was the surprise of the father and child to behold, soon afterwards, a string of negroes, more than twenty in number, troop in before them, headed by one old negro, and a female advanced also in years. The group was an extraordinary one, and a very slight observation was necessary to discover that the whole group, who presented the appearance of a regular gradation in age, from thirty downwards, and who were composed of individuals of both sexes, were all members of one family, the heads of which were the two old negroes alluded to. All of them were scantily clad, but evidently redundant in health and animation. They knelt before the surprised St Clairs, and all of them followed the example of the elder ones in exclaiming, "Pardon, massa! pardon, massa!"

A light broke suddenly on Mr St Clair's mind. He came down to the group, and exclaimed, "You are Gomez!" "Yes, massa! pardon!" We shall not weary the reader with the explanation of Gomez in his own words. On the occasion of his flight with his wife, he had gone far inland, and, when almost despairing of life, had lighted on a small colony of blacks, runaways like himself, who had fixed themselves in a secluded spot, and who there kept themselves in existence, for many years, by mutual aid. Of this settlement Gomez became a member, and continued so for many years. During all that time, he had only once or twice, and with great caution, visited the frequented districts of the colony. On the last occasion, he had heard tidings about Mr St Clair which made a deep impression on him. The runaway negro had a warm and generous heart, and he never had forgotten the kindness of his old master, to whom, moreover, he was intelligent enough to know, he was regularly bound by a legal payment, or cathy of money, on the other's part. As his family grew up, their outlawed and precarious condition, as a runaway race, had often inclined him to give himself up, and, after hearing of Mr St Clair's distresses, he went back to his colony with a fixed resolution to return to his master, and relieve his wants by the hands of himself and his family, which numbered *twenty-one* members. Even these formed still but a part of his family, for two or three of his elder children had united their fortunes with those of other young persons of the original colony, and a few young, merry-eyed, white-toothed, grinning creatures, slung at the backs of the stronger members of the party, had a right to call old Gomez grandfather.

Such was the story that Gomez told, and which he closed by the reiterated cry of "Pardon, massa! pardon!" Mr St Clair, for many reasons, was deeply affected by this event. But his first answering exclamation was, "No! no! I can never hold myself entitled to a right over this family." The simple creatures, however, cried at his refusal, and laughed when they gained his permission that they should at least serve and work for him. And upon these terms of voluntary servitude did the healthy and happy race of Gomez enter upon the St Clair estate. The proprietor of it, however, insisted upon formally manumitting the parents, and the young ones remained as hired servants ever afterwards.

Need we say what was the consequence of this new horde of cultivators upon the estate of Mr St Clair? Under the government of Gomez, the fields soon resumed their former aspect, and the proprietor became a "comfortable" man, if not quite so rich as before. Mr Lightburn speedily lost all hope, also, of getting a bargain of the property, and was content to let it come into his family in a more pleasant and respectable way, namely, by the intermarriage of his son with the beautiful and dutiful heiress.

And so ends this TRUE STORY.

SIR SAMUEL ROMILLY.

THE Memoirs of the Life of Sir Samuel Romilly, written chiefly by *himself*, and arranged by his sons, form one of the most interesting works of the day, whether regarded as a piece of biography, or as a description of the career of a man in public life.* For the sake of those who may not have it in their power to peruse the original, and also that we may attract to the work the attention of those who are placed in more fortunate circumstances, we beg to offer the following brief sketch.

Samuel Romilly was descended, through both his parents, from respectable families, expatriated from the south of France at the commencement of the eighteenth century, on account of their attachment to the Protestant religion. The father became a jeweller in London, and followed that profession with success during his life, being a man of good abilities and the most estimable character. His children were numerous, but few survived to mature years. Samuel, born in 1757, was left in infancy chiefly to the care of servants, his mother being afflicted with ill health; and, at this early point of his career, impressions were made upon his mind which well deserve attention, as having materially influenced his after-career. On reaching nearly the prime of life, he wrote a biographical sketch of his youthful days for his own gratification; and in this record, with which the volumes before us open, he thus refers to the period in question:—"It is commonly said to be the happy privilege of youth to feel no misfortunes but the present, to be careless of the future, and forgetful of the past. That happy privilege I cannot recollect having ever enjoyed. In my earliest infancy, my imagination was alarmed, and my fears awakened, by stories of devils, witches, and apparitions; and they had a much greater effect upon me than is even usual with children; at least I judge so, from their effect being of a more than usual duration. The images of terror with which these tales abound, infested my imagination very long after I had discarded all belief in the tales themselves, and in the notions on which they are built; and even now, although I have been accustomed for many years to pass my evenings and my nights in solitude, and without even a servant sleeping in my chambers, I must, with some shame, confess that they are sometimes very unwelcome intruders upon my thoughts.

I had other apprehensions, and some of a kind which are commonly reserved for maturer years. I was oppressed with a constant terror of death, not indeed for myself, but for my father, whose life was certainly much dearer to me than my own. I never looked on his countenance, on which care and affliction had deeply imprinted premature marks of old age, without reflecting that there could not be many years of his excellent life still to come. If he returned home later than usual, though but half an hour, a thousand accidents presented themselves to my mind; and, when put to bed, I lay sleepless, and in the most tormenting anxiety, till I heard him knock." This uncommon sensitiveness of disposition, partly natural, perhaps, but most certainly fostered also, to a large degree, by the unfortunate morbidness of fancy alluded to, tended ultimately to produce consequences most unhappy for Romilly himself, as well as for his country, to which he had made his life of the deepest value. A warning to parents, and all employed about the young, is thus to be drawn from this case, in which we see one of the most powerful of human intellects unalterably affected by erroneous treatment in mere infancy.

When a little further advanced in life, Romilly was sent to a very inferior school, selected seemingly because it had been once kept by a French refugee, and because many persons of that description (who were always very intimate among themselves, and attended a common place of worship) still sent their children thither. The miserable creature who kept this seminary was a tyrant to all but a few boys of the more affluent class, among whom Romilly was numbered; but the latter gives us a remarkable proof of the early excellence of his disposition, by telling us that he was wont to "burn with shame at not being *among* the victims of the master's injustice." He also made the observation, that the ill-conduct of the boys increased in *proportion* to the cruelty exercised upon them. After learning, at this school, scarcely any thing but a little French, Samuel was taken away, and various schemes were proposed for his settlement in life. The profession of an attorney was thought of, as also that of a merchant, and several others. Fortunately, obstacles sprung up for the moment in the way of all these proposals. We say fortunately, because by being temporarily taken into his father's own

* Three vols. London: Murray. 1840.

Digitized by Google

office, young Romilly was left with such leisure as enabled him to supply a great existing deficiency, and *educate himself*. He became an unlimited reader. His father's easy or rather wealthy circumstances gave the youth the power of purchasing books and entering libraries at will, and he used the privilege to the acquisition of extensive general information. Nor was this all. He had formerly begun to learn the Latin language, but he now made himself a good classical scholar, and read all the best works of antiquity. In short, he fairly educated himself, as so many other men of talent have done.

Sir Samuel's picture of his family-circle at this period, consisting of his parents, his brother, his sister, and himself, is a delightful one. Their house, in High Street, Marylebone, was not large, and a casual observer might have imagined their comforts to be few. "But those who had mingled in our family, and had hearts to feel in what real happiness consists, would have formed a very different judgment. They would have found a lively, youthful, and accomplished society, blest with every enjoyment that an endearing home can afford; a society united by a similarity of tastes, dispositions, and affections, as well as by the strongest ties of blood. They would have admired our lively, varied, and innocent pleasures; our summer rides and walks in the cheerful country, which was close to us; our winter evening occupations of drawing, while one of us read aloud some interesting book, or the eldest of my cousins played and sung to us with exquisite taste and expression; the little banquets with which we celebrated the anniversary of my father's wedding, and of the birth of every member of our happy society; and the dances with which, in spite of the smallness of our rooms, we were frequently indulged. I cannot recollect the days, happily I may say the years, which thus passed away, without the most lively emotion. I love to transport myself in idea into our little parlour with its green paper, and the beautiful prints of Vivares, Bartolozzi, and Strange, from the pictures of Claude, Carracci, Raphael, and Correggio, with which its walls were elegantly adorned; and to call again to mind the familiar and affectionate society of young and old intermixed, which was gathered round the fire; and even the Italian greyhound, the cat, and the spaniel, which lay in perfect harmony basking before it. I delight to see the door open, that I may recognise the friendly countenances of the servants, and, above all, of the old nurse, to whom we were all endeared, because it was while she attended my mother that her health had so much improved."

The autobiographical sketch from which these extracts are taken, brings down the life of Romilly only to his twenty-first year, though not written till after he had arrived at the age of thirty-nine, and had been at the bar for twelve years. One of the most interesting points in these volumes consists in the contrast of feelings and circumstances, which the opening of the second and distinct autobiographical sketch exhibits, as compared with the first. In commencing his first sketch, he says, "I sit down to write my life; the life of one who never achieved any thing memorable, and who will probably leave no posterity." He continues to say, that a subject so uninteresting could never attract any readers but himself: "It is for myself I write, for myself alone." Written in 1813, the second sketch thus opens:—"After an interval of seventeen years, I am about to resume the task of writing my life—a task undertaken in very different circumstances, and with very different views, from those with which I now resume it. When I began to set down the few events of my unimportant history, I was living in great privacy; I was unmarried, and it seemed in a very high degree probable that I should always remain so. My life was wasting away with few very lively enjoyments, and without the prospect that my existence could ever have much influence on the happiness of others; or that I should leave behind me any trace by which, twenty years after I was dead, it could be known that ever I had lived. But since that period, and within the last few years, I have been in situations that were more conspicuous; and though it has never been my good fortune to render any important service, either to my fellow-creatures or to my country, yet, for a short period of time at least, some degree of public attention has been fixed on me. It is, however, with no view to the public that I am induced to preserve any memorial of my life, but wholly from private considerations. It is in my domestic life that the most important changes have taken place. For the last fifteen years, my happiness has been the constant study of the most excellent of wives; a woman in whom a strong understanding, the noblest and most elevated sentiments, and the most courageous virtue, are united to the warmest affection, and to the utmost delicacy of mind and tenderness of heart; and all these intellectual perfections are graced and adorned by the most splendid beauty that human eyes ever beheld. She has borne to me seven children, who are living; and in all of whom I persuade myself that I discover the promise of their, one day, proving themselves not unworthy of such a mother. Some of them are of so tender an age that I can hardly hope that I shall live till their education is finished, and much less that I shall have the happiness to see them established in life; and of some it is not improbable that I may be taken from them while they are yet of such tender years that, as they advance in life, they may retain but little recollection of their father. To these, and even to my dear wife, if, as I devoutly wish, she should many years survive me, it may be a source of great satisfaction to turn over these pages; to learn or to recollect what I was, what I have done, with whom I have lived, and to whom I have been known. Such is the information that these pages will afford, and they will, I fear, afford nothing more. Of instruction there is but little that they can supply: what to shun, or what to pursue, is that of which a life, so little chequered with events as mine, can hardly present any very striking lessons. I have been in no trying situations; the force of my character has never been called forth; I have fallen into no very egregious faults, and I have had the good fortune to escape those situations which generally lead to them; but, from the pious affection which may have been instilled into my children's minds, they may set a considerable value, and take a lively interest in facts which, to the rest of mankind, must appear altogether insipid and indifferent. It is, therefore, to enjoy conversation with my children, at a time when I shall be incapable of conversing with any one, and to live with them, as it were, long after I shall have descended into the grave, that I proceed with this narrative of my life. It is surrounded by these children in their happy infant state; cheered with the little sallies of their wit; exhilarated with their spirits; become youthful, as it were, by their youth; and transported at sometimes discovering in them the dawnings of their mother's virtues; it is in the repose of a short period of leisure after unusual fatigues in my profession; it is in a fine season, in the midst of a beautiful country, with some of the richest and most luxuriant scenes of nature spread before me; it is in the midst of all these sources of enjoyment and of happiness, that I sit down to this pleasing employment."

Such a passage as this it is impossible to curtail, though, by quoting it, we leave to ourselves but little space for noticing the events of Romilly's public life. After visiting the Continent, he was called to the bar in 1783, and entered on the midland circuit in the following year. In 1784, he also translated a pamphlet of Mirabeau, whose warmest friendship, as well as that of Dumont and other distinguished foreigners, he afterwards enjoyed, as their correspondence with him, in these volumes, sufficiently proves. Lord Lansdowne was one of the first British statesmen whose notice he attracted, and by that nobleman he was early offered a seat in parliament. But this and other similar offers he declined, from a dislike to enter the house but as an independent or popularly elected member. A number of years also elapsed ere he rose at the bar; and here the cause was one not less honourable to him. He never concealed his early formed wishes for the reform both of our civil and criminal laws, and in the eyes of employing attorneys such sentiments were any thing but recommendatory. However, Romilly's abilities ultimately overcame all obstacles. In 1798, being then evidently in the way to abundant wealth, as well as to the highest professional honours, he married Miss Gerbett, of Knill Court, Herefordshire, with whom he had formed acquaintance in a way that he must himself describe to the reader. "Some miles from Bowood is the form of a white horse, grotesquely cut out upon the downs, and forming a land-mark to a wide extent of country. To that object it is that I owe all the real happiness of my life. In the year 1796, I made a visit to Bowood. My dear Anne, who had been staying there some weeks with her father and her sisters, was about to leave it. The day fixed for their departure was the eve of that on which I arrived; and, if nothing had occurred to disappoint their purpose, I never should have seen her. But it happened that, on the preceding day, she was one of an equestrian party which was made to visit this curious object; she overheated herself by her ride; a violent cold and pain in her face was the consequence. Her father found it indispensably necessary to defer his journey for several days, and in the mean time I arrived. I saw in her the most beautiful and accomplished creature that ever blessed the sight and understanding of man. A most intelligent mind, an uncommonly correct judgment, a lively imagination, a cheerful disposition, a noble and generous way of thinking, an elevation and heroism of character, and a warmth and tenderness of affection such as are rarely found even in her sex, were among her extraordinary endowments. I was captivated alike by the beauties of her person and the charms of her mind. A mutual attachment was formed between us, which, at the end of little more than a year, was consecrated by marriage."

In 1806, when the Whig party, to which he had attached himself, came into power, Romilly became Solicitor-General, on which occasion he received the honour of knighthood, though greatly against his will; he also now entered parliament for Queensborough. During his short tenure of office, he gave universal satisfaction, and afterwards maintained the esteem of all men, as a representative of the nation, up to the period of his decease. He distinguished himself, above all, as an advocate of humanity in our criminal code, and reformer of our civil laws. For many years, in session after session of parliament, he laboured unwearidly in his liberal and benevolent course, endeavouring to lessen the severity of the laws against felony, forgery, and other branches of crime, then punished capitally in almost every case. But the reigning king was a stern upholder of the existing laws, and all the chief legal dignitaries of the time opposed themselves to Romilly's views. Though Sir Samuel was destined, through these causes, to attain success only to a very limited extent in his lifetime, his toils were not thrown away. Almost by him alone, was the public mind prepared by slow degrees for the adoption of a more humane penal code, and for the reformation of abuses in the civil laws. Latterly, his sons, animated by similar humane considerations, have been instrumental in carrying into effect several of his proposed meliorations; and others, who admit themselves to be pupils of Romilly, have been successful in effecting similar improvements. In short, if the entire abolition of capital punishments seems now to be a thing nearly attainable, we owe it in a great measure to the twenty years' labours of Sir Samuel Romilly.

In 1818, his beloved wife fell grievously ill, and the brief entries in Sir Samuel's diary of this period shew how inseparably his existence was entwined with hers. On the 9th of October she had become slightly better, and the diary then records that the writer "slept for the first time after many sleepless nights." She relapsed, and died on 29th October; and, three days afterwards, his finely-fibred intellect being disarranged by the heavy calamity, Sir Samuel Romilly terminated his own life, leaving a reputation, both as respects public or private character, excelled by that of no man among his contemporaries.

SOME GOSSIP RESPECTING THE CARSE OF GOWRY.

UNPREPARED as our English readers may be for the announcement, there *are* two or three plains in Scotland. One, and perhaps the principal one, is the Carse of Gowry, a broad stripe of almost perfectly level land, stretching along the north side of the Firth of Tay, and forming part of the county of Perth. It is about fifteen miles in length, and in some places four or five in breadth, the hills of Fife rising on the south beyond the Firth, while, to the north, there is a similar range of moderately high hills, dividing the district from Strathmore and the Stormont, two similarly level tracts of less extent; beyond which, again, to the north, rises the great rampart of the Grampians. At the lower or east end of the Carse of Gowry, is Dundee, from which the smoke of numerous factories is seen perpetually rising. At the upper or west end, about the place where the river ceases to be navigable, and in one of the most beautiful spots in the country, is placed the "fair city" of Perth. The ordinary road between these two towns passes through the whole length of the Carse, with (to all appearance) scarcely a rise or fall of a single foot from end to end.

This fine plain, being composed, as far as the soil is concerned, of a deep clayey alluvium, is, in the proper season, one sea of waving grain of the richest kind, excepting that here and there the eye rests upon a gentleman's mansion, thickly ensconced in wood, or upon a scarcely less comfortable-looking suite of farm-buildings, beside which, perhaps, several stacks of last year's grain may be observed, even while the crop of the present year is yellowing unto the harvest. No stone enclosures harshly break up the wide expanse into formal squares, but at the utmost a low hedge-row divides field from field—the more general demarcation, even where the estates of different proprietors are concerned, being merely a sunk drain. Only in two or three places does the ground rise at all above the general surface; and it is remarkable that most of these places bear names in which the syllable *inch* occurs—as, for example, Inchsture, Inch Martin, &c. Inch is Gaelic for island. [Strange to say, it signifies the same thing in some of the aboriginal languages of North America.] It is therefore believed that all these places were at one time in the condition of islands, while the adjacent country was a deep *flow* or morass, or perhaps covered with the waters of the Tay. That the carse was at one time in the latter state, tradition loudly avers; and such is said to have been the case since the country at large began to be inhabited. Places are even pointed out on the face of hills above the carse, on the north side, where rings used to confine vessels had been found rivetted in the rock. It is certain that this fine region continued to be a mere morass till within a century from the present time. The inhabitants, instead of the race of intelligent and affluent farmers they now are, were then a set of boors, who contended for a wretched maintenance with a soil of wet clay, and were generally known as the *Carles* [that is, churls] *o' the Carse*. A story goes that a certain laird, provoked out of all patience by their rude and intractable nature, declared in his anger that he believed he could make better men out of the clay with his own hands. Not long after, he got bogged in going home, and, after some hours of vain struggling, was fain to ask the help of a carle whom he saw passing. "Ah, yes," said the hob-nail, "I see you are *making your men:* I'll not disturb you."

We must not be too ready to sneer at such traditions as the above. The modern doctrine of changes of level in the earth's surface gives it considerable credibility. It could have only required an elevation of some ten or twelve feet (such an elevation as often takes place in South America at this day) to convert the Carse of Gowry from the condition of a broad estuary to its

Digitized by Google

present state. Perhaps the elevation is still gradually, though imperceptibly, advancing, just as it may be a slow and unobserved sinking which is causing the sea to aggress upon the coast in some other districts. This supposition derives some countenance from an old popular saying with regard to two large boulder stones which lie within the water-mark at Invergowry, near the bottom of the Carse, and go by the name of the Gows of Gowry. It is said of these stones, from which the sea is supposed to be gradually receding,

"When the Gows of Gowry come to land,
The day of judgment's near at hand."

The prophecy is laid in the name of Thomas the Rhymer. As such it is, of course, of no value; but, if it be an indication that the stones appear from time to time to be somewhat nearer the land, the couplet is not unworthy of notice. At Invergowry, it may here be remarked, is one of a series of small harbours constructed along the Firth of Tay about sixty years ago, for the shipping of rural produce, and which have been of great service in advancing agriculture in this beautiful region.

Many fine mansions are interspersed throughout the Carse. The traveller, advancing from Dundee, finds the first of any note in Castle Huntly, a stupendous old fortalice which formerly belonged to the Strathmore family, and now to a gentleman named Paterson. The next is Rossie Priory, the seat of Lord Kinnaird—a modern specimen of the monastic style, at least in externals. Errol, the seat of Mr Allan, and Murie, the seat of Miss Spence Yeaman, are conspicuous near the centre of the district. Farther on, we have Glendoig, the seat of Mr Craigie, some of whose predecessors have been eminent in the law. Megginch (one of the ancient islands of the Carse) is the residence of a family, the ladies of which have been remarkable during several generations for their beauty, and the rank which some of them thereby attained. A certain "bonnie Jeany Drummond" of Megginch, who, according to a song in her praise, "towered aboon them a'," became Duchess of Athole, by which alliance she gave occasion to a former lover, a Dr Austin, to write the well-known complaint, "For lack of gowd she's left me." Seggieden, the residence of a branch of the Hays of Kinnoull, is a little way farther west. In that house is kept an old family-piece in the shape of a drinking cup, which every successive laird was expected to drain at a draught, in order to prove his being worthy of the honours of the family. This is alluded to in an old local proverb, the sense of which, we must own, is somewhat obscure.

"Suck it out, Seggieden,
Though it's thin, it's weel pledged."

But by far the finest house in the whole district is Kinfauns, the seat of Lord Gray, a very ancient Scottish baron, one of whose family is noted in Mary's sad history under the name of the Master of Gray. This superb modern castle is felicitously placed on a terrace about a hundred feet above the level of the Carse, with lofty wooded heights on both sides, and fine cultivated slopes extending behind, while the front commands one of the most beautiful views in the country, composed of the Tay winding gracefully through its rich vale, and the Fife hills rising at no great distance beyond. So elegant a house, so beautifully situated, and adorned with so many objects of taste, it has rarely been our fortune to visit. The principal floor is composed of a magnificent suite of apartments, comprehending, besides a dining-room and two drawing-rooms, a splendid vestibule and gallery, full of statuary, &c., a gorgeous library, a billiard-room, and a room which Lord Gray calls his "workshop," seeing that it contains the tools, machines, and philosophical instruments, with which he amuses his leisure. In all of these rooms there are pictures by the first masters, constituting in themselves an attraction of the highest order. One by Guercino, in the principal drawing-room, "the Denial of Christ by Peter," is certainly one of the most arresting pictures we have ever chanced to behold. Lord Gray has spent a lifetime in collecting the many beautiful works of art of all kinds with which his house is adorned.

The district of Gowry contains several places which no one acquainted with the history of our country can visit without interest. At the back of the range of hills bounding the Carse on the north, is Dunsinnan, so celebrated in the tragic tale of Macbeth. This hill stands detached from the rest, and, rising to a height of seven or eight hundred feet, commands a view of the country around to a considerable distance, including Strathmore, the Stormont, and Blairgowrie. Amongst the hills bounding the distance, the attention of the visiter is always directed to Birnam, which is in the immediate neighbourhood of Dunkeld, and fully fifteen miles distant. Dunsinnan bears on its face and top substantial proofs of Macbeth's history. The remains of a waggon road are observable sloping round the hill from the bottom to the top, being no doubt that by which the usurper caused his thanes to drag the materials for his castle. On the top are the remains of several concentric walls and fosses, and of some large building which they had surrounded, as well as of a well by which it is said the garrison was supplied with water. One is filled with strange feelings in standing amidst these grassy vestiges of what was a castle eight hundred years ago—a castle reared by a tyrant to defend himself from a nation's hatred, and amidst whose ruins he ultimately perished. It is felt, at the same time, how history sinks beneath the tale told, however wildly, by genius; and it is to Shakspeare, not to Dalrymple, that we revert for the story of the usurper, while endeavouring to realise it on the ground where it is said to have taken place. It is remarkable how correct in general the bard of Avon has contrived to be with respect to the geography of his play; and this has led to a surmise that he may have visited the spot in person, possibly in the capacity of a member of the company of players which Elizabeth is known to have sent to Scotland to regale James VI., and which appears to have acted at the neighbouring city of Perth. It is, however, quite possible that Shakspeare may have attained all this correctness by merely adhering closely to the legend he found in Hollinshed's Chronicles.

Amongst the hills overlooking the Carse are several places noted in the popular accounts of Sir William Wallace. Kilspindy is now a small parish village, but was formerly the site of a castle: it lies at the opening of one of the little glens which pervade this range of hills, about half way up the carse. Henry the Minstrel relates that, when Scotland was subjugated by Edward, the elder Wallace fled with his eldest son to the Lennox, and that then the mother, with her second son, William,

"To Gowry passed, and dwelt in Kilspindy.
The knicht, her father, thither he them sent
To his uncle, that with full gude intent
In Gowry dwelt, and had gude living there—
Ane aged man, the whilk received them fair."

Young Wallace was then placed at school in Dundee, where, however, his indignation at the insolence of the English garrison led to his killing the son of a distinguished officer, and he had then to fly for his life. Escaping from the town, he made for Kilspindy, and on his way is said by tradition to have rested for a little at the village of Forgandenny, where a poor man named Smith and his wife refreshed him with cakes and milk. Little more than forty years ago, the descendants of Smith showed the stone on which the hero had sat by their ancestor's door, and perhaps do so still. While skulking under the protection of his uncle, he is said to have concealed himself occasionally in a cave within the glen of Pitroddie, near Kilspindy. We had lately the curiosity to visit this glen, and to inspect the cave. The glen is wild and lonely, with steep fursy slopes, and a little rill trickling at the bottom. In the face of a porphyritic rock overhanging the rivulet, there is a long slit, which was probably at one time masked with brushwood. On entering this opening, we find that from the rock hanging over in a screen-like fashion in front, there is room both to stand and lie in the interior. This, according to tradition, was the lair of the brave youth who was destined thereafter to "rescue Scotland thryse." At the distance of about a couple of miles to the westward, and within a similar opening of the hills, are the remains of the ancient tower of Balthayock, the residence of that family of Blairs, of which Wallace's friend and chaplain, Mr Robert Blair, was a scion. We lately felt no small surprise at learning that this family still exists, and in possession of its original property, though it has removed its residence to a small modern mansion in the neighbourhood. The old tower is now reduced in height, but what remains is of great age and vast strength: a plain dwelling adjoins, on which we found a coat armorial, with the initials A. B., and the date 1578. The poem of Blind Harry, we may only remind our readers, professes to be constructed on the basis of a history of Wallace compiled by Mr Robert Blair. Kinfauns is another place associated with the name of Wallace. The ancient castle, which stood on the site of the present, was the seat of Thomas Longueville, a noted French pirate, whom Wallace overpowered at sea, and converted into an ally, and who seems to have been the ancestor of a family named Charteris, long settled at Kinfauns. There still exists in the modern castle a two-handed sword, which invariable tradition describes as having formerly belonged to Wallace.

One of the most picturesque of the openings in the Gowry hills is occupied by the old mansion of Fingask, the seat of Sir Peter Murray Threipland, Bart., from whose terraces, in our opinion, the views are even finer than from those of Kinfauns, the space commanded being much greater and equally beautiful, while the opposite hills, being more remote, give all their peculiar effect without any detraction on the score of tameness or deficiency of wood. Fingask was remarkable in the last century for the Jacobitism of its proprietors. Sir David Threipland was in the insurrection of 1715, and his lady entertained at this house the unfortunate prince for whose sake the party had taken up arms, while on his progress from Peterhead to Perth. The estate was consequently forfeited, and the family dispossessed of their ancient seat. A striking anecdote is related of the lady of the mansion on that occasion. Amidst the ruin of her husband's affairs, and while he was endeavouring to escape from the country, she gave birth to a son. A few frightened friends had gathered round her at that distressing moment, and amongst the rest a clergyman of the persecuted Episcopal Church of Scotland from Perth. It was desirable to use the services of this gentleman while he remained in the house; but the friends knew not how to proceed, having no instructions from the father, and being fearful of agitating the mind of the mother with questions. The lady, hearing their whispers in her chamber, and comprehending that they wished to know what name should be bestowed on the child, said hastily, from her bed, "Stuart, to be sure." And the infant was christened by that name accordingly, at the very moment when, for its sake, the parents were ruined. This child lived to fight in the insurrection of 1745–6, after which he skulked a long time in the Highlands in company with Young Locheil. Escaping all these perils, he lived to purchase back the family property by means of his wife's fortune; and the government, in 1824, restored the title to his son. In the house are still shown some remains of the bed occupied by the old chevalier, and also the camp bed which Prince Charles carried about with him in his more romantic campaign, besides a great quantity of medals and other interesting memorials of the expatriated family of Stuart.

The people amongst the hills are a more primitive people than those of the Carse, and retain many old-world stories which, in another situation, must have long ago been obliterated. There is a lonely ruined tower in this mountain district, called Evelick Castle, till a recent period the seat of a branch of the family of Lindsay. One of the last Lindsays of Evelick married a sister of the famous Earl of Mansfield; and one of the children of that pair married Allan Ramsay, the celebrated portrait-painter. The place is now desolate, and the property has been divided amongst heirs-female. With a wild and tragic tale respecting Evelick, we shall conclude this long chapter of chit-chat. Some ages ago, the laird of Evelick, being a widower with one son, married a widow who also had a son about the same age. The young people grew up together; but the lady's child soon saw that he was a very different person in the eyes of the world from his step-brother. Envy and deadly malice then took possession of him, and he one day beguiled the other youth into the neighbouring glen of Pitroddie, the same lonely dell where Wallace had found refuge from the English. Having there induced his brother to lie down upon the ground, as for the purpose of measuring their comparative lengths, he cut the throat of the unsuspecting youth, and then, in an agony of fear and remorse, rushed home to the castle of Evelick, where he shut himself up in his own room. The story goes on to relate, that his mother and step-father saw him no more, and that he continued in his room, fed by his nurse through a small window, until he was taken to Edinburgh by the officers of justice, and there tried and condemned to death. His original doom was to be hanged; but his mother gave a sum of money to obtain for him the less ignominious death of decapitation, and he thus perished accordingly.

SKETCHES OF SUPERSTITIONS.

WITCHCRAFT IN ENGLAND.

Witchcraft was first denounced in England, by formal and explicit statutes, in the year 1541, in the reign of Henry VIII. Previously to that time, many witch-trials had taken place, and severe punishments had even been inflicted on the parties concerned; but this was occasioned by the direction of the arts of sorcery, in these particular instances, against the lives and well-being of others, and not from the legal criminality of such arts themselves. Shakspeare has made some early cases of this nature familiar to us, and in particular that of the Duchess of Gloucester, who, for conspiring with witches against the life of the reigning sovereign, Henry VI., was compelled to do public penance, and imprisoned for life. But, as has been said, the mode of prosecuting the guilty purpose was here altogether a subsidiary matter. If a person waved his hat three times in the air, and three times cried "Buzz!" under the impression that by that formula the life of another might be taken away, the old law and law-makers (as, for example, Selden, who states this very case), considered the formulist worthy of death as a murderer in intent; and, upon this principle, the trafficking with witches was punished in early times.

Witchcraft, however, by and bye assumed greater statutory importance, in England as elsewhere. Henry VIII.'s two acts were levelled against conjuration, witchcraft, false prophecies, and pulling down of crosses. Here the charge was still something beyond mere sorcery, and it was left for Elizabeth, in 1562, to direct a statute exclusively against that imaginary crime. At the same time, that princess extenuated her conduct in part, by limiting the penalty of the crime, when stripped of its customary accessories, to the pillory. The first transgression, at least, received no heavier punishment. The cases of Elizabeth's reign were chiefly cases of pretended possession, sometimes, however, involving capital charges against those said to have caused the possession. In one famous case, of which the main features were as ludicrous as the issue was deplorable, three poor persons, an old man named Samuel, with his wife and daughter, were tried at Huntingdon, for having bewitched the children of a Mr Throgmorton. Joan Throgmorton, a girl of fifteen, and the eldest of the children, was the main witness for the prosecution. She related many scenes, in which the actors were herself and a number of spirits sent by Dame Samuel to torment her, and to throw her into fits. These spirits, she said, were on familiar terms with her, and were named Pluck, Hardname, Catch, Blue, and three Smacks who were *cousins*. Among other things, she said that one of the Smacks professed himself an admirer of hers, and beat the rest for her sake, as in the following instance related by her. One day Smack appeared before her.

Digitized by Google

"Whence come you, Mr Smack?" she said to him. "From fighting Pluck and the rest, with cowl-staves, in Dame Samuel's back-yard," replied Smack; and soon thereafter, accordingly, Pluck and Blue walked in, the one with his head broken, and the other limping. "How do you manage to beat them," said the young lady to the victorious Smack; "you are little, and they are big." "Oh," says Smack, "I can take up any two of them, and my cousins beat the rest." Of such stuff were these charges made. It would appear that they were either the offspring of insanity on the part of the youthful Throgmortons, or that, having begun the farce in sport or spite, the accusers found at length that they could not retreat without a disgraceful confession of imposture. In part, the conduct of the poor Samuels was affecting, and even high-minded. After lengthened worrying, the accusers got Dame Samuel indirectly to confess her guilt, by making her repeat a prescribed charm, which had the effect of at once bringing the children out of their fits. But the old man and the daughter steadily maintained their innocence. The unfortunate family were condemned on the 4th April 1593, and soon after executed.

When James I. ascended the English throne, he unfortunately conceived it to be his duty immediately to illuminate the southerns on the subject of witchcraft. An act of the first year of his reign defines the crime with a degree of minuteness worthy of the adept from whose pen it undoubtedly proceeded. "Any one that shall use, practise, or exercise any invocation of any evil or wicked spirit, or consult, or covenant with, entertain or employ, feed or reward, any evil or wicked spirit, *to or for* ANY *purpose*; or take up any dead man, &c. &c. &c.; such offenders, duly and lawfully convicted and attainted, shall suffer death." We have here witchcraft first distinctly made, of itself, a *capital* crime. Many years had not passed away after the passing of this statute, ere the delusion, which had heretofore committed but occasional and local mischief, became an epidemical frenzy, devastating every corner of England. Leaving out of sight single executions, we find such wholesale murders as the following in abundance on the record. In 1612, twelve persons were condemned at once at Lancaster, and many more in 1613, when the whole kingdom rang with the fame of the "Lancashire witches;" in 1622, six at York; in 1634, seventeen in Lancashire; in 1644, sixteen at Yarmouth; in 1645, fifteen at Chelmsford; and in 1645 and 1646, sixty persons perished in Suffolk, and nearly an equal number, at the same time, in Huntingdon. These are but a few selected cases. The poor creatures, who usually composed these ill-fated bands, are thus described by an able observer:—"An old woman with a wrinkled face, a furred brow, a hairy lip, a gobber tooth, a squint eye, a squeaking voice, or a scolding tongue, having a ragged coat on her back, a spindle in her hand, and a dog by her side—a wretched, infirm, and impotent creature, pelted and persecuted by all the neighbourhood, because the farmer's cart had stuck in the gateway, or some idle boy had pretended to spit needles and pins for the sake of a holiday from school or work"—such were the poor unfortunates, selected to undergo the last tests and tortures sanctioned by the laws, and which tests were of a nature so severe that no one would have dreamed of inflicting them on the vilest of murderers. They were administered by a class of wretches, who, with one Matthew Hopkins at their head, sprung up in England in the middle of the seventeenth century, and took the professional name of *witch-finders*. The practices of the monster Hopkins, who, with his assistants, moved from place to place in the regular and authorised pursuit of his trade, will give a full idea of the tests referred to, as well as of the horrible fruits of the witchcraft-frenzy in general. From each town which he visited, Hopkins exacted the stated fee of twenty shillings, and, in consideration thereof, he cleared the locality of all suspected persons, bringing them to confession and the stake in the following manner:—He stripped them naked, shaved them, and thrust pins into their bodies to discover the witch's mark; he wrapped them in sheets, with the great toes and thumbs tied together, and dragged them through ponds or rivers, when, if they sunk, it was held as a sign that the baptismal element did not reject them, and they were cleared—but if they floated (as they usually would do for a time), they were then set down as guilty, and doomed; he kept them fasting and awake, and sometimes incessantly walking, for twenty-four or forty-eight hours, as an inducement to confession; and, in short, practised on the accused such abominable cruelties, that they were glad to escape from life by confession. If a witch could not shed tears at command (said the further items of this wretch's creed), or if she hesitated at a single word in repeating the Lord's prayer, she was in league with the evil one. The results of these and such-like tests were actually and universally admitted as evidence by the administrators of the law, who, acting upon them, condemned all such as had the amazing constancy to hold out against the tortures inflicted. Few gave the courts that trouble. Butler has described Hopkins in his Hudibras, as one

> Fully empower'd to hunt about
> Finding revolted witches out.
> And has he not within this year
> Hanged *threescore* of them in *one* shire?
> Some only for *not* being drown'd;
> And some for sitting above ground.

After he had murdered hundreds, and pursued his trade for many years (from 1644 downwards), the tide of popular opinion finally turned against Hopkins, and he was subjected, by a party of indignant experimenters, to his own favourite test of swimming. It is said that he escaped with life, but, from that time forth, he was never heard of again.

The era of the Long Parliament was that, perhaps, which witnessed the greatest number of executions for witchcraft. *Three thousand persons* are said to have perished during the continuance of the sittings of that body, by legal executions, independently of summary deaths at the hands of the mob. Witch-executions, however, were continued with nearly equal frequency long afterwards. One noted case occurred in 1664, when the enlightened and just Sir Matthew Hale tried and condemned two women, Amy Dunny and Rose Callender, at Saint Edmondsbury, for bewitching children, and other similar offences. Some of the items of the charge may be mentioned. Being capriciously refused some herrings, which they desired to purchase, the two old women expressed themselves in impatient language, and a child of the herring-dealer soon afterwards fell ill—in consequence. A carter drove his waggon against the cottage of Amy Dunny, and drew from her some not unnatural objurgations; immediately after which, the vehicle of the man stuck fast in a gate, without its wheels being impeded by either of the *posts*, and the unfortunate Amy was credited with the accident. Such accusations formed the burden of the dittay, in addition to the bewitching of the children. These young accusers were produced in court, and, on being touched by the old women, fell into fits. But, on their eyes being covered, they were thrown into the same convulsions by *other* parties, precisely in the same way. In the face of this palpable proof of imposture, and despite the general absurdity of the charges, Sir Matthew Hale committed Amy Dunny and Rose Callender to the tender mercies of the hangman. It is stated that the opinion of the learned Sir Thomas Browne, who was accidentally present, had great weight against the prisoners. He declared his belief that the children were truly bewitched, and supported the possibility of such possessions by long and learned arguments, theological and metaphysical. Yet Sir Matthew Hale was one of the wisest and best men of his time, and Sir Thomas Browne had written an able work in exposition of Popular Fallacies!

This case occurred in 1664. For some subsequent years trials and executions were yet far from unusual. Chief-justices North and Holt, to their lasting credit, were the first individuals occupying the high places of the law, who had at once the good sense and the courage to set their faces against the continuance of this destructive delusion. In one case, by detecting a piece of gross imposture, Chief-justice North threw into disrepute, once and for all, the trick of *pin-vomiting*, one of the most striking and convincing practices of the possessed. A male sorcerer stood at the bar, and his supposed victim was in court, vomiting pins in profusion. These pins were straight, a circumstance which made the greater impression, as those commonly ejected in such cases were bent, engendering frequently the suspicion of their having been previously and purposely placed in the mouth. The chief-justice was led to suspect something in this case by certain movements of the bewitched woman, and, by closely cross-questioning one of her own witnesses, he brought it fully out that the woman placed pins in her stomacher, and, by a dexterous dropping of her head in her simulated fits, picked up the articles for each successive ejection. The man was found guiltless. The acquittal called forth such pointed benedictions on the judge from a very old woman present, that he was induced to ask the cause. "Oh, my lord," said she, "twenty years ago they would have hanged me for a witch if they could, and now, but for your lordship, they would have murdered my innocent son."

The detected imposture in this case saved the accused. It was under Holt's justiceship, however, that the first acquittal is supposed to have taken place, in *despite* of all evidence, and upon the fair ground of the general absurdity of such a charge. In the case of Mother Munnings, tried in 1694, the unfortunate pannel would assuredly have perished, had not Chief-justice Holt summed up in a tone so decidedly adverse to the prosecution, that the verdict of Not Guilty was called forth from the jury. In about ten other trials before Holt, between the years 1694 and 1701, the result was the same, through the same influences. It must be remembered, however, that these were merely noted cases, in which the parties withstood all preliminary inducements to confession, and came to the bar with the plea of not guilty. About the same period, that is, during the latter years of the seventeenth century, summary executions were still common, in consequence of confessions extracted after the Hopkins fashion, yet too much in favour with the lower classes. The acquittals mentioned only prove that the regular ministers of the law were growing too enlightened to countenance such barbarities. Cases of possession, too, were latterly overlooked by the law, which would have brought the parties concerned to a speedy end in earlier days, even though they had done no injury to other people, and were simply unfortunate enough to have made compacts with the demon for the attainment of some purely personal advantages. For example, in 1689, there occurred the famous case of a youth, named Richard Dugdale, who sacrificed himself to the devil, on condition of being made the *best dancer* in Lancashire. The dissenting clergy took this youth under their charge, and a committee of them fasted and prayed, publicly and almost incessantly, for a whole year, in order to expel the dancing demon. The idea of this imposter leaping for a twelvemonth, and playing fantastic tricks before these grave divines, is extremely ludicrous. But the divines played tricks not less fantastic. They became so contemptuously intimate with the demon, as to mock him on account of saltatory deficiencies. A portion of their addresses to him on this score has been preserved, but of too ridiculous a nature for quotation in these pages. If any thing else than a mere impostor, it is probable that Dugdale was affected with St Vitus' Dance; and this is the more likely, as a regular physician brought his dancing to a close after all. But the divines took care to claim the merit of the cure.

After the time of Holt, the ministers of the law went a step farther in their course of improvement, and spared the accused in spite of condemnatory *verdicts*. In 1711, Chief-justice Powell presided at a trial where an old woman was pronounced guilty. The judge, who had sneered openly at the whole proceedings, asked the jury if they found the woman "guilty upon the indictment of conversing with the devil in the shape of a cat?" The reply was, "We do find her guilty of that;" but the question of the judge produced its intended effect in casting ridicule on the whole charge, and the woman was pardoned. An able writer in the Foreign Quarterly Review remarks, after noticing this case, "yet, frightful to think, after all this, in 1716, Mrs Hicks and her daughter, aged *nine*, were hanged at Huntingdon for selling their souls to the devil, and raising a storm by pulling off their stockings, and making a lather of soap! With this crowning atrocity, the catalogue of murders in England closes." And a long catalogue, and a black catalogue it was. "Barrington, in his observations on the statute of Henry VI., does not hesitate to estimate the numbers of those put to death in England, on this charge, at THIRTY THOUSAND!"

We have now glanced at the chief features in the history of witchcraft in England, from the enactment of the penal statutes against it. These statutes were not finally abolished till the middle of the eighteenth century, and unhappy consequences followed, in various instances, from their being left unrepealed. Though among the enlightened classes the belief in witchcraft no longer existed, the populace, in town and country, still held by the superstitions of their forefathers, and, having the countenance of the statute-book, persecuted the unfortunate beings whose position and circumstances laid them open to the suspicion of sorcery. The ban of public opinion told severely enough upon the comforts of such poor creatures, but the rabble occasionally carried their cruel and ignorant oppressions to a greater length. On the 30th of July 1751, an aged pauper named Osborne, and his wife, were seized by a mob in Staffordshire, dragged through pools, and otherwise so vilely misused, that the woman died under the hands of her assailants. The attention of the law, and the indignation of the humane, were aroused. One man, who had taken a prominent share in the brutal outrage, was condemned on trial, and executed. Immediately afterwards, the penal statutes against witchcraft were abrogated by the legislature, and the remembrance of them only remains, as a wonder and warning to the posterity of those who practised and suffered from them, as well as to mankind at large.

It must not be imagined, we may observe in conclusion, that the present generation has no need of such a warning, or is relieved by its increased enlightenment from all chance of falling into similar errors. The nineteenth century has witnessed such impostors as Johanna Southcote, Matthews, and Thom, and has seen a degree of enthusiastic and unhesitating credence given to their pretensions by many persons moving in a most respectable rank in society, which shows that the credulous spirit that created and supported witchcraft is not by any means extinguished. It is indeed a spirit only to be fully eradicated by such a universality of education and intelligence as can scarcely be expected to exist, excepting after the lapse of long-coming centuries of improvement. The subject which has been treated of here, has therefore a moral. In brief words, the world may learn from it the peril of encouraging the idea of the possibility of direct spiritual influences and communications in these latter days—a thing discountenanced alike by the lights of reason and scripture.

INTEMPERANCE.

We extract the following observations on a cause of intemperance, from a late number of the Athenæum:—

"The mode in which Sunday is spent by the lower classes, appears to be a very prominent, though unsuspected, source of juvenile delinquency. Some persons believe it to be their duty to legislate for the world as it ought to be, and, in the meantime, they do infinite mischief to the world as it is. Rarely has the operative an opportunity of seeing a green field, of admiring the works of creation, or even of breathing the pure air of heaven: yet, as is justly observed by the pious author of 'The Shunammite'—'Can we view nature in any other light than that of a book of instruction presented to the sons of men, that they may learn the character of God from all its pages, and read how the earth is filled with the goodness of the Lord; that the cattle upon a thousand hills, the calm pursuits of pastoral life, and the

Digitized by Google

scenes of rural peace and innocence, may serve as counteractions to the solicitations of vice, to the blandishments of sensual pleasure, and all the snares which an impure and sinful world would have laid for our souls?' Owing to the exertions of the Society for the Protection of Footpaths, the vicinity of Manchester affords the operatives means for enjoying delightful country walks, of which they avail themselves in great numbers. Liverpool wants these advantages, and its corporation offered an annual sum to the proprietors of the Botanic Gardens, on the condition of having the grounds thrown open to the public on Sunday; but, unfortunately, through the influence of some leading members, the proposition was rejected. Whether common sense may triumph on some future occasion, we cannot, of course, conjecture; but assuredly there is not a day in the week when the lower ranks of Liverpool are subjected to such corrupting influences as on the Sunday. The cause is obvious: the poor man has no home in which he can enjoy his day of rest, and abroad he has only to choose between a place of worship and the alehouse. It is very desirable that all classes should attend their religious duties; but the fact is that they do not, and that any attempt to compel them aggravates the evil. Keeping every park, garden, and place of recreation shut, will not add a single individual to the congregations in places of worship, but it fearfully augments the crowds collected on such spots as the progress of buildings and of enclosures has yet left open: circumstances coerce the poor to join these crowds, and vice is the inevitable consequence. 'What man shall there be among you that shall have one sheep, and if it fall into a pit, on the Sabbath day, will he not lay hold on it, and lift it out?' But the cellars, the lodging-houses, the dens of vice, and the filthy haunts to which the poor are perversely confined on the Sabbath day, are infinitely worse than any pit into which a favourite animal could fall. Justly, then, may the indignant question be asked—'How much is a man better than a sheep?'"

As far as our own experience is concerned, we should say that the efforts made to prevent appearance out-of-doors on Sunday, causes much in-door drinking in the large towns in Scotland. In passing through by-streets on Sunday, to or from church, we frequently observe the strongest indications of intemperance within doors.

UGOLINO OF PISA.

THE name and story of Count Ugolino of Pisa have been made famous by the Italian poet Dante, and Chaucer has also given poetic immortality to the same melancholy tale. Count Ugolino de Gherardeschi was one of the victims of the civil broils which agitated Italy in the middle ages, and are known in history by the title of the Wars of the Guelphs and Ghibellines. These names were of Germanic origin, being the family designations of two powerful and princely houses of that country, one of which has had the honour, in modern times, of supplying a line of sovereigns to Great Britain. It was more, however, on account of the importance of the causes of which these names became the watchwords, than through the intrinsic consequence of the families which then bore them, that the terms Guelph and Ghibelline attained to such celebrity in the annals of Europe. The pope and the Franconian emperors, the successors of Charlemagne, began to struggle for ascendancy in Germany and Italy about the twelfth century, and it chanced that the Guelphs took the side of the church, while the Ghibellines adopted the imperial cause. At a great battle fought in 1140, these two names formed the war-cries of the contending parties, and the use of them, from that time, became permanent, as has often been the case with titles or epithets originating in a similar incidental manner. When the great cities of Italy, such as Venice, Genoa, Milan, and Pisa, sprung up into wealth and influence, their citizens were for centuries divided between the church and imperial parties, and in the factious wars and disturbances that arose in consequence, Guelph and Ghibelline constituted the watchwords of the combatants in the field and in the senate. Though the cities in question had freed themselves from the political dominion both of emperor and pope, yet the countenance of either of these potentates was influential enough to affect the balance of power among the petty native princes and nobles, who struggled with one another for authority in the numerous republics of Italy.

In the second last decade of the thirteenth century, Pisa, then the third maritime power in Italy, was violently agitated by the contests of the Guelph and Ghibelline factions for political superiority. The neighbouring towns of Florence and Lucca, with other cities of Tuscany, were under the Guelph domination, and formed a league against Pisa. At this juncture, Ugolino, a nobleman well advanced in life, and Count of the Gherardeschi, a mountainous country between Leghorn and Piombino, used his great power among his fellow-citizens of Pisa to advance himself to the supreme authority. The count was of a Ghibelline family, but he had united his sister to a Guelph house, and his nephew, Nino di Gallura, was then chief of that party in Pisa. Thus divided, as regarded family ties, between the two factions, Ugolino appears to have played off the one against the other to raise himself, till, finally, he joined his power to that of Ruggieri or Roger degli Ubaldini, archbishop of the city, and a great Ghibelline chief, in order to expel Nino di Gallura and all his followers from within the walls. As it would have been a disgraceful act to join openly in the overthrow of his sister's son, Ugolino retired for a time to his country seat, but, as soon as he heard of the expulsion of Nino and the Guelphs, he returned to the city, and was received with great rejoicing.

At the same time, the Pisans were in great alarm for the consequences of the Tuscan league against them, although, being chiefly attached to the Ghibelline cause, they delighted in the banishment of Nino. In this extremity, they felt the necessity of a powerful and skilful head, or dictator, and pitched upon Ugolino as the person most able to reconcile them with the Tuscan league, or to command them in the field, should necessity call them there. They therefore named the count captain-general, the office to be held for ten years. Ugolino contrived to obtain peace with the enemy, but not till he had caused all the fortresses of the Pisan territory to be opened by his creatures to the Lucchese and Florentines. That this was a condition in his treaty, he dared not openly avow. "From that time (says the historian Sismondi) he sought only to strengthen his own despotism, by depriving the magistrates of power, and by intimidating the archbishop Roger degli Ubaldini, who held jointly with him the highest rank in the city. The nephew of Ubaldini, having opposed him with some haughtiness, was killed by him on the spot with his own hand." His violence soon rendered him obnoxious to the partisans on both sides, but his bravery and ability bore him through for a time. It was in 1782 that the Guelphs had been exiled; and six years afterwards, Ugolino, finding himself endangered by the growing hatred of the Ghibelline chiefs, resolved upon the recall of the Guelphs. He gave his son secret charges respecting their introduction into the city; but his project was discovered, and the Ghibellines, secure of the partialities of the citizens, called them hastily to arms. The Pisans rose at the summons, and proceeded to the seignorial palace to seize Ugolino. It is at this point that the history of the count assumes a character which calls forth the deepest sympathies of the reader.

Ugolino, with his sons, grandsons, and adherents, barred the gates of the palace against the besiegers on the 1st of July 1788. For some time all the force of the city contended with him in vain; he defended himself like an old lion brought to bay. At length, finding themselves unable to vanquish the obstinate resistance opposed to them, the citizens set fire to the palace, and entered amid the flames. Ugolino, two of his sons, and two of his grandsons, were dragged forth by the exasperated Ghibellines, and thrown into the tower of the Sette Vie, on the Piazza of the Anziani, where they were confined in one apartment. The key was given over to the custody of the Archbishop Ubaldini, "from whom (says Sismondi) was expected the vigilance of an enemy, but the charity of a priest." What the prelate's sense of charity was, became soon apparent. For some weeks, Ubaldini allowed his wretched prisoners a pittance of food, but at length the priest cruelly threw the key of the dungeon into the Arno, and consigned his victims to a slow and most horrible death. From that hour no human eye saw them, at least in life. The details of Ugolino's miserable end, with that of his sons and his little grandsons, have been so finely imagined by Dante, that it would be unpardonable to fashion forth the conjectural horrors of that extremity in other words than his. The spirit or shade of Ugolino himself, under circumstances to which we shall presently allude, is made the narrator of the story; and as the captives could be heard in their dungeon, though not seen, the poet may have had some slight facts to aid his fancy in his delineation. "Know, I was on earth Count Ugolino," says the spirit of the Pisan noble; and then, after mentioning his confinement, as well as the terrible dreams that indicated both to himself and his children their coming fate, he says,

"When I awoke
Before the dawn, amid their sleep I heard
My sons (for they were with me) weep and ask
For bread. Right cruel art thou, if no pang
Thou feel at thinking what my heart foretold.
Now had they wakened; and the hour drew near,
When they were wont to bring us food; the mind
Of each misgave him through his dream, and I
Heard at its outlet underneath locked up
The horrible tower: whence, uttering not a word,
I looked upon the visage of my sons.
I wept not; so all stone I felt within.
They wept; and one, my little Anselm, cried,
'Thou lookest so! Father, what ails thee?' Yet
I shed no tear, nor answered all that day,
Nor the next night, until another sun
Came out upon the world. When a faint beam
Had to our doleful prison made its way,
And in four countenances I descried
The image of my own, on either hand
Through agony I bit; and they, who thought
I did it through desire of feeding, rose
O' the sudden, and cried, 'Father, we should grieve
Far less, if thou would'st eat of us: thou gav'st
Those weeds of miserable flesh we wear;
And do thou strip them off from us again.'
Then, not to make them sadder, I kept down
My spirit in stillness. That day and the next
We were all silent. Ah, obdurate earth!
Why open'dst not upon us? When we came
To the fourth day, then Gaddo at my feet
Outstretch'd did fling him, crying, 'Hast no help
For me, my father?' There he died; and e'en
Plainly as thou seest me, saw I the four
Fall one by one 'twixt the fifth day and sixth;
Whence I betook me, now grown blind, to grope
Over them all, and for three days aloud
Call'd on them who were dead. Then fasting got
The mastery of grief."

Thus closes Ugolino's story. Whether the last words simply mean that death came to cure the mortal agony, or whether the poet intends to give a dreadful hint that fasting drove the count to a banquet which nature revolts at, and which seemingly will not sustain life, it would be difficult to say. "Three days I called aloud," says the count. This would appear to be founded in truth, for the historian Villani tells us, that Ugolino was heard to utter "loud cries" for a priest, but none was allowed to approach the place. The same writer thus describes the veritable end of all. "In a few days, they died of hunger. All the five, when dead, were dragged out of the prison, and meanly interred; and from thenceforward the tower was called the TOWER OF FAMINE, and *so shall ever be.*"

If human imagination can conceive any thing more terrible than the real end of Ugolino and his children, it is the punishment which Dante has assigned in the after-world to the main agent in the earthly tragedy, Roger degli Ubaldini, the Pisan prelate. Many readers will be aware that Dante, in his Divine Comedy (a word not bearing the sense now commonly given to it), has fancied himself conducted through the infernal regions by a guide, who points out to him a great number of the most noted evil-doers of preceding times, undergoing fitting and varied punishments for their crimes. In one region, he saw many doomed beings suffering their award in prisons of ice, enclosing, in whole or part, their bodies. At one spot, he says,

"I beheld two spirits by the ice
Pent in one hollow, that the head of one
Was cowl unto the other; and as bread
Is ravened up through hunger, the uppermost
Did so apply his fangs to the other's brain,
Where the spine joins it. Not more furiously
On Menalippus' temples Tydeus gnawed,
Than on that skull and on its garbage he.
'Oh, theu! who show'st such beastly sign of hate
'Gainst him thou prey'st on, let me hear,' said I,
'The cause.' * * * *
His jaws uplifting from their fell repast,
That sinner wiped them on the hairs o' the head,
Which he behind had mangled, then began:
'Thy will obeying, I call up afresh
Sorrows past cure. * * Know, I was on earth
Count Ugolino, and the archbishop he
Ruggieri."

The count then proceeds to tell the story of his fate, as the reader has had it already laid before him.

From what has been detailed, few will wonder that the story of Ugolino should have attracted the notice and employed the powers of painters as well as poets. In one famous performance, Sir Joshua Reynolds has taken up the story of Ugolino in the dungeon, at the moment when the count is sitting, stupified into stone, and "little Anselm" clasps his arm, exclaiming, "Father! what aileth thee?" while the other three are grouped around, one fainting in the arms of another. In another picture, Fuseli has taken up the tale at a moment somewhat later, when one son (Gaddo) has flung himself in a perishing state across his father's feet, and the others are drooping around. Ugolino is, of course, the prominent figure in both paintings. The count of Fuseli is more expressive, and has an aspect more befitting the horrors of his condition, than that of Sir Joshua, whose Ugolino, as an able critic has said, with some show, at least, of truth, is too like a "famished mendicant, deficient in any commanding qualities of intellect, and regardless of his dying children who cluster around his knees." Having only small engravings of these pieces before us, it would be presumptuous here to expatiate on their merits or defects. Both have been allowed to be great works, and, on the whole, worthy of the extraordinary and fearful story which they were intended to illustrate.

HEIR-LOOMS.

The term heir-looms has occasioned much dispute, but the rule which is recognised appears to be this: no chattles personal are capable of being entailed; but the law recognises a power of descent in such things as appear to be necessary to support the dignity, uphold the splendour, or continue the importance, of an estate or inheritance. The word loom is a Saxon word, signifying a limb or member; and thus heir-looms are limbs or members of the inheritance, and which generally cannot be separated from it without detracting from its value. Thus the ancient jewels of the crown are held to be heir-looms, because the loss of them would materially detract from the grandeur of the inheritance and the dignity of the sovereign for the time being. Deer in a park, fish in a pond, charters, deeds, court-rolls, and other documents necessary to verify titles of estates, together with the chests in which they are kept, become heir-looms, and pass with the land. Plate and other valuables, presented to a peer for public services, have been held to be heir-looms, as being necessary to the dignity of the several inheritors of the honours of him by whom they were received. Such, also, is the case with things which cannot be separated from the inheritance to which they belong: as chimney-pieces, pumps, ancient fastened tables and benches, and whatever might be considered as rational appendages to the freehold. Thus tombstones, monuments, and coat armour hung in a church, come under the same designation, together with any ensigns of honour that may hang with them. For though the church be the parson's freehold, and these are annexed to the freehold, yet they were placed there by consent, for the advantage and honour of the ancestor and family of the heir, and exist therefore for his benefit. So that the parson, though he is not liable for any damage that may be done to them, which has not occurred through his special act, or those of his agents, yet he cannot take them away, without being subject to an action from the heir for trespass.—*Tyas's Legal Hand-Books: Personal Property.*

A FEW PLAIN OBSERVATIONS ON POLITENESS.

A REFINED species of civility is sometimes expressed by the term *politeness*, which is an exterior indication of good breeding or good manners, and may be defined as that mode of behaviour which not only gives no offence, but which affords agreeable sensations to our fellow-creatures. In our intercourse with the world, this species of civility is imperative. We possess no right to give offence, by language or actions, to others; and we are bound to conduct ourselves agreeable to the reasonable and set rules of society. Some severe writers on morals have confounded *politeness* with *insincerity*. They seem to imagine that the act of speaking gracefully to another, is necessarily mere grimace, or an empty flourish signifying nothing. In many instances, with insincere people, this may be the case, but it is not so with those of well-regulated minds. It is always better to speak politely, that is, with extreme propriety and delicacy, than bluntly, coarsely, or impertinently. We say, cultivate politeness of manner by all means, for it is *refined civility*, and will spare both ourselves and others much unnecessary pain.

Civilised society has in the course of time instituted certain rules in the code of politeness, which, though of little actual value, it is every one's duty to learn, because, by knowing and acting upon them, we can make life glide on much more smoothly and pleasantly than if we remained in ignorance of them. These rules are sometimes called the rules of *etiquette*. We shall here mention a few of the more important of these social regulations:—

1. *Honour to the female sex.*—Women are physically weaker than men. They are unable to defend themselves from insult or injury, and it would be considered indelicate for them to do so, even if they possessed the power. For these and other reasons, it is only simple politeness and a sign of good sense to render any little service to women, to assist them when they appear in any difficulty, to speak respectfully of them and to them, and to give them honour whenever it can be reasonably required. It will be observed, therefore, in what is called good society, that women are treated with exceeding delicacy and deference: they are offered the best seat, or the only seat if there be no other; allowed to walk next the wall, or at the farthest point from danger, in the street; never rudely jostled against in a crowded thoroughfare; and are always parted from with a respectful bow. All this is considered essential in good manners, and attention to it will not in the smallest degree degrade any man in the opinion of the world. At the same time, as respects the women who receive these attentions, it is expected that they will not "give themselves foolish airs," or presume on the forbearance and kindness of the stronger sex. In fact, no female will do so who is acquainted with good manners, or wishes to avoid being despised.

2. *General courtesy and respect.*—It is incumbent on every one to be courteous or respectful in his intercourse with neighbours, acquaintances, or with the public generally. To inferiors, speak kindly and considerately, so as to relieve them from any feeling of being beneath you in circumstances; to equals, be plain and unaffected in manner; and to superiors, show becoming respect, without, however, descending to subserviency or meanness. In short, act a manly, courteous, and inoffensive part, in all the situations in life in which you may be placed. Society, for good and sufficient reasons, which it is needless here to explain, has ordained certain modes of address, and certain exterior signs of respectfulness, which it behoves us to support and personally attend to. In eastern countries, as of old, it is the custom to uncover the feet and to sit down, in token of respect, on going into the presence of kings, or on entering any religious edifice or private dwelling. In our country, the custom is entirely the reverse. It is an established mark of respect to uncover the head and to stand, in the situations which we have mentioned, and to this point of etiquette we are bound to adhere. We must not, from any crotchet of our own, violate the rules or customs which society sanctions and enjoins, as long as these rules and customs are not opposed to reason and sound morals, and only refer to such trivial arrangements as taking off our hat, making a bow, shaking hands, or other matters equally unworthy of deliberate consideration. None but persons of a silly, eccentric turn of mind, think of disputing about these trifles. On the same principle, give every one the title, which, by law or courtesy, he usually receives.

3. *Personal behaviour.*—A well-bred man is always known by the perfect ease and tranquillity of his manner. These are points to be carefully cultivated. Acquire, if possible, an easy confidence in speaking, so as never to appear abashed or confused, taking care, however, not to fall into the opposite error of forwardness or presumption. Persons moving in the highest circles of society never allow themselves to appear disturbed or vexed, whatever occurs to annoy them. Perhaps there may be an affectation of indifference in this; still their conduct is worth admiring, for every thing like fidgetiness or boisterousness of manner is disagreeable to all who witness it.

Carefully avoid the following things in personal behaviour:—Loose and harsh speaking; making noises in eating or drinking; leaning awkwardly when sitting; rattling with knives and forks at table; starting up suddenly, and going unceremoniously out of the room; tossing any thing from you with affected contempt or indifference; taking any thing without thanking the giver; standing in the way when there is scarcely room to pass; going before any one who is looking at a picture or any other object; pushing against any one without begging pardon for the unintentional rudeness; taking possession of a seat in a coach, theatre, or place of public meeting, which you are informed belongs to another; intruding your opinions where they are not wanted, or where they would give offence; leaving acquaintances in the street, or a private company, without bidding them good-bye, or at least making a bow to express a kindly farewell; slapping any one familiarly on the shoulder or arm; interrupting any one who is conversing with you; telling long and tiresome stories; whispering in company; making remarks on the dress of those about you, or upon things in the room; flatly contradicting any one, instead of saying, "I rather think it is otherwise," "I am afraid you are mistaken," &c.; using slang expressions, or words of a foreign language; acquiring a habit of saying, "says she," "says he," "you know," "you understand," &c.; helping yourself at meals without first asking if you may not assist others to something which they would like; picking your teeth with your fork, or with your finger; scratching or touching your head; paring or cleaning your nails before company; mentioning the price of any article of food or drink which you are offering to guests; asking questions or alluding to subjects which may give pain to those you address; neglecting to answer letters. It would be easy to enumerate many other things which should be avoided as savouring of bad manners, but these will be sufficient to indicate the principle of politeness, and if that be understood, there can be no difficulty in knowing how to act with delicacy and discretion in all the concerns of life.

4. *Gentility and vulgarity.*—By attention to the rules of good breeding, such as we have just alluded to, the poorest man will be entitled to the character of a *gentleman*, and by inattention to them the most wealthy individual will be essentially *vulgar*. Vulgarity signifies coarseness or indelicacy of manner, and is not necessarily associated with poverty or lowliness of condition. Thus, an operative artisan may be a gentleman, and worthy of our particular esteem; while an opulent merchant may be only a vulgar clown, with whom it is impossible to be on terms of friendly intercourse. Vulgarity of manner is often exhibited, in its most offensive form, by persons originally of humble birth and breeding, who have risen to wealth by the force of fortuitous circumstances. It is not uncommon to hear persons of this class, particularly ladies, speaking of "my coach," "my house," "my governess," "my family," "my servants," "my furniture," and so forth; all which is *pure vulgarity*, and indicates a low tone of breeding, and weak understanding on the part of the speaker. A man or woman of refined taste never alludes to matters of dress, domestic convenience, or things strictly personal, and rather endeavours to direct conversation into those channels in which all may harmoniously join.

INJURIOUS EFFECTS OF BLACK PAINT.

The following is abridged from a paper on this subject by Mr L. Thompson, published in the Transactions of the Society of Arts. "There is nothing," he observes, "which will prove the injurious effects of black paint, more than by observing the black streaks of a ship after having been in a tropical climate for any length of time. It will be found that the wood round the fastenings is in a state of decay, while the white work is as sound as ever: the planks that are painted black will be found split in all directions, while the frequent necessity of caulking a ship in that situation, likewise adds to the common destruction; and I am fully persuaded, that a piece of wood painted white will be preserved from perishing as long again, if exposed to the weather, as a similar piece painted black, especially in a tropical climate. I have heard many men of considerable experience say, that black is good for nothing on wood, as it possesses no *body* to exclude the weather. This is, indeed, partly the case; but a far greater evil than this attends the use of black paint, which ought entirely to exclude its use on any work out of doors, namely, its property of absorbing heat. * * Wood having a black surface, will imbibe considerably more heat in the same temperature of climate, than if that surface was white: from which circumstance we may easily conclude, that the pores of wood of any nature will have a tendency to expand, and rend in all directions, when exposed under such circumstances. The water, of course, being admitted, causes a gradual and progressive decay, which must be imperceptibly increasing from every change of weather. Two circumstances, which have fallen under my own immediate notice, deserve mention. The first was the state of H.M. Sloop Ringdove, condemned by survey at Halifax, Nova Scotia, in the year 1828. This brig has been on the West India station for many years. On her being found defective, and a survey called, the report was to the effect that the wood round all the fastenings was totally decayed in the wake of the black, while that in the wake of the white was as sound as ever. The next instance relates to H.M. Ship Excellent, of ninety-eight guns (formerly the Boyne). The ship is moored east and west, by bow and stern moorings; consequently, the starboard side is always exposed to the effects of the sun, both in summer and winter. In this situation her sides were painted in the usual manner of a ship of war; namely, black and white, of which by far the greater part is black; this latter portion on the starboard side I found it impossible to keep tight; for as often as one leak was apparently stopped, another broke out, and thus baffled the skill of all interested. In the meantime, the side not exposed to the rays of the sun remained perfectly sound. I then suggested to Mr Kennaway (the master caulker of her majesty's dockyard at Portsmouth), who had previously given the subject consideration, the advantage likely to be derived from altering the colour of the ship's side from black to white. Captain Hastings having approved of the alteration, the ship was painted a light drab colour where it was black before, upon which the leaks ceased, and she has now continued perfectly tight for more than twelve months; and, indeed, I can confidently state, that the ship will last as long again in her present situation, as she had begun to shrink and split to an astonishing extent when the outside surface was black, which has entirely ceased since the colour has been altered."—*Athenæum.*

TO THE WILD BEE.

One of my boyhood's dearest loves wert thou,
Melodious rover of the summer bowers;
And never can I see or hear thee now,
Without a fond remembrance of the hours
When youth had garden'd life for me with flowers!
Thou bringest to my mind the white-thorn bough,
The blooming heath, and fox-glove of the fells;
And, strange though it appear,
Methinks in every hum of thine I hear
A breeze-born tinkling from my country's own blue-bells.

Most sweet and cheering memories are these
To one who loves so well his native land—
Who loves its mountains, rivulets, and trees,
With all the flowers that spring from nature's hand,
And not at man's elaborate command.
Yet, ah, they are no more than memories:
For I have dwelt perforce this many a year
Amid the city's gloom,
And only hear thy quick and joyous boom,
When thou my dusky window haply passest near.

No longer can I closely watch thy range
From fruit to flower, from flower to budding tree,
Musing how lover-like thy course of change,
Yet from all ills of human passion free.
Though thou the summer's libertine may be,
And, having reft its sweetness, may estrange
Thyself thenceforward from the flow'ret's view,
No sting thou leav'st behind—
No trace of reckless waste with thee we find—
And sweetly singest thou to earn thy honey-dew.

Oft have I marvell'd at the faultless skill
With which thou trackest out thy dwelling-cave,
Winging thy way with seeming careless will
From mount to plain, o'er lake and winding wave:
The powers which God to earth's first creature gave,
Seem far less fit their purpose to fulfil
Than thy most wondrous instinct—if, indeed,
We should not think it shame,
To designate by such ambiguous name
The bright endowments which have been to thee decreed.

Hurtful, alas! too oft are boyhood's loves.
The merle, encaged beneath the cottage eaves,
The pecking sparrow, or the cooing doves,
The chattering daw, most dexterous of thieves,
That oftentimes the careful housewife grieves,
And nimbly springs aloof when she reproves—
Happier by far these pets of youth would be,
Had they been left alone,
To human care or carelessness unknown,
Roaming amid the woods, unheeded still and free!

Well, too, for thee, wert thou thus left, poor Bee!
In chase of thee and thy congeners all,
How oft have I coursed o'er the fields with glee,
Despite all hindrances of hedge or wall
That in my onward way might chance to fall:
But, ah, though fervently admiring thee,
Thy piebald stripes, perchance, or golden hues,
Too often then did death
Bring sudden pause to thy harmonious breath,
And all for thy sweet bag, so rich with balmy dews.

Nor could the beauty of thy earthen home,
In a green bank beneath a fir-tree made,
With its compact and overarching dome,
Enveloping thy treasure-stores in shade—
Nor the fine roadway, serpentinely laid—
Nor all thy lovely cups of honied comb—
Protect thee from the instruments of ill,
Who forced thy tiny cave,
And made a place of peace and joy a grave,
Killing thy race, though still admiring while they kill.

Vainly against the thoughtless plunderers,
Didst thou direct thy poison-pointed sting;
With branches from the super-pendent firs,
They beat thee down, and bruised thy little wing:
Thy queen, although a strangely gifted thing,
Saw ruin fall on all that once was hers,
Nor could the hand of fell destruction check:
Thy cells, of honey reft,
In one confused, sod-mingled mass were left,
And thou, thy home and works, lay whelmed in one sad wreck.

Hence, though the wild flowers of my native hills
Before my mind at sight of thee arise,
And though my sense their fancied fragrance fills,
And their bright bloom delights my inner eyes,
Yet painful thoughts the while my breast chastise.
Oh, could poor man accomplish what he wills,
I would live o'er my days of youth again,
If but to cherish thee,
With kindness unalloy'd, thou little busy Bee,
And have thy memory unmix'd with aught of pain!

But still to me thou art a thing of joy!
And the sweet hope is mine, that this new age
Shall see thee saved from all such sore annoy.
Following a path alike benign and sage,
The Man doth now his faculties engage
In teaching early wisdom to the Boy.
Youth now shall love thee, and have no desire
To hunt, or hurt, or kill;
And thou henceforth shalt safely roam at will,
The happiest, merriest member of the summer choir!

NUMBER 450. SATURDAY, SEPTEMBER 12, 1840. PRICE THREE HALFPENCE.

THE DANCING MANIA.

By accident we have lately encountered an extremely curious and interesting book, bearing the title quoted below.* The subject treated is the Dancing Mania, the author having in other treatises (which we have not seen) considered the Black Death, and the Sweating Sickness, all of these having been "epidemics of the Middle Ages." In the preface to the volume before us, he speaks of having collected materials for the history of other prevailing diseases of that period; but we are not aware of his having published any such works.

It seems not improbable that the Dancing Mania, which for five centuries occasionally broke forth in Europe, took its origin in an accidental circumstance. In the year 1027, a few peasants disturbed divine service on Christmas eve, at the convent-church of Kolbig, near Bernburg, by brawling and dancing, whereupon the priest inflicted a curse upon them, that they should dance and scream for a whole year without ceasing. When we consider the superstitions of that age, we cannot be much surprised to learn that the men did continue to scream and dance as long as nature would allow, and were at length only relieved from the curse by the intercession of two pious bishops. The story adds, that four of them died of exhaustion, and that the survivors were never afterwards free from a trembling in their limbs.

This tale was of course told as a remarkable instance of the punishment of impiety, and we may well believe that it greatly impressed the minds of the people. The idea of frantic screaming and dancing, thus rendered familiar, became, of course, a ready shape or model for the conduct of persons under more than usual religious excitement, or who were, from whatever cause, in an unsound state of mind. There were probably many repetitions of the Kolbig scene within no long time after its occurrence; but we have no authentic notice of any such before the year 1237, when upwards of a hundred children were seized with this frenzy at Erfurt, and thence proceeded dancing and jumping along the road to Arnstadt. When they arrived at that place, they fell exhausted to the ground, and, according to an account of an old chronicle, many of them, after they were taken home by their parents, died, and the rest remained affected to the end of their lives with a perpetual tremor.

It was more than a century after the date last mentioned, when the dancing mania assumed for the first time the appearance of an epidemic. Certain persons of both sexes, who had travelled out of Germany, introduced it, in 1374, into Aix-la-Chapelle. They appeared in the streets and in churches, dancing wildly in circles, until, nature being exhausted, they sunk to the earth. From these persons it spread to others, and was soon propagated all over the Netherlands. In individual cases, the first symptoms were epileptic convulsions. Those affected fell to the ground senseless, panting and labouring for breath. They foamed at the mouth, and suddenly springing up, began their dance amidst strange contortions. For hours they would dance deliriously in circles, in the open streets, regardless of the bystanders and of all external objects, but wrapt apparently in internal visions, for they frequently shrieked out the names of spirits and of divine persons, and some would exclaim that they saw the heavens open before them. After continuing their spasmodic dancing and raving till their last strength was gone, they fell to the ground, usually in a state of violent tympany or inflation, and apparently in the agonies of death; but when a cloth was tied tightly round them, or when they were soundly kicked or buffeted, they recovered, and were free from the delirium till its next attack. So usual was this result, that at length those who wandered about the country exhibiting their appalling malady, got swathing bands tied round them, to be ready for use. A stick inserted into this band, and twisted once or twice round, restored them to temporary soundness.

In the course of a few months, wandering bands of these frenzied dancers had propagated the disease all over the Netherlands. Wherever they appeared, the people flocked around them in crowds to gratify their curiosity with the frightful spectacle. In towns and villages, they took possession of the religious houses; processions were every where instituted on their account, and masses were said and hymns were sung. No one doubted that the disease was of the nature of a demoniacal possession. The priests, against whom they poured forth threatenings and imprecations, had recourse to exorcisms, being the more anxious to put an end to the malady, because some of the afflicted were heard to declare that they designed to enter the bodies of the nobility and princes, and, through these, to destroy the clerical order. The exertions of the priests were effectual, for exorcism was a powerful remedy in the fourteenth century. About ten months after its appearance, the disease had in a great measure ceased in Belgium.

It was about the same time advancing along the Rhine. At Cologne five hundred, and at Metz eleven hundred, were affected at the same time. The streets of the latter city were filled with the dancers, and the crowds of all sorts of people from town and country who flocked to behold and join in their wild revels. Children quitted their parents, servants their masters, mechanics their workshops, and housewives their domestic duties, to partake in the disorder which pervaded this rich commercial city. Many of the wandering dancers are understood to have been impostors, who assumed the character for the sake of adventures and maintenance; but these propagated the disorder as successfully as the truly afflicted, the susceptible being every where prepared to fall into a frenzy of which they heard so much. In the Rhenish cities, as in Belgium, it at length in a great measure exhausted itself, and for a time fell out of notice.

The time when this mania appeared in Germany, was remarkable in that country for civil disturbances. The barons were incessantly at war with each other, and the people suffered tremendous oppressions. In the early part of the year, the Rhine and Maine had overflowed their banks, and wrought grievous havoc in the country. There was consequently considerable suffering from want. These causes may be presumed to have given at this particular time an unusual tendency to a delirious disease, which superstition always kept more or less alive. Another circumstance is to be taken into account. St John's festival had for many ages been celebrated with rude dances, probably in allusion to the dancing of Herodias at his death. This saint had therefore become associated in the popular mind with the dancing mania. Now, his festival takes place in July, and we find it was in that month that the disease was introduced under such flagrant circumstances into Aix-la-Chapelle.

The dancing mania made another conspicuous appearance in the towns of Belgium and the Lower Rhine in 1418, when bands of the afflicted passed along from place to place, accompanied by musicians playing on bagpipes, and by innumerable spectators attracted by curiosity. For a century after this period, it appeared from time to time, like other epidemics, and the symptoms were always of one kind. It now became known as St Vitus's dance, from a notion that to that saint was commissioned the power of curing it, for which reason his shrines were resorted to by the afflicted. It attacked people of all stations, especially those who led a sedentary life, such as shoemakers and tailors; but even the most robust peasants became its victims. The fury of some was so great, that they would dash their brains out against the walls and corners of buildings, or rush headlong into rapid rivers, where they were drowned. Roaring and foaming as they were, the bystanders could only succeed in restraining them by placing benches and chairs in their way, so that, by taking high leaps, their strength might be the sooner exhausted. Many, after wearing themselves out, would revive in a certain time, and join once more the frantic revel. The afflicted had some strange antipathies. They could not endure to see any one weeping; and when they saw a red garment, they flew at the wearers as infuriated cattle do, and endeavoured to tear them in pieces. The malady became nearly extinct about the beginning of the seventeenth century.

Varieties of the dancing mania appeared in other parts of Christendom during the middle ages.

There is in Apulia, in Southern Italy, a harmless species of spider, called the tarantula. About the same time that the dancers appeared in Germany and on the Rhine, the people of Apulia seem to have become possessed by a nervous dread of the bite of this little insect. Hence arose one of the strangest delusions that ever possessed the human mind. Those who were bitten, or supposed themselves to be bitten, "generally fell into a state of melancholy, and appeared to be stupified, and scarcely in possession of their senses. This condition was, in many cases, united with so great a sensibility to music, that, at the very first tones of their favourite melodies, they sprang up, shouting for joy, and danced on without intermission, until they sank to the ground exhausted and almost lifeless. In others, the disease did not take this cheerful turn. They wept constantly, and, as if pining away with some unsatisfied desire, spent their days in the greatest misery and anxiety. Others, again, fell into morbid fits of love; and instances of death are recorded, which are said to have occurred under a paroxysm of either laughing or weeping."

At the close of the fifteenth century, this malady had spread over Italy, and the virulence of its symptoms was increased. Nothing short of death was expected from the bite of either the tarantula or the scorpion; and all who fancied they had ever been so bitten, became victims of the disease. Sunk in profound melancholy, they never betrayed the least sensibility, except under the influence of music. At the sound of the flute or cithern, they awoke, as if by enchantment, opened their eyes, and, moving slowly at first, according to the measure of the music, gradually hurried on to the most passionate dance. It was generally observed that, on these occasions, the most rustic people showed a grace in their movements which never was observed under other circumstances in persons of their class. Musical pieces devised for the afflicted were called Tarantellas; some of them are preserved, and extracted into Dr Hecker's work. Dancing was sought for in this disorder as a means of relieving it. It was supposed that, by the exercise, the poison of the bite was diffused over the body, and not only made less intensely virulent, but expelled to some extent by perspiration, though it was still thought that, as it could not be thus altogether thrown off, a

* The Epidemics of the Middle Ages. From the German of J. F. C. Hecker, M. D., professor at Frederick William's University at Berlin. Translated by B. G. Babington, M. D. London: Sherwood, Gilbert, and Piper. 1836.

germ of the disorder must remain in the veins. When summer recurred, the malady again took possession of those formerly afflicted, and it was necessary again to resort to music. Thus, in time, the cure of the *Tarantati* became a kind of public festival of annual occurrence. Crowds attended these festivals, which became scenes of great general excitement, and many, particularly of the female sex, caught the malady, not from the poison of the spider, but "from the mental poison which they eagerly received through the eye."

Tarantism lasted in full vigour in Italy till the seventeenth century, at which time it might be said to be at its height. From the end of the seventeenth century it began to decline, until at length it was confined to single cases, as it now is. One great cause of the decline seems to have been the frequency of cases of imposture. These, being detected in great numbers, threw discredit over the whole, and, the "conceit" being thus shaken, people became less liable to be affected by the real disorder. The spirit of the eighteenth century, which was inquiring and anti-enthusiastic all over Europe, must also be acknowledged to have been unfavourable to a malady which perhaps took its origin in, and was all along supported by, religious extravagance.

Yet even during this cold period, there have not been wanting comparatively isolated instances of similar affections. In 1731, the grave of the Deacon Pâris (the zealous opponent of the Ultramontanists), in the cemetery of St Medard at Paris, became the scene of a singular popular mania. Many individuals were there seized with convulsions and tetanic spasms, causing them to roll upon the ground like maniacs, while their countenances and limbs were thrown into the most violent contortions. Crowds flocked to witness this spectacle, and the number of the patients at length became so great that the king found it necessary to issue an order to shut up the cemetery, or, as a wit expressed it, to forbid further miracles in that place. There can be no doubt that these proceedings were the consequence of the fervour to which certain devotees were wrought up by the controversy on account of the bull "Unigenitus." The enthusiasm and the convulsions are said to have been kept up by a small and obscure sect till the Revolution. The preachings of Whitfield, and those of several other divines of the like fervour of manner, were attended, as is well known, with similar effects both in Britain and America. In 1760, a sect originated in Cornwall, who acquired the name of Jumpers, in consequence of its being a regular part of their devotional exercises to work themselves, by the use of certain unmeaning words, into a spasmodic state, in the course of which they jumped with strange gesticulations, until they were exhausted.

In the last age a disorder, locally termed convulsion-fits, prevailed to a great extent in the remote archipelago of Shetland. The disorder was traced to a very simple circumstance, namely, the falling of an epileptic woman into a fit during service in one of the churches. The minds of the congregation being probably in a state of high excitement at the time, several individuals immediately experienced palpitation and faintness, and then fell into a motionless and apparently cataleptic condition. For years afterwards, especially during summer, similar occurrences frequently took place, but not always with the same symptoms, for women especially often fell into convulsions, and raved furiously, writhing their bodies into various shapes, and uttering the most dismal cries. It would have been easy perhaps to counteract these disorders. A sensible clergyman, newly introduced to his charge, finding the service much impeded by them, gave notice that, understanding immersion in cold water to be a cure for the malady, he should in future order every person so affected in church to be instantly carried out and plunged into the neighbouring lake. From that time the malady was heard of no more in that congregation.

A disorder of an analogous kind, called the leaping ague, was prevalent about the same time in Forfarshire. According to a writer in Sir John Sinclair's Statistical Account of Scotland, "Those affected with it first complain of a pain in the head, or lower part of the back, to which succeed convulsion-fits, or fits of dancing, at certain periods. During the paroxysm, they have all the appearance of madness, distorting their bodies in various ways, and leaping and springing in a surprising manner, whence the disease has derived its vulgar name. Sometimes they run with astonishing speed, and often over dangerous passes, to some place out of doors, which they have fixed on in their own minds, or perhaps mentioned to those in company with them, and then drop down quite exhausted. Cold bathing is found to be the most effectual remedy; but when the fit of dancing, leaping, or running, comes on, nothing tends so much to abate the violence of the disease as allowing them free scope to exercise themselves, till nature be exhausted."

At a cotton manufactory at Hodden Bridge in Lancashire, on the 15th February 1787, a girl put a mouse into the breast of another who had a great dread of mice. The girl was immediately thrown into a fit, and continued in it, with the most violent convulsions, for twenty-four hours. On the following day, three more girls were seized with fits similar to what they had beheld in the first girl, and, on the 17th, six more became affected in the like manner. The work was now stopped, under an impression that a pestilence had been introduced into it through the medium of a bag of cotton. A physician was sent for from Preston; and before he arrived, three more were seized. On the morning of the 19th, there were in all twenty-three girls affected, besides one man, who had been much fatigued by holding the girls. Five other girls, working at a factory at Chitheroe, five miles distant, were affected merely by hearing of what took place at Hodden Bridge. The physician cured them by an electrical machine, and by assuring them that the malady was entirely nervous. Phenomena similar to these took place in 1801 at Berlin. A patient affected by tetanic spasms being introduced into the Charité Hospital there, and falling down at her entry in strong convulsions, six other patients, at sight of her, became affected in the same way, and by degrees eight more were attacked in the like manner. While their new ailment continued, their former complaints were banished, returning, however, after the convulsions had been cured, which was chiefly effected by the use of opium.

The various cases which have now been adduced, make it, we presume, quite plain, that there is a spasmodic disease, to which human beings are liable under certain predisposing circumstances, and which may be propagated through the medium of morbid sympathy, or, to speak more properly, the imitative faculty in a state of disease. Amongst the predisposing causes to this malady, the first is certainly nervous weakness, whether it may arise from great physical sufferings, or from the long-continued operations of a harassing superstition, or be simply a natural character of the individuals affected. Such, we should think, must have equally been the state of the oppressed and superstitious peasantry of Germany in the fourteenth century, of the over-tasked monotonously-labouring girls in the Hodden factory, and of the under-fed and lonely people of the Shetland Islands. It may also be induced in persons of better condition, by protracted exposure to addresses in which the most enthusiastic eloquence is employed to work upon the feelings. When many are in the requisite condition of nervous weakness, the disease passes from one to another by morbid sympathy, and the consequences are what we have seen.

If these be the proper inferences from the facts stated, it becomes clear and indubitable that many of the fervours which take place under the hallowed name of religion, do not proceed either from the good or evil spirit, as opposite sects have represented them, but are mere results of natural laws operating on the nervous system. On the importance of this deduction we need not pause to make a single remark.

A MODERN ROMANCE OF REAL LIFE.

In explanation of the subjoined narrative, which is translated from a foreign newspaper, it is necessary to remind the reader that the island of Mauritius, appertaining at this day to the English, was originally colonised by the French, and that the population yet consists in a great measure of persons of that nation, to whom, by a formal treaty between the powers concerned, their ancient laws and usages were preserved without any material alterations.

About ten or twelve months ago, the Sieur Clodomir Frenois, a rich merchant of the island, was found dead and frightfully disfigured in his own habitation. His body was discovered lying on the floor, with the head and face mutilated by means of a pistol, and all doubt as to the cause of the catastrophe was dispelled by the discovery of the fatal weapon by the side of the corpse, and also of a paper in the handwriting of the deceased. This paper contained the following words: "I am ruined!—a villain has robbed me of twenty-five thousand livres sterling; dishonour must be my portion, and I cannot await or survive it. I leave to my wife the task of distributing among my creditors the means which remain to us, and I pray that God, my friends, and my enemies, may pardon my self-destruction! Yet another minute, and I shall be in eternity! (Signed) CLODOMIR FRENOIS."

Great was the consternation caused by this tragic event, which was the more unexpected, as the loss alluded to in the note had never been made public. The deceased had been held in great esteem over the colony as a man of strict honour and probity, and was universally lamented. His attached widow, after endeavouring faithfully to fulfil his last wishes, found her grief too overpowering to permit her to mingle longer with the world, and took the resolution of consecrating her remaining days to the services of religion. Two months after the sad end of her husband, she entered a convent, leaving to a nephew of the late merchant, a physician, the charge of completing the distribution of the effects of Frenois among his creditors.

A minute examination of the papers of the defunct, led to the discovery of the period at which the unfortunate merchant had been robbed; and this period was found to correspond with the date of the disappearance of a man named John Moon, long in the employment of Frenois. Of this man, on whom suspicion not unnaturally fell, nothing could be learned on inquiry; but, shortly after the division of the late merchant's property, Moon reappeared in the colony. When taken up and examined respecting the cause of his flight, he stated that he had been sent by his master to France to recover certain sums due to the merchant there, in which mission he had been unsuccessful; and he further averred, that if Clodomir Frenois, in his existing correspondence, had thrown any injurious suspicions upon him (Moon), the whole was but a pretext to account for deficiencies of which the merchant himself was the sole cause and author. This declaration, made by a man who seemed to fear no inquiry, and whose worldly circumstances remained to appearance the same as they had ever been, had the effect of silencing, if it did not satisfy, the examinators, and the affair soon fell in a great measure out of the public recollection.

Things remained for a short time in this condition, when, one morning, Mr William Burnett, principal creditor of the late Clodomir Frenois, heard a knocking at his gate at a very early hour. He called up one of his servants, who went down and opened the door, and immediately returned with the intelligence that a stranger, who seemed desirous of keeping his person concealed, wished to speak with Mr Burnett in private. Mr Burnett rose, threw on his dressing-gown, and descended to the parlour. He saw there a stranger, of tall person, seated in an easy and familiar attitude upon a sofa, with a number of the Morning Post in his hand. The back of the visiter was turned to Mr Burnett as he entered. Rather surprised to see a stranger conduct himself so like an old friend of the house, Mr Burnett said aloud, "Sir, may I beg to know your business with me?"

The stranger turned round, and advanced to salute his host warmly and courteously. Mr Burnett started back, and uttered a loud exclamation of surprise and alarm. Well he might; for before his eyes stood his friend and debtor, Clodomir Frenois, whom he had beheld, nearly a year before, a mutilated corpse, and whom he himself had followed to the grave!

What passed at that interview between Mr Burnett and his strange visiter, remained for the time a secret. Mr Burnett was observed to issue several times, pale and agitated, from his dwelling, and to visit the magistrate charged with the conduct of the criminal processes of the colony. In the course of that day, while John Moon was regaling himself with tea under the palm-trees of his garden, along with a Circassian female whom he had bought some time previously, he was arrested and taken to prison by the officers of justice. On the following day, he was brought before the criminal court, accused of robbing the late Clodomir Frenois, the crime being conjoined with breach of trust and violence. Moon smiled at the charge, with all the confidence of a man who had nothing to fear. The judge having demanded of him if he confessed the crime, the accused replied, that the charge was altogether absurd; that clear testimony was necessary to fix such a delict upon him; and that, so far from there being any such evidence producible, neither the widow of the deceased, nor any one person in his service, had ever heard the pretended robbery even once mentioned by Frenois during his life.

"Do you then affirm your innocence?" repeated the judge gravely, after hearing all that the other had to say.

"I will avouch my innocence," replied Moon, "even before the body of my late master, if that be necessary." [Such a thing often took place under the old colonial law.]

"John Moon," said the judge, in a voice broken by some peculiar emotion, "*it is before your late master* that you will have now to assert your innocence, and may God make the truth appear!"

A signal from the judge accompanied these words, and immediately a door opened, and Clodomir Frenois, the supposed suicide, entered the court. He advanced to the bar with a slow and deliberate step, having his eye calmly but sternly fixed on the prisoner, his late servant. A great sensation was caused in the court by his appearance. Uttering shrieks of alarm and horror, the females present fled from the spot. The accused fell on his knees in abject terror, and shudderingly confessed his guilt. For a time, no voice was heard but his. However, as it became apparent that a living man stood before the court, the advocate for the prisoner gained courage to speak. He demanded that the identity of the merchant be established, and the mystery of his existence explained. He said that the court should not be biassed by what might prove to be a mere accidental likeness between a person living and one deceased; and that such an avowal as that of the prisoner, extracted in a moment of extraordinary terror, was not to be held of much weight. "Before being admitted here as accuser or witness," continued the advocate, addressing the resuscitated merchant, "prove who and what you are, and disclose by what chance the tomb which so lately received your body, mangled by bullets, has given up its tenant, and restored you to the world in life and health!"

This firm appeal of the advocate, who continued steadfast to his duty under circumstances that would

Digitized by Google

have closed the lips of most men, called forth the following narrative from Clodemir Frenois. "My story may be soon told, and it will suffice to establish my identity. When I discovered the robbery committed by the accused, he had then fled from the island, and I speedily saw that all attempts to retake him would prove fruitless. I saw ruin and disgrace before me, and came to the resolution of terminating my life before the evil day came. On the night on which this determination was formed, I was seated alone in my private chamber. I had written the letter which was found on my table, and had loaded my pistol. This done, I prayed forgiveness from my Maker for the act of despair I was about to commit. The end of the pistol was at my head, and my finger on the lock, when a knock at the outer door of the house startled me. I concealed the weapon, and went to the door. A man entered, whom I recognised to be the sexton of the parish in which I lived. He bore a sack on his shoulders, and in it the body of a man newly buried, which was destined for my nephew, the physician, then living with me. The scarcity of bodies for dissection, as the court is aware, compels those who are anxious to acquire skill in the medical profession to procure them by any possible secret means. The sexton was at first alarmed at having met me. 'Did my nephew request you to bring this body?' said I. 'No,' replied the man; 'but I know his anxiety to obtain one for dissection, and took it upon me to come and offer him this body. For mercy's sake,' continued the sexton, 'do not betray me, sir, or I shall lose my situation, and my family's bread.'

While the man was speaking, a strange idea entered my mind, and brought to my despairing bosom hopes of continued life and recovered honour. I stood for a few minutes absorbed in thought, and then, recollecting myself, I gave two pieces of gold to the resurrectionist, the sum which he had expected. Telling him to keep his own counsel, and that all would be well, I sent him away, and carried the body to my cabinet. The whole of the household had previously been sent out of the way on purpose, and I had time to carry into execution the plan which had struck me. The body was fortunately of the same stature as myself, and like me in complexion. I knew the man; he had been a poor offender, abandoned by his family. 'Poor relic of mortality!' said I, with tears in my eyes, 'nothing which man may do can now injure thee; yet pardon me if I rudely disfigure thy lifeless substance. It is to prevent the ruin of not one, but twenty families! And should success attend my attempt, I swear that thy children shall be my children, and, when my own hour comes, we shall rest together in the tomb to which thou shalt be borne before me!'"

At this portion of the merchant's narrative, the most lively interest was excited in the court, and testified even by tears from many of the audience. Frenois thus proceeded:—"I then stripped off my clothes, and dressed the body in them. This accomplished, I took up the pistol, and with a hand more reluctant than when I had applied it to my own person, I fired it close to the head of the deceased, and at once caused such a disfigurement as rendered it impossible for the keenest eye to detect the substitution which had been made.

Choosing the plainest habit I could get, I then dressed myself anew, shaved off the whiskers which I was accustomed to wear, and took other means to alter and disguise my appearance, in case of being subjected by any accident to the risk of betrayal. Next morning saw me on board a French vessel on my way to a distant land—the native country of my ancestors. The expectations which had led me to the execution of this scheme were not disappointed. I knew that John Moon, the man who had robbed me, and who now stands at the bar of this court, had formed connexions in this island, which would in all probability bring him back to it as soon as the intelligence of my death gave him the promise of security. In this I have not been disappointed. I have been equally fortunate in other respects. While my unworthy servant remained here in imaginary safety, I have been successful in discovering the quarter in which, not daring at first to betray here the appearance of wealth, he had lodged the whole of the stolen money. I have brought it with me, and also sufficient proofs, supposing his confession of this day to be set aside altogether, to convict him of the crime with which he stands charged. By the same means," continued Clodimir Frenois, with a degree of honourable pride in which all who heard him sympathised, "will I be enabled to restore my family to their place in society, and to redeem the credit of a name on which no blot was left by those who bore it before me, and which, please God, I shall transmit unstained to my children, and my children's children."

John Moon, whose guilt was thus suddenly and strangely laid bare to the world, did not retract the confession which he had made in the extremity of his terror, and, without separating, the court sentenced him to confinement for life in the prisons of the colony.

The news of Clodimir Frenois's re-appearance spread rapidly, and the high esteem in which his character was held led to an universal rejoicing on the occasion. He was accompanied from the court to his home by a dense multitude, who welcomed him with prolonged shouts. It would be vain to attempt any description of the feelings of the wife, who thus saw restored to her the beloved being for whose sake she had quitted the world. She was released from her ecclesiastical vows, and rejoined her husband, no more to part till the grave really claimed one or other of them as its due.

REPORT RESPECTING THE IRISH POOR.

The Sixth Annual Report of the Poor-Law Commissioners has just been published. Only a few pages are devoted to matters connected with England; but from what is said, the gratifying fact may be learned, that the new law is in all places working well, and fulfilling the expectations of its projectors. The rule, which is inflexibly acted upon in all the combined parishes or unions, of placing relief for the able-bodied upon the simple alternative of coming into the workhouse, has been attended with the best results. Masses of individuals are now employed, and living as independent labourers, who formerly relied upon a parish allowance in aid of their wages. The demoralising practice of giving money in aid of wages to able-bodied labourers, is not yet altogether abolished, but it is annually declining, and will ultimately be unknown. At the present time, there are still 799 parishes in England and Wales which have not been brought under the operation of the Poor-Law Amendment Act, containing a population of more than two millions of souls.

The bulk of the volume is devoted to proceedings in Ireland, in reference to the extension of the law to that country. The business of sectioning the country into unions, and building a workhouse in each, has been actively carrying on throughout the past year. The number of unions declared up to the 25th of March 1840, is 104, and 30 more will probably complete the total number of unions into which Ireland will be arranged. The formation of unions was followed by elections of guardians by the rate-payers; and the new measures seem generally to have produced satisfaction in the various districts. Sixty workhouses have been contracted for, and are now in progress of erection. The houses of the old charitable foundations are likewise in the course of being remodelled to meet the arrangements of the new system, which has already, or will very shortly, come into operation in the Dublin and Cork unions. The various boards of guardians concur in representing, that as soon as the workhouses in their respective jurisdictions are ready for the reception of inmates, all public begging and mendicant vagrancy should cease; and to accomplish this desirable object, they express a hope that a vagrant act will be passed, similar to that which applies to England. It may seem hard that paupers should not be allowed to seek alms from the charitably disposed; but in all matters of this kind we must consult general, not individual, advantage. Beggary is a disgrace in a civilised community. It argues that society is in a wrong condition. The least that can be said of it is that it is a nuisance, and is practically a tax on the benevolent for the support of the poor, while the more churlishly disposed, but not the least wealthy, escape. Thus, in Dublin, under the old state of things, the entire charge for the poor fell exclusively on the benevolent. We rejoice, therefore, that by the law as now constituted for Ireland, every householder in ordinary circumstances will be compelled to pay his fair share for the support of his poorer brethren. The establishment of workhouses, to which every man, woman, and child, in a state of destitution, may resort for relief, is the only effectual remedy against the nuisance of begging, because it leaves no excuse whatever for the application of the mendicant, and permits us with a safe conscience to refuse his request. The country which possesses no workhouses or other establishments for the ready relief of the pauper, and yet prevents public begging, commits a monstrous crime; in fact, it consigns myriads of unfortunate creatures to pinching penury and starvation. We are not overlooking here that the more important benefit of a poor-law is its supporting the moral tone of the humbler orders of the people, keeping them above that degree of want which induces despair and recklessness, and the effects of which have already been more frightfully exemplified in Ireland than in any other country.

Two of the most instructive papers in the Report are those on the proposed workhouse dietaries in Ireland, by Messrs Hawley and Hall, assistant poor-law commissioners. Mr Hawley gives us the following account of the common food of the people:—"That the potato is the staple food of the peasantry is a fact too well known to require any proof; and it will hardly be necessary to state, that I have found the use of this vegetable to prevail in all parts of my district. The grand object of the peasant, when planting the potato, is to raise the largest crop on the smallest extent of land; and with this view the sorts called *lumpers* and *whites* are generally preferred, as being most prolific; they are, however, of a very inferior and a watery nature, and the loss in cooking reduces them in weight much more than the superior kinds; but as the gross produce of these potatoes, on any given portion of land, is considerably greater than that of any of the other sorts, they continue to hold the preference. The market value of the several sorts corresponds with their quality, and the cheapness of the lumpers and the whites, the two sorts above mentioned, furnishes another reason for their general use.

The potato is eaten at every meal, and throughout all seasons of the year. A failure of the crop, or even an improvident use of an abundant supply, frequently, however, causes the necessity of resorting to the use of other species of food; and oatmeal, eggs, butter, lard, dripping, and herrings, are then partially though sparingly substituted for it, particularly in the months of May, June, and July, when the old crop is exhausted, and the new is not yet ready for digging, an operation which generally commences about the first week in August. Milk, after being skimmed, as in the state of buttermilk, in the districts where dairy farms abound, is also much used; the quantity consumed being regulated by the nature of the district and the consequent supply, which varies according to the season of the year, being of course least plentiful in the winter months. When the supply of milk fails, water becomes the only beverage of the working class; and their dry meal of potatoes has then a relish imparted to it by the addition of a herring, which is generally eaten by the heads of the family, the children dipping the potatoes into the sauce in which it was cooked. Illness appears to be most prevalent at those seasons of the year when water is used as the only beverage. Frequently lard with salt is boiled in water, and the potatoes dipped into this mixture, which is called *dip*.

Labourers employed by farmers, who are obliged, by the terms of their contract, to feed them, are, in many instances, better off than those who receive full money wages, and cater for themselves. Butter, eggs, milk, and even meat, are occasionally furnished them; but if left to his own resources, the labourer rarely tastes animal food. Porridge, composed of oatmeal boiled in water, with salt and pepper, is a frequent substitute for potatoes.

There is little doubt that the pernicious custom of whisky-drinking has hitherto abridged the domestic comforts, by tending to deteriorate the quality of the food used by the families of the peasantry. It would be premature to reason upon the future effects likely to be produced by the reformation in this respect lately introduced; but from inquiries which I am constantly making at the village shops, where groceries as well as spirits are sold, I find that there is an increase in the sale of the former, more than in the ratio to the decrease of the latter, and that tea, coffee, and bread, are now purchased by the poor for consumption in their cabins, and public coffee-shops are established in most of the towns.

Perhaps it may not be out of place to state here, that there is also a remarkable improvement in the dress of those who were formerly addicted to drunkenness; and this, in conjunction with the fact stated above, affords a proof that the poor generally are beginning to appreciate those comforts which an abstinence from intoxicating liquors has now placed within their reach.

The number of meals eaten during the day by the labouring class is very generally regulated by the following circumstances, namely, the season of the year, the locality, the supply of fuel, and the supply of food. In the short days in the months of November, December, and January, in manufacturing towns, and at times when turf is scarce and dear, the supply of potatoes falling short, and employment scarce, supper is frequently omitted; but at other times, and under different circumstances, particularly where hard labour has to be performed, a third meal is partaken of.

The quantity of food consumed by able-bodied women is almost invariably less than that consumed by able-bodied men, but in quality it is precisely similar. Males up to sixty years of age consume fully as much as young men in the prime of life, and those above sixty very little less. The same proportional consumption of food is also observable in women. There is more difficulty in obtaining any correct data as to the relative consumption of food by children of all ages; but from the best information I can obtain, I am led to suppose that those upwards of ten years of age require fully as much as a full-grown woman to sustain them, at the period of life when muscular expansion and a rapid digestion require equivalent support." Mr Hawley here adds a table, showing the quantity and nature of the food consumed by individuals in various parts of the country. It appears from this, that in most places the breakfast of an able-bodied man is about four and a-half pounds of potatoes; dinner the same, but herrings or lard are substituted when milk is scarce; supper is seldom taken. Women eat about one pound less of potatoes daily. Rarely is bread or oatmeal used. It may be said, with the trifling exceptions to which Mr Hawley alludes, the universal diet consists of from eight to nine pounds of potatoes, and two and a-half pints of skimmed or buttermilk daily. The weight is calculated with the potatoes raw; there is a loss of two ounces in every pound in boiling. In jails, hospitals, and houses of industry, from six to eight ounces of oatmeal made into porridge are in many instances substituted for the potatoes at breakfast; and sometimes a kind of potato soup is given for dinner. There is, therefore, reason to believe, that hitherto the diet afforded in jails and hospitals has been superior to the ordinary food enjoyed by the humbler orders out of these establishments.

We now come to Mr Hall's report, which consists of suggestions for the adoption of the guardians in the Dublin unions. "The essential principle to be attended to," he proceeds to observe, "in framing a dietary for a workhouse, appears to be, that the food a pauper, maintained at the public cost, should not

Digitized by Google

be more abundant or better than that of the poor man maintaining himself in independence by his industry. In England it has been found very difficult to preserve this principle; it was almost impossible, in many districts, to prescribe a diet less abundant, and of inferior quality, than that of the majority of the labouring classes, and at the same time sufficient to keep the inmates of the workhouse, belonging to the same classes, in health and strength. It is well known to all who have accurately inquired into the matter, that the diet ordered or allowed by the poor-law commissioners for the English workhouses, is in many, not to say in most instances, superior in quality, and more nutritious than the ordinary diet of the poor; a fact attested by the improvement generally observable in the condition of the inmates, within a short period after their admission into the workhouse.

Such being the case in England, it must be expected that the difficulty of regulating the dietary of the paupers, so as not to hold out the additional inducement of superior food to those who may be already disposed, by the prospect of shelter and clothing, to seek relief from the union, instead of working for a livelihood, will be even greater in Ireland. And yet, exactly in proportion to the difficulty of adjusting the diet according to this principle, is the necessity of being careful to do so; because, where subsistence is precarious, scanty, and unwholesome, and, such as it is, not to be obtained without severe exertion, a supply of food, even of tolerable quality and in moderate quantity, yet provided regularly and without fail, becomes almost irresistibly attractive to the poor. Where such is the case, there is great danger of those tests becoming ineffectual, whereby some security is given that none but the actually destitute are relieved; and when once pauperism becomes on the whole, and in the estimation of a large portion of the poorer classes, more eligible than independence, evils which cannot be contemplated without dread are sure to follow.

It is matter of notoriety that meat is rarely, if ever, tasted by the Irish peasant; and the fact of its being almost universally excluded from the dietaries of public institutions, shows that the change in his habits and circumstances in life that a man undergoes when he becomes an inmate of any of them, does not render a change of diet necessary for his well-being. This almost general rule may be proved by the few exceptions that occur. Your assistant commissioner, Mr Phelan, whose medical knowledge and professional experience add great weight to his opinion, when discussing this point in a report on dietaries, writes as follows:—'The dietaries of prisons are of three descriptions—bread diet, mixed diet, and vegetable diet. Each consists of only two meals. The first, for various reasons, is in most use: but, from no inconsiderable acquaintance with prison discipline, I am satisfied that the third is the best—that which would keep the prisoners in better health. This consists of stirabout and new milk for breakfast, and potatoes and skimmed milk for dinner.' And again, in another part of the same report, he says, 'Whether meat or broth should be allowed in our workhouses is a matter of doubt with me, as those who are likely to become the inmates but rarely obtain either at their own residences, or at their own expense, except perhaps about three or four times a-year. If meat be at all allowed, it should be extremely well boiled, so that the soup or vegetable porridge prepared with it may be used at dinner instead of milk, and that the meat itself will be considered as of less value than such soup or porridge. I have come to this conclusion from having frequently found, to my very great annoyance, that more serious affections of the bowels occurred within the twenty-four hours after meat and broth had been used in the Clonmel House of Industry, than during the remainder of the week.'"

Mr Hall having submitted the subject to the consideration of the guardians of the South Dublin Union, a committee of the body reported in complete agreement with the views above expressed, and proceeded to suggest that therefore two meals a-day would be sufficient for the paupers in the workhouse, namely, a breakfast and dinner. "They advise," says the report, "that on two days of the week the dinner should consist of broth made of ox-heads and shins, and other coarse pieces of beef, together with potatoes, to be mashed up therein; the allowance for each adult pauper to be four pounds of potatoes, weighed before cooking; on the other five days potatoes and buttermilk, the allowance for each adult being four pounds of potatoes (weighed raw), and one pint of buttermilk. They advise that the breakfast every day should consist of oatmeal boiled into stirabout, and new milk; the allowance for each adult pauper being seven ounces of meal, and half-a-pint, imperial measure, of milk." Finally, they advise "that food of the same kind, but in less quantities, with a portion of bread, be provided for the children; and that the sick and infirm be dieted according to the directions of the medical officer."

It thus appears, that, in organising the workhouse system in Ireland, the same anxiety has been felt as in England to keep the diet on a level with that usually enjoyed by the independent labourer out of doors. To the feelings of people living in this country, the two meals and no supper allowed to the Irish paupor, is no pleasant subject of reflection; but no one can dispute that, to make the diet superior within to what it is without doors, would be deeply injurious. Here, as in many other cases, one must to a certain extent make general principles yield to what is locally expedient. At the same time, it is not to be overlooked that the Irish diet, even where it consists only of two meals, is one of far superior aggregate weight to any other diet which has ever been statistically ascertained. The diet of the working people of Britain in general is about twenty-four ounces of solids per day, chiefly meal, and only in small part animal food. Against this, nine pounds of potatoes, watery as the root is, makes a good appearance. We must own, indeed, that we are a good deal surprised at learning the aggregate weight of the Irish peasant's daily diet. In weight it is immense, and we suspect that, though unvaried, and attended by little relish or relief, it must be, upon the whole, where there is open-air exercise along with it, healthy and sustaining.

VISIT TO A SUGAR HOUSE.

A short time ago curiosity led us to visit an establishment for the refining of sugar, and we were equally pleased and surprised to observe the extraordinary improvements which in latter times have taken place in that branch of manufacture. What with improved modes of clarifying and boiling, the art of sugar refining has been almost entirely altered in character within the last twenty or thirty years.

Sugar, as is generally known, arrives from the place of its produce in a brown or raw mass, which is a concretion of the juice of the sugar-cane, divested of its molasses or uncrystallisable syrup. This coarse material, on being brought to the establishment of the refiner, is in the first place put into a vessel with water, and subjected to a process of purification; but this early stage of the manufacture possesses little interest, and we therefore pass on to the second, which consists in draining the partially cleansed liquid through a bed of bone charcoal. The manner in which the draining is performed is not always the same, there being constantly improvements and alterations upon it; it may, however, be described as follows. A black granulated substance, bearing an exact resemblance to gunpowder, and made by braying charred bones, is purchased in large quantities by sugar refiners from the manufacturers of the article. As much as perhaps a ton of this substance is placed in a large chest lined with lead, and having outlets at the bottom for the escape of the liquid. Upon the bed of charcoal so prepared, there is sent a flow of syrup for the purpose of filtration, and, strange to say, notwithstanding the blackness of the powder, the liquor is found to run from it very nearly pure and light in colour. Much of the brown colouring property of the sugar is thus deposited in the charcoal, which, after a certain length of time, requires to be washed away, when the substance is again charred in retorts and again applied to this exceedingly useful process of filtration. The employment of charred bones for this object is of comparatively modern date, and was the discovery of a Frenchman. It has greatly lessened the expense and simplified the process of refining.

The syrup, having now undergone all its preliminary purifications, is removed to pans in which it is to be boiled, that being necessary to cause it to granulate or crystallise. It is at this point that we see the most remarkable improvement in the art of refining. Formerly, the boiling was effected in large open pans heated beneath by a fire. Neither open pans nor fire are now used. The boiling is effected in closed copper vessels by means of steam. It may here be mentioned, that little or no fire is now employed in any branch of refining, all the heating that is desirable at the various stages in the process being now accomplished by steam, conducted in iron tubes from large boilers kept constantly in operation. Thus we find heating vessels at all parts of the establishment, and on wooden floors, from the garret to the cellar. A steam engine is at the same time kept at work, performing a variety of offices, including the raising up of huge casks from the ground to the higher floors of the house.

When it was the practice to boil the syrup in open pans, the liquid, as a matter of course, was exposed to the pressure of the atmosphere, which prevented it from arriving at the vaporific or boiling point till it reached a temperature of 220 degrees—a pitch of heat which impaired the quality of the sugar, while the vaporisation carried off a portion of what was really valuable. There are few liquid articles of food, those of vegetable product in particular, which are not injured by being boiled at a temperature of 212 degrees, but, to boil them at a less heat, it would be necessary to remove the atmospheric pressure from their surface, and this would be attended with a considerable degree of trouble and expense to the operator. The magnitude of the scale on which sugar is prepared, has permitted this to be effectually done. The syrup is poured through a pipe into a pan made of copper, which is a flattened sphere in form, measuring six feet in diameter, and from four to five feet deep at the middle. On the top of this flattened round vessel there is a raised part, resembling a kettle with a lid, into which the vapour rises, and to which an air-pump is attached. The steam for heating is conducted from a boiler to a vacant space between the outer and inner shell of the lower part of the pan. The vessel is thus kept quite close, and impervious to the outer air. All things being prepared for boiling, the air-pump, wrought by a steam-engine, begins to work, and draws off the air in the pan, as well as the vapour which arises in the ebullition. By particular arrangements in the process, all that is valuable in the withdrawn vapour is condensed and saved as it passes out, so that nothing is lost to the manufacturer. Except for the care taken in this respect, the loss incurred by pumping off the saccharine vapour would be immense. The withdrawal of the atmospheric pressure from the surface of the liquid, allows it to boil at a temperature of about 150 degrees, at which the good qualities of the sugar are no way deteriorated. Having boiled the proper length of time, the contents of the pan are allowed to escape by opening a plug beneath, and fall into an open vessel for their reception on the floor below. The vessel employed in this office was in former times called the cooler, because in it the liquid was cooled down from 220 to 180 degrees, the latter being the temperature at which crystallisation may best be effected. In the present day, the cooler has become a heater, for with the aid of steam enclosed round its sides, it is now used for elevating the temperature of the liquid from 150 to 180 degrees. The thick and viscous syrup being now fully prepared, is transferred from the heater, in copper ladles, to the moulds in which it is to cool and become firm. These moulds are of unglazed brown earthenware, and conical in form. They are of different sizes, according to the size of the loaf which is required, or from about twelve to twenty inches in depth. They are supported in rows on the floor, or in a frame with the broad open end uppermost; in the narrow pointed tip below, there is an orifice which is at first closed by a bit of twisted paper, but afterwards opened to allow a drainage of the coarser particles. The inverted cones are now left to cool, the temperature of the air around being gradually lowered, to assist and modify the process of crystallisation. At one time it was customary to place layers of pipeclay, in a liquid state, on the surface of the cooled mass in the cones, for the purpose of pressing down the refuse liquid; the more improved practice now consists of substituting for the clay certain quantities of refined sugar liquor, which runs through the loaf, and draws off the coloured molassy matter by the inferior orifice. This matter, as in the case of all droppings throughout the process, is carefully preserved, and forms one of the varieties of the saccharine product. Being thoroughly drained, the loaves are taken from the cones, and dried or baked in an oven raised to a temperature of from 130 to 140 degrees, by means of steam. Formerly, the baking was effected by a stove, and hence the danger of fire in the old sugar-baking establishments. After being baked, the loaves may be said to be ready for market, and are individually tied up in blue paper, as we see them in the shops of the grocers.

Such is a rough sketch of the modern process of sugar refining, in which, for the sake of intelligibility, we have avoided saying any thing of the different qualities of the article which are prepared. It must be understood, however, that the original raw sugar, in the course of its refinement, produces at least four kinds of material—double refined loaves, usually of about ten pounds in weight each; coarser loaves of four or five times that weight, called *lumps*, which are largely used by confectioners, &c.; a very coarse brown sugar called *bastards*, which is used only by the humblest classes; and, lastly, treacle or molasses. The produce of a hundredweight of raw sugar, in former times, was estimated at about sixty-four pounds of double and single refined lumps, fourteen pounds of bastards, twenty-eight of treacle, with six of trash or deficiency. In consequence of improvements in the manufacture, but chiefly by the use of the vacuum pans, a greater proportion of refined lumps is now produced from the same quantity of the article, to the benefit both of the maker and consumer. An idea of the great value of the vacuum pans may be had from the fact, that the inventor, near the expiry of his patent, realised, in all probability, not less than L.40,000 a-year for liberty to use it; some manufacturers paid L.2000 annually for this important privilege. The patent being expired, any one may now freely use the vacuum pans.

The quantity of refined sugar made from any given quantity of the raw material, depends not only on these improved processes, but on the original quality of the sugar employed. In this respect sugars differ very considerably, some being coarse and brown in quality, and others more pure and light. I was made very sensible of this, on being conducted into the store of the sugar-house after having seen the various operative departments of the concern. On a table there lay spread out a number of samples of raw sugar ready for the inspection of customers; and having observed that these were generally of a coarse appearance, the manufacturer took from a drawer a small packet containing a quantity of sugar of a much finer quality. "This," I remarked, "will of course be a much dearer sugar." "No such thing," he answered, "that sugar is much cheaper, but we cannot offer it for sale." "For what reason?" I inquired. "Because that fine sample is sugar from Brazil, and it is not allowed to

Digitized by Google

be introduced into this country except at such a heavy duty as amounts almost to a prohibition. We can buy it for 22s. 6d. per hundredweight, but being loaded with 63s. of duty, we are compelled to purchase that West India sugar which you see on the table, at 54s. 3d., which, with 25s. 3d. of duty, is raised to 79s. 6d."

In the compass of a few words, here was delivered one of the most striking lectures on political economy which it had ever been my fortune to hear. A single instant had served to explain that very incomprehensible affair, the high price of sugar, of which Mrs Balderstone had latterly been making such doleful complainings. This high price, it seems, had arisen from *no general scarcity of the article*; there had been only a shortcoming in the West India colonies, and the people of Great Britain had been such extraordinary simpletons as to continue buying bad sugar in limited quantities from that quarter, at 54s. per hundredweight, rather than buy a better article from Brazil, or any where else, at 22s. 6d. Did ever any one hear of such a piece of absurdity!

Before leaving the establishment, my friend enlightened me with a few more details respecting the sugar trade. It was a subject I had never before known any thing of, and therefore the information had all the effect of novelty. Perhaps the reader may allow me to retail a few particulars for his advantage.

Up till the year 1839, there was no material reduction in the quantity of sugar imported from the West Indies, East Indies, and Mauritius, but in that year quite a new state of things arose; there was a falling off in the imports from thence to the extent of from 8000 to 9000 tons; the usual imports of 210,000 tons having fallen to 201,900 in one year. We are at the same time informed that there will be a much greater deficiency this present year. Fortunately, while there has been a decrease in the production of West India sugar, there has been an increase in that of Siam, Java, and the Phillipine Islands, where the culture is carried on by free labourers. Lately, there were 10,000 tons of this sugar lying in bond in London; but being foreign, and not from a British colony, it could not be bought, except, as above mentioned, at a prohibitive duty. Foreign grown sugars, whether raised by free or compulsory labour, being thus practically excluded from the home market, while the scarcity of colonial sugars continues to increase, the result is that we are voluntarily paying more than double price for all the sugar we use. In other words, if the people thought proper to buy and consume foreign sugar, paying upon it the same duty as is laid upon the West India product, they would have it for 47s. 9d. per hundredweight, instead of 85s. 6d.—in plain terms, every poor man might have for 7d. that for which he now pays 1s. It appears that by this our fancy for buying from a dear instead of a cheap shop, we are absolutely giving away about L.4,000,000—some say L.5,000,000—annually. We are assured that if the present self-imposed dearth continues, the loss will not be less than L.6,000,000.

This magnificent self-denial on the part of John Bull is only equalled by his generosity to other nations. Though he will not buy cheap foreign sugar for his own use, he has no objection whatever to supply others with it to their heart's content. Foreign sugars—the produce of free or compulsory labour, it is all the same which—are imported in large quantities to be manufactured into refined loaves in bonded warehouses. London is the great seat of this trade. The sugar is brought in ships up the Thames, landed on wharfs which are secluded by lock and key from the public, and, after being refined by those processes of art which I have already described, is again put on board ship, and sent abroad to any country which will buy it. By this arrangement, fine lump sugar, such as we are buying here for 112s. per hundredweight, or 1s. per pound, is exported to the continent or elsewhere at 37s. or 38s., or something like 4s. or 5s. below what we are paying for common treacle!!!

These things appear so inconsistent with ordinary principles of action, that the mind can hardly be brought to that point of credulity to believe them. Unfortunately, they are but too true, as the excessive dearth of an important article of daily food, not to speak of other evidence, amply testifies. As a question of legislation, we have no wish to intrude either an opinion or observation on the subject. We only take the liberty of laying before our readers a few facts intimately connected with their domestic expenditure and comforts. It has been observed as a feature in social life, that the state of civilisation and physical comfort of a people are generally proportionate to their use of sugar; the condition, at least, of most European nations, might be guessed with tolerable accuracy from this fact in statistics. Should there be any truth in the remark, we are brought to the melancholy conclusion that the condition of the people of this country is suffering a deterioration. Although the population increases 1¼ per cent. annually, the quantity of sugar consumed remains the same, or, strictly speaking, is falling of. The mass of the population evidently cannot keep up to the sugar pitch of domestic comfort—they fall back upon food less pleasing to the palate, and, we fear, less nourishing to the system. While the allowance of sugar is gradually diminishing to the less opulent class of persons in England, it is increasing in a greater ratio in almost every other European country. As is generally known, the cultivation of the beet-root has received a great impulse during the last few years in France, and other parts of the continent. In the year 1838, in France alone, the quantity of sugar yielded from this source was 80,000 tons, and since then, establishments in this branch of industry have grown up in various districts of Prussia and central Germany. The effect of this augmented supply among our neighbours has been to check British exports, and to reduce the price of sugar on the continent to much below what it is in England. We believe, that in most European countries, the best lump sugar is now to be obtained at 4d. per pound, exclusive of any duty which may be chargeable upon it. As the people of Great Britain, from a regard for their colonies, will neither cultivate beet-root sugar, nor import sugar of any kind from foreign countries for home consumption, they accordingly must endure the pecuniary loss and privations which such acts of self-denial impose upon them.

RECENT PROCEEDINGS IN AND RESPECTING NEW ZEALAND.

THE public at large have probably a very vague and imperfect idea of the recent proceedings in and respecting New Zealand. We shall endeavour to bring together such particulars of these proceedings as may form an historical outline of what we cannot but consider as among the most important transactions in the way of colonial settlement that have taken place in our time.

It may be mentioned, in the first place, that the *New Zealand Association*, of whose designs we gave some account in the Journal for December 9, 1837, ceased to have a distinct existence soon after that period. That association, as well as an earlier one called the *New Zealand Company*, and a private copartnery named the *New Zealand Colonisation Company*, which was established in August 1838, may be said to have merged in a "NEW ZEALAND COMPANY," which was organised in May 1839, and is now the most conspicuous association of individuals for promoting emigration to that part of the world.

When this company started into existence sixteen months ago, the minds of many individuals of all orders were ripe for affording it encouragement; and to this circumstance, in some measure, we may attribute the remarkable success it met with. From the Colonisation Company, merged in it, it inherited an extensive territory adjoining the Kaipara and Hokianga harbours in the northern island; which territory had been recently purchased by the Colonisation Company, but not surveyed. While as yet the new company had formed no other connexion whatever with New Zealand, but entirely upon the faith of being able to purchase land and effect settlements, it issued proposals to sell, to intending colonists, what it might be said as yet not to possess, namely, 990 sections of land in what was to be the principal settlement of the company, wherever that might be pitched, each section to consist of 100 acres of country land, and one acre of town land; 110 similar sections being reserved for the use of native settlers. Thus, the first principal settlement was to consist of 1100 sections in all, or 111,100 acres. Let the reader mark, these sections had as yet no geographical situation; the whole settlement was as yet, we might say, in the clouds. Nevertheless, within seven weeks from the issue of the proposals, purchasers had come forward for all the disposable sections, and the company had in its treasury, as the purchase-money, L.99,990. Of this sum, however, they professed to have a right to only a fourth part. The remainder, L.74,992, 10s., was reserved to be employed in carrying out labourers to the settlement, according to what we may call the *Wakefield plan of colonisation*, already followed in South Australia. It is important to add, that priority in the choice of sections was determined by lot.

This company has had to contend at its outset with one great difficulty. The British government refused to afford its plan of settlement any countenance, so that no provision for maintaining order in the new colony could be had, besides what was afforded by a gentleman who possessed an old commission as a justice of peace in New Zealand, derived from General Macquarie, governor of New South Wales. The company, nevertheless, proceeded with their scheme, and the government soon after found it advisable to send out a Lieutenant-Governor of New Zealand, whose proceedings we shall have occasion to notice hereafter.

The whole procedure of the company, and of those dealing with it, forms a singular and striking example of that confidence between parties which is only to be expected in even its simplest forms amidst a community considerably advanced in civilisation. Not only was the ground of the first settlement *paid for* before it had a cognisable existence, but, before its existence was yet known in Britain, *nine ships, containing* 1125 *emigrants*, had been dispatched to it. There was first the Tory, of 382 tons, which sailed on the 5th of May 1839, with only six emigrants, but containing Colonel Wakefield, the company's principal agent for the arrangement of settlements, and a great store of articles designed to be employed in bartering for land with the native chiefs. Colonel Wakefield, it may be remarked, had distinguished himself in the Spanish service, and is brother of the author of the well-known plan of colonisation followed on this occasion. On August 1st, followed the Cuba of 373 tons, with eight first-class emigrants, and twenty-two labourers, and containing also the surveying staff, under Captain W. M. Smith of the royal artillery. In the middle of September, the Oriental, Aurora, and Adelaide, respectively of 506, 550, and 640 tons, proceeded on the same voyage, with a large body of emigrants of both classes. All of these were from London. On October 5th, the Duke of Roxburghe sailed from Plymouth with 167 settlers. Three other vessels, one of which was from Glasgow, and two from London, sailed before the end of the year. Besides these, there were three ships containing stores, designed to guard against the possibility of any deficiency of necessaries being felt during the early days of the settlement.

Behold, then, nine vessels proceeding on their voyage to this distant clime, the last ignorant of the fate of the first, and all of them unknowing of a particular destination—the rudiments of a new state all afloat at once in search of ground on which it might be set up! The voyage of the Tory was prosperous, and uncommonly quick. In ninety-six days from Plymouth, namely, on the 16th of August, she hove in sight of Cape Farewell, the northern point of the Southern Island, and which forms one side of the opening, named Cook's Straits, between the two islands. She lost no time in standing through the Straits, and on the 18th she anchored in Ship Cove, as nearly as possible in the same spot that Captain Cook occupied in his three visits to the island. Colonel Wakefield, in his journal, describes the Southern Island as forbidding in its appearance at a distance—"a succession of apparently barren mountains stretching away from the coast till they reach those covered with snow in the interior." But, "on nearing the land, you find that the whole is covered to the very highest points with timber and brushwood, which not till then betray their perpetual verdure." Ship Cove, in the northern island, was a beautiful place. "The water, tranquil as an inland lake, has ten fathoms' depth within a ship's length of the shore, which is covered to the water's edge with an evergreen forest, consisting of every variety of indigenous tree and shrub, so thick as to be scarcely penetrable, and presenting to the eye an undulating carpet of verdure reaching to the summit of the surrounding mountains, the highest of which is from 1200 to 1500 feet. The birds, as in the time of the immortal English navigator, fill the air with their notes, the mingling of which he has aptly likened to the tinkling of small bells; and the sea teems with fish, of which we caught enough with hooks and lines for the whole ship, before we dropped anchor. These consisted of hake, cole-fish, spotted dog-fish, gurnet, flounder, and joe-fish, all of which are eatable. * * *

It being Sunday, after the ship was moored and the decks cleared, I dismissed the natives, with a request that they would come early to-morrow with what they had for sale, and went on shore with the naturalist and other gentlemen of the expedition. The little beach, with its springs and rivulets, retains, at the distance of nearly seventy years, vestiges of Cook's visits, in the timber cut down but not used by him, the wild radishes and cabbages, and the space cleared for his forge and workshop.

The wood is almost impenetrable on the sides of the hills from the web of supplejacks and creepers; but for a hundred yards from the beach there is a swampy flat, through which run three rivulets of delicious water, which, flowing from the heights, here assume a shape before mixing with the water of the bay.

The soil here and on the hills is very rich, being, in fact, the decayed vegetation of centuries, and in the flat producing a thick carpet of weeds and herbage; but even were the land cleared higher up, which would be a work of time, it is doubtful whether the great acclivity would not prevent cultivation for the purposes of husbandry, though there can be little doubt that the vine and Indian corn might be grown up to the summit."

It was at this time winter in New Zealand; and the thermometer ranged between 40 and 56 in the shade. "The climate," says Wakefield, "very much resembles that of the north of Portugal; the most lovely days bursting out in the middle of winter." Cook's Straits, where the Tory now was, lies chiefly between the 40th and 41st parallels of latitude.

Colonel Wakefield found no difficulty in communicating with the native chiefs; but it was not so easy to acquire lands, not owing to any disinclination of the natives to sell them at a moderate price, but because it was difficult to ascertain who were the proper owners, or the owners who could convey a sound title. The general feeling of the natives is in favour of British settlements. They have tasted the benefits of civilisation sufficiently, to be very anxious for increased intercourse with the English, and for this

Digitized by Google

reason they appeared to Colonel Wakefield as if they would have willingly allowed the soil to be appropriated to a large extent, without looking for any remuneration. But the company was anxious that a reasonable, and, considering the circumstances, a liberal price, should be given for lands; and the main difficulty, as just stated, was to discover the parties who were entitled to part with the soil. An immense quantity of land had already been appropriated by private persons or by the missionary societies, without much ceremony.

Colonel Wakefield sent home a journal brought down to the 2d of September, and not long after, he dispatched another section of it, containing not less interesting intelligence. The second section of his journal commences on the 6th of September with a description of the trade carried on in Queen Charlotte's Sound, and other bays connected with Cook's Straits. He describes whalers in the pay of Sydney capitalists as being the chief followers of this hazardous but profitable commerce. It is estimated that the whale-fishery produces 1200 tons of oil per annum, and that the number of British who compose "shore-parties" in Cook's Straits and the stations on Banks's Peninsula, are about 500. They are a lawless set of people, quarrelling with the natives and among themselves. There are, however, some respectable persons among them.

On the 6th of September, Colonel Wakefield started with a small party on an expedition to explore the river Oyeroi or Pelorus, where he found the mountain forest scenery magnificent, but was not tempted to purchase land, finding it less fertile than it had been represented. Returning on the 11th, after a very difficult navigation, the party disembarked on Guard's Island, where they found a native settlement, with "excellent houses, and stores of pigs, potatoes, and flax," and where the people appeared "more independent, free from alarm, and happier" than any natives the party had yet seen.

Learning that the church missionaries were endeavouring to frustrate their views respecting Port Nicholson, a fine harbour and country in the Northern Island, about the centre of Cook's Straits, Colonel Wakefield now made haste thither. He met with a very hearty reception from the chiefs. "Epuri, an old chief, eagerly inquired the motives of our visit, and betrayed the most lively satisfaction at being informed that we wished to buy the place, and bring white men to it. He was followed by Wareperi, his nephew, who is about thirty-five years old, and has for some years superseded the older chiefs in influence, by his prowess in war and skill in the rude arts cultivated by these people. He also in fine words expressed his desire to see white people here, and his willingness to sell the land, which was solemnly made over to him by the natives of this place five years ago, when the greater portion of them emigrated to one of the Chatham Islands in an English vessel, whose master they partly obliged to carry them.

The two chiefs remained on board at night. They informed us that the schooner had left some native missionaries here, who were instructed to have houses and chapels built by the time Mr W—— was expected, with which orders they had complied. In discussing the merits of the missionary labours as opposed to the former practices of the natives, namely, those of war and cannibalism, they deprecated the constant occupation of praying and singing, which took people off from their potato-grounds and their canoes; the younger one declaring that the incessant worship had nearly driven him mad, whilst they at the same time warmly denounced any further fighting. 'What we want,' they said, 'is to live in peace, and to have white people come amongst us. We are growing old,' alluding to the numerous aged chiefs on shore, 'and want our children to have protectors in Europeans; but we do not wish for the missionaries from the north. They are natives. We have been long told of vessels coming from Europe. One has at length arrived; and we will sell our land and harbour, and live with the white people when they come to us.'"

Colonel Wakefield ascended the principal river which falls into the bay, and was well satisfied with the capabilities of the district. The soil is a rich black loam; the timber excellent in quality and of various descriptions; and the navigation of the river, which was obstructed by heaps of stones and trees thrown across, susceptible of great improvement at slight expense.

Colonel Wakefield determined to fix upon this part of the island for the first and principal settlement of the company; and he lost no time in coming to terms with the natives. A very amusing and graphic account is given of the debates, in a sort of ambulatory parliament of the different tribes owning the territory, on the question of sale or no sale. There was an opposition, but not a formidable one; and after a large majority had agreed to sell the land, the minority was acquiescent. Colonel Wakefield thus describes his purchase:—

"I found a territory of forty or fifty miles in length by twenty-five or thirty in breadth, containing a noble harbour, accessible at all times, and in the very highway between New Holland and the Western world, and land exceeding in fertility any I have seen in these islands, and equalling that of an English garden. I found a race of people of warlike habits, and but little used to intercourse with Europeans, just emerging from their barbarism, and inclined to cultivate the arts and intimacy of Great Britain; appreciating the protection from their hostile and still savage enemies that British settlers would afford, and anxiously desiring to assist them in their first labours in a new country. I found that these people, mustering, upon the slightest call, three hundred armed men, and quite capable, as they have repeatedly proved themselves, of retaining their possessions, and never having parted with a single acre of land in their district, by sale or otherwise, now, for the first time, disposed to make over their country to me, as the representative of a body of my countrymen, in consideration of the promises of remuneration and advantage I had held out to them. Under these circumstances, and following out the spirit of my instructions, I determined to act in the most liberal manner in the transaction. Moreover, I was most anxious to distinguish this bargain from all others that have been made in New Zealand, that none of the haggling and petty trading which usually take place between the Europeans and natives of this country should enter into any operations between the latter and the company's agents; and that the value of this property should not be regulated by what has hitherto been considered the standard of exchange in similar transactions."

The amount paid, of course, is not published; but the natives were highly pleased with their bargain, and eager to sell more of their land. The chiefs carefully examined the articles given in barter, and then signed a formal deed, alienating the land for ever. The war-dance, the hoisting of the New Zealand flag, and the formal ceremony of taking possession of the territory, are vividly described. Colonel Wakefield left a person in charge of his newly-acquired territory.

"I had brought with me a person from Queen Charlotte's Sound, a trustworthy man, well qualified, by his knowledge of the language and habits of the people, for the purpose. I left with him saws, tools, garden seeds, and various articles of trade, in which to pay for native labour, and to supply himself with food. Warepori undertook to put him up in a new house at his village, and render him every assistance. I had landed also a sow which had littered on our voyage from England, and her progeny, the goats, and the poultry. I left Mr S—— ample instructions to encourage the natives to build temporary houses at Thorndon, to plant potatoes, and to keep their pigs for their expected visiters; and supplied him with boards to place on the most prominent spots, on which is painted 'New Zealand Land Company.'"

This important business being settled, the Tory proceeded along the coast of the Northern Island towards the north, and on the 16th October came to an anchor off Kapiti, near Evans's Island. A smart battle had just then taken place between the two chief tribes in those parts, the Ngatirocowas and Ngatiawas, the latter of whom, a comparatively civilised and pacific race, had acted on the defensive, and been victorious. Colonel Wakefield had some intercourse with Raupero, a corrupt chief of the Kafia tribe, who had aided and instigated the Ngatirocowas, and with Hiho, an amiable young chief of the Ngatiawas; and, after some deliberations, and one somewhat wild scene, purchased the extensive tracts of land on both sides of Cook's Straits, forming "the commanding portions of the two islands." The goods given in exchange were upon the same liberal scale as in the case of Port Nicholson, and ultimately all the natives expressed themselves as quite satisfied. With regard to some portions of the ground purchased, it was known that there were other tribes, now dispossessed, who had claims upon them; but from these parties Colonel Wakefield apprehended no trouble of any consequence. In all cases he took care to have deeds of cession formally executed on the spot—a precaution the more necessary, as already speculators were sending emissaries from Sydney to buy up land in New Zealand, on a supposition of its soon acquiring a marketable value. For the next two or three weeks, Colonel Wakefield employed himself in sailing to different points in Cook's Straits, in order to buy up the claims of as many parties as possible. In concluding his survey of both sides of these straits, he gives a table of the native population of the principal districts, which he estimates as amounting in all to 6650.

Colonel Wakefield now proceeded to Hokianga, a deep inlet near the farther extremity of the Northern Island, leaving Mr Barrett, a whaling merchant, to arrange with the natives for the purchase of the lands more immediately to the north of Cook's Straits. He reached Hokianga on the 2d December, and entered into negotiations for the purchase of lands there and in the Bay of Islands, on the opposite or east side of the country. Private settlers are here numerous, some of them possessed of considerable tracts of land. Amongst others is a Baron Thierry, a Frenchman, whose right, however, to the land he professed to have bought, was disputed. The natives are not here so fine a people, physically or morally, as in the south, and not so ready to cede their lands. Colonel Wakefield obtained possession of a tract at Herd's Point, being the land purchased by Captain Herd in 1826, for the old company—reserved by the natives since that time—and now scrupulously made over to their successors. This done, he left Hokianga on the 13th December for Kaipara, another important inlet, a little farther to the south. At this point, he completed his third dispatch.

According to subsequent dispatches, the Tory struck upon a (supposed) newly-formed sand-bank in going into Kaipara bay or harbour, and, though got off in twenty-four hours, sustained such damage that Colonel Wakefield judged it prudent to leave her for repairs, and proceed with his land-buying operations. Having therefore secured all important papers, he walked across the continent to the Bay of Islands, and there chartered a small brig to go to Kaipara, to take charge of the cargo and passengers. He likewise engaged another small vessel to take him to Port Hardy in D'Urville's Island (Cook's Straits), the place of rendezvous for the emigrant ships. He reached Port Hardy on the 11th January; but finding none of the emigrant vessels arrived, he judged it best to cross the straits to Port Nicholson, which he did in a whale boat, leaving an Englishman to direct these vessels to follow him thither. Port Nicholson was the place of all others which he thought suitable for the first settlement, and he was now anxious to prepare matters as far as possible for the arrival of the settlers. It is gratifying to state, that all the vessels dispatched last year had reached the port in safety before the 7th of last March.

Meanwhile the government had deemed it necessary to take some step regarding the colonisation of New Zealand. In August 1839, it dispatched Captain Hobson, R. N., as Lieutenant-Governor of New Zealand. He arrived at the Bay of Islands on the 30th of January, and on that day issued a proclamation, intimating that the queen did not deem it expedient for the interests either of her British subjects resorting to New Zealand, or for those of the native tribes, to recognise as valid any titles to land not derived from or confirmed by her majesty, but yet, "to dispel any apprehension that it was designed to dispossess the owners of land acquired on equitable conditions, and not in extent or otherwise prejudicial to the present or prospective interests of the community," declaring "that her majesty had been pleased to direct that a commission should be appointed, with certain powers to be derived from a Governor and Legislative Council of New South Wales, to inquire into and to report on all claims to such lands," and further intimating that "purchases of land in any part of New Zealand which may be made from any of the chiefs or native tribes after the date of these presents [January 30, 1840], will be considered as null and void, and will not be confirmed, or in any way recognised, by her majesty."

In terms of this proclamation, it will be necessary for all who have purchased land in New Zealand to prove their rights before the commission. Captain Hobson left the Bay of Islands on the 17th February, declaring it an unfit place to be the seat of government for New Zealand, being distant from the more fertile parts of the country, and cut off from all easy communication with the southward. He had previously had some conferences with the native chiefs relative to the acquisitions of land by the missionaries. But unfortunately the proceedings of this officer were brought to a sudden and unexpected stand on the 1st of March, by his having sustained a paralytic shock when on board H.M.S. Herald, at Waimate. In consequence of this calamity, he at first proposed to resign his duty; but when the last accounts left New Zealand, he had resumed his functions, and was nearly recovered. He had appointed magistrates of the districts, and fixed on the shores of the River and Bay of Waitemata as the seat of his future government; while the surveying department were engaged in selecting the fittest site for the capital of the colony.

Other companies besides that represented by Colonel Wakefield have in the mean time been taking steps for promoting the colonisation of New Zealand. One of these, the *Plymouth Company of New Zealand*, advertised on the 18th July that it had secured an extensive purchase of land, and had sent out orders for the selection of a settlement. A thousand sections of town and rural land were in the way of being engaged, on the understanding that, out of the L.70 of purchase-money of each section, L.40 was to be expended in carrying out labourers. The *New Zealand Manakau and Waitemata Company* acquired valuable tracts on those harbours (in Northern Island) in 1838, and sent out a clever young officer, Captain W. C. Symonds, H.M.S., to survey the same and report, before taking any further step. A report from Captain Symonds, dated in February last, and of a highly favourable nature, was received in July, and the company then proceeded to receive applications for 200 sections, of 1 town acre and 100 country acres each, at L.101 each, 65 per cent. of the purchase-money to be expended in taking out labourers. In last July, the *Paisley New Zealand Emigration Society* was formed in connexion with the London company, for the purpose of promoting an extensive emigration of hand-loom weavers from the west of Scotland to New Zealand. This scheme is creditable to the parties concerned, as it is certainly time that hand-loom labour were deserted. We heartily wish that the scheme may meet with that encouragement from the government and the wealthy part of the community, which appears to be necessary for its success. It is at the same time worthy of remark, that symptoms have appeared of an extensive emigration from South Australia to New Zealand.

While these proceedings have been going on on the part of the British, a French expedition has sailed for the same country, designing to appropriate land for a settlement, but chiefly to all appearance with a view to the whale-fishery. Penal settlements by both France

Digitized by Google

and England have been spoken of, but, we would hope, without the least chance of any such monstrosity being accomplished. Disputes between France and England respecting the sovereignty of New Zealand, have also been foreboded; but we have no fear that any thing of the kind, to an extent at all troublesome, will take place.

We have only to add, that our sole purpose in preparing this article is to present a connected and comprehensive view of the late proceedings respecting the colonisation of New Zealand, and this solely upon a consideration that these proceedings are of a generally interesting character. As to the eligibility of New Zealand as a place of settlement for individuals desirous of emigrating from their own country, we are totally unprepared to say one word; and therefore not one word shall be said.

"THE PARIS SKETCH-BOOK."*

THE "Paris Sketch-Book," as its author Mr Titmarsh has chosen to name it, is a dashing, off-hand work, consisting of a variety of sketches of French manners and character, which, we dare say, come pretty near the truth. Papers on such personages as Robert Macaire, Cartouche, and George Sand, are intermingled with accounts of the French school of painting, Napoleon and his system, the drama, and other matters of lesser importance. A considerable portion of the volumes, we understand, has already appeared in periodical works. A few scraps which we select will convey an idea of the author's style of treating subjects.

A traveller's first impression of the streets of Paris is conveyed in the following passage:—"But, behold us at Paris! The diligence has reached a rude-looking gate, or *grille*, flanked by two lodges; the French kings of old made their entry by this gate; some of the hottest battles of the late revolution were fought before it. At present it is blocked by carts and peasants, and a busy crowd of men, in green, examining the packages before they enter, probing the straw with long needles. It is the Barrier of St Denis, and the green men are the customs' men of the city of Paris. If you are a countryman, who would introduce a cow into the metropolis, the city demands twenty-four francs for such a privilege: if you have a hundredweight of tallow candles, you must previously disburse three francs: if a drove of hogs, nine francs per whole hog. In the present instance, after a momentary pause, one of the men in green mounts by the side of the conductor, and the ponderous vehicle pursues its journey. The street which we enter, that of the Faubourg St Denis, presents a strange contrast to the dark uniformity of a London street, where every thing, in the dingy and smoky atmosphere, looks as though it were painted in India-ink—black houses, black passengers, and black sky. Here, on the contrary, is a thousand times more life and colour. Before you, shining in the sun, is a long glistening line of *gutter*—not a very pleasing object in a city, but in a picture invaluable. On each side are houses of all dimensions and hues; some but of one storey; some as high as the Tower of Babel. From these the haberdashers (and this is their favourite street) flaunt long strips of gaudy calicoes, which give a strange air of rude gaiety to the looks. Milkwomen, with a little crowd of gossips round each, are, at this early hour of the morning, selling the chief material of the Parisian *café-au-lait*. Gay wine-shops, painted red, and smartly decorated with vines and gilded railings, are filled with workmen taking their morning's draught. That gloomy looking prison on your right is a prison for women; once it was a convent for Lazarists: a thousand unfortunate individuals of the softer sex now occupy that mansion: they bake, as we find in the guide-books, the bread of all the other prisons; they mend and wash the shirts and stockings of all the other prisoners; they make hooks and eyes, and phosphorus boxes, and they attend chapel every Sunday—if occupation can help them, sure they have enough of it. * * But we have passed the prison long ago, and are at the Porte St Denis itself. Passing *round* the gate, and not under it (after the general custom, in respect of triumphal arches), you cross the Boulevard, which gives a glimpse of trees and sunshine, and gleaming white buildings; then, dashing down the Rue de Bourbon Villeneuve, a dirty street, which seems interminable, and the Rue St Eustache, the conductor gives a last blast on his horn, and the great vehicle clatters into the court-yard, where its journey is destined to conclude."

With respect to the French mode of representing the English and English manners on the stage, we have the following graphic picture. "I don't know whether the great Dumas has passed any time in England, but his plays show any thing but an intimate knowledge of our habits. Thus, in the play styled 'Kean,' the stage-manager is made to come forward and address the pit, with a speech beginning, '*My lords and gentlemen*;' and a company of English women are introduced, and *they* all wear *pinafores*; as if British females were in the invariable habit of wearing this outer garment, or slobbering their gowns without it. There was another celebrated piece, enacted some years since, upon the subject of Queen Caroline, where our late sovereign, George, was made to play a most despicable part; and where Signor Bergami fought a duel with Lord Londonderry. In the last act of this play, the House of Lords was represented, and *Sir Brougham* made an eloquent speech in the queen's favour. Presently the shouts of the mob were heard without; from shouting they proceed to pelting; and pasteboard-brickbats and cabbages came flying among the representatives of our hereditary legislature. At this unpleasant juncture, *Sir Hardinge*, the Secretary-at-War, rises and calls in the military; the act ends in a general row, and the ignominious fall of Lord Liverpool, laid low by a brickbat from the mob! The description of these scenes is, of course, quite incapable of conveying any notion of their general effect. You must have the solemnity of the actors, as *they mess* and *milor* one another, and the perfect gravity and good faith with which the audience listen to them. Our stage Frenchman is the old marquis, with sword and pig-tail, and spangled court coat. The Englishman of the French theatre has invariably a red wig, and almost always leather gaiters, and a long white upper Benjamin; he remains as he was represented in the old caricatures, after the peace. And to conclude this catalogue of blunders: in the famous piece of the 'Shipwreck of the Meduse,' the first act is laid on board an English ship-of-war, all the officers of which appeared in light blue or green coats (the lamp-light prevented our distinguishing the colour accurately), in little blue coats, and TOP BOOTS!"

All this is certainly very ridiculous, but how, it may be asked, are Frenchman represented on the stage in England? They are made to appear as thin shivering old men, or in some other guise equally unlike the reality.

The author does not like to travel by railways, because the rate of speed destroys all romance, a reason too fanciful and poetic to be worth combating. Of the journey from the French capital to Versailles, now performed by steam, he observes:—"This little journey, then, from Paris to Versailles, that used to be so merry of old, has lost its pleasures since the disappearance of the cuckoos; and I would as lief have for companions the statues that lately took a coach from the bridge opposite the Chamber of Deputies, and stepped out in the court of Versailles, as the most part of the people who now travel on the railroad. The stone figures are not a whit more cold and silent than these persons, who used to be, in the old cuckoos, so talkative and merry. The prattling grisette, and her swain from the Ecole de Droit; the huge Alsatian carabinier, grim smiling under his sandy moustaches, and glittering brazen helmet; the jolly nurse, in red calico, who had been to Paris, to show mamma her darling Lolo, or Guguste; what merry companions one used to find squeezed into the crazy old vehicles that formerly performed the journey!

The town is certainly the most moral of towns. You pass, from the railroad station, through a long, lonely suburb, with dusty rows of stunted trees on either side, and some few miserable beggars, idle boys, and ragged old women, under them. Behind the trees are gaunt, mouldy houses, palaces once, where the cheap defence of nations gambled, ogled, swindled, intrigued; whence mighty princes rolled away, in gilt carèches, hot for the honour of lighting his majesty to bed, or of presenting his stockings when he rose, or of holding his napkin when he dined. Tailors, chandlers, tinmen, wretched hucksters, and greengrocers, are now established in the mansions of the old peers; small children are yelling at the doors, with mouths besmeared with bread and treacle; damp rags are hanging out of every one of the windows, steaming in the sun; oyster-shells, cabbage-stalks, broken crockery, old papers, lie basking in the same cheerful light. A solitary water-cart goes jingling down the wide pavement, and spirts a feeble refreshment over the dusty thirsty stones."

Louis XIV. expended a thousand million of francs in the erection of Versailles. "In the year 1681, then, the great king, with bag and baggage, with guards, cooks, chamberlains, jesuits, gentlemen, lackeys, Fenelons, Molières, Laxuns, Bossuets, Villars, Villeroys, Louvois, Colberts, transported himself to his new palace; the old one being left for James of England, and Jaquette his wife, when their time should come. And when the time did come, and James sought his brother's kingdom, it is on record that Louis hastened to receive and console him, and promised to restore, incontinently, those islands from which the *canaille* had turned him. Between brothers such a gift was a trifle.

Out of the window the king's august head was one day thrust, when old Condé was painfully toiling up the steps of the court below. 'Don't hurry yourself, my cousin,' cries magnanimity; 'one who has to carry so many laurels cannot walk fast.' At which all the courtiers, lackeys, chamberlains, jesuits, and scullions, clasp their hands, and burst into tears. Men are affected by the tale to this very day. For a century and three-quarters, have not all the books that speak of Versailles, or Louis Quatorze, told the story!—'Don't hurry yourself, my cousin!' Oh, admirable king and christian! what a pitch of condescension is here, that the greatest king of all the world should go for to say any thing so kind, and really tell a tottering old gentleman, worn out with gout, age, and wounds, not to walk too fast! What a proper fund of slavishness is there in the composition of mankind, that histories like these should be found to interest and awe them!"

Passing on to some gossip about a later period of French history, the author proceeds:—"If any man is curious, and can get permission, he may mount to the roofs of the palace, and see where Louis XVI. used, royally, to amuse himself, by gazing upon the doings of all the town's-people below with a telescope. Louis is said to have been such a smart journeyman blacksmith, that he might, if Fate had not perversely placed a crown on his head, have earned a couple of louis every week, by the making of locks and keys. Those who will, may see the workshop, where he employed many useful hours; Madame Elizabeth was at prayers; meanwhile, the queen was making pleasant parties with her ladies; monsieur, the Count d'Artois, was learning to dance on the tight-rope; and Monsieur de Provence was cultivating *l'eloquence du billet*, and studying his favourite Horace. It is said that each member of the august family succeeded remarkably well in his or her pursuits; big monsieur's little notes are still cited. At a minuet, or sillabub, poor Antoinette was unrivalled; and Charles, on the tight-rope, was so graceful and so *gentil*, that Madame Saqui might envy him. The time only was out of joint."

* "The Paris Sketch-Book," by Mr Titmarsh. London: John Macrone. Two vols., with engravings. 1840.

M'CULLOCH, THE MECHANICIAN.

IN the Scots Magazine for May 1789, there is a report by Captain Philip d'Auvergne, of the Narcissus frigate, on the practical utility of Kenneth M'Culloch's sea compasses. The captain, after an eighteen months' trial of their merits, compared with those of all the other kinds in use at the time, describes them as immensely superior, and earnestly recommends to the admiralty their general introduction into the navy. In passing, on one occasion, through the Race of Alderney in the winter of 1787, there broke out a frightful storm, and so violent was the opposition of the wind and tide, that while his vessel was sailing at the rate of eleven miles on the surface, she was making scarce any headway by the land. The sea rose tremendously—at once short, high, and irregular; and the motions of the vessel were so fearfully abrupt and violent, that scarce a seaman aboard could stand on deck. At a time so critical, when none of the compasses supplied from his majesty's stores *would stand*, but vacillated more than three points on each side of the pole, "it commanded," says the captain, "the admiration of the whole crew, winning the confidence of even the most timorous, to see how quickly and readily M'Culloch's steering compass recovered the vacillations communicated to it by the motion of the ship and the shocks of the sea, and how truly, in every brief interval of rest, it pointed to the pole." It is further added, that on the captain's recommendation these compasses were tried on board the Andromeda, commanded at the time by Prince William Henry, our late king; and so satisfied was the prince of the utility of the invention, that he too became a strenuous advocate for their general introduction, and testified his regard for the ingenious inventor, by appointing him his compass-maker. M'Culloch, however, did not long survive the honour, dying a few years after, and we have been unable to trace with any degree of certainty the further history of his improved compasses. But though only imperfectly informed regarding his various inventions—and they are said to have been many, and singularly practical—we are tolerably well acquainted with the story of his early life; and as it furnishes a striking illustration of that instinct of genius, if we may so express ourselves, which leads the possessor to exactly the place in which his services may be of most value to the community, by rendering him useless and unhappy in every other, we think we cannot do better than communicate it to the reader.

There stood, about forty years ago, on the northern side of the parish of Cromarty, an old farm-house—one of those low, long, dark-looking erections of turf and stone, which still survive in the remoter districts of Scotland, as if to show how little man may sometimes improve, in even a civilised country, on the first rude shelter which his necessities owed to his ingenuity. Such was the farm-house of Woodside, in which Kenneth M'Culloch, the son of the farmer, was born some time in the early half of the last century. The family from which he sprung—a race of honest, plodding tenants—had held the place from the proprietor of Cromarty for more than a hundred years before, and it was deemed quite a matter of course that Kenneth, the eldest son, should succeed his father in the farm. Never was there a time, in at least this part of the country, in which agriculture stood more in need of the services of original and inventive minds. There was not a wheeled cart in the parish, nor a plough constructed on the modern principle. There was no changing of seed to suit the varieties of soil, no green cropping, no rotatory system of production; and it seemed as if the main object of the farmer had been to raise the least possible amount of grain at the greatest possible expense of labour. There was the single-stilted plough, that did little more than scratch the surface; the wooden-toothed harrow, that did hardly so much; the cumbrous sledge—no inconsiderable load of itself—for carrying home the corn in harvest; and the basket-woven conical cart, with its rollers of wood, for bearing out the manure in spring. And yet, now that a singularly inventive mind had come into existence

Digitized by Google

on this very farm, and though its attentions had been directed, as far as external influence could direct them, to the various employments of the farmer, the interests of husbandry were to be in no degree improved by the circumstance. Nature, in the midst of her wisdom, seems to cherish a dash of the eccentric. The ingenuity of the farmer's son was to be employed, not in facilitating the labours of the farmer, but in inventing binnacle lamps, which would yield an undiminished light amidst the agitations of a tempest, and in constructing mariners' compasses on a new principle.

Kenneth's first employment was the tending of a flock of sheep, the property of his father, and wretchedly did he acquit himself of the charge. The farm is bounded on the eastern side by a deep bosky ravine, through the bottom of which a scanty runnel rather trickles than flows; and when it was discovered on any occasion that Kenneth's flock had been left to take care of themselves, and of his father's corn to boot—and such occasions were wofully frequent—Kenneth himself was almost invariably to be found in this ravine. He would sit for hours among the bushes engaged with his knife in carving uncouth faces on the heads of walking-sticks, or in constructing little water-mills, or in making Lilliputian pumps of the dried stalks of the larger hemlock, and in raising the waters of the runnel to basins dug in the sides of the hollow. Sometimes he quitted his charge altogether, and set out for a meal-mill about a quarter of a mile from the farm, where he would linger for half a day at a time watching the motion of the wheels. His father complained that he could make nothing of him. "The boy," he said, "seemed to have nearly as much sense as other boys of his years, and yet, for any one useful purpose, he was nothing better than an idiot." His mother, who was an easy, kind-hearted woman, had better hopes of him. Kenneth, she affirmed, was only a little peculiar, and would turn out well after all. He was growing up, however, without improving in the slightest, and when he became tall enough for the plough, he made a dead stand. He would go and be a tradesman, he said—a mason, or smith, or house-carpenter—any thing his friends chose to make him; but a farmer he would not be. His father, after a fruitless struggle to overcome his obstinacy, carried him with him to an acquaintance in Cromarty, an ingenious cabinet-maker, named Donald Sandison; and after candidly confessing that he was of no manner of use at home, and would, he was afraid, be of little use any where, he bound him by indenture to the mechanic for four years.

Kenneth's new master was one of the best workmen in his profession in the north of Scotland. He was an intelligent man, too, as well as a superior mechanic. With all his general intelligence, however, and all his skill, he failed to discover the latent capabilities of his apprentice. Kenneth was dull and absent, and had no heart to his work; and though he seemed to understand the principles on which his master's various tools were used and the articles of his trade constructed, as well at least as any workman in the shop, there were none among them who used the tools so awkwardly, or constructed the articles so ill. An old botching carpenter who wrought in a little shop at the other end of the town, was known to the boys of the place by the humorous appellation of "Spul-(or spoil) the-wood," and Kenneth came to be regarded as a sort of second of the same name—as a fashioner of ricketty tables, ill-fitted drawers, and chairs that, when sat upon, creaked like badly-tuned organs. Such, in short, were his deficiencies as a mechanic, that in the third year of his apprenticeship his master advised his father to take him home with him and set him to the plough—an advice, however, on which the farmer, warned by his previous experience, sturdily refused to act.

It was remarked that Kenneth acquired more in the last year of his apprenticeship than in all the others. His skill as a workman still ranked a little below the average ability; but then it was only a little below it: he seemed, too, to enjoy more, and become less bashful and awkward. His master on one occasion brought him aboard a vessel in the harbour, to repair some injury which her bulwarks had sustained in a storm; and Kenneth, for the first time in his life, was introduced to the mariner's compass. The master in after days, when his apprentice had become a great man, used to relate the circumstance with much complacency, and compare him, as he bent over the instrument in wonder and admiration, to a negro of the Kanga tribe worshipping the elephant's tooth. On the close of his apprenticeship, he left this part of the country for London, accompanied by his master's eldest son, a lad of a rather thoughtless disposition, but, like his father, a first-rate workman.

Kenneth soon began to experience the straits and hardships of the inferior mechanic. His companion found little difficulty in procuring employment, and none at all in retaining it when once procured. Kenneth, on the contrary, was tossed about from shop to shop, and from one establishment to another; and for a full twelvemonth, during the half of which he was wholly unemployed, he did not work for more than a fortnight together with any one master. It would have fared worse with him than it did, were it not for his companion, Willie Sandison, who generously shared his earnings with him every time he stood in need of his assistance. In about a year after they had gone to London, however, Willie, an honest and warm-hearted but thoughtless lad, was inveigled into a disreputable marriage, and lost in consequence his wonted ability to assist his companion. We have seen one of Kenneth's letters to his old master, written about this time, in which he bewails Willie's mishap, and dwells gloomily on his own prospects. How these first began to brighten we are unable to say, for there occurs about this period a wide gap in his story, which all our inquiries regarding him have not enabled us to fill up; but in a second letter to his mother, now before us, which bears date 1772, just ten years after the other, there are the proofs of a surprising improvement in his circumstances and condition.

He writes in high spirits. Just before sitting down to his desk he had heard from his old friend Willie, who had gone out to one of the colonies, where he was thriving in spite of his wife. He had heard, too, by the same post from his mother, who had been so kind to him during his luckless boyhood; and the old woman was well. He had, besides, been enabled to remove from his former lodging to a fine airy house in Duke's Court, opposite St Martin's Church, for which he had engaged, he said, to pay a rent of forty-two pounds per annum—a very considerable sum sixty-eight years ago; and he had entered into an advantageous contract with Catherine of Russia for furnishing all the philosophical instruments of a new college then erecting in Petersburg—a contract which promised to secure about two years' profitable employment to himself and seven workmen. In the ten years which had intervened between the dates of his two letters, Kenneth M'Culloch had become one of the most skilful and inventive mechanicians in London, perhaps in the world. He rose gradually into affluence and celebrity, and for a considerable period before his death, his gains were estimated at about a thousand a-year.—*Abridged from the Witness (Edinburgh newspaper).*

THE CLOUDS.

[BY MELLEN, AN AMERICAN WRITER.]

Oh clouds! ye ancient messengers,
Old couriers of the sky,
Treading, as in primeval years,
Yon still immensity!
In march how wildly beautiful
Along the deep ye tower,
Begirt, as when from chaos dull
Ye loomed in pride and power,
To crown creation's morning hour.

Ye perish not, ye passing clouds!
But, with the speed of time,
Ye flit your shadowy shapes, like shrouds,
O'er each emerging clime;
And thus on broad and furiless wings
Ye float in light along,
Where every jewell'd planet sings
Its clear eternal song,
Over the path our friends have gone!

Against that deep and peerless blue
Ye hold your journeying—
That silent birth-place of the dew,
Where life and lustre spring.
And then, how goldenly ye shine
On your immortal way,
Sailing through realms so near divine,
Under the fount of day!
O'er ye concenter'd glories play.

Ye posters of the wakeless air!
How silently ye glide
Down the unfathom'd atmosphere,
That deep—deep, azure tide!
And thus in giant pomp ye go,
On high and reachless range,
Above earth's gladness and its wo,
Through centuries of change.
Your destiny how lone and strange

Ye bear the bow of beauty—flung
On your triumphal path,
Splendid as first in joy it hung
O'er God's retiring wrath.
The promise and the covenant
Are written on your brow—
The mercy to the sinful sent
Is bending o'er them now.
Ye bear the memory of the vow.

Ye linger with the silver stars,
Ye pass before the sun—
Ye marshal elements to wars,
And when the roar is done,
Ye lift your volumed robes in light,
And wave them to the world,
Like victory flags o'er scatter'd fight,
Brave banners all unfurl'd—
Still there, though rent and tempest-hurl'd

Ye bear the living thunder out,
Ye pageants of the sky!
Answering with trumpets' brattling shout
The lightning's scorching eye.
Pale faces cluster under ye,
Beneath your withering look,
And shaking hearts bow fearfully
At your sublime rebuke.
Has man his mockery forsook?

And then, in still and summer hours,
When men sit weary down,
Ye come o'er heated fields and flowers,
With shadowy pinions on—
Ye hover where the fervent earth
A sadden'd silence fills,
And, mourning o'er its stricken'd mirth,
Ye weep along the hills.
Then how the wakening landscape thrills!

And thus ye circle countless spheres,
Old spirits of the skies!
The same through nature's smiles and tears,
Ye rose on paradise.
I hear a voice from out your shrouds,
That tells me of decay—
For though ye stay not, hurtling clouds!
Till the last gathering day,
Ye pass like life's dim dreams away.

MERINO SHEEP INTRODUCED INTO RUSSIA.

One of the most successful as well as interesting speculations in southern Russia, has been in merinos; and the commencement was attended with such difficulty and chance, as to make it rather romantic. M. Rouvier, a French merchant at Malaga, on becoming bankrupt in 1802, resolved to try fortune anew in Russia. He embarked in a vessel bound to the Euxine, and landed at Sevastopol. Thence, traversing the country to Nicolaef, he was struck with the extent and fertility of the steppes; and reverting to the grazing lands in Spain, thought that merinos would thrive on them. His fortune then consisted, it might be said, in a piece of paper and a pencil. He drew out a memoir, in which he described the condition and expense of merinos in Spain, and pointed out the advantage of introducing the breed into a country where pasturage was unlimited and unowned. This was sent to the minister of the interior. The author demanded a grant of 10,000 *dieatines* of land, and a loan of 100,000 roubles without interest: he offered to return to Spain to purchase rams; and proposed that a government agent should accompany him if deemed requisite. He engaged to have 10,000 merinos on his land at the end of twelve years, and to have repaid half of the loan. The government agreed to these terms. A vessel was freighted for M. Rouvier, who sailed for Spain, provided with letters for the Russian embassy at Madrid. On arriving at Malaga, the hitherto successful adventurer caught the yellow fever, and there lost three months between sickness and quarantine. This delay nearly caused the complete failure of the enterprise; for when he at length reached Madrid, the Russian ambassador had just quarrelled with Godoy, and therefore no assistance was forthcoming in that quarter. In those days the exportation of merinos was prohibited, and only granted occasionally as a special favour. After dancing attendance for two months, and exhausting all the ante-chamber modes of obtaining his suit indirectly, Rouvier solicited an audience of the Prince of Peace, with the determination to throw himself at his feet, if necessary, in order to gain leave to export a few rams. Godoy said to him, "If you had addressed yourself to me in the first place, I would have granted your request; but as you chose to make the Russian ambassador your mediator, you may return: you shall not have one sheep." Rouvier accordingly left Madrid, and returned to Malaga in despair; for the issue of the negotiation was to make his fortune, or leave him a beggar. He was about to re-embark for Russia, when an hidalgo came to him mysteriously, and said, "I know your object: I will dispose of one hundred rams to you; name the breed you prefer, and you shall have them." Rouvier of course accepted the unexpected offer, and willingly agreed to the enormous price demanded. It was settled between them that he should ship a slight cargo for the Crimea, to avert suspicion; then sail, and after dark alter his course for a certain cove to the westward of Malaga. If his signal-light should be answered, he was to send his boat on shore for the sheep, with the money. All turned out as desired; and, Jason-like, he sailed away triumphantly with the golden fleece. At the Dardanelles he was detained two months by a foul wind. He arrived at Sevastopol at length with eighty sheep remaining out of the hundred, and there experienced another delay by quarantine. That being terminated, the ship was weighing anchor to move into the harbour, half a mile distant, when Rouvier, struck by a presentiment of danger, entreated the captain to land him and his flock at the lazaretto. The captain ridiculed his fears, and naturally objected to lose time in order to gratify a whim. Nevertheless, he yielded to the nearly frantic solicitations of his passenger, and set him on shore with his sheep. Scarcely was he landed, and the vessel under sail, when a squall took her between the reefs which form the entrance of Sevastopol harbour, and threw her on the rocks, where she bilged and went to pieces. M. Rouvier led his charge to Theodosia. He gave twenty rams to the minister of the interior, twenty to the president of the council, and with forty commenced operations on his own account. He crossed with sheep of the country, and four years afterwards obtained as important addition to his stock from Saxony. He fully realised his promises, and left a large fortune amongst his three daughters, one of whom had married his partner, Mr Wassel.—*Slade's Travels in Germany and Russia, just published.*

MRS SOMERVILLE.

Even in the lowest class of rustic geniuses there is some stimulus of ambition and companionship; boys applaud and encourage one another; a girl usually hides her occupations. Ferguson was nothing to Mrs Somerville. Imagine a pretty young woman, the darling of a family, addicted to the gay life usual to idle people in a large city, liked as well as admired by every one, only chidden sometimes by her relations for reading too much, and told how unamiable it was to be a blue-stocking—stealing away into her solitary chamber, to pore unaided over the difficulties of geometry and algebra, and commune with the stars. How deep, and generous, and beautiful, was the enthusiasm of that young mind! How clear and ardent the spirit that would "scorn delights and live laborious days," for no reward, but the pleasure of exercising its strong energies! How lofty that pure ambition which was content with victory, and required not applause!—*Thoughts on the Ladies of the Aristocracy.*

NUMBER 451. SATURDAY, SEPTEMBER 19, 1840. PRICE THREE HALFPENCE.

A FEW WEEKS FROM HOME.

WINCHESTER—ST CROSS.

My last two articles referred to the Isle of Wight. The reader will recollect that I finished my tour of the island at the pretty town of Ryde, at its eastern extremity; and as it chanced to be Saturday evening when I had accomplished the excursion, I resolved to betake myself to the ancient city of Winchester to spend the succeeding day. Geographically speaking, Winchester is placed at a respectful distance in Hampshire from Ryde, and any one who may be pleased to glance at the map, will naturally suppose that a day would be required to travel from the one to the other. The railway, however, has knocked all these old calculations on the head. The steamer shoots up alongside the jetty—we are on our way across the Solent—Southampton in an hour—train just going to start—two places to Winchester—there—take seats—off—in forty minutes we are sitting quietly at tea in an old-fashioned parlour of the George, in the heart of one of the oldest cities in England. "This is an old established inn!" I remarked, as a little dapper waiter arrayed the materials of comfort on the table. "Yes, sir, we've been here since the twelfth century." I leave the Tabbard in the Borough, or any other house in England, to match that—if it can.

Winchester is situated in the bottom of a rich grassy vale, through which, in its eastern environs, flows the small river Itchin, whose entire duty consists in turning several mills, and irrigating in its lazy course a considerable expanse of green meadow all the way down to Southampton, a distance of about twelve miles. High downs bound the vale on the east, while on the west are spreading uplands, disposed as arable fields; and through this quarter, by a moderately deep cutting, the railway from London has been carried. As the train sweeps up abreast of the town, we perceive below us a wide extended mass of old brick houses, grey church towers, and red-tiled roofs, with immediately in front, on the brow of the descending eminence, a huge square edifice, now answering as a barrack for soldiers, but formerly a royal residence of various members of the Stuart family, as well as of the protector Richard Cromwell.

The interior of Winchester, on closer inspection, exhibits a cluster of commonplace streets and alleys, possessing few symptoms of modern improvement, but rendered striking here and there by some decided mark of antiquity, the most prominent of which is a Norman cross, in good preservation in a by corner of the market-place. The objects of greatest curiosity, however, are the cathedral, the college, and, at a short distance, the establishment of St Cross, any one of which is worth travelling at least a hundred miles, even by stage coaches, to see. Winchester, in fact, by possessing these things in an unimpaired condition, may be described as one of the most interesting places in England. It would now be impossible to tell why the spot on which the city stands, and which, as we have seen, is far from convenient, should have been chosen, in early times, for the seat of a capital, yet such was the fact. There was a town here before the Christian era, and it afterwards became the principal city of the Danish, Saxon, and Norman dynasties. It only finally lost its character of capital of England, as London arose in eminence and wealth. Till the Revolution, it continued a chief place of residence of the royal family. Winchester was the scene of Alfred and Canute's glories, and here, with innumerable distinguished princes, abbots, and bishops, they are entombed. During the reign of Edgar, in the tenth century, Ethelwold, Bishop of Winchester, built a cathedral on the site of a former and very ancient church, and which he dedicated to St Swithin. A century later, the city became the favourite place of residence of William of Normandy, and afterwards of his son William Rufus, who was entombed here a few days after his death in the New Forest. Here also resided Stephen, and his successor, Henry; and here Richard Cœur de Lion received the homage of his nobility, and was crowned with unusual magnificence. Passing over the reigns of several succeeding monarchs, we come to that of Edward III., in whose time Winchester became the episcopal see of the celebrated William of Wykeham. (1366.)

Let us pause a moment over the memory of this great man, who shone out a brilliant star in the midst of an age of darkness. Born of humble parents in the neighbouring town of Wykeham, from which he took his name, and educated and bred to the priestly office, he ultimately rose to the highest dignities. He was chiefly distinguished for his knowledge of the refined arts, particularly architecture, and was hence appointed surveyor of works to Edward III., in which capacity he executed divers buildings at Dover, Windsor, and other places. Latterly, he was appointed secretary of state, keeper of the privy seal, chancellor of the kingdom, and bishop of Winchester. He founded New College, at Oxford, which was finished in 1386, and in the following year he began to erect the college or preparatory school at Winchester, in reference to his Oxford institution. He new-modelled nearly the whole of the west end of the cathedral, in the manner in which it exists at present. In 1404, he concluded a life of eminent usefulness, and was buried in the nave of the cathedral which he had so lately embellished.

With these snatches of bygone history, we may proceed to the edifice which William of Wykeham preserved for our gratification. It is a delightful Sunday morning in June—the service, which takes place at ten o'clock, is about to commence—and the hour is rung as we pass along the avenue of tall leafy trees, which stretches diagonally across the churchyard from the houses of the town to the door of the cathedral. What a stupendous mass of beautiful Gothic architecture is the western gable, with its airy pinnacles and deep groined doorways, through one of which we pass into the wide, long, and open nave! How exquisite the tall shafts which support the lofty roof! What reflections pass through the mind as we pace over the inscribed flagstones, beneath each of which sleeps a bishop, monk, soldier, or prince! But our eyes are attracted from these lesser details to the resting-place of Wykeham, a chantry or small chapel of open work, occupying the space between two pillars on the south side. The whole, externally and internally, is of beautiful construction, with a number of niches, and a place on which once stood an altar. In the centre, on an elevated sarcophagus, lies the figure of Wykeham, in white marble, and represented in full costume, with his mitre, crosier, and other episcopal ornaments worn at the period. On a pillar supported by two angels rests the head; and three figures of friars are kneeling at the feet in the attitude of prayer. This beautiful monument, which probably is without its equal in Britain, has, at different periods, been much damaged. Nearly thirty statues, as well as the altar, have been destroyed; and the enclosed escutcheons, bearing the prelate's arms and devices, are rent off. A Latin inscription in black letter, inlaid in brass, has been permitted to remain, and surrounds the marble slab on which the figure rests. The inscription narrates the name and good deeds of the worthy bishop, and concludes with the pious request, that "those who behold this tomb cease not to pray that William of Wykeham may enjoy everlasting rest."

Proceeding onward from this elegant mausoleum, we observe several others, of similar but less elaborate workmanship, the principal ones being those of Cardinal Beaufort; Bishop Fox, the patron of Wolsey; and Bishop Waynflete. The tranquil repose of these ancient monumental erections is finely enhanced by the adjoining scene and objects. There is a clear, cold expanse, perfectly appropriate to the solemn character of the building; the walls, pillars, and roof, are of a pale stone hue, possessing no appearance of damp, and the large windows are composed of painted glass of an extreme antiquity. Passing to the extremity of the nave, we arrive at the steps and screen of the choir, or enclosed space in the centre and east end of the building, which is appropriated for divine service. Latterly, the whole of this part has been fitted up in a style exactly conformable to the general character of the architecture, the bald Grecian ornaments with which Inigo Jones and others had loaded it having been entirely removed. I do not know whose taste has thus been employed in restoring the cathedral to the pure Anglo-Gothic; but, whoever he may be, he deserves very great credit for his design and skilful adjustment of parts. The whole is equal to any thing in York Minster.

We are now beneath the central tower, or in that part of the edifice which was constructed by Ethelwold, and cannot fail to be struck with the appearance of the Saxon arches, blending with others of a later date in the Norman style, and showing the rudiments of what we now call the Gothic, or pointed order. This part of the building contains the mausoles of numerous distinguished persons. We have before us on the floor near the communion-table, a slab of dark marble which covers the tomb of William Rufus; while on each side, and elevated on the top of the screen-work of the choir, are several chests or mortuaries, which contain the remains of various Saxon kings and princes—the Edreds, Edmunds, Kenulphs, and others. On each is a Latin inscription denoting the contents. One may be translated as follows:—"King Edred died in the year of our Lord 955: in this tomb rests pious King Edred, who nobly governed this land of Britain." An inscription on another imports, that "in this and the other chest opposite are the remaining bones of Canute and Rufus, kings; of Emma, queen; and of Wina and Alevin, bishops." The most ancient of the royal relics are those of King Kinegils, the first Christian king of the West Saxons, who died in the year 641. From these singular objects, our attention is directed to the superb and elaborate altar-screen, erected by Cardinal Beaufort, and now renovated and cleaned. But to describe this and the surrounding curiosities of art, would far exceed the limits of this slight sketch, and it is enough to say that the whole interior of the cathedral abounds in objects of deep interest to the architect, historian, and antiquary. A number of my observations were made during the service, for in a place of such novelty it was impossible to restrain the vagrant glances of the eye, as they sought out and fixed upon old carvings, monuments, and inscriptions, the whole lighted up by the beautifully coloured sunbeams, which shone like streams of glory from the lofty Norman windows of the choir. The exterior of the building, which afterwards repeatedly engaged my attention from the open churchyard, has an old grey appearance; it is solid rather than elegant in its masonry, except at the western extremity; and its central tower being cut

Digitized by Google

off abruptly, a short way above the roof, it has nothing imposing in its altitude. The entire length of the structure from east to west is 545 feet. Many parts of the fine old wall are in a state of great decay, from the effects of time or the weather, and it is to be hoped that the dean and chapter will spare a trifle to restore them.

From the snug and sunny recesses of the cathedral close, we wander through a labyrinthine alley and by-street to the college of William of Wykeham, which is perhaps the more interesting of the two. The college, it is necessary to premise, is only a school of a high order for Latin and Greek; and being endowed for the benefit of "seventy poor scholars," is now very properly devoted to the education of young gentlemen, preparatory for the university. Having served as a model for the schools of Westminster and Eton, and lasted upwards of four centuries unimpaired, the institution is unquestionably the oldest of the kind in England. If we wish to know what was the nature of school-instruction in the middle ages, here we may see it in full operation. The buildings and grounds are situated on the verge of the green vale of the Itchin, in the lower environs of the town, and cover a number of acres, the whole being enclosed with sheltering walls. In front, close upon the street, are the principal buildings, all of an old Gothic character, with a spacious gateway, through which we are admitted to a court, and from that we penetrate to an inner court, where the splendid old chapel and antique hall are before us. Having inspected the chapel, with its exquisite furnishings of stalls and benches of black oak, and its elegantly painted windows, we pass on to the refectory or mess-room, which we reach by a flight of steps. Here the scholars dine in the style which was in fashion five hundred years since. The tables being covered, we observed that, instead of plates of stoneware or metal, each boy was provided with a small square piece of wood without a ledge, from which he had to eat his food. This punctual adherence to minute and trifling regulations, while great purposes are apt to be neglected, is quite of a piece with the whole system of the old educational establishments in England. How puerile the conceit that there is any virtue in eating off a wooden board instead of a Delft trencher!

From the dining-hall, we proceed to a court-yard, the third in the series, in which is the school of the institution, and adjoining it the most antique part of the whole fabric—namely, the cloisters, or covered walks, enclosing a spacious quadrangle, and consisting of old Gothic buildings. In the centre of this secluded grassy square, stands a small, I should say a miniature, chapel of ancient architecture, which now forms the library of the institution. I entered this interesting place, and found that the books were all in the dead languages, bound chiefly in vellum, and therefore quite appropriate to the scene.

Before leaving the institution, the visiter is conducted into an outer room adjoining the college kitchen, to view an odd kind of painting on the wall, commonly called "The Trusty Servant." The object represented is an ideal being resembling an ancient serving man, but having the head of a pig, with a padlock on the mouth, the ears of an ass, and the feet of a deer; in the left hand are held a shovel, pitch-fork, curry-comb, and broom. Beneath are some quaint Latin rhymes, which are thus rendered in English—the hint, it will be perceived, is a pretty good admonition:—

> "A trusty servant's portrait would you see,
> This emblematic figure well survey.
> The porter's snout, not nice in diet shows;
> The padlock shut, no secret he'll disclose;
> Patient the ass, his master's rage will bear;
> Swiftness in errand, the stag's feet declare;
> Loaded his left hand, apt to labour saith;
> The rest, his neatness; open hand, his faith.
> Girt with his sword, his shield upon his arm,
> Himself and master he'll protect from harm."

Wykeham's college contains, besides the scholars on the foundation, a certain number of young men named "commoners," who are educated under the care of the head master, on the terms of a boarding-school. The institution is subject to the regulation and annual visitation of the warden and fellows of New College, Oxford, of which, in fact, it is the elementary branch. I can say nothing of the routine of instruction. The scholars and masters are dressed in black caps and gowns, in the style of Oxonians, and are subject to similar rules of discipline. The singing boys of the cathedral act as fags for the establishment. On departing from the college of the pious Wykeham, I could not but acknowledge that it formed a rare and valuable object of antiquity, which I should lament to see impaired or injured; but I at the same time felt the full force of the error of so splendid and extensive an establishment doing so little as boarding and educating only seventy "poor scholars" of questionable poverty. This, however, is trenching on a topic which we may shortly have an opportunity of discussing on its own proper merits.

From the college of Wykeham we are offered a remarkably pleasant walk to the hilly grounds on the east, or, if we prefer it, a stroll down the meadow to the Hospital of St Cross. At Winchester, one so often hears of St Cross, that there is no resisting the desire to see the hospital so named, which is only a mile to the southward. I selected the best of all times for the excursion, namely, the hour of mid-day meal. The day, also, was one of the finest of the season, and well suited for making a loitering pilgrimage among blossoming hedge-rows, and down cool alleys of trees environed by green paddocks of luxuriant-looking pasture, to the secluded spot.

Conceive us, at length, brought up in front of the old grey pile of buildings, with its huge gateway, out-houses, and other buildings, the whole forming an old monastery, only that lay paupers instead of monks are the inhabitants. The Hospital of St Cross was first founded and endowed in the year 1136, by Henry de Blois, Bishop of Winchester, and brother of King Stephen. The founder's charter of institution required that thirteen poor decayed men, past their strength, so that without assistance they could not maintain themselves, should have continual residence in the hospital, and be provided with proper clothing and other necessaries, and a daily allowance of good wheaten bread and small beer. Besides these thirteen indigent brethren, the charter required that one hundred others, the poorest that could be found in Winchester, should be provided every day with a loaf of bread, three quarts of small beer, and two messes for their dinner, in a hall appointed for the purpose. On the anniversary of the founder's decease, August 9th, several hundreds of poor persons were also to be entertained, in addition to the ordinary number. It appears that shortly after its institution, the hospital property was greatly dilapidated by the Knights Hospitallers of St John of Jerusalem, and was not effectually rescued from the fangs of these and other intruders till Wykeham took charge of the patrimony, and restored the privileges of the establishment. In 1444, Cardinal Beaufort added to the wealth of the endowment, and almost entirely rebuilt the structure as we now see it. To the house, so renovated and strengthened, he gave the title of the Alms-house of Noble Poverty. Again, after Beaufort's time, during the struggles of the rival factions of York and Lancaster, St Cross was fleeced of its revenues and possessions by the former of these parties; and as no one afterwards thought fit to make good its losses, we find the Alms-house of Noble Poverty in the enjoyment of only a scrap of its ancient possessions. This scrap, however, affords a tolerable picking; it is enough to maintain a master, steward, chaplain, and a few subordinate functionaries, along with thirteen brethren, whose support is the ostensible object of the charity. These brethren are men in the decline of life, and, excepting that they wear the badge of pauperism, there seems nothing to lament in their condition: each is dressed in a black woollen gown, on the left breast of which is attached a cross of silver, and in this guise they may be observed lingering about the roadsides in the neighbourhood.

It is one of the ancient and peculiar usages of St Cross, that when any stranger presents himself at the porter's lodge, and requests the bounty of the establishment, a small tray is put before him, on which is a dole of bread and a horn of beer. The piece of bread, to be sure, is very small, and the beer of the poorest possible brewage, still the custom is kept up much in the form it has been since the days of King Stephen. "You must have a good number of visiters in the course of a day," I observed to the old grey-haired porter, as he leant over his wicket, and presented the accustomed offering. "Yes," he replied, "we've a-many at this season; all the trampers of the country come this way; but, by the master's orders, we never give away more than two loaves of bread and two gallons of beer daily—bless you, sir, there's hardly a great family in the country that has not, some time or other, tasted the hospitality of St Cross."

On passing from the archway in which is the porter's domicile, we enter an open and spacious quadrangle, bounded on our left with an ancient edifice, having in its front a cloister or covered walk, where exercise may be taken to a limited extent in bad weather; at the further extremity, on the same side, is the church, and beyond it, the meadows dotted over with massive trees, which close the view in this direction. On the other two sides are ranged the neat stone buildings of the hospital, two storeys in height, and ornamented with fig-trees and vines loaded with young fruit, and expanded in full leaf to the brilliant sun. Turning to the right to inspect this department of the institution, in which is the house of the steward and domiciles of the brethren, we arrive in the first place at an old stone porch, which projects over a few steps that lead to the kitchen and dining hall. Having ascended to this latter apartment, we find it to be a very perfect specimen of the monastic refectories of former days, and that it possesses much to excite interest. The lofty roof is of old oak; over the doorway is a gallery of the same material, where, anciently, the benediction was sung, and whence, also, on particular festivals, the sound of minstrelsy enlivened the banquet. On the wall, at the opposite end of the apartment, there is attached a wooden case resembling a cupboard, and the two leaves or doors which enclose it being reverently opened by the portress, we have before us a travelling altar-piece of extreme antiquity. The painting, which represents the Virgin and Child, and some other figures, is of the Albert Durer style of delineation, and such has been the care bestowed on its preservation, that the colours are as clear and brilliant in effect as they were centuries ago. Before leaving the hall, we were shown a number of antique vessels still in use, including two leathern stoups or black jacks for ale, which we were assured were three centuries old. The hall is at present used only in allotting and distributing the food of the inmates, who now enjoy the privilege of carrying their doles to their respective lodgings. This concession to modern habits is of importance to the married men who receive the bounty of the establishment. At the period of my visit, the brethren were engaged in the agreeable duty of carrying off their dinner, with bread and beer, and the whole place wore the appearance of joyous comfort. Each inmate has three chambers for his use, either on the ground or upper floor, also a patch of garden behind for cultivation or amusement; and, besides his daily allowance, he receives about half-a-crown weekly, and a share of the fines on the renewal of the hospital lands. At Christmas, Easter, the obit of the founder, and one or two other occasions annually, they enjoy a festival of more than usual hilarity, and, upon the whole, I should consider that they lead as easy and useless a life as any monk who ever wore cowl, and loitered away existence in a cloister.

Having thus disposed of the brethren in their snug vine-clad domiciles, like so many bees in their well-stocked hives, we step across the green turf of the court-yard to the tall old church, which next invites our attention. To antiquaries, the ecclesiastical structure will seem the most interesting of all parts of St Cross's establishment. It was founded and partly built by Henry de Blois, brother, as we have said, of King Stephen, and finished by the pious Wykeham. To a superficial observer, it will appear only a damp, cold, and plainly fitted-up church, in the usual form of cross aisles; but those who are desirous of studying the early efforts of the architect to realise what afterwards became the pure Anglo-Gothic style, will be delighted with various points in the structure. We observe, in the lofty central chain, a similar blending of the round and lance-shaped arches which distinguish the older portion of the cathedral, and embody varied specimens of the Saxon, Norman, and Pointed style. Here, likewise, we behold every ornament appertaining to this early period of architecture—the chevron, the billet, the hatch, the pellet, the fret, the nebulé, down to the wavy, all executed in the best style of art. From these antique architectural devices overhead and on the lower walls, we direct our eyes to the pavement, which is in many places composed of ancient tiles of mixed colours, and the art of making which appears to be lost. On some are inscribed the words "Have mynde," an admonition probably intended to remind the brethren to pray for the souls of their deceased benefactors. The church also contains several sepulchral inscriptions on brass; one, placed under the central tower, is that of John de Campden, master of St Cross

in 1383. There is, however, a monumental inscription of a still earlier era, being that commemorative of a master named Peters, and bearing the date 1295. Near this tomb, in the open aisle fronting the entrance, is placed a baptismal font, which is supposed originally to have belonged to the church of St Faith, a structure which was taken down in the sixteenth century, when its parochial institutions were annexed to the church of St Cross.

In pity to the reader, I must now draw this idle gossip about things of the olden time to a conclusion. I will not tell him how I sauntered for an hour round the precincts of St Cross, inspecting the exterior of the buildings which contained the living, and the burying-ground which afforded a place of repose to the dead. It is enough to say that I viewed the whole as an object of the deepest interest, from its antiquity, and as a singular monument of the benevolence and piety of former times, suffered to remain in an almost unaltered condition to the present day.

THE GRATEFUL GYPSY.

A STORY.*

One pleasant morning in the end of October, about the beginning of the present century, whilst Eliza Wilson was enjoying herself plucking the ripe brambles which grew in the wood near to her father's residence of Linnfern, she was suddenly joined by a trio of ragged children, two boys and a girl, the last of the group apparently about five years of age. Eliza was herself but a child, though her years doubled those of the stranger. She was very timid, and ran instantly towards her excellent governess, Miss Anderson, who was seated at the foot of a tree, and had been engaged reading during the time that her youthful pupil was amusing herself according to the ever-varying fancy of childhood. When Miss Anderson approached, she at once recognised the intruders to be the offspring of the gypsy tribe, a race of wanderers who very frequently pitched their tent at the entrance to this forest belonging to Eliza's father; and the worthy gentleman never gainsaid their title to a temporary residence on his property.

"How many of your people are here just now?" inquired Miss Anderson of one of the boys.

"There are two camps," he replied.

By this description my readers are to understand two carts, which serve as travelling conveyances to this strange, migratory race, and whenever they halt, during their course of perpetual travel, this vehicle, supported in a horizontal form, and hung round with blankets, is the shelter whither they retire for the night. Under these carts whole families repose, the cold earth being their pillow. Miss Anderson observed that the little girl's worn-out habiliments were so much in tatters that she was almost totally naked.

"Why does that child's mother suffer her to be so ill clothed?" she inquired of the oldest boy.

"She has no father or mother," he replied.

"What! has she no relation in your camp?" resumed Miss Anderson.

"No relation," continued the gypsy narrator; "she has followed our people from Yorkshire, where her own folks all died a year a-gone."

"Poor child!" said Miss Anderson, and she kindly stroked the cheek of the forlorn and destitute being before her, exclaiming, at the same time, in a half audible voice, "Oh that I were rich!"

The girl, apparently unused to tenderness, looked gratefully in the face of the lady now mentioned, and also clung to her gown, whilst her infantine countenance was lighted up with a glow of frolic which neither want nor suffering had altogether subdued.

"What is your name?" asked Eliza Wilson, handing her a biscuit as she spoke.

"Moggie," answered the child, leaping for joy as she eagerly devoured the young lady's gift.

"Moggie Ruthven," said one of the boys, "and Moggie is Margaret in print books, folk say."

"Oh, Miss Anderson," said her youthful pupil, "if papa would allow Moggie to sit by our kitchen fire; and Peggie would teach her to spin, and let her sleep in her bed at night, and then, you know, I could give her some of my clothes, and I could give her lessons, too, the lessons you have taught me. Oh, dear Miss Anderson, come and let us ask papa."

This trait of affectionate feeling on the part of her protegée, delighted the benevolent mind of Eliza's governess, and she expressed herself pleased at her pupil's kindness of heart, now evinced in anxiety to provide for the stranger. "You know, my love," said she, "that all that you have is your papa's property, and you have no right to bestow either the dress which he has given you, or to promise accommodation in his house, without his permission. However, we shall hear what he will say to your proposal."

Miss Anderson and her pupil accordingly proceeded to the house of Linnfern, where Mr Wilson was seated in his old wainscoted dining-room. Eliza was his only child, the child of his old age, for his years were now seventy in number. Very dear was she to her father, and more so, on account of this painful circumstance connected with her birth—the death of her excellent mother. Mr and Mrs Wilson had been twenty years married, during which period they remained childless. And when, at the end of the period now mentioned, they hailed with joy and gratitude the birth of a daughter, one week served to convince all around of the mutability of earthly enjoyments, for Mrs Wilson's presence had ceased to bless either husband or child only eight days after the latter first drew breath. Mr Wilson felt long and deeply the loss of his beloved wife, and not being able to separate himself from Eliza, he engaged the services of a lady to take charge of her education at home. Miss Anderson well supplied a mother's place, and had lived at Linnfern for the last six years. But to return to our narrative.

While walking from the wood, where Eliza first saw the gypsies, to the house, Moggie followed her kind friends apparently in great glee, one minute laughing in their faces, the next dancing to her own wild music, now leaping over stones and bushes, and, at last, when Miss Anderson and Eliza stood before Mr Wilson, little Fibbertigibbet was jumping in a gay and lively manner, like a bird hopping from spray to spray. Eliza ran forwards to her papa, sprang upon his knee, and straightway her arm was round his neck, and his cheek and forehead were stroked by her tiny hand, and, in the most coaxing accents which artless childhood had hitherto taught her to use, she besought him to allow Moggie to become an inmate of their house. "Papa," said she, "Moggie has no parents or relations." "Well, my dear," replied Mr Wilson, "let the lassie remain here for the night, and send her down to the camp i' the morning, to be off wi' her ain folk." Eliza was obliged in the mean time to content herself with this answer.

On the following day, one of the farm-servants, who lived in a cottage hard by, was desired to convey the little stranger to the gypsy encampment, when, to the surprise of the whole household of Linnfern, it was found that the gypsy band had fled, leaving the child to the care of the family. Eliza had no feeling of aristocratic pride, and the thought of having a child to play with her was delightful to her juvenile perceptions. She danced about the room, and Moggie, whose extreme liveliness made her feel quite at her ease, followed her example. Eliza, according to her formerly expressed intention, commenced to instruct her playfellow in reading. However, the employment of teaching was too serious a one for her volatile years, so that the task fell to the lot of Miss Anderson. This lady found her new pupil possessed of a quickness of capacity she had never seen equalled. Little Moggie's talents seemed only to be rivalled by her affectionate disposition, and willingness to oblige all who lived in the house with her. When the look of famine and misery vanished from her cheek and eye, she became a beautiful child. Miss Anderson possessed a heart of the most enlightened philanthropy, and in her estimation high rank, and all its pomp of circumstance, when compared with the nobility of nature, seemed but "trifles light as air." The thought entered into her mind of imparting to her little gypsy protegée the knowledge by which she had been enabled hitherto to maintain herself in most respectable circumstances.

In this sketch of domestic life, we now pass over a period of eleven years, and present the characters considerably altered by time. We shall only speak at present of what the revolution of years had done for the junior branches of the happy household of Linnfern. Miss Wilson was now a grown-up young lady, both amiable and handsome, and being of an ancient, though not of a rich family, she had doubtless many suitors. Regarding the expert of our touches, the gypsy—whom we shall cease to call Moggie, as that name reminds us of her tattered garments and penury, and shall henceforth designate Margaret, or Miss Ruthven—she had now arrived at the age of sixteen. Her complexion was rather dark, but this was not unsuitable with the brilliancy of her black eyes, the exquisite whiteness of her teeth, and those delicate aquiline features which at once indicate a high style of beauty. Her figure was slender and sylph-like, yet finely rounded, and graceful as that of a Nautch girl of Hindostan. But let us inquire how these charms were regarded by those who visited at Linnfern. By too many, alas! she was treated with distance, and some even evinced contempt for one who was worse than nobody, that is, inferior to the daughter of a poor man or a low man, for she owed her birth to a lawless race of vagrants.

The only sister of Mr Wilson married an English gentleman, by name Colonel Vincent. She had been some time dead, when her youngest son for the first time paid a visit to his uncle and cousin. He told them that he could only be their guest during one month, as he had been recently appointed to a cadetship in the service of the East India Company, and must therefore quickly join his regiment in Bengal. The young soldier was only seventeen; he was frank, open-hearted, and intelligent beyond his years. Eliza Wilson was delighted with Arthur Vincent. Notwithstanding that he was her junior, she found his conversation instructive as well as entertaining, for he had seen much more of the world than she had done, her duty to her aged father requiring her to be constantly at home, and in the country. He was, besides, more polished in manners than any young man she had hitherto met with, so that Eliza felt great pleasure in the society of her cousin. But it was not love that she experienced. It is not usual, nor at all natural, for a young woman of one-and-twenty to fall in love with a lad of seventeen, although he may be superior to most of his contemporaries. Arthur Vincent, on his part, loved Miss Wilson with the most sincere friendship, but for Margaret Ruthven he entertained an enthusiastic attachment. He was completely captivated with the attractions of this lovely young creature, and he made his friend Eliza the confidant of his feelings on the subject.

"My dear Arthur," said his cousin, "consider how the aristocratic prejudices of your father would be outraged by the thought of such an union. He is himself descended from one of the most ancient families in Derbyshire, and what he considers respectable birth in the marriages of his children, will ever be regarded by him as indispensable. Besides, remember your extreme youth, and strive to resist the sin of disobedience to your parent. If, after the expiration of four years, you find that neither time nor absence has had power to annihilate your affection for my young friend, then you can, with a better grace, implore the consent of Colonel Vincent before marriage, and if denied, his forgiveness after it. Nevertheless, I pray that at present you make no attempt to gain the affections of Margaret, who is possessed of acute sensibility; and your first professing regard for her, and then neglecting her, might prove destructive to the health, may, perhaps even to the life, of the unhappy girl."

The young man promised that, until he should be of age, he would defer his union with Miss Ruthven, but, at the same time, he would not engage to be silent to Margaret herself regarding his attachment.

Our heroine was flattered by the attentions which she received from the handsome nephew of Mr Wilson. He pulled the fairest flowers for her, he wandered from hill to hill in search of the finest scenes for her pencil. She was already an artist of no mean pretensions, and her taste in painting was so excursive, that there was hardly an object in nature or art but what the imitative power of her genius enabled her to produce a surprising resemblance of. The time of Vincent's departure approached, and in a solitary field he found Margaret when he came to bid her farewell. He could not resist disclosing to her his secret sentiments, in the hope that his love would meet with a favourable reception. But, in an instant, surprise and sorrow blanched the cheek of poor Arthur, when the only girl he had loved, and one whom he loved most tenderly, told him, with an expression of subdued mildness, with very grateful acknowledgments, but at the same time in a decided manner, that she could never accept the offer of his hand. With some difficulty he gave utterance to the following words:—

"And, at my return from India, must I find you the wife of another?"

"The wife of no one will you ever find me, dear Mr Vincent," replied the girl; "but reasons which I cannot disclose to you, occasion my choice of a single life."

"Farewell, then," said he. "I shall not utterly despair of gaining your affections after you have had proof of many years fidelity on my part. Farewell! and may every blessing attend you."

Arthur departed, to the great regret of all at Linnfern, and soon afterwards took leave of Old England.

Vincent was the only gentleman who had ever treated Margaret Ruthven with peculiar and devoted attention, and she could not be indifferent to his striking preference of her, especially when contrasted with the cold, heartless civilities, which were the utmost she received from the neighbouring gentry.

The joyous feelings of early youth, though for a season clouded, soon look forth again from amidst temporary shadows, clad in the sunny radiance of their own brightness. Such was the state of our heroine's mind a few months after the departure of her lover, and her happiness at this time was greatly increased by the anticipated event of Miss Wilson's marriage, thus proving that her conjectures were unfounded as to Eliza's love for Vincent.

The gentleman to whom Miss Wilson was about to give her hand, with the entire approbation of her now aged parent, belonged to the mercantile profession, and resided in Edinburgh. Mr Allan was not rich, that is to say, he had not realised a fortune; but his business as a general merchant was lucrative, and his prospects at this time were as good as those of other young men who had chosen the same line of life. A numerous bridal party was assembled at Linnfern, on which occasion Margaret Ruthven was honoured as the officiating bridesmaid to her benefactress. And now, Mrs Allan left her father's house, amidst the tears of the affectionate old man, while, at the same time, it may be well believed that the parting of the bride herself with him was a sorrowful one, when she considered that she could no longer be constantly present to soothe her father's advanced years. However, this dutiful daughter, before she would consent to leave her early home, had prevailed on Miss Anderson to be a constant inmate at Linnfern during the remainder of Mr Wilson's life. This gentleman felt grateful to the excellent person who had discharged the duties both of mother and governess to his child, and in his will he bequeathed to her an annuity, to be paid from the rental of his estate, immediately after his decease. He did still more; knowing Miss Anderson's partiality for Linnfern, he caused a handsome little cottage to be erected in a pleasant field, where there were a few straggling trees. Its walls were whitewashed, jessamine and honeysuckle also covering the front of it; and a pretty little garden surrounded it behind and before. This was intended as the future residence of Miss Anderson, in the event of Mr Wilson's death, and he felt pleased to contemplate, that whenever that should occur, her finances were such as to enable her to maintain herself without further toil, as long as she remained an inhabitant of this world.

The time now approached when Margaret Ruthven should leave the hospitable mansion of her kind benefactor, and provide for her own wants by laudable industry. When she had attained the age of seventeen, her friend Mrs Allan procured for her a situation in the metropolis of Scotland.

Miss Ruthven was received with much kindness into the family of Mr Alison, a writer to the signet, and she became the preceptress of this gentleman's two daughters.

The children very soon loved their governess exceedingly, and the progress they made under her tuition, rendered her a most valuable person in the eyes of their doting parents, who in a short time increased her salary to L.50 per annum, at that time considered a handsome allowance for a young person situated as she was. Margaret had not been many months absent from Linnfern, when her friend Mrs Allan had to mourn the death of her venerable old father; and it may be well supposed that our heroine shed many tears over the grave of her

* We extract the above story, with some slight abridgments, from a volume which we should have brought under the notice of our readers some time ago: it is entitled "The Decameron of the West" (Edinburgh—1838), and consists of a series of narrative pieces, strung together after the manner of Miss Lee's Canterbury Tales. The work is the composition of a lady of modest merit, and possessing no small share of literary acquirements.

Digitized by Google

benefactor, whose dissolution, though long expected, was nevertheless a great bereavement to those who had for so many years assembled round his hospitable fireside. His daughter was the sole heiress of Mr Wilson's estate, which was burdened merely with a small annuity to Miss Anderson, who now retired to her woodland cottage.

From the date of Mrs Allan's marriage five years had passed rapidly away, and, with the exception of her father's death, no shade of misfortune had in the slightest degree blighted the happiness she enjoyed as the wife of Mr Allan. During this period she had become the mother of three fine children, a boy and two girls. But, alas! earthly prosperity is often fleeting as a summer cloud, which the noonday sun quickly dissipates. The mercantile house in which Mr Allan was a partner, being involved by the failure of several eminent merchants in London, was now declared insolvent. Mrs Allan's landed property was not entailed, nor settled in such a manner as to exclude the right of her husband's creditors to the possession of it. Linnfern was seized by the latter, and quickly advertised for sale. Poor Miss Anderson was now obliged to leave the premises, to lose her annuity, and, what was still more unfortunate, the total savings of her past life, which were in the hands of Mr Allan. The melancholy intelligence of the failure was the occasion of such intense grief to our heroine as to cause a fever, with strong delirium. However, after recovering health and strength, her mental energy resumed its power, and she was not long in designing a plan wherewith to aid both her benefactresses. She thought it but a light matter that all her salary should be transmitted to them, and that for a great length of time she should purchase no new clothes. The profits resulting from the labours of her pencil were now put in requisition for behoof of those she loved.

The creditors of Mr Allan allowed him what was sufficient to preserve his wife and children from beggary; yet Margaret Ruthven well knew that this lady had been all her life accustomed to many indulgences, which habit had converted into necessaries; and also that Mrs Allan had at present not the means of procuring those comforts. All that our heroine conveyed either to the Allans or Miss Anderson, was done in such a way that the donor could not be detected, lest the industrious earnings of the poor girl should have been declined. Margaret's quondam governess being rather too far advanced in life to render her situation agreeable by entering into the house of strangers in that capacity, chose, in preference, to have a small school for girls; and for this purpose she hired a cheap lodging in the southern part of Edinburgh. The number of her scholars was not considerable, and the pittance she derived from their tuition was inadequate for her maintenance. She would not beg, and must have starved, had it not been for her former pupil, once the little ragged gypsy.

At this time Margaret Ruthven rose with the lark, and never permitted the morning sun to surprise her with closed eyes. Soon after dawn she would start from her pillow, dress herself hurriedly, and prepare her colours, waiting only for sufficient light to commence her labours. Her works sold well, and great was her delight when she found that by this means she could in some degree contribute to the comfort and maintenance of those who had protected her orphan childhood.

Linnfern was two years in the market before a purchaser appeared for it. At last Mr Alison, in whose family Margaret Ruthven lived, was commissioned to buy the estate for a gentleman who at that time was residing abroad.

It may be supposed that the former inmates of Linnfern were anxious to know to whom their quondam habitation now belonged; but their curiosity was fruitless, as the name of the present possessor was kept secret by his man of business, who in this respect acted according to the wishes of his client.

About five years subsequent to the failure of Mr Allan, that gentleman became a second time successful in trade, and his family were now independent of all aid but what he could himself procure for them. Our heroine's affectionate heart being consequently satisfied as to the comfort of the Allans, she still prosecuted her painting, with the view of realising a competence for Miss Anderson, in order that this lady might be able to retire to the country, and relinquish the toil of teaching during the remainder of her life.

One morning, when Margaret went to the shop of the carver and gilder where she frequently disposed of her pictures, she observed a gentleman dressed in deep mourning, who seemed from his attitude to be intently examining one of her landscapes. His back was towards her, and, from the bent and rather elderly aspect of the figure, he seemed about forty. However, when he turned round, she observed that he was young, though much emaciated, and apparently in very delicate health. The stranger's eye was scarcely for a moment diverted from his contemplation of the picture. Our heroine felt inclined to remain till after his departure, that she might learn the name of this admirer of her painting. However, a sense of modesty caused her to withdraw, lest she should be afterwards introduced to him as the fair artist. On returning home, Mrs Alison told Margaret that her husband expected a client to dine with him, a gentleman who had just returned from abroad.

On entering the drawing-room before dinner, Margaret was surprised to behold the person whom she had seen some hours previously gazing at her landscape. Mrs Alison politely introduced her young friend to the stranger. He bestowed but a momentary glance at her, when immediately he seized her hand, clasped her in his arms, then burst into a flood of tears. With difficulty he at last exclaimed, "Margaret!"

The voice fell upon her ear like an electric shock. She in her turn looked attentively in the gentleman's countenance, and it was a little while before even love could recognise, in the shattered appearance of Major Vincent, what was once the youthful form of her beloved Arthur. We shall now suppose the drawing-room of Mr Alison's house emptied of all its inmates save the lovers, eager to hear each other's tale.

Major Vincent's history was one of war, repeated wounds, and broken health, with here and there the pleasant interludes of the captures of Indian towns, and abundance of treasure found. The allowance of the latter which had fallen to his share enabled him now to retire from military service; and his physicians entertained hopes that a short residence in a European climate would at his early age recruit his strength. He told Margaret that he had never been inconstant in his regard for her, but that, knowing his father's disapprobation of the match, he could not during the lifetime of his parent unite his fate with hers; and a sense of filial duty also forbade him even to correspond with her, lest such should be discovered by Colonel Vincent. That gentleman being now no more, Arthur Vincent knew no further obstacle to prevent his union with one whom he had so long loved.

Arthur was hitherto the unknown proprietor of Linnfern, and the cause of his name being concealed was an unwillingness that Margaret should hear the mention of it, as long as the thought of him must be allied with the idea of inconstancy; and while his father lived, he could make no disclosure concerning the continuance of his regard for her. Major Vincent told our heroine that he had in the morning purchased a landscape, "drawn surely," said he, "by a first-rate artist;" and he mentioned that the scene was one which he had formerly pointed out to her as a fit subject for her pencil. She smiled, but dared not tell that she had failed to recognise her lover when in the attitude of contemplating the picture now alluded to.

Margaret told Major Vincent that the idea of his cousin's attachment to him, was the sole cause which in her early youth prevented the engagement of her hand to him. She had soon found, she added, that her opinion in this respect was erroneous; nevertheless, Arthur was assured by her that one condition must be submitted to on his part, ere Margaret's consent could be obtained to be his wife.

"I am, indeed, willing to make a great sacrifice for your sake," he replied; "tell me quickly what you wish."

"I wish," said she, with firmness of manner, "that you restore to Mrs Allan the abode of her ancestors, the inheritance she has lost from the misfortunes of her husband. Give back to your cousin the estate of Linnfern without recompence or reward, and let it be settled upon herself and children, so that no creditor of Mr Allan's can ever lay claim to it; let it be burdened only with the liferent of Miss Anderson's cottage, and with the annuity which your uncle bequeathed to that lady. After this matter is legally settled, then, and not till then, can the poor and low-born Margaret Ruthven become the wife of the well-descended and rich Major Vincent."

The fortune of Arthur was so ample, that the loss of four hundred a-year was to him inconsiderable; yet he was grieved and disappointed in consequence of this request, for he desired ardently to conduct his beautiful bride through those woods and meadows where he had formerly walked with her, when she viewed herself a dependant, and which he fondly hoped she would now behold as her own. But her purpose was taken, and nothing could overcome a resolution strong as hers was. She could make any sacrifice for those she loved, and the love that could not in turn make sacrifices for her, appeared too questionable to be accepted of. At last her wishes were gratified, her friends reinstated in their former habitation, and Mrs Vincent's marriage-jaunt was to Linnfern, the restored residence of Mrs Allan.

OCCASIONAL NOTES.

CLUB-HOUSES FOR WORKMEN.

In the western or fashionable parts of London, there are a number of large and particularly splendid buildings called Club-Houses. These establishments are individually the property of a body of subscribers or members, each paying a certain sum at entry, and afterwards annually, to liquidate the general expenses of the concern. The members are admitted to the society by ballot; and a committee undertakes the management, the appointment of servants, &c. These club-houses combine the character of a hotel for day-boarding, and a reading-room. Nobody sleeps in the houses at night. Members are alone permitted to resort to any part of the establishment. This species of institution holds out two advantages to its members—an exclusive society, and the means of enjoying all kinds of food, drink, literary recreation, and other comforts, at cost price. The price of every article served is charged according to a low fixed scale, nearly corresponding to its original cost in the market. Thus, the members of club-houses pay no profit on anything they consume, while they enjoy the additional benefit of having all their commodities purchased in large quantities, and at the lowest wholesale price. It remains to be explained, that the members of these institutions belong almost entirely to the higher orders, such as the nobility, landed gentry, members of the House of Commons, and officers of the army and navy. The middle classes, having little time to spare, and being more inclined to spend that little time at home, in the bosom of their families, than in places of public resort, have never fallen into the way of setting up club-houses, and probably never will.

Our object in mentioning these fashionable establishments, is to suggest the propriety of copying them, to a certain extent and under certain restrictions, in the humbler walks of life. They would not by any means answer in places with a small population; but in all large towns, where there is a considerable aggregation of the working classes, they might be set up with the best prospects of success. At present, as is universally allowed, the houses of vast numbers of workmen are very limited in size, poorly furnished, and any thing but comfortable. In such towns as London, Manchester, Liverpool, Glasgow, and Edinburgh, there are thousands of young operatives who are unmarried, and rent a very small apartment wherein they sleep. It is of no use to tell these men to go home after their day's labour is over, and sitting down comfortably by the fire, peruse some good or entertaining work. They have neither a parlour to sit in nor a book to amuse them; perhaps one-half of them cannot even read, or at any rate cannot read with fluency and satisfaction. We know that such is the case. Lecturers on temperance, science, and other subjects, when they recommend their auditors to spend their leisure hours in reading at home, are sometimes told by the operatives that they should be very glad to follow the advice, provided, in the first place, they had fit homes to go to; and in the second, that they could read when they got there. The recommendation, therefore, though well meant, is of little practical value. For those who have commodious homes and the means of making them attractive and comfortable, no club-houses of any description are wanted, and, consequently, to them our observations do not apply. We refer only to that large mass of very imperfectly educated, paid, and lodged working men, with which some of our great seats of population abound. Let these, then, we say, imitate the economic principle on which the London club-house system is founded. Club or unite a small portion of your weekly earnings, so as to raise a sum sufficiently large to purchase or rent a commodious set of premises. The house should contain a large sitting apartment, fitted up with tables and benches like a coffeeroom, be well heated, and supplied with newspapers, books, and periodical publications; a separate room, in which a person could read aloud to those who felt disinclined to peruse a paper themselves; a person of respectable character to be appointed as housekeeper and director, who could undertake to supply certain articles of food at a low fixed charge; house to be open from five in the morning till nine in the evening; tea, coffee, or any other liquid not of an intoxicating quality, to be only allowable within the premises.

We present this as a rough sketch of the plan and organisation of a club-house for the working classes, and of which one might be established in every district of a large town, according to circumstances. With such an institution, every operative would have it in his power to command a permanent fund of comfort at the minimum of expense. He would eat at least a portion of his food at a trifling advance on the wholesale market price; and he would have a place in which he could spend his leisure hours with advantage, or in harmless and improving recreation. One thing only strikes us as a possible drawback. If married men were to be drawn from the midst of their families to spend their time in such houses, the scheme would be so far injurious. Possibly, there might be such restrictions as to obviate this consequence. At the same time, we are not to consider even the case of the married men as one in which there is home on the one side and a club-house on the other: it *is* in a great measure a question between the besotting public-house and the temperate reading-room. The institution would be a kind of temperance coffeeroom, only sustained by the men themselves, and furnished with every thing at cost-price.

It will be observed that the plan which we suggest differs from that of mechanics' institutions, schools of arts, and similar establishments, only in so far as the principle is confined to objects of a less aspiring nature. Mechanics' institutions have, generally speaking, failed in their design, as respects the mental cultivation of the working classes. It is discovered that but a small proportion of the members are mechanics; the greater number being in reality shopkeepers and young persons of a miscellaneous order, who embrace the opportunity of procuring scientific education at a cheap rate. Such a result might have been foreseen; the bulk of the operative classes, when released from their daily toil, have no relish for abstract studies. They require to be amused and cheered; and as nothing in the form of harmless amusement falls in their way, they adjourn, as a matter of course, to the public-house, or loiter away their time idly in the open street. A proposal has lately been made to grant public assistance to mechanics' institutions and schools of arts; and to this there can be no reasonable objection, only let it be understood that it is not the working classes who will be benefited. An institution, to be serviceable to the mass of this order of men—we speak more particularly of the masses in Warwickshire, Staffordshire, Lancashire, and Yorkshire—would require to be of that simple and unpretending character to which we have above alluded; in fact, an establishment which proposed to give a degree of *bodily comfort*, independently of any kind of literary recreation, and at such a cheap cost that it would be available by all.

CURE OF SQUINTING.

A person in London, who favours us with his name and address, mentions, that in consequence of the account given in the Journal (No 423) of the mode of curing squinting by a surgical operation, he had been induced to submit himself to the hands of a skilful surgeon in the metropolis, who, by an operation on the eye, of only a few minutes' duration, effectually remedied a squint which he had possessed since youth. In little more than ten days, he observes, the slight wound was completely healed, and he now looks perfectly straight, with a greater range of vision than formerly. This is a very gratifying announcement.

Digitized by Google

It appears that squinting now falls within the scope of the surgeon's art, the same as any other superficial defect or injury in the bodily frame; and, therefore, any one who continues to endure the perpetual annoyance of obliquity of vision, has in a great measure himself to blame. We believe that surgeons are to be found in every large town capable of performing the operation.

INSTRUCTION OF YOUTH IN PHYSICAL SCIENCE.

HIGH SCHOOL OF GLASGOW.

On a former occasion we gave a short sketch of some interesting improvements which had been introduced in the High School of Glasgow, with the view of increasing its range of usefulness, and bringing it into conformity with the more extended views of education which now prevail. Previous to 1834, this great school was strictly a classical seminary. Nothing was taught there but Latin and Greek, and writing and book-keeping. There was one teacher only for the latter branches, on which one, or at most two hours daily were spent; while there were four or five classical teachers, who occupied the pupils' time five or six hours daily. In 1834, the classical department was cut down to two masters, and three (now two) hours daily; and teachers were introduced for the English language and literature—arithmetic, geography, and mathematics—modern languages—and drawing. Able teachers of these very important branches being appointed, and the public becoming more alive to the necessity of giving their children full instruction in these newly introduced departments, the change was attended with great success. The school, which was previously declining, revived, and the English and mathematical departments are now absolutely crowded; each teacher requiring the aid of an assistant to get through the duties which his loaded benches impose upon him. The teacher in the English department is Mr A. J. D. D'Orsey, a gentleman whose professional abilities are of the first order, and to whose enterprise and perseverance, in the face of formidable obstacles, much of the reputation of this department in the institution is doubtless to be ascribed. It may be added, that no small praise is also due to Mr Connel, who has, with great success, conducted the mathematical department of the school, as well as to all the other teachers.

But though these changes alone were exceedingly important, and conferred no small boon on the citizens and youth of Glasgow, we cannot but consider another department, which has lately sprung up in this school, as equally entitled to consideration on account of its utility, while its novelty gives it a still more particular claim. We refer to the PHILOSOPHICAL DEPARTMENT. This section, from small beginnings, has gradually become a branch of great importance. It commenced with a short course on natural philosophy by the mathematical teacher. A course on chemistry was afterwards introduced. These, given only once or twice a-week, for one hour at a time, could not convey much solid information to the pupil, and gave a degree of trouble to the teacher disproportionate to the remuneration.

Accordingly, it was suggested to the Town-Council (the patrons of the school) by Mr Reid, then the teacher of the chemical class, to create a philosophical department, under one teacher, and embracing the three great branches of physical science—natural philosophy, chemistry, and natural history; and to assign a separate class-room for the teaching of these branches. Thus, the master would be enabled, by meeting the pupils frequently, to give a substantial body of instruction in these sciences, taking them through a full and satisfactory course, extending over several years—at once conveying efficient information on a number of useful subjects, and forming an admirable system of mental discipline. To this the council agreed; a "philosophical department" was created, and a separate class-room assigned to it. This was the first institution of the kind in Scotland;* and, as it holds out an example we would desire to see imitated in every public school, we believe a few observations on the subject will not be inappropriate at the present time.

If we inquire what are the objects of education, we shall find that there are few studies that tend more to promote these objects than the physical sciences; and we shall be disposed to congratulate ourselves on living in an age when these sciences have acquired such an extent and systematic form, that they are capable of being thrown into a plain course for the instruction of youth—such a relation to the works of nature and art, that they constitute a course of study at once useful and delightful. We are somewhat too much apt to smile and wonder at our ancestors, and dispute their wisdom in causing their children to spend so much time in studying the dead languages. But what could they do? They were sensible, as well as we are, of the advantages of education and mental training, and keeping the time of the young always occupied. But they had no other knowledge to offer them but Greek and Latin. There was no natural philosophy, no chemistry, no botany, no zoology, no mineralogy, no geology, scarcely astronomy; no travels or geography, little history, excepting that of the Greeks and Romans; and scarcely an English literature. In short, there was no knowledge but that of languages and ancient history; and our forefathers made ample provision for having their children instructed in the knowledge that the times afforded.

But we are better provided. The book of nature has, to a certain extent, been laid open to our view. More knowledge, really useful knowledge, has been accumulated within the last one hundred and fifty years than the whole stock then possessed by mankind. Numbers of substances previously quite unknown have been discovered, their properties examined, and applied to useful purposes. An immense mass of curious and interesting facts have been brought to light. We now have what Locke complains of the want of—"a comprehensive, scientific, and satisfactory knowledge of the works of nature." Our knowledge is positive, not speculative; systematic, though not complete. The contrast between the knowledge of Locke's time and that of ours, is like that between midnight and noon. Let us not, then, shut our eyes to the light. Let us make use of the ample stores of knowledge which have been laid up. Let education take advantage of the extension of science, and adapt it to the understandings of the young. Let us, now that we have the means, cultivate the faculties of youth by imparting knowledge, which, being somewhat congenial to their tastes, will awaken, stimulate, and interest them—at once a tool whereby to sharpen their intellects, and a material of value in itself.

Independently of religious and moral instruction, there are *three* great objects to be attained by the education of youth.

1. To communicate information which shall be useful professionally, and in fitting the individual for intercourse with society, and furnishing agreeable and rational resources for leisure hours.
2. To train and exercise the intellectual faculties.
3. To occupy the time.

Our limits prevent us entering on any exposition of how admirably the physical sciences are adapted for these ends, except what is hinted in the following sketch, extracted from the prospectus published when the philosophical department was established in the Glasgow High School, which will convey some idea of the ends proposed to be attained:—

"To familiarise the pupils with the appearances of the various products of nature and art, apparatus, and philosophical instruments, and teach them how to distinguish them from each other.

To teach them the composition of bodies, their properties, the phenomena arising from their mutual action, their uses, and how and where procured.

To instruct them in the principles of natural philosophy and chemistry, on which the useful arts depend; a knowledge of which is now found to be essential in so many different pursuits, while all find it difficult to acquire that knowledge unless the first encounter of the study be made in youth, when there is time for it, when the mind is pliant and flexible, easily takes up new ideas, and is in the habit of learning.

By directing attention to the interesting phenomena of nature and art, and the truths of science, to implant early a taste for, and furnish the means of, agreeable, harmless, and rational occupation for leisure hours in after life.

To communicate that information regarding the nature of the various bodies and powers which surround us on all sides, and are continually acting on us, and influencing our condition (as air, water, attraction, heat, &c.), which is now necessary to qualify for general intercourse in society.

To communicate that information, that sense of the importance of the applications of science, which will enable those who will be our future magistrates and councillors, directors of public trusts, merchants and manufacturers, to appreciate and assist in forwarding those improvements which the advance of science is daily suggesting.

The striking nature of the phenomena of the physical sciences—the hidden properties which they disclose—their applications in explaining the great phenomena of nature and the interesting processes of art, admirably adapt them to excite the interest of the young, and give them a pleasure in learning—to call their mental powers into action—stimulate and give a right turn to that disposition to observe and inquire which is so characteristic of boys—train them to habits of observing accurately—prevent that too great confidence in their preconceived notions, which they are apt to entertain, and lead them to penetrate beneath the surface of things, and reflect upon the causes of what comes before them. The varied properties and relations of bodies, the different modes of action which nature employs, and the peculiar principles, methods of inquiry, and modes of reasoning in each science, form an admirable basis for mental exercise. Such studies correct and invigorate the judgment by the analysis which they present of reasoning in all its varieties, and increase the mental resources by enriching the memory with stores from every quarter. A course of logic, the concluding and most valuable part of a general education, cannot be regarded as complete, unless it embrace an analysis of the several kinds of evidence on which the truths of science rest. These differ, both in degree and kind, from moral evidence and from each other. For sharpening and invigorating the intellectual powers, there is no exercise like the analysis of evidence; and the more varied the subjects of exercise the better. It is now allowed that men would be much better qualified for the business of life and the exercise of the liberal professions, were they carried through a preliminary course of discipline in the various sciences; and the sciences are now far enough advanced, and their principles sufficiently settled, to admit of their being applied to this end."

In conclusion, we have to observe, that the fear sometimes expressed of youth being unfit for the study of science is totally groundless. From what we have witnessed, we feel perfectly assured that boys of from ten to fourteen years of age are capable—if it be properly set about and time allowed—of acquiring much more of the *principles* as well as *facts* of the sciences than is generally supposed. The sciences are like most other branches of knowledge, such as grammar, composed chiefly of *facts*; and we consider that youth are much more capable of understanding the laws of philosophy than the principles of language and grammar, while their minds may be at the same time as effectually trained to pursue a course of exact reasoning as if schooled in the abstractions of classical literature. In a correct scientific education, indeed, the degree of mental discipline it imposes is not the least of its recommendations.

Our object in thus bringing a sketch of what has been done to improve the course of instruction in the High School of Glasgow, before the extensive circle of our readers, has simply been to incite other institutions to pursue a similar line of policy. With extremely few exceptions, our provincial grammar-schools are daily falling behind in this age of advancement. Latin—Latin—Latin—scarcely any branch of a superior order but Latin, is taught at these seminaries, while the bulk of the boys instructed in them are designed for common mercantile and trading professions. Much of this evil is of course owing to the ignorance of parents; but much more is due to the *want of the proper kind of seminaries*. Let us hope that what has been above stated in reference to Glasgow, will be the means of remedying this remarkable deficiency.

* Preceded in Great Britain only by the philosophical class established in the new Liverpool High School.

THE OLD IRISH HARPERS.

THE harp appears to have been the national musical instrument of Ireland from a period beyond the range of authentic history. It continued, from the days of antiquity down to the end of the eighteenth century, to be practised by a body of men, generally blind, often of good families and respectable acquirements, who travelled about the country, receiving and giving entertainment in the houses of persons of condition. In those days, blindness was a comparatively common calamity in all ranks; the Irish gentry, of whatever extraction, were also more given to keeping up the national usages and amusements of Ireland: hence there were the more harpers and the more entertainment for them. Many of the harpers were composers of airs; and to their genius we must be considered as chiefly indebted for those exquisite melodies, which a refined musician and a refined poet of the present age have caused to be diffused wherever beautiful music is appreciated in the civilised world.

The last survivors of this musical fraternity had a meeting at Belfast in 1792, when they played over their best airs, in the presence of a distinguished audience, and received money prizes apportioned to their respective degrees of skill. On this occasion, there was present a young man named Edward Bunting, who felt, in a peculiar manner, the charms of the music, and the interest of the whole scene. He has given us the following account of the personal appearance of the men. "They were in general clad in a comfortable homely manner, in drab-coloured or grey cloth, of coarse manufacture. A few of them made an attempt at splendour, by wearing silver buttons on their coats, particularly O'Higgins and O'Neill; the former had his buttons decorated with his initials only, but O'Neill had his initials, surmounted by the crest of the O'Neills, engraved on buttons the size of half-a-crown. Some had horses and guides when travelling through the country; others their attendants only, who carried their harps. They seemed perfectly happy and contented with their lot, and all appeared convinced of the excellence of the genuine *old Irish music*, which they said had existed for centuries, and, from its delightful melody, would continue to exist for centuries to come. The editor [Mr Bunting] well remembers the anguish with which O'Neill contemplated the extinction of the old strains, which he said had been the delight of the Irish nation for so many years; he called them, with tears coursing down his aged cheeks, 'The dear, dear, sweet old Irish tunes!'" Mr Bunting immediately set about collecting the harp music of Ireland. He travelled into the counties of Derry and Tyrone, and into the province of Connaught, taking down the airs from the country people, and from the surviving harpers. He was largely indebted to Denis Hempson, a harper above a hundred years of age, whom he found bedrid, but who still had his harp beside him, keeping it literally in his arms, under the bed-clothes. From him, also, Mr Bunting learned the ancient mode of fingering the harp, which was not done with the fleshy part at the end of the finger, as in the Italian harp, but by the space between the flesh and nail, the nail being for this purpose kept long and crooked. It was with difficulty

Digitized by Google

that this aged man could be induced to play the more ancient music. He regarded it with a superstitious veneration, and shrunk from presenting it to modern, and perhaps unsympathising, ears. When asked to play these airs, he uniformly replied, "There was no use in doing so; they were too hard to learn; they revived painful recollections."

The consequence of Mr Bunting's exertions was the publication of sixty-six airs in 1796, and the addition of seventy-five in a second volume given to the world in 1809. These two volumes furnished the materials of the "Irish Melodies," as harmonised by Sir John Stevenson, and married to *brilliant* verse by Mr Moore. In the present year, nearly half a century after his attention was first attracted to the subject, Mr Bunting has given us a third volume,* containing a hundred and fifty-one airs, of which one hundred and twenty were never before published. These are arranged for the piano, and accompanied by a practical digest of ancient Irish musical science, and by much historical and traditionary matter respecting both harping and harpers. Mr Bunting has thus performed a most eminent service to the world, for which the thanks of all persons of taste and feeling are due: he has been *the* preserver of the old Irish music. "While forming," he says, "these collections, he had an opportunity, never perhaps enjoyed by any other musical compiler, of rendering himself thoroughly acquainted with the genius and habits of the old native people of the country. His plan would have been imperfect, had he not resorted to the artless modulations of the aged heads of families, and of females taught by their parents to sing to children on the breast, or at the milking of the cow—an occupation in which the native Irish took particular delight. In these excursions, particularly in the remote parts of Tyrone and Derry in Ulster, and of Sligo and Mayo in Connaught, he has had the satisfaction of procuring old music, and experiencing ancient hospitality, at the same time, among *people of manners so primitive and sincere*, as could leave no doubt on any mind of the perfect genuineness of every thing about them. Had he gained nothing else on these occasions but *a knowledge of the worth and warm-heartedness of his poor countrymen*—a knowledge so little sought after by those who might turn it to the best account—he would have been well repaid for all his toil."

Mr Bunting's notices of the Irish harpers go back to the end of the sixteenth century, when there flourished two brothers, John and Harry Scott, eminent performers and composers from the county of Westmeath; Gerald O'Daly, the supposed author of Aileen-a-Roon (Robin Adair); and Roderick O'Cahan (pronounced O'Keene), otherwise called Rory Dall, that is, Blind Roderick, who was a chief person among the O'Cahans of the O'Cahan country, and entitled to large estates there. Tradition represents Rory Dall as travelling into Scotland, not long before the accession of James VI. to the English throne. He was attended by a retinue befitting a gentleman of figure. He is said to have called at Eglintoune Castle, where the lady, not apprehending his real character, affronted him by asking a tune in a peremptory manner. "O'Cahan refused and left the castle. Her ladyship afterwards, understanding who he was, sought a reconciliation, which was readily effected. This incident gave occasion to the composition, by O'Cahan, of the appropriate tune of 'Da mihi manum,' or 'Give me your hand,' the fame of which afterwards spread through Scotland, and, reaching the ear of the king, induced him to send for the composer. O'Cahan accordingly attended at the Scottish court, and so delighted the royal circle with his performance, that James walked towards him, and laid his hand familiarly on his shoulder. One of the courtiers present remarking on the honour thus conferred on him, Rory observed, 'A greater than King James has laid his hand on my shoulder.' 'Who was that, man?' cried the king. 'O'Neill, sire,' replied Rory, standing up." This was O'Neill, Earl of Tyrone, the leading Irish chief of his day, and who about this time, in a rebellion against Elizabeth, had brought nearly the whole country to his feet.

Rory spent much of his time in Scotland, travelling about amongst the nobility and gentry. He composed *Ports* or harp lessons in honour of his entertainers, and bearing their names—for example, Port Lennox, Port Gordon, and Port Athole. One of his best known pieces is called *Lade's Supper*, having been composed on a visit to the house of Robertson of Lude. He died in Skye, while on a visit at the house of Macdonald of Sleat, in which family his silver harp-key, adorned with precious stones, and worth seventy or eighty pounds in intrinsic value, was retained till 1773, when Lord Macdonald presented it to another harping visitor. The writer of this notice has heard the late Mr Alexander Campbell, editor of Albyn's Anthology, describe, with his characteristic enthusiasm, a pilgrimage he once made to the grave of Rory Dall, somewhere in the West Highlands.

The reign of Charles II. introduces us to Thomas Connallon, a native of the county of Sligo, some of whose airs, marked by great beauty, are preserved in Mr Bunting's new volume. He also travelled into Scotland, carrying with him, it is said, the air of "Lochaber," which is here stated to have been the composition of a harper named Miles O'Reilly, of Killincarra in the county of Cavan. The latter days of Connallon brought him an honour, the last we should have expected to accrue to a "great harper:" he became a bailie in the city of Edinburgh, where he died. At a somewhat later time, flourished one Murphy, a first-rate performer, who travelled into France, and was admitted to play before the Grand Monarch. We have now come to the age of Carolan; but, having already given a life of this child of genius in our Journal, we shall here pass him over with the single remark, that a portrait of him, in Hardiman's Irish Minstrelsy, represents one of the most beautiful artistic heads we have ever beheld, while the countenance, sightless as it is, beams with the rapt expression of high genius. One of the most eminent of his contemporaries was Cornelius Lyons, harper to the Earl of Antrim, and composer of certain graceful variations to Aileen-a-Roon, Coolin, and other tunes, which Mr Bunting preserves. Lyons was a person of good manners and attainments, insomuch that Lord Antrim himself delighted in his conversation. Our editor quotes, from a manuscript *memoir by Arthur O'Neill*, an anecdote which serves to show how peculiar the style of playing of some of these old harpers must have been. "His lordship was both a wit and a poet, and delighted in equality where vulgarity was not too gross. At one time, he and Lyons, in London, went to the house of a famous Irish harper, named Heffernan, who kept a tavern there; but, beforehand, they formed the following plan: 'I will call you Cousin Burke,' said his lordship; 'you may either call me Cousin Randall or my lord, as you please.' After regaling for some time, Heffernan was called up, who was, by this time, well aware of the dignity of his guests from the conversation and livery of his lordship's servants. When Heffernan came into the room, he was desired to bring his harp and sit down, which he did, and played a good many tunes in a grand style. His lordship then called upon his Cousin Burke to play a tune. The supposed cousin, after many apologies, at length took up the harp and played some of his best airs. Heffernan, after listening a little while, started up and exclaimed, 'My lord, you may call him Cousin Burke, or what you please, but, *dar dieh*, he plays upon Lyons' fingers.' What is very extraordinary, Heffernan had never seen Lyons before. His lordship then retired, leaving the minstrels to indulge in Bacchanalian rivalry, which O'Neill assures us they did 'like bards of old.'"

Jerome Duigenan, a Leitrim harper, who lived with a Colonel Jones of Drumshambo, was born about the year 1710. O'Neill related an anecdote of him, which it is not easy to believe, yet looks after all characteristic. "The colonel, being in Dublin at the meeting of the parliament (in which he sat for Leitrim county), met with an English nobleman, who had brought over a Welsh harper. When the Welshman had played some tunes before the colonel, which he did very well, the nobleman asked him had he ever heard so sweet a finger. 'Yes,' replied Jones, 'and that by a man who never wears either linen or woollen.' 'I'll bet you a hundred guineas,' says the nobleman, 'you can't produce any one to excel my Welshman.' The bet was accordingly made, and Duigenan was written to, to come immediately to Dublin, and bring his harp and dress of *Cauthach* with him; that is, a dress made of beaten rushes, with something like a caddy or plaid of the same stuff. On Duigenan's arrival in Dublin, the colonel acquainted the members with the nature of his bet, and they requested that it might be decided *in the House of Commons*, before business commenced. The two harpers performed before all the members accordingly; and it was unanimously decided in favour of Duigenan, who wore his full *Cauthach* dress, and a cap of the same stuff, shaped like a sugar-loaf, with many tassels; he was a tall handsome man, and looked very well in it."

Dominic Mungan, a native of Tyrone, and blind from his birth, regularly accompanied the bar on the north-west circuit. He was a prudent man, and giving his sons a good education, one of them became an eminent physician, and the other Bishop of Limerick in the established church. Echlin Kane, born at Drogheda, was an opposite character. "His love of adventure early led him to Rome, where he played before the Pretender, then resident there. He afterwards travelled into France and Spain, where the fetish, of whom there was at that time a great number residing in Madrid, patronised him very liberally, and introduced him to the notice of his Catholic Majesty, who is said to have contemplated settling a pension on him, in compliment to his countryman. Kane's preferment, however, was marred by his *own indiscretions*; and after exhausting the patronage of his countrymen at the Spanish court, he was obliged to set out for Bilboa, on his way home, on foot, and carrying his harp on his back. He is described as a very strong, tall, athletic man, and is asserted to have outstripped the post on his journey, which may appear the less extraordinary when the state of the roads in Spain at the time is considered." He was afterwards a great part of his time in Scotland, whose Lord Macdonald presented him with the harp-key of Rory Dall; an unlucky proceeding, for the profligate soon after converted it into money, to supply his extravagances. Kane died about 1790.

Let not the reader suppose that these were men of little musical accomplishment, whom no modern ears could patiently listen to. The performances of all who have been named were of a very high character. Mungan excelled in piano passages, which he would give so soft and low, that to hear them it was necessary to bring the ear close to his instrument. "In their greatest degree of softness, they resembled rather the sympathetic tones than those brought out by the instrument. These janglings of the strings, so general among ordinary practitioners, were never heard from the harp in his hands." He was conversant with the best music of his day, that of Corelli, Handel, and Geminiani, select *adagios* from which he often played. Similar excellence marked the playing of Denis Hempson, the man to whom Mr Bunting was indebted for many of the airs in his collections. "His fingers lay over the strings in such a manner that, when he struck them with one finger, the other was instantly ready to stop the vibration, so that the *staccato* passages were heard in full perfection. * * His *staccato* and *legato* passages, double slurs, shakes, turns, graces, &c., comprised as great a range of execution as has ever been devised by the most modern improvers." The shake, which is so difficult on every species of harp, was performed by Arthur O'Neill with the greatest ease, and with such success, as Mr Seybold, a celebrated performer on the pedal harp, declared he should in vain endeavour to rival.

Hempson died in 1807, at the extraordinary age of 112, having been born in 1695. From a portrait of him in Mr Bunting's second volume, he seems to have been a tall meagre-faced man, with long grey hair, the very *beau-ideal* of the ancient minstrel. Having become blind at three years of age, he began at twelve to learn the harp under Bridget O'Cahan, for in these days women as well as men taught the instrument. The harp which two friendly gentlemen then bought for him, he retained to the close of his long life, calling it endearingly the Queen of Music. Hempson chiefly played the old music of Ireland; but, in later days, when he knew it to be little regarded, he shrunk, as already stated, from exposing it to common ears. In his younger days he had travelled through both Ireland and Scotland, and he used to relate anecdotes of his adventures. There was a certain Sir J. Campbell of Auchinbreck, who, having spent too freely, was at length reduced to live on a small weekly allowance. Hempson, hearing of this, and not liking to trouble a gentleman under such circumstances, passed his house without calling. The spirit of the old Highland gentleman rose at the indignity; a servant was dispatched to go after the harper, and bring him back. Sir James asked Hempson why he had not called, adding, "Sir, there never was a harper but yourself that passed the door of my father's house." To which Hempson answered, "that he had heard in the neighbourhood his honour was not often at home;" with which delicate evasion the baronet was satisfied. Hempson stated, "that this was the stoutest and highest-bred man he ever knew; if he were putting on a pair of new gloves, and one of them dropped on the floor (though over so clean), he would order the servant to bring another pair."

Being in Edinburgh in 1745, Hempson was introduced at the court of Holyrood, by Colonel Kelly of Roscommon and Sir Thomas Sheridan. He was called into the great hall to play; at first, he was alone; afterwards four fiddlers joined. The tune called for was "The king shall enjoy his own again." In rehearsing the anecdote, he used to sing a part of the words:—

"I hope to see the day,
When the Whigs shall run away,
And the king shall enjoy his own again."

A clergyman named Simpson visited Hempson in 1806, when he was one hundred and ten years old, at his cabin, where he lived with a cooper who had married his daughter. "I found him lying on his back in bed, near the fire; his family employed in the usual way; his harp under the bed-clothes, which also covered his face. When he heard my name, he started up (being already dressed), and seemed rejoiced to hear the sound of my voice, which, he said, he began to recollect. He asked for my children, whom I had brought to see him, and he felt them over and over; then, with tones of great affection, he blessed God that he had *seen* four generations of the name, and ended by giving the children his blessing. He then tuned his old time-beaten harp, his cronies and bedfellow, and played with astonishing justness and good taste. The tunes he played were his favourites; and he, with an elegance of manner, said, at the same time, 'I remember you have a fondness for music, and the tunes you need to ask for I have not forgotten,' which were Coolin, The dawning of the day, Aileen-a-Roon, &c." The only trace of mental debility which this gentleman found in the old harper, was a notion that *he* was the supporter of the family, and that his son-in-law, the cooper, was a spendthrift; both circumstances being the reverse of the fact. "As to his body, he has no inconvenience but that arising from a chronic disorder. His habits have ever been sober; his favourite drink, once beer, now milk and water; his diet chiefly potatoes." His last days were "made comfortable by the Rev. Sir Henry Harvey Bruce, from whose hand he was often literally fed. The day before his death, upon hearing that this gentleman had come to his cabin, he desired to be raised up in his bed, and the harp placed in his hands. Having struck some notes of a favourite strain, he sunk back, unable to proceed, taking his last adieu of an instrument which had been a companion, even in his sleeping hours, and was his

* The Ancient Music of Ireland, arranged for the Piano-Forte. To which is prefixed a Dissertation on the Irish Harp and Harpers; including an account of the old Melodies of Ireland. By Edward Bunting. Dublin: Hodges and Smith. 1840. 4to.

hourly solace through a life protracted to the longest span. His harp is preserved in Sir Henry's mansion, at Downhill, as a relic of its interesting owner."

We regret to learn from Mr Bunting, that, in the latter days, a considerable number of the harpers partook of the dissolute character of Eshlin Kane. Of this sort was Owen Keenan, who, notwithstanding his being blind, performed some rather singular frolics. At Killymoon, the residence of a Mr Stewart, he was detected, Romeo-like, mounting on a ladder to woo a French governess, and committed to Omagh jail. To pursue the story in the words of Mr Bunting: "There was at that time a very good harper, also blind, called Higgins, who was of a respectable family in Tyrawley, county Mayo, and who travelled in better style than most others of the fraternity; he, hearing of Keenan's mishap, posted down to Omagh, where his appearance and retinue readily procured him admission to the jail. The jailer was from home; his wife loved music and cordials; these harpers, too, knew how to humour the amiable weakness of one who had once been a beauty. The result may be imagined. The blind men stole the keys out of her pocket, while oppressed with love and music, made the turnkeys drunk, and, while Higgins stayed behind, like another Orpheus charming Cerberus with his lyre, Keenan 'marched out by moonlight merrily,' with Higgins's boy on his back, to guide him over a ford of the Strule, by which he took his route direct to Killymoon again, scaled the walls once more, and, finally, after another commitment for the 'ladder business,' as O'Neill calls it, carried off his Juliet, and married her."

The harp has not been allowed to decline in Ireland without various efforts being made to keep it alive. A Mr Dungan, resident in Copenhagen, conceived the idea of annual meetings, where prizes should be distributed; and such a meeting, accompanied by a ball, took place in 1781, in Mr Dungan's native town of Granard, in the county of Longford. Seven good harpers attended, and there were five hundred persons at the ball, which was held in the market-house. Perhaps one of the most characteristic circumstances was, that a Mr Burrowes, one of the stewards, and a good judge of music, was so angry at the decision of the premiums, that he *thrust his cane through one of the windows*. Two other meetings took place; but they then terminated in consequence of private jealousies. In 1792, another meeting of harpers was held at Belfast, when ten attended. This was the last. In 1807, the *Belfast Irish Harp Society* was established by private subscription, for the support of a teacher, and the tuition of a number of blind boys. The office of preceptor was conferred on Arthur O'Neill, who may be called the last of the old order, being a polite and well-informed person, as well as a very delightful performer: he died in 1818, at the age of eighty-five. The society fell to the ground for want of funds, after an existence of only four years. In 1819, another society was instituted, chiefly through the liberal subscriptions of Irish gentlemen in India, and a teacher was found in one Rainey, described as a nephew of the Scotch poet Burns, and a very good performer. At this time, there existed no harpers in Ireland who had not been pupils of O'Neill in the Belfast academy, so completely had the instrument ceased to be national. Few more years this last society has been in a declining state, and we are led by Mr Bunting to understand that it is now extinct. It has been found that the young men educated to the harp can only earn their livelihood by playing in hotels, which is apt to have a bad effect on their character; and the supporters of the society have adopted the notion that their money could be more usefully laid out on other charities. We feel most reluctant to accord with this view of the subject. If we could judge at all from one instance, we would say that an Irish harper may yet be a respectable person. A worthy representative of the fraternity, Mr Patrick Byrne, a pupil of the Belfast Academy, makes a livelihood by playing to parties at Leamington. He is a well-informed, modest, and agreeable man, of perfectly virtuous habits, as well as a delightful performer on his instrument. We had the great pleasure of hearing him about three years ago in Edinburgh, where he attended private parties for a moderate fee, and was generally esteemed. Why may not other blind youths be reared to the same walk in life, and conduct themselves with equal propriety? Any thing rather than that so beautiful an instrument should perish from the face of the earth.

Let it not be supposed that the Irish music may nevertheless be preserved and played on other instruments. No one who has heard the Irish harp could imagine such a thing. When we hear Sir John Stevenson's Irish Melodies played by a young lady on the piano-forte, or even on the pedal harp, we do not hear the same music which O'Cahan, Carolan, and Hempson played. It is as much altered as Homer in the translation of Pope. For the true presentment of this music to modern ears, we require the old sets as preserved in the volumes of Bunting, and the Irish harp played by an Irish harper. This instrument, it must be remembered, is of peculiar structure. It contains about thirty brass wires, the twang of which give the music a striking metallic brilliancy. The high notes are given with the left hand, reserving the more powerful member for the deep chords of the bass. There is moreover—at least so we found it in Mr Byrne's playing—a certain national accent, like the tone in speech, given to the music by the Irish performer, which every one must recognise as extremely interesting, both from its real beauty and from association.

In conclusion, we heartily recommend Mr Bunting's new work to general favour. To it must every one resort who would wish to become acquainted with "the dear, dear, sweet old Irish tunes."

THE EXQUISITE AT COVER.

[We copy the following *jeu d'esprit* from an article in the New York Mirror, November 23, 1839, purporting to be extracted from a forthcoming work, called "Hark-away, or Random of Flood and Field." We do not know whether the work has yet been issued, and therefore are unable to say who is the author or publisher.]

The impatient sportsmen, with palpitating hearts, surrounded the cover, holding tightened reins upon their ardent horses. All were watching for the glorious "break," with "Tally-ho!" ready to burst from every lunging tongue. The horses, with pricked ears and glaring eye-balls, pawed the ground and champed their bits with anticipation of delight.

The personification of tailors', hatters', and perfumers' advertisements, Mr Charles Olivier, seeing his friend Colonel Scourfield within a few yards, cantered his graceful galloway towards him.

"Ah! my dear colonel, how de doo?" inquired Mr Olivier, checking his curbing nag. "I never saw this animal called a fox. By what means shall I be enabled to distinguish it?"

"By his brush," briefly responded the colonel, with a smile.

"Brush! pray what *is* a brush?"

"A *tail*, my dear fellow—a tail resembling your well-trimmed whiskers round a broom-handle."

"How very odd!"

"You cannot mistake him; but surely you have no intention of following the hunt in that gear?" said the colonel, laughing.

"Gracious! No. The truth is, I was obliged to say last night that I had never seen a thing of this kind. It appeared Goth-like, and so I determined to venture this morning, and examine what is called, I believe, the *throw-off*; but *I've* no intention of being thrown off. Dear me! No. I abominate danger in all shapes," replied Mr Olivier, elegantly kissing his white glove to his friend, and cantering away. He had proceeded but a few yards, when he returned, and said, "If I should see the animal, what shall I say, colonel?"

"Not a word, if in cover."

"And if the creature comes out?"

"Halloo 'Tally-ho!' as loud as you can," replied the colonel, turning his horse's head away from Mr Olivier, leaving him alone to ponder upon his instructed duties.

The dress of Mr Olivier had any thing but the appearance of a fox-hunter's; a superfine black coat and prunella pumps not being generally donned for the casualties of the dashing chase. His steed was slight-limbed, showy, and high-spirited, but suited only to carry a lady—*or* Mr Charles Olivier, who was unaccustomed to flying gates, or scrambles through prickly hedges.

The hounds continued to drive the fox from one corner of the cover to the other, without effecting the desired *exit*. Reynard had no inclination to quit his quarters, although his enemies were in such unenviable proximity. Every now and then he would come to the verge of the wood and take a survey; but, disliking the appearance of the surrounding pink coats, in he popped again, much to the annoyance of many who flattered themselves that now "break" he must, and the view-hallos ready to escape died into a grumble of suppressed disappointment.

Every hound now pressed close to the fox, and it was certain that out he must come, or submit to the degrading fate of being "chopped"—killed upon his own hearth, without a meritorious struggle for life.

"Tilly-hoo-oo-oo, Tilly-hoe-oo-oo-oo!" to the astonishment of all, came evidently for a broad "Tally-ho!" from some novice with the view halloo.

"Fo'ard, fo'ard, fo'ard!" shouted the huntsman, galloping towards the spot, with a few of the hounds, from whence the sound came.

"Come away, come away!" bawled the whipper-in, cracking his whip for the remainder to leave the cover and join the huntsman.

The horn winded a cheering "Hark-forward!"—horses reared and danced with delight. "Hold hard," every body said; "let them get at it."

"Now for luck, and no checks," said one.

"He'll go for Sydenham earths," said another.

"Not he. The wind's wrong," suggested a third.

"A cool hundred that he makes for Ealing," a fourth offered to bet.

The huntsman arrived at the place where "Tilly-hoe-oo" proceeded from, and there sat Mr Charles Olivier, perseveringly chanting "Tilly-hoe." An observation about "a poet sometimes points out the road," undoubtedly came from the lips of the old huntsman as he saw the source from whence it came. Rising in his stirrups, he took off his cap and cheered the hounds to pick up the scent.

Wagging their tails, they snuffed the earth with distended nostrils, but no response was given. They ran to and fro, each endeavouring "to snatch the track, and lead the willing pack," but all to no purpose.

"Where did he break, sir?" inquired the huntsman, puzzled by the hounds being at fault.

"Gracious me! Close where you stand, the animal jumped out," replied Mr Charles Olivier, with a confidential air.

Again the hounds were tried, but in vain. No scent could be found.

"Point out the exact spot, Olivier," said Colonel Scourfield.

"Gracious me! Why, there the creature is *now*."

"Where—where—where?" was shouted in every direction.

Mr Charles Olivier placed his glass quietly to his right eye, and, pointing to the topmost branch of a lofty elm, said,

"There it is—I knew him by his tail."

Who shall describe the horror, the astonishment, and disgust of all, upon obeying the direction of the pointed finger, at seeing a squirrel, with his bushy tail curled over his head, peeping at the scene below with indubitable pleasure "at being above all danger."

Laughs, groans, and hisses, proceeded from every quarter. Mr Charles Olivier began to suspect that he had committed some mistake; but, conceiving it politic to appear cool and collected under any accidents or awkwardness, he, with admirable *sang froid*, continued to look at the "animal," and occasionally observe that he recognised him by his tail.

"Flog him off!" "Duck him in a horse-pond!" "Go home!" "Get your nurse to come with you next time!" Such were the various little pleasant suggestions from the enraged sportsmen, at being subjected to the grievous disappointment occasioned by Mr Charles Olivier's ignorance of natural history.

With fears, which were very excusable under the circumstances, the mistaken innocent felt that he was one too many. If in carving a goose the ill-shaped bird had glided into the lap of the fairest creature in the world, Mr Charles Olivier could have imitated that refined personage who said, upon an occasion of the kind, "Madam, I'll trouble you for that goose." He could even have added, "Pray, don't apologise; such trifles *will* occur." However collected he would have been under such a trying ordeal, Mr Olivier could not appear so comfortable under the present. "Flogging" and "horse-pond" possessed so much of the nerve-agitating system, that, with chattering teeth, he looked beseechingly, and requested "to be heard."

"Hear him, hear him!" cried the majority, laughing.

"No, no! Duck him—duck him!" shouted others, among whom the huntsman's voice was the loudest.

As the reporters say, after a noisy squabble in the house, "order was restored," and Mr Olivier then commenced:—

"Gentlemen, I certainly have mistaken an animal which I learn to be a squirrel, *for* a fox. I asked my friend, Colonel Scourfield, how I should know the fox—that is, by what feature—and he said" ——

"What did I say?" sharply interrupted his friend, disliking the appeal.

"By his tail, my dear colonel, you certainly said," replied Mr Olivier, with praiseworthy decision.

Bursts of laughter.

"*As if* a fox had a tail," said the old huntsman.

"I presume, by that observation, that the animal is without a tail. That is no fault of mine. I was informed by the colonel that the creature had a brush. The colonel also stated that I could not but know the animal, although I informed him that I had no idea of the creature's form; for his brush or tail, which appear to be synonymous, have a strong resemblance to one's whiskers round a broom-handle" ——

Roars of continued laughter.

"Now, gentlemen, you must admit a strong resemblance exists between that little creature's bushy tail and my whiskers, both in shape and colour," said Mr Charles Olivier with a triumphant smile, pointing to the exalted squirrel.

After loud mirth for some minutes, it was unanimously decided that the speaker had satisfactorily justified himself. The sportsmen good-humouredly shook Mr Olivier by the hand, rather too roughly, perhaps, for his delicate fingers, and some said with courtesy that they'd "back him against the parson for an argument."

"Try-back, try-back," hallooed the huntsman, and away the hounds went to pick up the lost scent. "Hark! back, Musical—hark back, I tell ye!"—off galloped the old favourite leader to obey the mandate. In a few moments "Tally-ho" rang from a corner of the cover, from which burst a splendid fox, closely followed by the crying Musical.

"Fo'ard, hark fo'ard—hark to Musical!" shouted the huntsman. The horn was blown; the whipper-in hurried on with the tail hounds, and, in an instant, on rushed the panting and pursued—the many for sport, the one for life.

"Gracious me! Be quiet," said Mr Charles Olivier to his courser, as the animal caught some of the enthusiasm of the sport. "I certainly—shall—not be able to hold him." Our hero was correct in this opinion; for his horse pulled upon his hands, unused to exertion, so violently that, after a few useless struggles, he followed his own inclination by galloping after the others, to the great discomfiture of his rider.

"What shall I do?—what shall I do? He surely will not attempt to leap that wall!" exclaimed Charles Olivier, as they neared one of tolerable altitude. Still the resolute horse approached it with a determined manner. "Heavens! I certainly shall be off!" said the rider, clinging to the pommel of the saddle with pertinacity; "I certainly shall!" They were within

Digitized by Google

a few strides of the wall, when the horse's ideas corresponded with his master's, that he should not attempt it. Throwing himself suddenly upon his hocks, the careful animal succeeded in preventing any accident to himself by stopping on the right side of the barrier. This quick decision, however, did not hinder Mr Charles Olivier from enjoying a leap. The impetus had the effect of sending him in a straight line over the horse's ears—clean over the wall, like the stick of a rocket, head-foremost into a duck-pond on the opposite side.

Crash, splash, went the luckless horseman—quack, quack, quack, screamed the ducks. "Gracious me!" bubbled from the lips of Mr Charles Olivier, as he crawled from the water and the mire; "I—I—I never will see another fox-hunt as long as I breathe."

STEAM-CARRIAGES OF M. DIETZ.

THE attempts to run steam-carriages on common roads in this country have generally failed in practice, chiefly, we believe, from the injury caused to the machinery by jolting over the ordinary rough materials of which our thoroughfares are composed, and the great expense for fuel. Lately, as we understand from the newspapers, a steam-carriage, the invention of Colonel Macerone, has been successfully run in experimental trips in the neighbourhood of London; and, according to the French press, similar success has attended the running of steam-carriages, the invention of a M. Dietz, in the neighbourhood of Paris. While attention is directed to this subject, it may be useful to offer a few particulars respecting M. Deitz's carriages, from the Reports of the Academy of Sciences and Academy of Industry.

M. Dietz's carriage has eight wheels, two of which are larger than the other six, and give the impulsion. The six smaller wheels rise and fall according to the irregularity of the ground, and at the same time assist in bearing the weight of the carriage, and in equalising its pressure, &c. The wheels, instead of having iron tires, are bound with wood, under which there is a lining of cork, in order still further to deaden the noise and prevent shocks which would otherwise derange the mechanism of the carriage. This wooden binding is secured by an iron circle, which does not touch the ground, and is so contrived as to be exceedingly durable. Another improvement of M. Dietz is a mechanism by which all the carriages of the train which are drawn by the engine (for he does not propose to carry either goods or passengers in the steam-carriage itself) are made to follow in the precise line of the wheels of the steam-carriage, which is so regulated by the six smaller or flexible wheels, acted upon by an endless pulley chain, that they describe any curve at the will of the conductor. Of the moving power of the engine, the report of the Academy of Industry says, "According to Colonel Macerone, whose calculations are not far from the truth, it appears certain, 1st, that to draw a weight along an iron railway, in a horizontal line, requires a force equal to a two hundred and fortieth part of the weight to be moved; 2dly, that to move this weight along a horizontal line, the force of traction must be carried to a twelfth of this weight; 3dly, that to move this weight upon a common road, with a rise of one foot in twelve, or eight degrees, which appears to be the greatest ascent accomplished by any of the diligences in France, the force of traction, whether on an iron railway or on common roads, must be augmented by one-twelfth of the total weight beyond what would be necessary on a horizontal line. It results, therefore, that it is not necessary on common roads to do more than double the power of traction for an elevation of eight degrees on common roads, whereas on a railway we must not merely double the primitive force, but add to it a power equivalent to a twelfth of the weight which is to be set in action. To fulfil the first condition, M. Dietz, proposing to draw only from thirty to forty thousand pounds, has made his engine of thirty horse power, calculating the power of traction of the horse at one hundred and fifty pounds at a speed of two hundred feet per minute; consequently, he has a force capable of surmounting every obstacle, and is at the same time able in case of necessity to double the power by a simple combination of pulleys."

The report then goes on to enumerate the arrangements made by the inventor for the regular supply of steam by the conductor, so as to increase or diminish it instantaneously, according to the nature of the ground, and for checking the engine at its greatest speed without shock or danger. In this description, however, there is little new to the English reader who has turned his attention to the construction of steam-carriages on common roads in England. The great merit of the invention of M. Dietz is avoiding the expensive repairs which have hitherto been the greatest obstacle to the use of steam-carriages on the common roads in England. A commission from each academy accompanied M. Dietz in one of his experimental journeys from Paris to St Germain, and report that it was performed at the rate of ten miles an hour, and that the hill between the Pecq and St Germain, which is one of the steepest within twenty miles of Paris, was ascended in less time than is occupied by the diligence. They state, also, that when the steam-carriage was compelled to deviate from the paved road to the unpaved sides, the return was accomplished without difficulty or danger, by the ingenious contrivance of the extra wheels, which kept the engine in the equilibrium. This principle does not indeed apply to the carriages of the train; but as they are so constructed as to present little danger of upsetting, the deficiency is of no importance; and if it were found to be so, it would be very easy to extend the principle to the whole of them. The power of returning without danger from the sides of the road to the pavement, is one of great value in France, for nine accidents out of ten which happen in the ordinary coach-travelling, arise from the difficulty of regaining the *pavé*, without losing the equilibrium. On many roads the *pavé* is too narrow for two diligences to run abreast, and when they meet each other, one of the two, if not both, must deviate a little from the centre. The *pavé* is very much rounded for the purpose of keeping it dry; and in winter the sides of the road are loose and rotten, so that the wheels sink several inches below the edge of the paved portion of the road. The danger, therefore, in regaining it is very great. If M. Dietz had not obviated it by his ingenious contrivance, not only would his machinery be subject to shocks, which would render frequent repairs necessary, but the engine itself would be very liable to upset.

All the evidence, as far as it goes, appears favourable to the invention of M. Dietz; but the proof of its utility, as in all such cases, is still to be given by carrying the invention into *practical* and *daily* operation.

THE RETURN.

[BY MRS HEMANS.]

"Art thou come with the heart of thy childhood back,
The free, the pure, the kind?"
So murmured the trees in my homeward track,
As they played to the mountain wind.
"Hast thou been true to thine early love?"
Whispered my native streams,
"Doth the spirit reared amidst hill and grove,
Still revere its first high dreams?"
"Hast thou borne in thy bosom the holy prayer
Of the child in his parent halls?"
Thus breathed a voice on the thrilling air,
From the old ancestral walls.
"Has thou kept thy faith with the faithful dead,
Whose place of rest is nigh?
With the father's blessing o'er thee shed?
With the mother's trusting eye?"
Then my tears gush'd forth in sudden rain,
As I answered—"Oh, ye shades!
I bring not my childhood's heart again
To the freedom of your glades!
I have turn'd from my first pure love aside,
Oh, bright rejoicing streams!
Light after light in my soul hath died,
The early, glorious dreams!
And the holy prayer from my thoughts hath pass'd,
The prayer at my mother's knee—
Darken'd and troubled I come at last,
Thou home of my boyish glee!
But I bear from my childhood a gift of tears,
To soften and atone;
And, oh, ye scenes of those blessed years!
They shall make me again your own."

—*Works of Mrs Hemans.*

ALL DIFFICULTIES MAY BE OVERCOME.

There are few difficulties that hold out against real attacks; they fly, like the visible horizon, before those who advance. A passionate desire and unwearied will can perform impossibilities, or what seem to be such to the cold and the feeble. If we do but go on, some unseen path will open upon the hills. We must not allow ourselves to be discouraged by the apparent disproportion between the result of single efforts and the magnitude of the obstacles to be encountered. Nothing good or great is to be obtained without courage and industry; but courage and industry might have sunk in despair, and the world must have remained unornamented and unimproved, if men had nicely compared the effect of a single stroke of the chisel with the pyramid to be raised, or of a single impression of the spade with the mountain to be levelled. All exertion, too, is in itself delightful, and active amusements seldom tire us. Helvetius owns that he could hardly listen to a concert for two hours, though he could play on an instrument all day long. The chase, we know, has always been the favourite amusement of kings and nobles. Not only fame and fortune, but pleasure, is to be earned. Efforts, it must not be forgotten, are as indispensable as desires. The globe is not to be circumnavigated by one wind. We should never do nothing. "It is better to wear out than to rust out," says Bishop Cumberland. "There will be time enough to repose in the grave," said Nicole to Pascal. In truth, the proper rest for man is change of occupation. As a young man, you should be mindful of the unspeakable importance of early industry, since in youth habits are easily formed, and there is time to recover from defects. An Italian sonnet, justly as well as elegantly, compares procrastination to the folly of a traveller who pursues a brook till it widens into a river, and is lost in the sea. The toils as well as risks of an active life are commonly overrated, so much may be done by the diligent use of ordinary opportunities; but they must not always be waited for. We must not only strike the iron while it is hot, but till "it is made hot." Herschel, the great astronomer, declares that ninety or one hundred hours, clear enough for observations, cannot be called an unproductive year. The lazy, the dissipated, and the fearful, should patiently see the active and the bold pass them in the course. They must bring down their pretensions to the level of their talents. Those who have not energy to work must learn to be humble, and should not vainly hope to unite the incompatible enjoyments of indolence and enterprise, of ambition and self-indulgence. I trust that my young friends will never attempt to reconcile them.—*Sharp's Letters and Essays.*

EDITORIAL NOTE.

ORIGINALITY OF THE JOURNAL.

WE lately received a letter from Newcastle, containing, first, the general inquiry whether the articles at the beginning of the various numbers of the Journal were generally our own, and contained our own opinions, or were copied, and, next, the special inquiry (supposing we did not choose to answer the first), if the article at the beginning of No. 445 were original. Could there be any doubt more mortifying to a poor labourer in the field of letters than what is here expressed? For eight years and upwards we have been leading a life of incessant toil, composing literary articles of various kinds, some of them descriptive, in a novel style, of society and manners in the middle ranks, others philosophical and scientific, the very least important being careful compilations, often from not very accessible sources; and, after all, "a reader," a person who has perhaps seen every number of the work as yet published, is not sure but that our very best, or at least most elaborate, papers are taken without acknowledgment from some other work. The results of a lifetime spent chiefly in study, and in industrious observation of human character, have been diffused throughout the 450 numbers of this work, not to speak of the many articles arising from the special labour of the time when they were composed; and, after all, it is surmised that the whole work is as much a compilation as a school collection. Three individuals spend nearly their whole time in preparing the work, and there are occasional contributions by others; many single papers requiring, for the collection of information, the composition, and the correction, three, four, and five days; and, when all this pains is taken by so many persons to produce a work sold far beneath any former standard of price, the reader languidly asks if we ever give anything original! If we were of the stuff to be disheartened by anything, we might certainly be so on thus learning that our labours are only remunerative in a business point of view, but do nothing in the way of creating confidence or respect, so that merely because we publish in a limited quantity at a limited price, we are supposed capable of, week after week, and year after year, holding forth selected matter with the usual appearances of that which is original.

It is not of course likely that *all* our readers are under the very disrespectful impression which seems to affect our Newcastle correspondent. But, from other revelations made to us, we fear that it is the belief of a great number, or at least that many are habitually doubtful of the originality of many of the articles presented without marks of quotation in the Journal. For instance, we were lately asked by a lady in London, who reads our Journal regularly, "from what book of Mrs Hall's it was that we extracted her very pretty tales;" and she was very much surprised to be told that the tales were original, being written expressly for our work, and paid for accordingly. It now therefore becomes necessary to reiterate a statement more than once made, that all the articles of the Journal are really and truly original composition, excepting in the comparatively rare instances where it is otherwise expressed—in other words, *every article is original which is not marked as extracted or selected matter.* A little reflection on the very extensive circulation of the work (72,000) should banish the false notion that, because the Journal is cheap, it cannot be composed in any part of original matter: it ought to be seen that its cheapness, leading to such an extraordinary sale, is, above all other things, the reason for its containing original matter, and that of the best kind which money can procure in the country.

We trust that no one will do us the further injustice to suppose, from what is here said, that we are unduly anxious on the score of literary reputation. We might point to the whole history of this work, its being scarcely ever advertised, its rare allusions to its editors or writers, the anonymity of all its articles, and its unswerving adherence to its original plan, for proof that this has been a matter to which little attention has been paid. At the same time it could not but appear to us extremely hard, if a labour which, more than any other, exhausts the human energies, and which, to be pursued in an efficient manner, calls for nearly a complete denial of all those social pleasures which the humblest enjoy, were to pass for a long series of years altogether unappreciated by those who may be presumed to profit by it.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 452. SATURDAY, SEPTEMBER 26, 1840. PRICE THREE HALFPENCE.

"THE WORLD."

THERE is a great number of charges of old standing against the world, from which each accuser regularly excepts himself. For instance, it is *a very censorious world*. So you will find your friend Mrs Thompson calling it every day in her life, seeing that she is a widow upon whom many set eyes of watchfulness, lest some day she should steal unperceived into a second matrimonial engagement. Mrs Thompson does not recollect that she occasionally takes observations of the goings on of the Misses Smith, a band of young milliners, who live in a third floor opposite to her. Were you to call upon these same Misses Smith, you would probably find them also complaining that it is a censorious world—meaning that they feel themselves exposed to Mrs Thompson's observation, but altogether unconscious that they talk nothing but scandal for at least three hours every day. So also Mrs Thompson speaks of it as *an evil-thinking world*, the worst construction being put by it upon every thing that is not quite as clear as daylight. She means that she has heard of her attentions to Mrs Johnson, who has so many fine young sons, being misunderstood. She does not say anything of her having conjectured that her maid Sukey was keeping improper company, in consequence of seeing her walking one day with a young man, who proved to be her brother, a sailor newly returned from a long voyage.

The world is also *a cold and heartless world*. Every one becomes convinced of this, when, falling into a few trifling difficulties, he goes about making an endeavour to borrow a hundred pounds. Mr Peregrine Harmnone was in these circumstances, and thought he had nothing more to do than to call on his friends Wilson and Jackson for the amount. But his friends had no money to spare. He forthwith declaimed against the heartlessness of the world, altogether forgetting that, when poor Robson applied to him last year for a like favour, he found himself unfortunately very low in account with his banker. So also, when Mr Abraham Sandy, merchant in Liverpool, failed in business, and applied to a few houses with which he used to be on very good terms, for renewed credit, he found himself rather coolly received, and his orders civilly declined. Remembering how friendly the partners in all those cases had once been, he began to talk of the heartlessness of the world, never once adverting to the fact that, not six months before, he had declined being a security for a credit to his own brother-in-law. Mr Sandy's daughters, finding he was unable to recommence business, very properly resolved to be no burden to him; but a year had not elapsed before they also began to talk of the coldness and heartlessness of the world, having found that, as family instructresses amongst strangers, they were not objects of so flattering a regard as they had been when they were thought to be young ladies of fortune, and dispensed the hospitalities of their father's elegant home. It quite escaped the recollection of these young ladies that, when an orphan cousin of theirs came a few years before to live with them, they had not been more than sufficiently kind to her, always taking care to let gentlemen know that she was only a person whom their father had been pleased to take into his house, because she had been left without a penny, and also taking specially good care that she never accompanied them to the balls at which they showed off amongst the gayest of the gay. Mr Sandy now lived in a poor lodging, where he was never visited by any of the friends who used to be delighted to wait upon him at his handsome villa two miles out of town. The world, he sighed to think, was but a summer friend. All was well so long as he could give good entertainments. He was then a man of some account. It was a matter of pride to most to have it to say that they had been at his parties. But now where were all those swallow-like friends!—all gone! Alas, what is friendship! he thought—

> "A shade that follows wealth and fame,
> But leaves the wretch to weep."

Mr Sandy did not remember that, after his friend Major Tomkins lost nearly all his Indian fortune by the failure of a Calcutta bank, and ceased to give dinners, he almost forgot that there was such a person in the world, although the major had oftener than once insinuated how happy he should be to see him and his daughters over a quiet game at whist.

The world is *a very deceitful world*. Mrs Higgins became deeply impressed with this idea, when she discovered that Miss Tims, who had come about her as a friend for several years, and seemed sincerely attached to her, made a practice of telling all her secrets and ridiculing her in every point. Mrs Higgins forgot that she had not a single friend about whose faults she did not speak quite candidly, on all occasions when they were not themselves present. *The world is also very envious*. Mr Dobson, of the —— Custom-house, found it so, when he ascended to the dignity of comptroller, forgetting that he had himself envied his predecessor in the office for the better part of twenty years. The same sentiment was deeply impressed on Mrs Dobson, when she heard that her new gown of gros-de-Naples had been spitefully spoken of by her old friend Mrs Pyne; Mrs Dobson being totally oblivious that, during the days of her humbler fortune, she had never seen a single dress of superior elegance at church, which she did not think would be far more suitable on herself than on the person who wore it. Amongst all the bad qualities, however, that attach to the world, in the eyes of all but the speakers, there is none so much spoken of as its *ingratitude*. This is one of the most notorious of its alleged failings. Instances are here out of the question. Ask any one if he ever finds any gratitude on earth, and he will answer in the negative, making only a mental exception in favour of himself, whom he believes to be wholly incapable of so black an offence as that of forgetting or wilfully overlooking a kind turn or benefaction from a neighbour.

There surely is some strange falsity at the bottom of these common forms of speech. It is not, of course, to be denied that censoriousness, evil thinking, deceitfulness, envy, and other such bad things, exist, and that to a considerable extent. It is also by no means uncommon to see reduced merchants sink in credit, and impoverished families cease to be so much courted as they were in the days of their prosperity. But the vices of censoriousness, deceitfulness, envy, &c., are faults which beset human nature in general; the impoverished decline into the condition of those who were always poor, by an irresistible tendency in our social system; and if there is not much gratitude in the world, may it not be owing to this—that when favours are conferred, there is usually an expectation of future deference, against which some principle common to all obliged parties hastens to rebel, and which is therefore never to be satisfied? Such faults, as far as they are faults, attach to all. Let almost any human being be in the circumstances proper for bringing them out, and out they will come. They are sentiments and acts liable to occur when human beings are in a certain relation to each other, and which no one can hope altogether to avoid. How strange, then, for any one person to speak of them as things attaching to all besides himself!

There are some other ways of talking of the world, which seem not quite free from similar absurdity. One often hears of its being difficult to "get on in the world." Now, the world is a common good, of which every person gets a share proportioned to his abilities, industry, the judgment he may have exercised in selecting a branch of employment, and the accidents of fortune to which he, like all other persons, is liable. If any individual, therefore, finds more than the usual difficulty, it must be from some inconsistency between these things and the extent of his wishes. He has had the same chance as the rest; his woes and weals, his fortunes and misfortunes, are exactly such as would have befallen any other person in precisely the same circumstances, and with precisely the same qualities as himself. He has therefore no right cause to find fault with the world, though it may be quite possible that, if he were carefully to inquire, he might find some in the history of his own actings with regard to circumstances, or his expectations and desires, as contrasted with what his abilities and fortune have brought to him. Again, it is not uncommon, when some instance of over-reaching is mentioned, to hear the remark, "Ay, it is the way of the world." There is here either a very loose observation of human nature, great prejudice, or an indifference to moral actions, for such things are only the way of a part of the world, and that but a small part, in most enlightened countries. Every one must have remarked how different minds consider the spirit of the world in various lights, according to the bent of their own nature. The ardent divine deems it a spirit indifferent to religion. The indifferent think it fanatical and bigoted. Morose and reserved persons consider it as given up to gaiety and frivolity. The gay are perpetually complaining that it is dull and stupid. The refined and unselfish think it sordid. No one of these suppositions is entirely true; they are only true in some part. They would never be affirmed as wholly true, were it not for certain habitual feelings in the minds of those who affirm them. The human mind is a cluster of various faculties, each of which seeks in the world for its appropriate gratification; and the employments of men are still more various than their faculties. Amidst such a bewildering variety of thoughts, desires, and actions, how can any one say that the spirit of the world is of any one special character whatever? Yet, attributing general characteristics to the world is a thing of daily occurrence. We lately read somewhere, that if Walter Scott had not had the ambition to be a great man "of the world's kind," he might have ended his life more happily. What can be the meaning of this? How could any one be what is called great, without having the praises of a pretty large section (at least) of the world. If it were said that the great novelist aimed too exclusively at being a man of wealth and title, the remark would be just, for such certainly was a fatal ambition in Scott. But if this is what is meant by being a great man after the world's fashion, we would deny the justice of the remark. The admiration or greatness which Scott acquired by literature was so much more than any he could gain by merely being a baronet and the owner of an estate, that the two are not worthy of being spoken of in the same day. For one that would have admired the greatness of a Roxburghshire country gentleman, there must have been thousands to admire the unprecedented novelist. We would therefore deny that it was the world's kind of greatness which he aimed at, but only that of a limited class in a limited district.

Upon the whole, there is extremely little rationality in sweeping charges, or depreciatory expressions,

Digitized by Google

respecting the world. Were the speaker a stamped supernatural, addressing others privileged like himself, it might be proper for him to comment in this way on the natural, for then we should suppose him to have a pedestal apart from the globe, and eyes gifted to see, and an understanding fitted to estimate, the errors of the poor creatures who crawl over it. But for one of these very creatures to stand up amidst the congregation of his equals, and pretend to affix characters upon them from which he presumes himself to be the only one who is exempt—every one present having as good a right to do so as himself—strikes us as a conceit of the most inordinate kind. It might be very amusingly burlesqued by supposing a single letter of the alphabet falling into a contempt for the rest—A, for instance, complaining of all besides himself as a set of censorious, hard-hearted, envious, or ungrateful wretches; B next complaining of A, C, D, &c.; then C complaining of A, B, D, E, &c.; so that, in the long run, all would have been complainers, and all complained against by the rest. Or we might suppose a jail-full of sheep-stealers, all equally guilty, where each in turn took another aside, and remarked, in a confidential whisper, that really it was a sad set of scamps they had fallen amongst. The absurdity is in the attempt to suppose two things, a judge and something to be judged, where in reality no judging power exists, but all are criminals alike. Surely nothing but the self-love which is at the bottom of this and so many other errors, could lead a human being into such a ridiculous position.

The position is perhaps not ridiculous only. A practice of thinking and speaking of the world external to ourselves as being in any way bad, must necessarily prevent us from seeing our own faults, and addressing ourselves to the all-important business of correcting them. It may also tend to engender and support a contempt of our fellow-creatures, than which there is scarcely any state of mind more opposed to true goodness. On the other hand, in candidly attributing such faults to human nature at large, and thus including ourselves, we may be presumed to be in the way of feeling our own fallibility and unworthiness, and, feeling it, to aspire after our improvement, at the same time that, conscious of our own liability to blame, we learn to touch gently and tenderly on the special faults of our neighbours.

POPULAR INFORMATION ON COMMERCIAL ECONOMY.

NATURE OF COMMERCE.

Man has been defined by some naturalists as an *exchanging animal*—an animal who buys and sells, that being a thing performed by no other living creature, and therefore suitable as a distinction in character, though others, much more exalted, might readily be found. The practice of exchanging one commodity for another is doubtless coeval with the first herding of mankind together. No man, even in the rudest savage state, and who lives in the society of neighbours, can rest satisfied with such objects as he can procure or fashion by his own labour. He must depend on others for assistance, while he assists them in return. The cultivator of the ground would exchange some of its produce for an animal from the flocks of his neighbour; and both would be glad to give a portion of their wealth for the clothing or weapons made by a third party. Thus, *exchanging* becomes a matter of convenience between two parties, each of whom is anxious to obtain a share of the other's goods for a share of his own, and a mutual advantage is the result. Such desires and practices must have been displayed in the very earliest stages of society. No nation of African or Indian savages is ever found without a strong inclination to exchange the rude products of their country for the articles possessed by the traveller; an ox or sheep being perhaps eagerly offered by them for a single needle, a nail, or a small toy looking-glass.

As mankind advance in their social condition, the practice of exchanging increases; the desires and necessities become more urgent; each person finds it more profitable and agreeable to adopt and hold by one fixed employment, and to sell the produce of his labour for a variety of articles made by others, than to attempt to make every thing for himself; and, finally, for the sake of convenience, a class of persons are engaged to conduct the exchanges from one hand to another. In this improved condition, the production of articles of general consumption is called *manufacturing;* while that department of industry in which the exchanging is transacted is called *trade* or *commerce*. For still further convenience, the business of exchanging is committed to several orders of traders—the wholesale merchants, who in the first instance purchase large quantities of goods from the producers; the retail dealers, who have been supplied in smaller quantities from the merchants, and sell individual articles or minute portions to the public; and to these sometimes an intermediate dealer is added. In this manner the transfer from the workshop of the manufacturer to the house of the actual consumer is interrupted by several distinct processes of exchange, in which each seller obtains a certain profit at the expense of the person who has ultimately to buy and use the article. It is a principle of trade, that the fewer hands through which any article is made to pass, the better for the consumer, because the article can be brought with the least burden of profits, or at the lowest price, into general use. But this principle, sound as it is in the abstract, is counteracted by another which must on no account be lost sight of. This is the principle of *convenience*. A manufacturer engaged deeply in his own pursuits finds it more profitable and agreeable to sell his articles in large than small quantities. The maker of millions of yards of cloth has no time to spend in selling single yards. If he were compelled to sell by retail, he would have no time to conduct his affairs; he could manufacture only a small quantity, and, therefore, being limited in his amount of produce and sales, he must take larger profits. Thus, upon the whole, it is much better for all concerned to allow the manufacturer to pursue his own way in selling only very large quantities to wholesale merchants. To these traders the same rule may be applied. They seek out the seats of manufacture; and, purchasing a large variety of goods, they send them to the towns and places where they are required by the public, and there the articles can be had individually from a shop. It is evident that if any man wish to buy a handkerchief, he may procure it much more cheaply from any shop in which such things are sold at an advance upon the original cost, than if he were to travel perhaps hundreds of miles to the house of the manufacturer, and there make the purchase. The use of an intermediate class to conduct exchanges is thus very conspicuous; and any attempt to revert, generally, to the original practice of causing the maker to deal with the consumer, would be entirely incompatible with an enlarged system of trade between different countries, or even between different places in the same country. We say generally, because there are instances in which makers may, with advantage to themselves and the community, sell their produce in small quantities or single articles to the public; but these are exceptions to a common rule.

Convenience, it is evident, forms a guiding principle of trade, and requires the same consideration as the actual value of an article. This, however, has been recognised only in very recent times. At one period there were laws to prevent farmers from selling their grain in a large quantity or by the lump, without exposing it in an open market. Such laws were manifestly unjust. They interfered with the liberty of the farmer, who in his capacity of manufacturer had surely a right to sell his produce in whichever way he felt it to be most for his advantage. It would be the same kind of injustice, if the law were to prevent a manufacturer of handkerchiefs from selling them at his own workshop to wholesale dealers, and causing him to take them many miles to a certain street in a certain town, and there expose them for sale in small lots to the public. It is of the greatest importance in matters of trade and commerce *never to interfere in any shape to prevent men from dealing in whatever manner appears most beneficial and convenient to themselves, provided it be conformable with strict justice*. By being left to consult their own inclinations, the public in the end, though probably in a way not easily recognisable by an unreflecting mind, reaps the advantage.

Commerce, by which we comprehend traffic carried on at home or with foreign countries, is of great antiquity, and, both in the earliest times and in our own day, has been one of the principal engines of civilisation. Among the industrious nations which at a remote period of history were planted on the borders of the Mediterranean Sea, it became a means of spreading knowledge in the interior of Asia, and many parts of Africa and Europe. Unfortunately, the intelligence which was so disseminated was afterwards obliterated by the overruling powers of barbarous and warlike nations; but the efficacy of commerce in modern times is likely to be permanent wherever its influence is extended, seeing that the greatest manufacturing and mercantile people are at the same time the most powerful and most capable of offering protection to those who sustain a commercial intercourse with them. It is exceedingly pleasing thus to reflect on what commerce is capable of effecting, independent of the actual comfort which it produces, wherever it is fairly introduced. By its appeals to the selfishness, the vanity, and other passions, good and bad, of mankind, it appears to be the best of all forerunners to the efforts of the schoolmaster and the missionary. Its influence in this respect has been remarkably exemplified in the boundless regions of Hindostan, which, by the efforts of a company of merchants, have been laid open to the settlement of enlightened men from Europe, who, though by slow degrees, will ultimately spread the blessings of education, and the decencies of social life, among many millions of human beings. In the remote islands in the Pacific Ocean, the influence of commerce has been recently of marked utility. The introduction of articles of a fanciful nature, both for the ornamenting and covering of the person, has induced a desire of following European manners and customs; and as these commodities cannot be procured but by the exchange of native commodities, a spirit of industry has consequently been produced, which cannot fail to be of both moral and physical advantage to the natives. It is always thus with the intercourse which commerce necessarily involves. New tastes are created, and to be gratified, industry must be exerted. But to witness the extraordinary influence of commerce in producing civilised and refined habits, we need not look beyond our own country. Commerce, in this its chosen seat, has caused roads every where to be cut, canals to be opened, railways to be formed, expeditious modes of travelling by sea and land to be effected; all of which great accessories to our comfort have tended in the most wonderful manner to introduce not only useful commodities and personal luxuries, but highly cultivated sentiments, literature, and the arts, into districts which at no distant period lay in a comparatively primitive condition. The intercourse which commerce in this manner requires, is the grand lever which, it is apparent, must in the first place be employed to lift the load of ignorance from off the natives of Africa; and when this lever is properly insinuated, the way will soon be prepared for the introduction of those measures of melioration which philanthropists so anxiously design.

It is obvious that this scheme of mutual interchange among nations of the commodities which they respectively produce, is agreeable to every rational principle, and must have been designed by a wise Providence for the universal benefit of his creatures. In order that manufactures may be produced, and commerce brought in to disseminate them both at home and abroad where they are wanted, no species of legislative enactment is requisite either to encourage or direct. The law which governs production and consumption is a law of nature—it is the overruling principle of *self-interest*, by which only that quantity of manufactures is produced which can be advantageously disposed of, and only those commodities purchased and consumed which the wants of individuals require. And it is very certain that this principle of self-interest, if allowed free scope, is uniformly and sufficiently competent to regulate both the production and consumption of commodities, to a degree more nice and satisfactory than could be attained by the best-devised statutes which the wisest legislators could enact. The grand principle, therefore, which can alone regulate commerce and manufactures, is found in the natural passion for gain; and the sole essential requisite for the successful advancement of mercantile and manufacturing industry and wealth among the people, is for the people to be let alone.

Evident as these principles must be to all who have any knowledge of social life, they have, either from ignorance or some other cause, been generally lost sight of. To such an extent have regulating and restrictive laws been carried in some countries, that they have nearly annihilated both manufactures and legitimate commerce, and in all cases they greatly impede them. It is, for instance, customary to impose duties on goods imported from foreign countries, with the view of protecting the manufacturers of such articles in the country to which they are brought; but this only benefits a class, or a few persons, at the expense of the whole community. Let us suppose a case. There is a country called A, in which shoes may be bought for five shillings a-pair, and another country called B, in which they cost ten shillings a-pair. The people of B would in this case be glad to buy their shoes for five shillings a-pair from the shoemakers of A, but the shoemakers of B interfere, and say—"No, you shall continue to buy our shoes at ten shillings a-pair, and no others;" and to make sure, they get a protective law passed, by which all shoes coming from A to B shall be loaded with five shillings a-pair of duty. After this, the people of B give themselves no trouble to import shoes from A; they go on paying double the value for all the shoes they wear, and all to please the small set of persons who are engaged in the trade. By being thus stripped of five shillings in the acquisition of every pair of shoes, the purchaser, it will be observed, is in reality deprived of a large share of his earnings, and is thereby prevented from buying many other things that he requires for himself and family. It is quite possible, that the shoemakers of B will argue in justification of the monopoly, that they themselves are compelled to pay high duties on all the articles they consume, and that therefore they require protection. But this is only pleading the existence of error as an excuse for committing another error. The crime by being universal is not the less a crime—it is a crime perpetrated against those laws of nature which have from the beginning designed that each country should produce in perfection, or in the best manner, certain articles, and that, by means of an unrestricted process of industry and exchange, these articles should be universally enjoyed.

Such is the character of restrictions on free trade, when placed in a moral and social point of view; but in a public point of view they will be found not less important.

It is argued by a shallow set of reasoners, that if a country allows free importation, without stipulating for a corresponding exportation, the said importing country will speedily be ruined by the loss of all its money. But this is a most unsound argument, for if payments in money be made, exports must also be made in order to get the money; in other words, there will necessarily be a preliminary trade in getting money to send away. "There is (observes Mr M'Culloch) no jugglery in commerce. Whether it be carried on between individuals of the same country, or of different countries, it is in all cases bottomed on a fair principle of reciprocity. Those who will not buy need not expect to sell, and conversely. It is impossible to export without making a corresponding importation. We get nothing from the foreigner gratuitously; and hence, when we prevent the importation of produce from abroad, we prevent, by the very same act, the exportation of an equal amount of British produce. All that the exclusion of foreign commodities ever effects, is the substitution of one sort of demand for another. It has been said, that 'when we drink beer and porter we consume the produce of English industry, whereas, when we drink port or claret we consume the produce of the industry of the Portuguese and French, to the obvious advantage of the latter, and the prejudice of our countrymen!' But how paradoxical soever the as-

Digitized by Google

sertion may at first sight appear, there is not at bottom any real distinction between the two cases. What is it that induces foreigners to supply us with port and claret? The answer is obvious:—We either send directly to Portugal and France *an equivalent in British produce*, or we send such equivalent, in the first place, to South America for bullion, and then send that bullion to the Continent to pay for the wine. And hence it is as clear as the sun at noonday, that the Englishman who drinks only French wine, who eats only bread made of Polish wheat, and who wears only Saxon cloth, gives, by occasioning the exportation of a corresponding amount of British cotton, hardware, leather, or other produce, the same encouragement to the industry of his countrymen, that he would were he to consume nothing not immediately produced at home. A quantity of port-wine and a quantity of Birmingham goods are respectively of the same value; so that, whether we directly consume the hardware, or having exchanged it for the wine, consume the latter, in so far as the employment of British labour is concerned, it is altogether indifferent."*

From these explanations, it will be observed that it is immaterial what is given in exchange for imported goods—whether money or native produce. At the same time, it must be understood that if money is given, there must exist some active industry in the country by which the money is realised. As a general question in commerce, it is of no consequence what is the nature of the industry by which the money is produced. It may consist in the raising of superabundant crops, or other raw produce for exportation, or of manufacturing raw and comparatively valueless materials into articles of value and demand, or of carrying goods from one country to another. Unless a country possess one or more of these branches of industry, it is without the means of paying for imported articles, and must retire from the field of general commerce. England is not of sufficiently large dimensions to export superabundant crops of grain, but it possesses in an extraordinary degree the means of manufacturing mineral and other substances into articles for exchange, and it derives no inconsiderable profit from the carrying of commodities. Its manufactured goods, therefore, pay for imports of foreign articles, including bullion or the raw material of money, and these again, in a manufactured state, are a fund for the payment of still farther imports. Thus the wealth of our country has increased.

* Dictionary of Commerce.

THE MAN ON THE MAST.

[We extract the following interesting narrative (abridged) from the Dublin University Magazine, a periodical of rising celebrity.]

The little fishing village of —— is placed on a flat neck of land, which unites a small rocky promontory with the sandy district of Fingal, and forms the point of junction of two sweeping bays that take a long curve inwards at both sides, leaving it standing far into the sea, so as to present from the distant heights the appearance of being built upon, or rather in, the water. On this rocky promontory, a small ruined chapel stands, bleak and unsheltered, to buffet as it may the force of the waves, which are occasionally swept, in long white lines of spray, completely over the roofless walls into the streets of the hamlet behind it. On the northern shore of the promontory, a small and rude pier has been constructed, and forms a narrow and imperfect shelter for the few wherries, by the assistance of which the village contrives to exist, and pay the landlord for the use of the patch of barren land on which it stands.

One autumn afternoon, in the year ——, three figures were observed standing in front of one of these habitations, against which two of them leaned, whilst the third stood a little in advance, and, with his hand over his eyes, seemed to be intently gazing in the direction of the seaward horizon. To a person less skilled in the prognostics of change of wind or weather, than the hardy race of deep-sea fishermen on the coast of Ireland, it would have been difficult to account for the evident marks of anxiety which could be discerned on the countenances of all three, imparting a thoughtful cast to those of the two elder and more retired of the party, and exhibiting itself in the most lively manner in the attitude and expression of the third, as he alternately swept the distant sea-line with his eye, and threw it up for an instant, nearly closed, to the sky.

"They'll be late, some of them, I'm afraid, after all," said the youngest of the party, turning to his companions, after a long and intent gaze to the eastward. "As for that cockle-shell, the Kittywake, with the young gantleman in her, it's well she's so near in shore, or she'd have but a bad look-out of it. Three of us have hove in sight, and are making for home; but the rest had better keep their offing, and seek to weather it out as they are for to-night."

"Ay, Jack, if they let the daylight go, they have no business in shore. It will be a dark night as well as a breezy one; and should they miss the harbour, and the ebb set in, it's all over with them, I'm afraid."

"Two more of them yonder to the north-east I see crowding up," said the third of the party, "and one of them's Bucker Bryan's boat, I'll warrant. I think I can tell the schooner-rig even with my old eyes. He's sure to run for it if he doubts the weather."

"But I say, Rooney, what's she just loomed out from behind the island yonder, nor'ward of the Coffin Rocks? Picking for the water-dogs, I suspect, from the cut of her jib. She's right to keep to windward now, any how, and let them have a sleep; she might land more than her cargo before morning if she were half a league closer in. I've some doubts of her, too, even where she is; she's deep in the water, and, now I look again, she's running a point or two too much to the westward, to have any one on board who knows much about the Chapel-head."

The signs of coming tempest were now too apparent to be mistaken. The wind, which had been blowing at first lightly from the westward, and then had lulled altogether, had within the last hour chopped about to the north-east, and continued every moment to gain in force, as was evidenced by the small, white foam with which every wave was tipped as it rolled shoreward, and the deeper swing and strain of the boats riding in the little harbour. The day had been cloudless; but as the sun approached the west, the eastern quarter of the heavens had become heavy with a lurid haze, which rose like an exhalation out of the waters, and stretched itself gradually onwards towards the land, tinging the sea with a dull brown, and leaving only one narrow rim of light running along the line of its distance, in which, as if touched by a pale gleam of sunshine, were discernible the far-off sails of some of the fishing-boats, whose return was so anxiously looked for by the three mariners on shore.

At last, something seemed to flit past so lightly and rapidly, that it might have been taken for a sea-bird's wing in the gathering gloom. In another instant, a gig of the lightest and most fragile build, had shot to the westward of all the other boats, under a small lug-sail, which was lowered in an instant, and was already aground on the foamy swell of the back-water at the bottom of the harbour. The next moment four persons—her whole crew—had jumped out of her into the water, and taking her under the thwarts, had run the frail bark high and dry upon the sand. A merry cheer announced the landing accomplished, and the figures began slowly to ascend the beach towards the sailors.

The youngest of the three fishermen descended to the beach at a signal from one of the party, and took charge of the boat. The amateurs were dressed in loose white shirts and trousers, with a small black handkerchief hanging round their necks. Their whole air was that of joyous excitement, and as the gale swept the long hair from their brows, and heightened the colour on their sunburnt cheeks, it was hard to say whether the recollection or the expectation of pleasure was predominant in the expression of their countenances. They had invigorated their bodies with manly exercise—got through difficulty and danger with success, and were now within reach of a hospitable house, where good cheer and smiling faces awaited them, and where the exertions of the day would serve only to give a topic for conversation, and a zest to the banquet. Alas! how different the lot of many a hardy youth who surmounted the same peril, with the same relish for enjoyment.

We will follow the party which had just landed to the neighbouring hall, where they had been anxiously looked for by sundry portly-looking personages, with ruddy faces, and snow-white waistcoats spread over the torrid zone of their stomachs. Dinner had been detained till the youths should arrive, and dinner was the object which always engrossed these worthy gentlemen's thoughts about this hour, to the exclusion of everything else.

[While engaged in the festivities of the dining-hall, one of the party, a young physician, was called suddenly away, and, following him, we arrive at a very different scene.]

The night was fearfully tempestuous, and pitchy dark; the rain swept down in torrents, and our poor Esculapius drew a hard breath between his teeth, and shuddered to his toes, as, wrapped in a muffler and dreadnought coat, he found himself in the open air, hurrying forward, led by a strange man, and totally unable to see anything but the false glare of light which remained at the back of his eyes after their long gaze at the dining-room fire. It was not until he had ascertained that all his mufflings were adjusted, and his coat-collar brought as near his hat as was consistent with leaving any of his face out, that he thought of asking the particulars relative to the nature of the call upon him beyond the "Where is it?" of the first moment. The answer to his query was gruff enough.

"Only some bodies cast ashore; we don't know from what ship, and one of them, the officer says, has a bit of life in it yet. A decent looking woman, too, and young enough to be worth saving."

The doctor hurried on, stumbling and splashing at every step. Their way lay at first through the avenue of the demesne; but, on passing the gate, the guide, who was a fisherman of the neighbourhood, and in his capacity of smuggler—a profession very commonly found united to the former—knew the by-ways at least as well as the high-ways, struck into the fields; and, as the disciple of Galen began to regain his sight, he could just distinguish that his course was directed towards that side of the promontory of the Chapel-head which lay farthest from the village of ——.

[At length, arriving upon the shore, the doctor was ushered into the midst of a party of the coast-guard, commanded by an officer.]

"Ah, doctor! a little too late, I fear. I knew those young fellows would have you up at —— house, so I got a hand to go for you—with some difficulty, I assure you. My own men I could not send off duty, and the rest, you see, expect to come in for share of what's going; and, I believe, they'd suffer their grandmother to drown by inches, ere they'd allow a bale of goods thrown up by one wave to be swallowed by the next, without a scramble for it. They've landed their cargo from some vessel sooner than they expected, poor devils; and here we are collected to take charge of it, without their leave. All drowned, I fear, doctor. A body or two already ashore. One woman is up there at the lime-kiln, and you shall have a look at her, for I think there's a spark left."

So saying, he gave his load into the hands of his men, and strode on before the physician, towards the building which the latter had seen, and which proved to be another of the deserted lime-kilns frequent in the neighbourhood, and which was not more than a score of yards off the spot he had reached.

"Come, my lads," exclaimed the officer, as he entered among them; "make room for the doctor. He's in for the inquest at all events. Make way, and fetch over a light."

In an instant the physician was on his knees beside a sort of litter made of coats, while a man held over his head a brand taken up from the fire, and which, as it flickered and flashed, showed the apparently lifeless form of a woman. Some of her dripping clothes had been removed; coats, &c., had been wrapped round her; she had been chafed, and a drop or two of spirits applied to her lips, but hitherto with no effect.

"She must be removed at once to a house," said the physician, after examining her attentively for a few moments. "Nothing can be done till that is accomplished;" and he rose from his knees.

"We cannot leave our duty, sir," they replied; "and there is no one else here but this fisherman. The folks below have something else to think of, and the nearest cabin is half a mile off, at the least."

"Well, this man and I can take her there between us. It is the only chance for her life."

He set at once about devising as convenient a way of removing her as possible. The promise of a reward out of his own pocket bought the services of the greedy peasant; and they were, in a short time, once again travelling in company, though with a cumbersome addition to their party. Hard they worked that night, the volunteer and the mercenary, bearing their senseless burden through the swampy fields, and over the slippery fosses in the storm: and late it was when their loud knocking at the door roused the peasant and his family from their labour-rooked slumbers.

It is needless to detail the alarm at first; the surprise, and then the ardent compassion of these poor cottagers. By those who know the superstitious timidity, and the boundless hospitality of the lower classes of the Irish, the succession of these feelings is understood at once; to those who do not, a description sufficiently concise for the present purpose would scarcely be satisfactory.

The *body*, as it may be called, was deposited on the only bed, warm from the occupation of the family; the few turf ashes were blown up, and replenished with fresh fuel, and all the additional bedding of the house (scanty enough, to be sure) collected and heated to envelope the limbs of the stranger. The poor woman herself, with that peculiar alertness and shrewdness of management commonly met with amongst the peasantry of that secluded and primitive district, set herself to strip the clinging habiliments from the cold and senseless form on the bed, and to chafe and dry it ere she re-involved it in the coarse but well-aired garments she had collected for the purpose. Life not being extinct, these efforts, under the judicious superintendence of the physician, produced at last their effect, and it was with real pleasure he saw the lids unclose from the eyes of an interesting looking female, apparently under the middle age, and in appearance somewhat above the common class. [By the use of proper remedies, this unfortunate being continued gradually to recover strength and consciousness.]

In the morning, meantime, a considerable assemblage of persons had been collected on the shore, consisting (besides the coast-guard) principally of the country people, although two or three of the nearer gentry, to whose ears tidings of the wreck had already reached, were of the number. The morning was clear and bright; the sun was fast ascending towards the horizon; but the weight of the north-easter was still rushing in, might and main, marking the surface of the water with white foam, and throwing the breakers upon the shore with tremendous fury.

Farther still, and just beyond the curl of the shoaling water, it was evident a vessel had sunk in the night, for there were two masts, by this time perfectly discernible, standing up almost perpendicularly, immersed about as far as the tops, as they are technically termed; that is, the broad framework which affords footing at the junction of the mast and top-mast. Of these, the foretops, being lower than the other, were rather below the level of the sea, but the maintops were above it, and on these the outlines of *four* human figures could be seen with tolerable distinctness by a spectator on the beach, standing out against the moving stay, although so little raised above the water as to be partially immersed by every wave as it swept past.

As soon as ever this had been ascertained by those on land, there had been a cry for a boat. The three sailors already mentioned were the first to volunteer their services; and it was with a view to completing their crew that two of them had gone to Lynch's cabin, while the third went northward across a neck of land to the little pier of ——, close to which their yawl lay high and dry. The greater part of the gazers from the top of the cliff had followed in the direction of the projected launch; but the officer of the coast-guard, an experienced seaman, remained with his men at their original station, occasionally raising his glass to his eye, and taking a narrow survey of the mast and those clinging to it; but when spoken to about the boat, and the chance of getting them off, he only shook his head, and looked up sagaciously to windward, without saying a word.

He had just shut up his glass, and slung it once more in its leathern case behind him, when the unhappy creature he had assisted to save the night before, came running wildly up, her hair floating behind her, her face ashy pale, and all the intenseness of fearful inquiry in its expression. Breathless and agitated, she could not at first say a word, but looked frenziedly back and forward along the horizon, the rapidity of her gaze preventing her from catching the object she was in search of. At last she

Digitized by Google

gained utterance, and cried, "Oh, sir; where are they? Where are they? Show me them, for God's sake! Oh, show me them!" and she clasped her hands before him.

"Look over that black rock there, about a quarter of a mile off shore, and you'll see the masts. I doubt whether you can make out what's on them, though."

She shaded her eyes with her hand, and ran her glance more slowly in the direction pointed out, and at length screamed, "Yes, yes, that's our ship; there she is, and people on the mast. Oh, who are they? For God's sake tell me, sir, is *he* there?"

"Don't know, ma'am, indeed. Can't well see yet who's there. Besides, I don't know the person you speak of that I'm aware of. Not likely he and I should be acquainted."

"Oh! look, look, sir! take the glass, or give it me. He's tall, sunburnt, with blue jacket. Oh, you can't mistake him!"

"Here, my lads," said the officer to his men, "unstrap this spy-glass and hand it to me."

They unbuckled it from the back of their superior, where it had been slung; and when he had received it at their hands, he commenced leisurely to place it at its focus, while the poor woman continued to watch him with agonised impatience.

"Oh, look! for the love of heaven, sir, look, and tell me what you see!"

"Why, ma'am, as well as I can see, there are four men holding on, and a boy, I think, besides, on the other mast; but of this I can't be altogether certain, for the sea washes over him, and it's only now and then I catch a glimpse of him. By George, there's one of the men off! Ha!" he continued, looking through his glass, "I caught him that moment on the top of a wave. He is close to the other mast. No doubt he will make for it, if he has strength, now that he has been swept off the mainmast; but he will hardly have so good a berth of it there, I expect, as the tops are below water. He's at it, by Jove—no, gone again; and the boy's off, too. My God, they'll not hold out much longer, any of them!"

"Oh, don't say so!" cried the woman. "What are the men on the mast like? Look, sir, look, and tell me, I beseech of you! What colour is their dress?"

"They're not down yet, though," continued the officer, without heeding her, and still looking. "There they were both together on a wave that time—a strong fellow that, to stand against such a sea—by Jove, he has hold of the boy; and, as I'm a living man, it was to save him he quitted the mainmast; and there he is now swimming back to it! Now that there's more light, I can see that he's a stout young fellow, and the biggest of them all."

"That's he, that's he, I knew it!" she exclaimed, bursting into tears; "my generous, noble Henry; who is there to save him? who will go out to him? Oh, sir, is there no boat here? I'll go out myself with any one!" and the distracted woman caught the arms of the officer.

"Why, ma'am, they're gone off already to launch one for trying the thing; but I've my doubts if they'll get through the surf—however, they'll try."

[One of the fishermen's boats was launched, and manned by four intrepid men, but on approaching the *bar* off the promontory, it was capsized by a dreadful wave and dashed in pieces, the men barely escaping with their lives.]

This event, discouraging in itself, was fraught with fateful consequences to others. Five human beings there were—alone in the midst of the winds and waves, and unconscious of what had been attempted—whose only earthly chance for deliverance seemed cut off for ever by that accident.

At the lime-kiln, the chief officer of the coast-guard was joined in the meantime by several individuals, whose curiosity had got the better of their chilliness.

As the tide rose, each hour saw the mast lightened of its human burden. One soul more was swept into eternity—body after body was washed ashore, and the wretched creature, who had returned to the cliff, and now watched them drifted successively in, was still satisfied that each, though well known, was not that of her beloved. The day, as it advanced, enabled her to see him distinctly—to mark his effort to preserve himself and his companions—his lashing the boy to the mast by a piece of loose rope, suspended to which, however, he expired early—his apparent sufferings from cold—his anxious and imploring looks towards the shore, and more than once the tokens of his supplications in the lifting of his hands to heaven. Much of this she could see herself from the station she had resumed at the lime-kiln, and much of it she gained by report from the officer, whose glass seemed the interpreter of her destinies.

She had not long been placed thus, when a dog, of the French poodle breed, was seen struggling up the steep cliff, occasionally stopping to shake the water from its long curly hair; and as soon as it had reached the top, it ran directly to where the woman was sitting, and began to jump upon her with the most extravagant marks of delight. She sprung up, seized the little animal in her arms, and covered it with caresses, and at length burst into an agony of tears. It had evidently called her mistress, and had probably floated ashore on some piece of the wreck without being observed by the persons on shore, and now rejoiced one of its owners with its safety. But the force of instinct told the animal that in its rejoicing it had a duty to perform; and no sooner did its mistress put it down from her arms, than it began to jump round her, to pull at her dress, to run to the brink of the cliff and look out to sea, and then run back with a greater show of eagerness, and go through the same energetic dumb-show again.

She had watched the struggles and agony of the shipwrecked man himself, and retained some possession of herself in the midst of her despair; but this was too much for her. She rushed frantically towards the precipitous pathway which led to the beach, and would in all probability have hurried down and plunged into the breakers in her frenzy, had she not been laid hold of by the bystanders and forced back to her old place, and the dog secured in the hands of one of the coast-guard.

Before mid-day, but one human being remained on the mast; and that was he to whom her existence clung. He appeared nearly worn out, the rising tide immersed him still more frequently and fearfully beneath the waves, and it was plain to see that he could not hold out much longer.

[The young gentlemen from —— house, unknown to their friends, now pushed off in their small boat from the pier, in the direction of the mast.]

A shout, lengthened and renewed, showed that the common people were ready to do justice to the generous heroism of their superiors. Who, indeed, could withhold at such a moment his tribute of heartfelt admiration at the conduct of those noble young spirits, who, when the stoutest heart quailed, and the strongest boat was deemed insufficient, had manned their slight and fragile craft, and braved in her the fate which the more experienced fishermen had so nearly met in the morning! They had *succeeded*, moreover, for the great danger was passed, the *bar* having been surmounted before they came into view, and they had now only the long swell of the deep sea to encounter. There they were, the four slender forms straining steadily and gracefully over their oars, their white shirts bright in the sun, while the youngest of the three sailors of the preceding evening, although one of those who had so narrowly escaped in the morning, sat in her stern. They had drawn off from the crowd, it was supposed, according to a preconcerted arrangement, as soon as ever the officer's opinion had been pronounced, and had hastened unperceived away to launch their boat out of reach of the officious interference of the multitude.

The only question now was, whether the solitary being on the mast had strength to hold out till they should arrive there; and it was a fearful interest that was now experienced by the whole assembly of spectators, as they saw the straining of the crew in the distance, and observed at the same time that the poor man was growing weaker and weaker, and, besides, did not see the succour that was so near him.

The distance of the Kitty-wake from the spectators was at first too great to allow of much more being distinguished than that it was *she*, and that she was manned in the manner described. The steersman showed his judgment by keeping well out to sea, and as close as possible to the wind, so that they might not only ride drier and easier, but be able to drop down alongside of the mast, rather than have to strain up to it. In this way they would find it easier to render assistance to the man upon it, and be themselves less exhausted in any exertion they would have to make in doing so. The object of their endeavonrs was every moment in a more critical situation. The gradual rising of the tide, and, as was supposed, the settling down of the vessel, had brought the sea up so as to cover the secure footing in the tops entirely, and he was now forced to depend for his whole support upon the rope which still adhered to the top-mast, and even so, every wave which happened to rise above the rest, swept over his head. As each subsided, the eyes of the people on shore confidently looked to see the mast relieved from the grasp that clung to it, and yet there still hung the powerful seaman, almost lifeless, and yet clinging instinctively, as it were, to his only hope.

To paint the emotions of one being on shore, would be a weak and presumptuous attempt. The powers of language are far too limited to venture on a description of feelings, the intensity of which can only be measured by the depth of woman's heart. No—the one heart which could have told its own tale is now still—and let it not be supposed that passion can be represented in the colours of the imagination.

Meantime, the little skiff, which had pushed boldly out to seaward, had now stretched sufficiently far to effect her object, and accordingly she began to let herself drop down in the direction of the mast, and at the same time the crew gave a hearty cheer, which had the intended effect, by making the sufferer aware that help was at hand. He was distinctly seen to raise up his head, and look round in the direction of the sound. He saw his preservers within a couple of hundred yards of him!

"Yes!" cried the agonised woman, "he sees them! Look, there he attempts to wave his hand over his head! God of mercy! will he hold out? He has fallen away again, and—there—another wave has washed over him! Strain, strain for your lives, generous young men!—*his* life, *our* lives, depend on you!"

The interest of the assemblage was at the highest pitch. Loud exclamations, oaths, cheers, were to be heard on all sides—the excitement was intense. Even the chief officer was restless, and the good owner of —— house paced up and down in a frenzy between nervousness for his sons' peril and pride at their heroism.

They are within a few boats' length. The crowd, from the extreme of clamour and confusion, become gradually stiller and more still. As they come up, every breath is held, for a few seconds will decide his fate. The woman stands like a statue—not a word escapes her—she looks straight upon him, her eyes fixed, her hands clasped before her. They drop a little on one side of the sunken vessel, making motions to the man to hold his place, and have just brought the boat up again so as to approach by her leeward side, for the purpose of grappling the mast, when a wave, more tremendous than the rest, rolled clean over the top of it, sweeping back the boat some yards; and when it receded, and allowed those on shore to see the mast once more, he was gone!

A cry of horror burst from the crowd. The woman alone continued silent and immoveable. Another moment, and the cry was changed into a shout of exultation! The bow oarsman had seized the perishing wretch by the hair, as he was swept by, and dragged him safely into the boat.

"Hurra! hurra!" shouted a thousand voices. Mr ——, of —— house, actually jumped into the air, and the officer waved his telescope over his head.

"Safe—safe!" weakly sighed the poor woman, as she sank down upon the bank, and closed her eyes.

In a short time the throng was collected upon the harbour beach again, ready to receive the triumphant adventurers, at the same place they had landed the evening before; and among them was the happy woman, now trembling with weakness and agitation. She sobbed and cried hysterically, and turned a deaf ear to the soothing expostulations of the physician, who was not a little alarmed at the sudden and violent reaction which had taken place. She screamed with impatience, and cried wildly to the crew to hasten to shore with the hope of her heart. They neared the land, and were hailed by shouts and cheers from all sides, to which, however, they made no reply. The rescued man was in the bow of the boat, doubtless dreadfully exhausted—one of the oars was shipped, and the oarsman stooped over him as he lay.

A few strokes more, and her keel was on the ground. The transported woman rushed into the water, and bent over the gunwale. Her lover lay at the bottom of the boat—*dead!*

OCCASIONAL NOTES.

LADIES' DRESS.

Only a few out of the great number of ladies one chances to see in the street, seem to dress with any regard to a correct standard of taste. First, as to the colours of their attire, they appear to have no idea of a harmony or agreeable assemblage of tints. You will observe a lady, for example, dressed in a blue silk bonnet garnished with a red flower, a scarlet shawl daubed with green spots, and gown of some neutral tint, but marked strongly with pink and purple streaks. The object in dressing in this guise, would seem to be the bringing together as many staring colours as possible—a bit of blue, red, green, yellow, pink, orange, or any thing else which will make a dash and look pretty. *Pretty* is the only standard; a pretty bonnet, a pretty shawl, a pretty gown, &c.; let it be only pretty, and that is quite enough. Thus, when things are bought separately, although each may look tolerably well by itself, the whole will probably make up a most fantastic assemblage of colours, and really render the wearer ridiculous. If we should be permitted to offer an advice upon the very delicate matter of a lady's dress, we should, by all means, recommend the adoption of simple, not flashy, colours. A high-toned colour is always dangerous: it may be quite at variance with the complexion, and at least cannot easily be suited to other parts of the attire. Ladies of a swarthy complexion should on no account attempt blues, lavenders, or any other violent colours; the most suitable or *becoming* for them, are whites, or any of the broken light tints. Sky-blue and pea-green are the most trying colours which can be worn. We have been told by manufacturers that they prepare dresses of certain colours for certain towns. In one place there is a demand for high-coloured goods, and in another these goods could scarcely find a purchaser, but the demand would be nearly all for neutral tints; in other words, the ladies, in one, exercise a coarse indiscriminate taste, and in the other, they are more refined in judgment.

The next point worth hinting at, though, after all, it is not of the least use, is the very small degree of taste exercised in making the dress suitable to the figure. The standard followed in this department is mere fashion. It is quite amusing to see how this ideal standard of perfection is worshipped, and how it drags its poor worshippers after it. Be a lady tall or short, lean or dumpy, she must dress herself exactly like her neighbours, no matter what be their stature or figure. A short woman, of course, should dress in such a manner as would seemingly add to her height, and not wear flounces, which only help to make her look more short. But if it be fashionable to surround the gown with flounces, then flounces the poor little dumpy woman must of course put on in all their plenitude. If, on the other hand, the lady be somewhat too tall, and would wish to shorten her appearance, she finds her case equally irremediable, in consequence of a peculiarity in the fashion for the time being. The lady who is already too broad across the shoulders, must make herself still more broad, by means of a pair of huge sleeves, which project like a pair of balloons. But if the fashion suddenly change, and a narrow-shouldered lady wish to keep up the reign of broad sleeves, she is compelled to retrench their exuberance, and submit to the new order of things. Again, a leader of fashion, with the view of covering a pair of bad ankles, sets the fashion of long gowns trailing in the mud, and all ladies at once lengthen their skirts, and trail their gowns in the mud also. No matter how absurd is the taste set by this ideal being, the leader of fashion; it is sure to be followed with all convenient speed. One or two cunning London milliners, in conjunction with a lady of ton—generally a young lady of some consequence just come out—have it in their power, by a magic whisk of their needle, to set any fashion they please. To the command of these nameless and mercenary female traders, the lady population of the united kingdom yield a ready and expensive obedience. Whether the order be to lengthen or shorten, to widen or narrow, the attire, it is punctually obeyed. A few may grumble at the change, but the change *is* made. Oh, ladies, ladies, how much your fate is to be commiserated!

NEW METHOD OF HANGING BELL-WIRES.

For some years there has been a practice of hanging bell-wires in houses, which seems to be known in few parts of the country, for we have seen it only in Edinburgh, and one or two other places. Instead of

Digitized by Google

causing the wires to go along beneath the cornices and cross partitions, and passages, till they reach the bells which they are designed to pull, a plan is followed by which not a single wire is seen in any of the rooms in the house. From the top of the bell-pull in each apartment, the wire is carried straight upward in a small tin tube, sunk in the plaster, to the vacancy below the slates: here the wires from the whole house meet, and in a body descend in a tube to their respective bells. By this means, each wire has only two cranks, or at most three, in its entire course; all boring of partitions is avoided; and the appearance of rooms is considerably improved. This is one of the most useful of recent improvements in house architecture.

JAMES SMITH AND HIS WRITINGS.

"Memoirs, Letters, and Comic Miscellanies, in Prose and Verse, of the late James Smith, Esq., one of the authors of the 'Rejected Addresses,' edited [in two volumes] by his brother Horace Smith,"* enable us to say something of one of the most admired humorous writers of the immediately past age. We presume that a large portion of our readers are acquainted with "the Rejected Addresses," so happy as a series of imitations of the principal writers of thirty years back, and are aware that it was written by the two brothers James and Horace Smith, the former of whom, deceased last year, is the subject of the work under our notice. The other writings of Mr Smith were entirely fugitive: he contributed to periodical works, helped theatrical friends with *jeux d'esprit*, and so forth; and it was therefore right that his surviving brother should have collected the best of these, together with a selection of his letters, into a pair of light volumes, prefaced by a memoir of the author.

Mr Smith, the eldest son of an eminent solicitor in London, was born in that city in 1775. He received the greater part of his education in the Rev. Mr Burford's school at Chigwell, where his taste for literary reading was first awakened by an accidentally found copy of Hoole's Ariosto. In mature life, he often visited Chigwell, and wandered "over the scenes that recalled the truant excursions of himself and chosen playmates, or the solitary rambles and musings of his youth. The whole of the surrounding scenery, every picturesque view, 'each alley green and bosky bourne,' nay, every individual field and tree, remained so firmly pictured upon his mind, that he could immediately detect the smallest alteration that had taken place since his first arrival at the school. Not even the many and growing infirmities of his later years were suffered to interfere with these visits. To the spots whither a horse or a carriage could not carry him he hobbled upon crutches, and thus contrived to reach the secluded nook, or the sequestered stream, where he had read or bathed upwards of fifty years before."

Reared by his father to his own profession, he succeeded him in business, and in the appointment of solicitor to the Ordnance; but he was too much a natural-born son of the comic muse, to allow himself to be at any time absorbed in professional pursuits. His earliest pieces in prose and verse were contributions to a newspaper, started in 1802, under the name of the Pic-Nic. Here, amongst his associates, were Mr Croker, Mr Cumberland, and Sir James Bland Burgess. The editor was Mr Coombe, the eccentric author of "Dr Syntax," who resided at this time, and had done so for many years, in the rules of the King's Bench. We are told that "to accommodate the latter gentleman, the weekly meetings at Hatchard's did not take place till night, which afforded the indispensable protection of darkness to the worthy editor." In the Pic-Nic, Mr Smith wrote satirical poems on Bonaparte, colloquies discussing modern plays, and a series of light playful papers descriptive of society and manners, under the title of "Endymion the Exile." For Mr Cumberland, Mr Smith afterwards contributed to the London Review, and helped to write prefaces for a collection of plays which appeared under the name of the veteran dramatist. He also wrote for the "Monthly Mirror," which then belonged to Mr Thomas Hill, still a well-known enjoyer of life in the metropolis. Here appeared the imitations by himself and brother, which afterwards took the form of a volume entitled "Horace in London."

This brings us to the year 1812, in October of which year the new Drury Lane Theatre was to be opened. Six weeks before the event, a casual hint from Mr Ward, secretary to the theatre, suggested to the two witty brothers the composition of "The Rejected Addresses," or a series of humorous addresses for the opening of the house, professedly composed by the principal writers of the day, and offered in competition for the prize held out by the directors. The two wits immediately arranged what writers they were respectively to imitate: Horace went to Cheltenham, executed his portion of the task, and returned to town a few days before the opening, when each submitted his papers to the other for any erasures or improvements that might appear requisite. The little volume in which they were published had an unexampled success, having run through sixteen editions in seven years. Mr Murray, to whom the copyright had been at first offered for twenty pounds, bought it after the sixteenth edition for £131. We find that some of our favourite pieces were written by James, as for instance the imitations of Wordsworth, Crabbe, Byron, and Cobbett. Was ever ordinary language put so easily or fluently into verse as in the first of these articles, where little Miss Lake describes the consequences of her revenge on Brother Jack's top?—

> "Aunt Sarah heard the window break,
> And cried, 'Ah, naughty Nancy Lake,
> Thus to distress your aunt!
> No Drury Lane for you to-day:'
> And while papa said, 'Pooh, she may!'
> Mamma said, 'No, she shan't!'
>
> My uncle's porter, Samuel Hughes,
> Came in at six to black the shoes,
> (I always talk to Sam)," &c.

We find, by the way, that James indulged in an idea that every family in the united kingdom has an aunt Sarah, whom they are sure to send for "when there is any misery afloat, but are sadly apt to overlook when matters go on smooth." It might have been supposed that the great sale of the Addresses would have made both the book and its authors very celebrated: but no—"James would humorously illustrate the limited and ephemeral nature of fame by an incident that happened to himself in a Brighton coach. An old lady, struck with his extraordinary familiarity with things and people, at length burst forth, 'And pray, sir, you who seem to know every body, pray, may I ask who you are?' 'James Smith, ma'am.' This evidently conveying nothing to her mind, a fellow-passenger added, 'One of the authors of the Rejected Addresses.' The old lady stared at them by turns, and then quietly said, 'I never heard of the gentleman or the book before.'"

The friends of Mr Smith entertained a high sense of his general abilities. Lady Blessington remarked that, if he had not been a man of wit, he would have achieved a much higher reputation. It was the opinion of those who saw him nearly, that his better powers remained unemployed, in consequence of his succeeding so easily as a writer of "comic miscellanies," and his thereby gaining that place in society which suited his gentlemanly tastes and good-humoured social character. After this period, therefore, he made no decisive effort in any literary walk. What he afterwards wrote was only on the spur of the moment, and to gratify individuals who solicited his aid. Amongst these was the late Mr Mathews, for whom he composed the entertainments styled the *Country Cousins*, the *Trip to France*, *Air Ballooning*, and the *Trip to America*. Mathews, who was a liberal and generous man, gave the author a thousand pounds, to which circumstance the latter rarely alluded without shrugging up his shoulders, and saying, "A thousand pounds for nonsense!" But it was nonsense which gave pleasure and relief to vast numbers of minds, and perhaps was not unworthy of its price. In Mathews's opinion, "Smith was the only man who could write clever nonsense." He also contributed pretty abundantly to the New Monthly Magazine: the series in that work entitled "Grimm's Ghost," and a great number of lively lyrics, were from his pen. "A cheerful, pleasant, effervescing spirit" animates all these compositions.

The ordinary life of Smith, notwithstanding his being engaged in business, was much that of "a gentleman about town." He was fond of theatrical amusements, and a regular haunter of green-rooms and rehearsals. He enjoyed an extensive circle of acquaintance, "including many of his contemporaries the most distinguished for virtues, talents, and rank." In that society he was a first-rate favourite, on account of his lively and entertaining conversation, and his benignant character. He had other engaging qualifications—"a dignified and manly figure, much beauty and animation of countenance, singularly fascinating manners, the charm of a comic vocalist, and a merry laugh that would extort a sympathising echo from the most phlegmatic hearer." He never entered into argument, and never lost his temper. His conversation comprehended the droll anecdote, the apt illustration, the shrewd remark, as well as the pun and witticism. "His was not the sly, sneering, sarcastic humour, that finds most pleasure in the *bon-mot* that gives the most pain to others; nor was it of that dry, quiet character which gives zest to a joke by the apparent unconsciousness of its author. His good sayings were heightened by his cordial good nature; by the beaming smile, the twinkling eye, and the frank hearty cachinnation that showed his own enjoyment of them." He was thoroughly a Londoner. Though sometimes he would go into the country to visit, yet London was the home of his heart. He used to observe that London was the best place in summer, and the only place in winter. He concurred with Dr Mosely that in the country "one is always maddened with the noise of nothing." He used to relate with great glee a story showing the general conviction of his dislike to ruralities. He was sitting in the library, at a country-house, when a gentleman, informing him that the family were out, proposed a quiet stroll into the pleasure-grounds. "Stroll! why, don't you see my gouty shoe?" "Yes, but what then? You don't really mean to say that you have got the gout? I thought you had only put on that shoe to avoid being shown over the improvements."

Smith had been all his life a temperate man; yet he sunk at length into a miserably gouty state, losing the use and even the form of his limbs. He bore the evil with exemplary fortitude, and, having always disliked people who made their sorrows obtrusive on others, he took care that no one should be annoyed by his; so he shut himself up with his old faithful housekeeper, and died without troubling anybody. In his last years, he formed an acquaintance with the Rev. Mr Torre Holme and his wife, who reside at Sheere near Guilford, and to this amiable pair he wrote frequently. The letters form a very delightful portion of the present work, full of his usual lively prattle, and at the same time presenting reflections befitting the old man who "knew that he must die." One or two select bits may be extracted here.

"Should the greatest of calamities befall you—the loss of one of your children (which Heaven avert)—I would, at the summons of you or your husband, visit you in your affliction; not to assuage your grief (a vain effort), but to alleviate by partaking of it. Such would have been my conduct, had I known you when deprived of Florence. I know that the hackneyed topics of consolation—viz. 'Time only can alleviate, impious to murmur, gone to a better place,' &c.—only add fuel to the fire. My course would be the direct reverse. I should dwell with melancholy pleasure on the merits of the departed, and agree with you that the affair was altogether beyond consolation.

> 'As skilful surgeons cut beyond the wound,
> To make the cure complete.'

What wonders time achieves! There was a period when you would have received as an insult an intimation that you could ever, after that bereavement, feel a moment of happiness; and notwithstanding our experience of his emollient powers, we continue to think that if certain calamities should now befall us, we should never more taste of felicity. Charles Fox was said to be a man of expanded benevolence. His love, like gold beaten by the limner, covered a large number, and thus clothed no individual cordially. Which of the extremes is best?—that adopted by him, or the concentration of our affections upon one? I should say the latter, but it is a fearful experiment."

"I dined yesterday with ——, at Ivy Cottage, Fulham, a beautiful retreat in the Swiss fashion. B—— and I went together. During our journey, he communicated to me the following strange story. A young, talented, and handsome married woman, whom he would only designate as Camilla, called upon him relative to an engagement on the stage. She had every requisite. B—— strongly advised her against it, telling her that its various horrors would be insuperable to a gentlewoman. She had, it appeared, a brute of a husband, from whom she had separated herself. She one day called upon B——, and seeing on the mantelpiece a phial marked 'poison,' asked him if he could help her to some slow poison. She appeared learned upon that head, mentioning a slow poison known ages ago as *toffonia*, and alluding to Madame Brinvilliers, who had destroyed several persons by that mode. He of course said that he could not accommodate her. Being, upon reflection, prevailed upon to forego her design of going upon the stage, she was induced to return to her husband. Her last letter to B—— was written at the bedside of her husband, who, she said, was suffering under a *slow* and consuming illness. Not long ago, an elderly lady in black called upon B——, calling herself the mother of Camilla, and earnestly requesting to know whether he was acquainted with the place of her daughter's retreat; adding that her husband had died, and that Camilla had thereupon suddenly absconded! B—— assured her (with truth) that he was quite ignorant upon the subject. Is not this a strange narrative! and does it not appear very probable that Camilla had administered *toffonia*, and, frightened at what she had done, had made a rapid retreat into obscurity!"

In a series entitled "Kit Kat Sketches," we have been much amused by a paper condemnatory of old heads upon young shoulders, and particularly by one illustration of the monstrosity, which we shall here take leave to extract, although it has been published before.

"The mental exception is one Smedley Jones, lately an articled clerk to an attorney—I beg his pardon, a solicitor—in Furnival's Inn, Holborn, but recently out of his time, and therefore qualified to kill game on his own account. He wears black half-gaiters, and is a member of the Philonomic Society; exhibits much wisdom, little whisker, and no shirt collar; simpers; makes a gentle bow at the close of every sentence, with his chin touching his left collar-bone: criticises the new law courts; wears lead-coloured gloves; affects a beaver with a broad brim; nods at the close of every sentence when the Court of Exchequer pronounces a judgment, by way of encouraging the three puisne barons; and carries his pantaloons to his tailor's in a blue bag, that they may pass for briefs. There is a lame clerk in the Three per Cent. Consol Office at the Bank, with whom Smedley Jones appears to be on terms of considerable intimacy. I rather suspect that the motive of this conjunction is, that the latter may obtain private information with respect to certain funded property appertaining to certain widows and maidens, his attention to whom rises and falls accordingly. It is an unquestionable fact, that whenever a young man rises, like Smedley Jones, upon his toes in walking—waltzes with every thick-ankled girl that would otherwise be a wallflower for the whole evening—looks benevolently downward upon his own cheeks—sings a second at church, and boasts of belonging to no club—he may, to a certainty, be set down as one who means to let fly an arrow at Plutus through the temple of Hymen.

* Colburn, London.

It is quite edifying to meet Smedley Jones at a dinner-party. The first thing he does, on entering the drawing-room, is to take up a book with an air of no common sagacity. If it happen to be Woodstock, he smiles with an aspect of compassionate disdain, and informs the bystander that he objects to historical novels, and that he prefers going to the fountain-head, as Lord Clarendon and Bishop Burnet. Upon the appearance of the mistress of the mansion, he takes a seat by her on the sofa; but so near to its edge, that the slightest backward movement of that article of furniture would seat him where he ought to be. He smoothes down the sand-coloured hair of the matron's accompanying offspring with an air of ineffable interest; inquires after dear Charles; hopes to see sweet little Emma; and ejaculates, 'Oh, pray now,' when mamma expresses a doubt as to her appearance. He then talks of the sea as beneficial to children, and recommends Worthing, because it has no cliff.

When dinner is announced, Smedley Jones looks sharply round for some female whose spine rather swerves from the perpendicular, aware that heiresses are seldom straight-backed, tucks her lean arm under his, and manœuvres to sit next to her at table. Whilst in the act of descending the stairs, our proprietor of an old head upon young shoulders takes due care that the tongue which vibrates in the mouth of it shall ejaculate, 'What a capital house this is!" in accents sufficiently loud to be overheard by the master or mistress of the mansion. He dilutes his wine with water, to adapt it to his conversation; and enlarges upon the folly of the maxim, 'a reformed rake makes the best husband.' I have heard him tell, nineteen times over, the anecdote of his uncle Major Flush, who, thirty years back, at a dinner with Sir Phelim O'Four-bottle, poured his claret into his boots, aware that they would stand a soaking better than the coats of his stomach. This gives Mr Smedley Jones an opportunity of observing how different things are at present; with an addition, that one glass of wine at dinner, and two after it, should never be exceeded by any man who wishes to render himself acceptable to the ladies.

Mr Jones belongs to a society for converting Captain Parry's Esquimaux, at the North Pole, from the errors of their ways. I have this fact from his own mouth, having had the misfortune to sit next but one to him at dinner, at old Spinsuit's, the Chancery barrister. The intervening individual was Miss Creek, of Upper Clapton, a white-visaged personage, whom the above-mentioned lame clerk in the Three per Cent. Office has introduced to his acquaintance. I rather think Spinsuit has been instructed to peruse and settle their marriage articles. Miss Creek having retired with the rest of the ladies, my left flank was cruelly exposed. The old headsman accordingly brought his juvenile left shoulder forward, and occupied the vacant seat. He asked me if I did not think the Esquimaux at the North Pole 'dark heathens:' I answered, not entirely so, because their whale blubber supplied them with oil for lamps. Mr Smedley Jones stared at this, and added, that his meaning was that they were poor unenlightened wanderers. I rejoined, 'True, but that's Apollo's fault!'

Finding that he had a neighbour who was not to be dealt with metaphorically, Mr Smedley Jones changed his course, and began to dilate upon his family affairs, and informed me that his brother George was a clerk in the Post-Office, whose he expressed a hope that Mr Freeling would push him. Finding, upon inquiry, that his brother George lodged at the last house in Cecil Street, which overlooks the sand-bank of the river Thames, I answered, 'I hope he will.' I was then informed that Mr Smedley Jones's brother Richard was a clerk in the brewhouse of Sweetwort and Company; the junior partner of which establishment, 'sitting under the same minister' at Hoxton, had promised to push him. Finding that Sweetwort and Company were celebrated for their large vat, I again said, 'I hope they will,' which procured for me one of those amiable chin-dropping bows which I have already depicted.

'For myself,' continued my juvenile companion with the antique bust, 'I have a clerk who is a cousin to one of the judges, who goes the home circuit next assizes; he knows something of the high sheriff, and that kind-hearted and noble personage (Mr Smedley Jones is not sparing of adjectives to benefactors in esse or in posse) has promised to push me'—'Neck and heels out of court into the High Street,' thought I, 'or his javelin-man will not be of my mind.'

A Captain Smithers, with a dull eye and a drawling voice, now offered his snuff-box to Mr Smedley Jones; this the latter declined, with another of those amiable bows to which I have faintly endeavoured to do justice; and turning to me, observed that snuff-taking was a bad habit for a young man. 'At all events,' answered I, 'he should wear a bad habit, or Scotch rappee will make it one.' 'Not but what I carry a box myself,' continued Mr Smedley Jones, with a look that he meant for arch; 'here it is:' so saying, he pulled out of his coat-pocket an oblong box, with an amber lid. 'May I perish,' thought I, 'if it does not come from Geneva! We shall now be pestered with a regular orthodox series of quadrille tunes.'

When this machine had interrupted conversation for the usual period, and had 'said its say,' I was in hopes that we had done with it: 'But soft! by regular approach—not yet.' It was again wound up, and again set a-going, to gratify little Theobald Spinsuit, who had bolted into the dining-room in quest of an orange. These little attentions gratify mothers, and are apt to procure the perpetrator a second invitation to dinner.

There now ensued a regular struggle between Mr Smedley Jones's tongue and my taciturnity. He is one of those civil young men who must speak to their neighbours, whether they have any thing to communicate or not. I was accordingly asked what I thought of the Catholic Question. I had entertained no thoughts upon the subject. 'Indeed!' was the reply. The next interrogatory to which I was subjected, was, 'Who was the author of Junius?' I protested that I had never given the matter a moment's reflection. This, however, did not stop the subject; and I was condemned to listen to the usual harangue, with the words 'Sir Philip Francis,' 'Lord Chatham,' 'Lord Shelburn,' 'bound copy at bankers,' and 'tall man at letter-box,' all which topics were by me, jointly and severally, returned *ignoramus*.

Mr Smedley Jones's battery here suffered a momentary pause: whereupon 'thinks I to myself,' now for my turn! 'Since nature has clapped an old head upon his young shoulders, art shall insert a young head between my old ones. Fifty-one shall start the topics which twenty-one ought to have discussed.' Accordingly, I asked Mr Smedley Jones, to his no small dismay, what he thought of Mrs Humby's Cherry Ripe and the Lover's Mistake! I took it for granted that he had seen Paul Pry on horseback at Astley's amphitheatre. I animadverted upon Madame Pasta's Medea: was sorry that Signora Garcia had picked up a Yankee husband: wondered why Potier came to the French theatre in Tottenham Street; and asked him if he could tell me what had become of Delia.

It is thus that extremes produce each other. If twenty-one monopolises all the sense at the dinner-table, fifty-one must take to the nonsense, or hold its tongue. 'Sir,' said the moralist of Bolt-court, upon an occasion somewhat similar, 'he talked of the origin of evil, whereupon I withdrew my attention, and thought of Tom Thumb.'

I fear that Smedley Jones has by this time become almost as wearisome to the reader at second-hand as he was originally to the writer. I shall therefore conclude with this observation:—All monsters ought to be smothered; and wherever nature puts an old head upon young shoulders, the sooner the one is knocked off the other the better."

A SPECIMEN OF NATIONAL SELF-COMPLACENCY.

Amongst the people of Scotland there is a very general opinion that their mode of managing the poor is the best possible, and, in particular, vastly superior to that followed in England, where the expenditure is supposed by our countrymen to be monstrous in amount, and most pernicious to the poor themselves, as tending to take from them all motive for self-exertion. In reality, the Scottish system has but one feature—that *of giving as little as possible, and to as few poor as possible*. A parish will boast to the passing stranger that it has no poor whatever, or next to none, and that the way to bring about this result is to give the poor no encouragement. Those who make this boast do not mention that they only banish the poor into less stingy districts, where three years' residence gives them a settlement. Practically, the case is simply this, that the poor of Scotland, as far as they get any public or recognised support at all, get it in a few places, chiefly the large towns. It is amusing to observe in Scotland the horror entertained of the so-called extravagant system pursued in England, at the very time when one-half of the English newspapers are full of railings against commissioners and guardians for starving the poor. The people of Scotland appear to be in a perfect delusion upon this subject.

Two facts that have lately come to our knowledge, may be allowed to speak for themselves with the generous natures south of the Tweed. An old female servant residing in Edinburgh, totally unable to work, and who has no other dependence whatever but on the occasional kindness of one former mistress, gets from the West Church parish an out-door allowance of 2s. 6d. *monthly!* A widow, lately left as such with four children, in a parish in Peeblesshire, *where there is not one enrolled pauper*, was offered the sum of 10s. quarterly under the direction of the minister, as all that was necessary for her support!

The memoranda which follow were taken down after a conversation with an individual who had been for above forty years the schoolmaster and almoner of a pastoral parish in the south of Scotland, and who consequently speaks from an uncommonly large experience. We believe that the most perfect confidence may be placed on every particular here stated:—

"E—— is a rural parish, with a considerable village—no manufactures—population, 636. The expenditure on the poor is about L.80, partly raised by assessment. There are about twenty poor, almost all of whom have been rural labourers. The lowest sum given, and this to a single person who is able to labour a little, is 5s. in six weeks. Persons in the next degree of destitution get 7s. 6d. in six weeks. A paralytic man, in middle life, with four young children, and a wife (who, however, can work during summer at field labour, and thereby earn 10d. per day without victuals), gets at present 12s. 6d. in six weeks. The sums given are confessedly inadequate for the support of the paupers, whose lives, accordingly, are of the most comfortless kind. Generally, they are after all much indebted to private benevolence. They haunt farmers' houses, especially those where they have had any sort of connexion, and get meal, potatoes, &c., in small quantities, to help out the parish pittance.

Mr —— attributes much of the evil to the small wages of the farm-labourers. They get about L.8 or L.10 a-year, besides meal, potatoes, coal, and sometimes a cow's grass, the whole not exceeding L.25 a-year.* Their extreme poverty, and the burden of their families, which make the want of a place an evil not to be encountered, place them much at the mercy of the farmers—who, having always a free market, without competition, and being therefore much united in interest, possess great power over the destinies of any troublesome servant, no one receiving a man whom another has found any fault with. The servants are thus no better than slaves, for, though they have nominally the power to change masters, they cannot exercise it. Pinched down to wages which barely afford the most scanty means of subsistence, they can save nothing for the future. Indeed, they are so ill supplied with the means of current subsistence, that pilfering is distressingly common amongst them; and the wives of several have actually confessed to Mr ——, that, *without that resource, they could not exist*. By and bye, they become feeble, and, if they continue to live, and have not children in a condition to support them, they cannot avoid coming upon the parish."

Our informant adds that, in former times, the farm-servants had no better wages, but rather worse; but fashions were different then; and no luxury of any kind, excepting a little tobacco, was known. In these days, there was more providence perhaps; but the question may still remain, if we are entitled to expect human beings to spare from such slender resources. Now, at any rate, they know of luxuries, such as tea; consequently, there is the temptation to use them. The force of the imitative principle is proverbially strong: we cannot, then, wonder greatly at their giving way in some measure to such prevailing fashions. Mr —— remarks, that, of persons in like circumstances, some are much more liable to come to parish relief than others. There is a class who are more reflecting, steady, and self-denying than others; and these, he remarks, are also those who have the most earnest religious character.

The latter remark is worthy of some attention. In such persons, of course, the moral nature is apt to be the strongest, and this may show itself in provident habits as well as in devout feelings. But we are not assured by these circumstances, that the physical support with which such persons are content, is sufficient for them. We only know too well that the physical laws operate independently of the moral, and that the best feelings in the world will not ensure any one against the consequences of imperfect diet, or the want of the many little comforts which go to contribute to a healthy existence. Discussion, however, upon this point seems needless. Is it to be expected of any man, in a country like this, that, with an income of about L.25 per annum, he can both support a family and lay by for old age?

The sympathies of the British nation are even yet in strong action respecting the West India negroes. They little reflect that, in their own land, there is a vastly greater number of unprotected poor men, with as little of real freedom as the slaves of the Caribbean islands ever enjoyed, and who are not by one-half so well supplied with the grosser comforts of life. How ready are we to kindle at the slave-holding Carolinian and Virginian! We do not remember—for it would be to our own disadvantage—that these gentlemen at least take care that their labourers, whether in their days of strength or their days of weakness, shall want for nothing which nature requires.

* In some parishes the money wages are larger, but the cow's grass is not then given.

ANECDOTE FROM THE CAUSES CELEBRES.

In the reign of Dom Pedro, the justice-lover, king of Portugal (says the compiler of the Causes Celebres), a prelate of high rank and standing in the kingdom chanced to take offence at some expression used towards him by a shoemaker, and caused the poor man to be assassinated. This punishment, so grievously disproportioned to the offence, was formally complained of in the ecclesiastical courts by the son of the victim; but, as might have been expected, the judges favoured their wealthy and powerful brother, and bestowed on him no heavier penalty than that of interdicting him from *saying mass* for the space of a year. The son, feeling even more aggrieved by this sentence, went to the foot of the throne, and there laid his complaint before Dom Pedro. The king was touched by compassion, and expressed that sentiment, as well as his sense of the injustice of the decision alluded to, in a way so peculiar, that the young man was encouraged to act in a most remarkable manner in consequence.

On an early day afterwards, the prelate took part in a public procession. He was clad in his full pontifical robes, and little dreamed of the fate which awaited him. The son of the murdered shoemaker had taken up his station at a point which was overlooked by the king, who, with all his court, viewed the procession from the palace windows. When the

Digitized by Google

prelate reached the proper spot, the young man darted forward, and, with two blows of a poignard well applied, slew the priest ere any man could interpose to stop the action. Such violence, committed on an ecclesiastic of high station, caused an extraordinary sensation. The assassin was at once seized and carried before Dom Pedro, by orders of the monarch himself. As soon as the young man appeared, the king demanded how he dared to commit such a deed? "How dared that unworthy prelate to murder my father?" was the reply. "I sought justice, and it was refused to me. I believed then that it was my duty to take vengeance into my own hands." The friends of the prelate replied, that the youth had received justice, and that the prelate had been condemned to cease performance of the mass for a whole year. The king listened in silence, and then turned to the young man. "What is thy trade?" "A shoemaker," was the answer. "I then *interdict thee from making shoes for a year*, and in the interval thou shalt receive fit maintenance from the prelate's funds. This is my decree."

NEW DISCOVERIES RESPECTING THE HISTORY OF MARY QUEEN OF SCOTS.

Mr P. F. Tytler, after distinguishing himself by various biographical works, exhibiting great research and a sweet and fluent style, commenced the publication of a history of Scotland about twelve years ago. The seventh volume, which has appeared within the last few weeks, and embraces the period between 1565 and 1574 (being the second last of the book), contains some new facts of considerable interest respecting the life of Queen Mary. These Mr Tytler has derived from documents hitherto buried in the State Paper Office.

The character of the affair of Riccio's death is now made considerably clearer than before. It sprung from two plots which had coalesced, their purpose being common; the one arose from Darnley's personal jealousy, the other from the dread which the Protestant party entertained of Riccio's influence in behalf of Romanism, and in effecting the forfeiture of the Earl of Murray and other Protestant lords, who had lately been driven as rebels from the kingdom. The parliament was to meet early in March (1566) to enact this forfeiture. About the middle of February, the murder of Riccio was arranged. The public will now learn with surprise that Queen Elizabeth was duly apprised of it, as an act favourable to her interests. More surprising still, the preachers John Knox and John Craig were amongst the actual conspirators. For this Mr Tytler does not adduce the original of the bond which the conspirators signed, but he brings forward, what is scarcely less to be trusted, a list which had been transcribed by the English ambassador and sent to Elizabeth. And not only did these men agree to the murder, but, to favour it, they appointed a general fast and humiliation to be held in the city during the week on which it was to take place, the solemnities of that occasion forming a pretext for the gathering of the partisans of the conspirators. "Directions for prayers and sermons, to be used during this week, were drawn up by Knox and the ministers, and the subjects chosen were calculated to prepare the public mind for the destructive scene about to ensue. They were selected from the Old Testament alone, and included, amongst other examples, the slaying of Oreb and Zeb, the cutting off the Benjamites, the fast of Esther, the hanging of Haman, inculcating the duty of inflicting swift and summary vengeance on all who persecuted the people of God." After the murder, when the queen unexpectedly retained her authority, Knox fled to Ayrshire, and lived there for a twelvemonth: his reasons for this act, formerly very obscure, are now made clear. What a strange impression do we receive of the age, when we find two personages otherwise so estimable as Elizabeth and Knox, concerned in so atrocious a murder as that of poor Riccio was in all its features!

Darnley's desertion of his associates, so as to leave them exposed to vengeance, was what led to his own death. These men seem to have determined that he should not escape their vengeance. It was only an accident that it also suited the convenience of the Earl of Bothwell to have Darnley destroyed. Here also the assassination was coolly covenanted. A bond was entered into, at which were the names of Bothwell, Lethington, Argyle, Huntly, and others, agreeing to stand by each other in this deed, and against its consequences. Morton was made privy to it, and it was also known to Murray, though he had the prudence to keep apart from all concern in it. Upon the whole, Mr Tytler's narrative makes it more likely than it ever seemed before to us, that Mary was aware of what was going on. She appears to have by this time contracted a passion for Bothwell—one of those infatuated attachments which human beings sometimes, though rarely, form for each other, in spite of not only the most obvious prudence but the most sacred principles. If privy to the design, the part she acted was one of most depraved hypocrisy: she must then be considered as having led the unfortunate young man like a lamb to the slaughter. One cannot but relent and pity the miserable youth, on learning that he dreaded her blandishments, but told his friend that he would go with her, "though she should murder me." On the fatal night, soon after being left by her, he retired to his bed-chamber. "Since his illness," says Mr Tytler, "there appeared to have been a great change in him. He had become more thoughtful, and thought had brought with it repentance of his former courses. He lamented there were few near him whom he could trust, and at times he would say, that he knew he should be slain, complaining that he was hardly dealt with; but from these sorrows he had sought refuge in religion, and it was remarked that on this night, his last in the world, he had repeated the 55th Psalm, which he would often read and sing. After his devotion, he went to bed and fell asleep, Taylor, his page, being beside him in the same apartment. This was the moment seized by the murderers, who still lurked in the lower room, to complete their dreadful purpose; but their miserable victim was awakened by the noise of their false keys in the lock of his apartment, and rushing down in his shirt and pelisse, endeavoured to make his escape, but he was intercepted, and strangled after a desperate resistance, his cries for mercy being heard by some women in the nearest house; the page was also strangled; and their bodies carried into a small orchard, without the garden wall, where they were found, the king in his shirt only, and the pelisse by his side." The wretches then blew up the house, by means of the gunpowder which they had deposited in one of the lower rooms.

The open efforts to screen Bothwell from justice, and Mary's disgraceful marriage to him, ruined her in the estimation of her subjects, as well as of the other sovereigns of Europe. At the same time, one cannot but feel equal indignation at the conduct of some of those great chiefs who now rose against her, thinking it a good opportunity to get quit of her government. These were the very men who had joined in the bond for the murder. They were as guilty as they represented her to be; but they were on the popular side in religion, and knew they were pretty safe in a hostile demonstration against objects so generally odious as Bothwell and the queen. To meet these "associated lords" she had about 4000 men. Mary and Bothwell advanced from East Lothian with 2000, and intrenched their troops in some old works on the crest of Carberry Hill. The transactions of the day were of that kind which makes history sometimes rise to the tone of the purest tragedy. We must here make a brief extract from Mr Tytler's volume.

Monsieur de Croc, the French ambassador, carried a message from her to Morton and Glencairn, "assuring them of their sovereign's disposition to pardon the past, on condition that they returned to their duty. 'We have not come here,' said Glencairn, when he heard this proposal, 'to solicit pardon for ourselves, but rather to give it to those who have offended.' 'We are in arms,' added Morton, 'not against our queen, but the Duke of Orkney [lately Earl of Bothwell], the murderer of her husband. Let him be delivered up, or let her majesty remove him from her company, and we shall yield her obedience.'

It was evident from this reply that there was little hope of peace, and the confederate lords were the more determined, as an indisposition to fight was beginning to be apparent in the royal troops, some men at that moment stealing over to the enemy. Observing this, Bothwell, who was never deficient in personal courage, rode forward, and, by a herald, sent his defiance to any one that dared arraign him of the king's murder. His gage was accepted by James Murray of Tullibardin, but Bothwell refused to enter the lists with one who was not his peer, and singled out Morton, who readily answered, that he would fight him instantly on foot and with two-handed swords. Upon this, Lord Lindsay, of the Byres, interfered. The combat, he contended, belonged of right to him, as the relative of the murdered king, and he implored the associate lords by the services he had done, and still hoped to do, that they would grant him the courtesy to meet the duke in this quarrel. It was deemed proper to humour Lindsay, and Morton presented him with his own sword, a weapon well known and highly valued, as having been once wielded by his renowned ancestor, Archibald Bell the Cat. Lindsay then proceeded to arm himself, and, kneeling down before the ranks, audibly implored God to strengthen his arm to punish the guilty and protect the innocent. Bothwell, too, seemed eager to fight; but at this critical juncture Mary interfered, and resolutely forbade the encounter.

By this time it was evident that desertion was spreading rapidly in her army, nor had her remonstrances the least effect: she implored them to advance, assured them of victory, taunted them with cowardice—but all to so little purpose, that when Grange at the head of his troops began to wheel round the hill, so as to turn their flank, the panic became general, and the queen and Bothwell were left with only sixty gentlemen and the band of hackbutters. It was the design of Grange to throw himself between Dunbar and this little force, thus cutting off Bothwell's escape, but Mary perceived it, and sent the laird of Ormiston to demand a parley. This was immediately granted; and when Grange rode forward, he assured his sovereign of their readiness to obey her, if that man who now stood beside her, and was guilty of the king's murder, were dismissed. To this she replied, that if the lords promised to return to their allegiance, she would leave the duke, and put herself in their hands. He carried this message to his brethren, and came back with a solemn assurance that on such conditions they were ready to receive and obey her as their sovereign. Hearing this, the queen, ever too credulous and apt to act on the impulse of the moment, held a moment's conversation aside with Bothwell. What passed can only be conjectured: he appeared to waver and remonstrate; but when she gave him her hand, he took farewell, turned his horse's head, and rode off the field, none of the confederates offering the least impediment. It was the last time they ever met."

A striking passage follows. Soon finding herself by no means a free agent, she broke out into reproaches, and bitterly repented her precipitation. "She called for Lindsay, one of the fiercest of the confederate barons, and bade him give her his hand. He obeyed. 'By the hand,' said she, 'which is now in yours, I'll have your head for this.' Unfortunate princess! When she spoke thus, little did she know how soon that unrelenting hand, which had been already stained with Riccio's blood, would fall still heavier yet upon herself."

The subsequent events are related with great spirit, and many new facts of importance are introduced. This is no proper place in which to make extensive extracts from a historical work. But one of Mr Tytler's new facts is of a nature to excite much surprise in Scotland—namely, that while the queen was confined in Lochleven, the Hamiltons, who have hitherto been looked upon as her constant friends, actually proposed to her more conspicuous enemies to have her assassinated. But, indeed, murder is the leading feature of this period of our history. There is not any character of the age so pure as not to have been in some way concerned in deliberate murder. The most politic sovereigns and ministers, the most vehement reformers of the national church, the most magnificent nobles—all are ready to shed blood, or to favour its being shed, privately, when it suited their ends to do so. It almost seems strange that so much pains should have been taken to make out Mary either innocent or guilty. When Elizabeth is found foreknowing of Riccio's murder, when Leicester is found openly counselling the killing of Mary at the Council Board of England, when every man and woman of any note in that age is found tainted with blood, it seems extremely likely that Mary was privy to Darnley's slaughter, but it is scarcely just to make her character rest on a point which, with regard to her contemporaries, is generally treated as a matter of indifference.

OCCUPATIONS FOR THE INSANE.

There is something very striking in the following description of the employments followed by the insane in the Glasgow Asylum, especially when we mentally contrast it with the accounts of *bedlams* given by the fictitious writers of the last century. Similar modes of engaging the attention of the insane are now followed with advantage at many other asylums throughout Britain, besides the excellent one at Glasgow. The following is extracted from the report of the directors for 1839, during which year the average amount of patients was 159:—

"One of the most beneficial means in the treatment of the insane, is daily occupation. This not only tends to prevent the mind from dwelling on its delusions, and thereby to lessen their intensity, but frequently puts an end to that restlessness, both of mind and body, which attends many forms of the disease. Of all the modes of employing patients so affected, bodily labour is the most advantageous, inasmuch as it not only produces the beneficial effects now adverted to, but contributes to bring the body into that state of health which is necessary for the due performance of all mental operations. It must always, however, be borne in mind, that to secure the advantages resulting from it, the patient must be free from any high excitation, or, at least, that any excitability which may exist, is only to such an extent as to admit of its being completely exhausted or subdued by labour. In the treatment of our patients we have always recognised these principles, and availed ourselves of them as far as circumstances would permit. The additional plans for the employment of our patients, as alluded to in last report, have been completed; and we have now the satisfaction to state, that we have ample means of affording work to our inmates of all classes who can in any way be thereby benefited.

In our capacious workshops, weavers, tailors, shoemakers, carpenters, and saddlers, may be seen diligently pursuing their avocations; while in the workrooms, laundry, and washing-house, the various operations of sewing, knitting, carding, spinning, winding, shoe-binding, washing, and dressing, are carried on with cheerfulness and alacrity. The convalescent ladies are employed not only in ornamental work, but in the benevolent occupation of making articles of dress for patients of the poorer classes. In addition to the kindly feeling thus fostered, and the benefit which full employment secures to the individuals themselves, the profits derived from the labours of all classes, may, in addition to other advantages, enable us very beneficially to augment our present library, without trenching on the funds of the institution. Among all classes of our patients who are in a calm or convalescent state, we find books in great demand; and the promise of the perusal of the works of a favourite author, frequently operates as the strongest

Digitized by Google

inducement to submit to that bodily exercise in which it is always our object to engage our patients.

It has been objected to the employment of the insane in workshops, that it is not so beneficial as exercise in the open air. This we readily admit. But the question lies between occupation and idleness. The weather is not at all times propitious for out-of-door labour, and even when it is, there are patients who cannot be induced to engage in it. In these circumstances, large well-ventilated workshops are of the utmost advantage. In corroboration of this, we may mention, that some of our patients who could not be induced to work in the garden, have become industrious weavers; and so anxious are they for employment, that they will work one-half of the day in the open air to be allowed to spend the other in the weaving-room. Nor, because we have workshops, do we force or induce all to engage themselves continually in them. On the contrary, we make it a rule, that when the weather permits, every one shall be engaged for a certain time daily in the garden or airing-grounds.

Besides the patients of the lower classes who are employed in out-door occupations, those of superior rank have been induced to betake themselves to the healthful exercise of manual labour in the open air, and by their exertions, some of the grounds have been laid down anew. Thus, one disadvantage under which patients of the better classes have in other establishments been allowed to remain, has been obviated.

The various means by which this was effected, it would be too tedious to mention here. Suffice it to say, that by the force of example, by holding out motives likely to operate on the character of the individual, nay, even in some cases by a simple appeal to their reason, the task has been accomplished, and the effect has been most beneficial.

The means of mental improvement, through the medium of rational and harmless amusements, have also been increased, while, at the same time, we have taken care that they be as much as possible suited to the rank and taste of each class of patients. Books, journals, and newspapers, have been amply supplied; and in the evening, after the labour and exercises of the day, the patients may be seen in the well-lighted parlours, billiard-room, and galleries, cheerfully employed in reading, playing backgammon, cards, or billiards, or solacing themselves and their companions with the flute, the violin, or the piano-forte.

This is no exaggerated account, drawn up to please the imagination or gratify the feelings of the philanthropist. The facts now stated, may be daily and nightly seen in the asylum; and we have only to appeal to those who, in their official capacity, have seen the institution lighted up in the evening, and call on them to declare, whether it did not appear a scene of peaceful pleasure, rather than the abode of those afflicted with the most distressing of all human calamities."

DRUG-TAKING.

Unhealthy people depend far too much on the druggist's shop. This perhaps would not be if it were recollected, as it ought to be, that the pain and disagreeableness of ill-health result from our perceptions of these things, and not from the things themselves. Those who go into battles know that in the heat of conflict men receive the most serious and painful wounds, which they do not so much as find out until the hurry and excitement of the fight are over. Now, one-half of the ill-health which annoys people in the atmosphere of London, and with London habits, is just of that kind from the *perception* of which they might escape. I am no *doctor* in the pulse-feeling and tongue-inspecting signification of the word; but I have reason to believe that the most intelligent among my very esteemed friends who practise the healing art are very well aware of the great importance of turning away the *attention* of the patient from his or her malady, be it real or only imagined. Medical folks who understand mankind morally as well as physically, are, I believe, far less solicitous than some people think to make out positively and certainly whether such or such a disease does really exist, or only the imagination of it. In the first place (I speak, however, with the utmost deference to more erudite judgment), it is in very many of the cases which come before medical men absolutely impossible to tell what is really the matter *physically*. Some diseases there are of which the symptoms are quite decisive, and not to be mistaken; but of by far the greater number of cases of ill-health, the physical cause must remain in considerable doubt. The chief good which we then derive from the doctor is a moral good: we submit ourselves to authority and to discipline; we feel that we are taking rational steps towards ridding us of the evil which oppresses us; and we are, for the most part, inspired with hope, not to say confidence, by the sensible and encouraging words which the physician speaks. But there are thousands upon thousands who do not think themselves quite ill enough to call in the doctor, and yet go on from week to week, from month to month, and from year to year, continually ailing, and continually sending to the elegant shop with plate-glass windows filled with glass jars of various coloured physic (especially crimson), as if sick people were as silly as mackerel, and very liable to be taken with the same colour of bait. Now, it is for these people that I would presume to prescribe. What they want is not so much physic as diversion. How many are there who, while they are at home moping about with dull companions, or no companions at all, feel pains in the shoulders and in the back and in the chest, have dizziness in the head, black things floating before the eyes, sudden startings and twinges, and so on; how many are there tormented thus, who, when some brisk, lively, and intelligent friend appears, capable of rousing the attention and setting the spirits in a glow, actually forget their complaints, and feel that, for that evening or morning, as the case may be, they are uncommonly well? Now, these persons, instead of taking "black draught," as they very commonly do (for the pretty colours in the druggist's front window are by no means common to his nauseous stock), should take some far less melancholy medicine. It should not be material physic, but a wholesome, cheerful philosophy.—*The Table-Talker, or Brief Essays on Society and Literature.* 1840.

LITERARY CURIOSITY.

In a late newspaper we find the following droll poetic effusion in dog Latin, with a translation into English. The Latin is an Address to the Sea, and the English an Address to Mary.

TONIS AD RESTO MARE.

O Mare, sva si forme,
Forme ure tonitru,
Iambecum as amandum,
Olet Hymen promptu!
Mihi his vetas an ne se,
As humano erebi;
Olet mecum marito te,
Or Eta, Beta, Pi.

Alas! plano more meretrix,
Mi ardor vel uno;
Inferiam ure arte is base;
Tolerat me urebo.
Ah me! ve ara scilicet,
To laudu vimen tuus;
Hiatu as arandum sex,
Illuc Ionicus.

Heu! sed heu! vexen imago,
Mi misss, mare sta;
O cantu redit in mihi!
Hibernus arida.
A veri vafer heri si,
Mihi resolves indu,
Totius olet Hymen cum,
Accepta tonitru.

TONY'S ADDRESS TO MARY.

Oh, Mary, heave a sigh for me,
For me, your Tony true;
I am become as a man dumb—
O let Hymen prompt you!
My eye is vet as any sea,
As you may know hereby;
O let me come, Mary, to tea,
Or eat a bit o' pie.

Alas! play no more merry tricks,
My ardour vell you know;
In fear I am your heart is base;
Tolerate me, your beau.
Ah me! ve are a silly set,
To laud you vimen thus;
I hate you as a random sex,
Ill luck I only curse.

You said, you vixen, I may go,
My missus Mary, stay;
O, can't you read it my eye?
I burn as arid hay.
A very vafer, here I sigh,
My eye resolves in dew.
To tie us, oh let Hymen come!
Accept a Tony true.

HOW TO ENTER UPON A SCIENTIFIC PURSUIT.

In entering upon any scientific pursuit, one of the student's first endeavours ought to be to prepare his mind for the reception of truth, by dismissing, or at least loosening his hold on, all such crude and hastily-adopted notions respecting the objects and relations he is about to examine, as may tend to embarrass or mislead him; and to strengthen himself by something of an effort and a resolve, for the unprejudiced admission of any conclusion which shall appear to be supported by careful observation and logical argument, even should it prove of a nature adverse to notions he may have previously formed for himself, or taken up, without examination, on the credit of others. Such an effort is, in fact, a commencement of that intellectual discipline which forms one of the most important ends of all science. It is the first movement of approach towards that state of mental purity which alone can fit us for a full and steady perception of moral beauty as well as physical adaptation. It is the "euphrasy and rue" with which we must "purge our sight" before we can receive and contemplate as they are the lineaments of truth and nature.—*Sir John Herschel.*

PROGRESS OF MODERN TRAVELLING.

Our fathers were—and that within the memory of men—contented to convey their goods from town to town on pack-horses. Narrow roads, which barely admitted a string of these beasts, burdened with the needs of many towns, ran on over hill and dale, and often were found worn deep between steep banks, by the persevering traffic of ages, and overhung by trees which had spontaneously sprung and grown over them, rendering them cool and pleasant. But the affairs of our worthy ancestors became sensibly on the increase. The string of pack-horses slowly progressing over the wolds and through forests, were found not equal to the demands of commercial exchange and speed; and they set their wits to work, and lo! Pickford's and Pettifor's waggons, and others, their contemporaries, appeared, piled up in ponderous stateliness, and drawn by horses in bulk next to elephants. For their convenience, the old roads were deserted as too narrow, or filled up as too slumberously profound. New roads of an airy width were laid down; and Mr M'Adam showed himself, with his necromantic hammer and pebble-gauge in his hand, and coaches came galloping after him at ten miles' speed per hour, loaded with eager and still impatient negotiants; roads of granite or of limestone, however smooth, or however wide, or however covered with waggons, coaches, mails, horsemen, and the infinite variety of carriages of pleasure, travel, and parade, which now appeared on them, were found too few; and canals were cut; locks—wonderful things in those days—were invented; and heavy boats and light barges hastened to convey their freights of living things, and things for the living—market goods and market people—to the places where they were wanted, or where they wanted to be. Well done, Englishmen! Things were come to a pretty good pass, it was thought. People said, wondering to one another, "If our grandfathers could but rise from their graves and see all this, how they would stare!" But it was soon found that the population and the needs of the country had outgrown even these accommodations. There was a cry for more conveyance and more speed. Some talked of balloons, some of velocipedes, and some of perpetual motion. The old and the orthodox said—"Let well be. Things move fast enough. There is no rest, no repose, no steadiness, in this generation—all is hurry, hurry, hurry. It is perfectly distracting!" They even looked back to the old hollow roads and string of pack-horses with affectionate yearnings. Nevertheless, a set of pig-headed fellows were busy with their brains, and began to utter strange speeches about the powers of steam. It was a thing which was to work our mines and mills, impel our ships, and convey us, with the velocity of a comet, from one place to another. Old men, and wise men too, laughed at such Quixotic vapourings; yet, spite of their laughter, there were heard great hammerings, and filings, and fizzings, in the workshops of Watt and Boulton; and presently that mighty monster, a steam engine, was seen pulling up buckets of water and heaps of ore out of the earth, and turning a thousand spindles in our factories. It has become locomotive, has mounted the roads and the ships prepared for it, and is now flying from town to town, and country to country, with us and our concerns, in a manner so wonderful, that we shall soon find ourselves past wondering at any thing. Do we not ride at the rate of thirty miles an hour, and grumble at such a snail's space—step over to America in ten days, and think it about five too long—and hear news from the East Indies in little more than a month! Well done, Englishmen! as our fathers said, so say we—that is pretty well for another fit.—*William Howitt.*

FIRST PRACTICAL DISCOVERY OF STEAM.

In the year 1605, Florence Rivault, a gentleman of the bedchamber to Henri IV., and the preceptor of Louis XIII., discovered that an iron ball, or bomb, with very thick walls, and filled with water, exploded sooner or later when thrown into the fire, if the steam generated were prevented from escaping. The power of steam was here demonstrated by a precise proof, which, to a certain point, was susceptible of numerical appreciation, whilst, at the same time, it revealed itself as a dreadful means of destruction.—*Newspaper paragraph.*

Paragraphs of this nature, relative to various discoveries in the arts, are very common in newspapers. Nobody doubts that the power of steam was understood by thousands of persons before it was ultimately known for any effective purpose, and therefore no credit whatever is due to such persons as M. Rivault. In our opinion, no merit can justly be given to discoverers, unless they can make their discovery to be of some practical use to mankind, or at least bring its value distinctly before the public.

EQUALITY OF HAPPINESS.

Nor is it to be imagined that the happiness of the individuals who are subjected to despotic government, is necessarily sacrificed during the effort of nature to throw off the load which oppresses it. The same improvidence and disregard of the future, which is the immediate cause of the growth of a redundant population, afford sources of enjoyment to the individual unknown in civilised life, and soften the stroke of suffering to a degree which can hardly be conceived in more prosperous states. It is by supposing the subjects of such governments actuated with our feelings, desires, and habits, that their condition appears so unhappy. We forget that nature has accommodated the human mind to all the circumstances in which mankind can be placed, under the varied physical and political circumstances of the species, and that instincts and gratifications to us unknown, compensate to them for the want of those enjoyments which to us appear indispensable. The country of Europe where distress appears in its more aggravated form is Ireland; and Persia is the dynasty of the east where desolation and misrule have longest prevailed: yet every person who has visited the former country, has observed the uniform cheerfulness and joyous habits of the peasantry; a very competent observer has expressed a doubt, whether the people of Persia do not enjoy life as much as in the more civilised and laborious states of Europe; and the able author, who has demonstrated that it is in the purity of domestic life, and simplicity of manners in the east, that the real antidote to the whole political evils to which they have so long been subjected is to be found, has confidently asserted the opinion, that the average amount of human happiness and virtue is not less in the east than the west. The French peasantry danced and sung in the midst of the political evils which led to the revolution; and even under the horrors of the West Indian slavery, the evening assemblies of the negroes present a specimen of temporary felicity rarely witnessed amidst the freedom or luxury of their oppressors. The freedom from anxiety, the sweetness of momentary gratification, the relaxations from labour which result from the prevalence of habits of improvidence, frequently compensate to the individual for the dear-bought comforts of prosperous life, while suffering loses half its bitterness by never being foreseen, and misfortune half its severity by being speedily forgot. "In peace of mind, and ease of body," says Mr Smith, "all ranks of men are nearly upon a level; and the beggar who suns himself by the highway possesses the security that kings are fighting for."—*Alison's Principles of Population.* 1840.

BEGINNING OF ROAD-MAKING.

The infancy of road-making, like that of navigation, must be sought in the infancy of nations. A canoe, hollowed out of the trunk of a tree, was the beginning of ship-building; and an Indian's trail, by which an untutored tribe wend their way, in single files, through forest or grassy glade of boundless extent, is the first germ of a road. Conveyance by a quadruped, which rendered necessary the widening of the trail into a sort of bridle-path, formed most likely the second step in the improvement of itinerancy. Next came the use of carriages; a sledge perhaps first; after that, the cart, or sledge, raised on two wheels, connected by an axle. Then came the double cart, or waggon of four wheels, by which two parallel and transverse axles were connected by a fixed longitudinal one. In principle, no improvement beyond this has been made in the construction of carriages, save the moveable joint, which at once, by the facilities it afforded for turning curved lines, dispensed with the necessity of rectilinear roads for large vehicles.—*Wade's British History.*

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

NUMBER 453. SATURDAY, OCTOBER 3, 1840. PRICE THREE HALFPENCE.

THE FLITTING.

As Mrs Weston, accompanied by her waiting-maid, was travelling through a remote part of Ireland, her jaded horses, which, for the last four miles, had with difficulty been prevailed on to proceed, on coming to a hill high and steep enough to have alarmed more vigorous steeds, made a dead stop, and neither the blows nor vociferations of the driver could induce them to move a step farther. As this is an event neither rare nor unexpected in Ireland, the lady was but slightly discomposed by it. Having dispatched the driver to the next town to procure fresh horses, she quietly looked round for some house or cabin where she might remain till his return. Seeing a decent-looking cottage at a little distance from the road, she alighted, and, in the full assurance of meeting with hospitality, proceeded towards it; but her steps were arrested by the assaults of a host of cabin curs, that seemed to resent with peculiar asperity the unlooked-for intrusion of a well-dressed stranger. Their barking at length brought out the mistress of the house, who, to Mrs Weston's great surprise, proved to be an old acquaintance, for whom, since the lady's return from England, she had been eagerly inquiring, but of whose fate she had not hitherto been able to procure any certain tidings.

"Do I dream?" said she, "or is it possible that I see Nancy Gallagher settled down here amongst the wilds of Connaught?"

"Oh, dear ma'am, and is it you? The heavens be praised that I see one sight of you again," said Nancy, kissing the lady's hand, and then her cloak, in the ardour of her joy.

"Let me come in, dear Nancy, to this nice cottage, which I hope I am right in considering as yours?"

"Then it is mine, and I wish it were a castle for your sake. Come in, dear, and a thousand welcomes! Wasn't I beside myself to keep you here standing in the cold? but it's all the perfect joy. Come in, dear, and I'll bring in your things."

"No, no; let them remain in the chaise, my maid will take care of them," said the lady, seating herself on a low stool beside the fire. "And now, Nancy, sit down and tell me all, for I am dying with curiosity. What has brought about this wonderful change in your situation?"

"Sure you'll take a chair, ma'am."

"Let us have done with ceremony now, dear Nancy; we have no time to spare for it. There—that will do—the fire is very good. Begin and tell me *out to the face*, as you used to say, all your history, and how you happened to leave Rathkeel."

"Why, then, I will, ma'am," said Nancy, smiling through the tears which the mention of Rathkeel brought to her eyes.

"But first," said Mrs Weston, "tell me where Jenny is. I do not see Jenny. She is well, I hope?"

"She is well and happy, I thank you kindly, ma'am; but she is not with me at present, as you shall hear. It wasn't passing two months after you left us, ma'am, that all the leases in the whole town, I may say, fell in to my lord. Well, my husband, thinking, to be sure, it would be as in the old times, puts in a proposal for his own little concern; when lo and behold you, down comes the agent, and, says he, 'You must *out* every one of you, for the lands are promised to a man of substance, that can show them justice, and will pay the rent duly.'

'That's hard upon me, please your honour,' says my husband, 'after me and mine living on the land these hundred years and better, to be turned out at last.'

'Mere shame for you and yours,' says the agent, 'not to have made a better hand of it. Sure your father held it for a song, I may say.'

'It's true for your honour,' says Christy; 'but then you know it was *ris* to fifty shillings when I got it.'

'And what are fifty shillings for such fine land? and why did not your father lay by a capital for you when he had it so cheap? Sure you know well you can't pay the arrear that's on it. Isn't my lord too good to forgive it you? and what a state the land is in—all racked and out of heart—not a fence that would keep in a beast. Why, it will take years to bring it into any condition again.'"

"And was this the real state of the case?" said Mrs Weston.

"Where's the use of denying it, ma'am?" said Nancy. "It was out of heart sure enough, for, though we did well with the good prices during the war, the last bad years left us down in the world. So away he went, and left us with heavy hearts that night, as you may believe; but where was the use of complaining, especially as we saw our neighbours just as badly off as ourselves, for there were better than forty families put out that same time. My husband had a brother that kept mostly in Dublin, and he gave the greatest account at all of it. 'Don't you see,' he'd say, 'how comfortable I live, with good clothes on my back, and my fill to eat. Not all as one as you and your family, slaving yourselves late and early—scarce able to keep a rag to cover you, or a bit of bacon in the pot, on a Sunday even. I'll get you work,' says he, 'at the foundry where I stop myself; and you will do well, and the children will get a little smartness into them.'

Well, he said so much, sure, that my husband inclined more and more to his advice, especially as we couldn't get ever a cabin in the neighbourhood, except one that had neither window nor chimney, things we were always used to; and, besides, the rain came into it at all parts, and for that same we should pay forty shillings. As for myself, I'd prefer staying in my own country, though it was in a hut built in the back of a ditch; and Jenny wanted us to put all together, and go off to America, for the books she used to be reading gave great accounts of it, and how industrious striving people like us might get on there; but the world wouldn't get me to cross the sea, so it was settled to Dublin we were to go—and a sorrowful day it was when we came to leave our little place, where we had lived many a long year, happy enough (for all our brother Paddy could say), to go to a strange town, and take up new ways.

Our neighbour, Tom Connor, was very kind entirely, and lent us his horse and dray for the journey. We were three days about it, and wet and weary we were the evening we got into Dublin, for it rained desperately all that day; and then, my dear life, I thought we'd never make our way to the lodging that Paddy had taken for us. Such turnings and windings through streets and lanes; and the boy we had with us not used to driving in such throng places. It was well ever we came safe, and that the dray was not smashed to pieces. At last, when we did make it out, all the stairs we had to mount; it was, for all the world, like going up the tower in the old castle of Rathkeel. Jenny, who was always for making the best of things when there was no remedy, said it was all for the better—that we should have fine air up so high; but as for air, myself thought I never got my breath rightly, from the time I went in it till I left it again. We had but two rooms—one of them you could scarce turn in, it was so small; and yet we had six pounds to pay for the two. My husband didn't get into work so ready as we expected, but he did at last. As for me, when I had finished settling our little matters, I felt as queer and lonesome as anything, for want of the cow, and the pig, and even the little chickens I used to be minding at home. Jenny put me up to go spin. There was no call that time for the kind I was used to.

So, 'Mother,' said she, 'why not try the tow for sacking. Suppose we make but twopence a-day, isn't better than nothing?—and it will serve to pass away the time.' Well, to it I went, though it came strange enough to me, that never was used to less than three hanks in my life before. We sent the children to school, to keep them out of mischief in the streets. My brother-in-law dieted with us, and he liked to live high, so we often had meat and tea; yet, with all that, I missed the sup of milk, and thought the children throve better when they had the churn to run to.

Well, things passed on in this way for about a year, when home comes my husband one night, with the news that all was upside down at the foundry—ever so many men discharged, and himself and his brother amongst the rest. It was well they got their week's wages even, the money was so scarce there. His brother said they might pick up a pretty penny by doing odd jobs about town; but what was that to keep up a family, especially as Paddy wouldn't hear of our giving up the bit of meat, though Jenny pressed it greatly, for she was mighty considerate entirely, and had more thought about every thing than myself, God help me! though she was such a young slip. Another thing that vexed her greatly, was the noticing the smell of spirits now and again upon her father, especially since he fell out of regular work. Sometimes he'd be even stupid like when he'd come home. She went down on her two knees to him, to beg him to quit Dublin, and he didn't say much against it; but her uncle called her a saucy jade for advising her elders, and brought Christy round to the mind to stay where he was. Well, I did my best, sure, to be saving; but it wasn't as in the country, where we had the potato ridge at our back. Every thing was so dear, and I not used to Dublin ways. Our little stock that we brought with us was getting less and less, till at last it was all gone; and, what was worse, the men got the fashion of not bringing home their wages regular.

One day we were low enough, and had nothing but a few dry potatoes in the house, when in comes Jenny—

'Mother,' says she, 'I have good news for you this evening.'

'Ah, what is it then, Jenny?' says I, 'for I'm sure it's much awanting.'

'I can get work at Mr Glennan's cotton factory, a little way out of town,' says she, 'and the wages will be a great help to us.'

'No, Jenny,' says I, 'I can never give in to that; it's too dangerous for a girl like you to be going and coming late and early'——

'Mother,' said she, 'I don't find any thing happens to those that have a mind to take care of themselves; and, with the blessing of Heaven, I will never do any thing to disgrace my family—so we had best take the offer; if we don't, we may be sorry for it.'

Well, at last she prevailed, and engaged herself for the next week at eightpence a-day. I thought she'd soon tire of it; but late and early, in the heat of summer and depth of winter, there would she be as regular as the work-bell. I used to be afraid that the town sparks would be following her as she was coming home late in the evening."

"I don't wonder you were afraid," said Mrs Weston, "if she grew up as handsome as she promised."

"Ma'am, you wouldn't believe how she improved:

Digitized by Google

it isn't I that said it, but every one. She was as likely a girl as you'd see of a summer's day—tall, slender; her skin as white as an egg, with a fine blush in her cheeks, and her eyes shining like two diamonds; and then such a smile, such a sweet smile, that high and low were taken with it—and many's the bachelor she might have had at the factory, only she was so distant in herself—and for all she looked so mild, had a way with her that none dared take the least freedom with her. Another thing of Jenny was, that she always went mighty plain, and instead of buying fine gowns or shawls, like other girls, she'd bring her money duly of a Saturday night, and throw it into my lap, saying—'There, mother, there's for the house;' and, indeed, we'd have been badly off but for it, for things were getting worse and worse with us; and we were forced to take the boys from school, which fretted Jenny greatly.

'What can I do,' says I, 'when I can't pay for them?' 'Can't you send them to the free school?' says she. 'Is it to a charity school?' says I—'that's where none of their family went yet; and I won't be the first to have my children taxed with it.' 'Wouldn't it be better, mother,' said she, 'than to have them taxed with being thieves and liars, as they surely will, if they keep company with the little vagabonds in the streets?' Then she began to tell me of ever so many people that got their education in such places, and came to riches and grandeur by means of their learning. 'And do you think, mother,' said she, 'they would have thanked their parents if they had kept them back from honour and advancement, out of false pride?' Well, she said so much, sure, that in the end she brought me over to her notion, and the boys were sent to the free school.

The winter was now coming on, and that was always the hardest time with us, on account of being obliged to keep up the spark of fire constant, and the coals so dear, and I not used to manage them—when one evening, as Jenny was coming home from the factory, she noticed a young man tracking her on purpose, as it were; so thinking to give him the slip, she turned into the house of an acquaintance in Thomas Street, and stayed there a few minutes, thinking, to be sure, the boy would be gone; but when she came out again, who should be lurking about the door but the very man? So, thinking it useless to wait longer, home she comes—he following every foot of the way, till she rapped at the door. Then he stopped too, and told the girl who opened it that he had business with the mistress. Jenny came up, and was just after telling me about the man, and how he startled her, when who should appear at our door but himself, and the landlady with him?

'Here is a young man,' said she, 'that is in search of a lodging. I haven't a hole fit to put a Christian in, but I think you could spare that little room there, for all the use you make of it, and that will help to pay the rent that you're always murmuring about.'

Jenny gave me a look, as if she suspected something, and I the same to her; so, as civil as I could, I gave him a denial. 'But,' says he, 'I see where your objection lies, madam; you are cautious about admitting a stranger; but if I bring a note from your priest, Father Ryan, recommending me as a sober, orderly person, perhaps you may change your mind; so I'll call again when Mr Gallagher is at home, and then we can talk further on the subject.' With that he made a bow as respectful as if we were two ladies, and departed. Well, in about an hour, back again he comes with the priest's note, recommending Mr Blake (that was his name) as a sober, industrious man, likely to prove a good tenant. My husband and Paddy, who were within, were proud to get one to take some of the heavy rent off us; so, the next morning, home comes Blake with his little furniture, a bed, a table, crockery ware, and the like, and, sitting down, he tells us how it came into his head to fix himself with us. He said he was lodging for a while near the factory, and used to see Jenny as she'd be coming and going; and noticing what a discreet look she had, he asked the overseer about her, who gave her the best of characters for being sedate and industrious, and said he was sure she came of a decent stock, and had got a good education, for her manners and behaviour showed it. So, when Mr Blake found the lodging he was in getting too dear for him, he considered he might get a cheaper one with her people, and, consulting with the priest, who, it seems, was an acquaintance of his, his reverence said sure that we were poor honest simple country folk, and that he'd be safe in dealing with us. From this time he wasn't easy till it was settled. Mr Blake mentioned that he was in good work at the factory, but never let fall a word as to what side he came from, and we noticed that his speech wasn't just like our own, but a little queer and foreign like. However, he was very kind and cordial, and would come in and sit with us of an evening when my poor husband and Paddy would be out, as they often were latterly. Well, it chanced one evening as we were sitting this way, in comes Paddy a little hearty or so, and, says he, in a joking way, as he used when he was in good humour, 'Jenny, girl, you mustn't be always moping this way; you must take a little diversion like another. Sure, you never so much as take a walk into the country, you that used to be so fond of it.'

'True for you,' said I; 'I'm always at her to take a walk instead of poring over those books.'

'Oh, it's a better thing than a walk I propose for her now,' said Paddy; 'what would you think of a nice dance, Jenny; you that used to be so fond of it in the country? There's Mrs Strypes, the milliner, that you saw here the other day, going to give a genteel party, and she has been so civil as to invite you.' 'I am sure I am obliged to her, and to you too,' said Jenny, 'but you don't consider that I've no clothes fit to appear in at such a place.' 'Wouldn't the pink cotton do,' said I. 'Oh, mother dear,' said she, 'you have no notion how they dress here—as fine as ladies.' 'Well,' said Paddy, 'I was thinking you might make that objection, so see what I've provided, that you might have nothing to say against doing as I'd have you.' With that he pulls a bundle from under his coat, and opens it, and there, my dear life, was the making of a beautiful white muslin frock, and a pair of white stockings, half of them silk, no less, I assure you. 'Well, what makes you look so *wonderful*, both of you?' said he; 'Mrs Strypes has promised to cut out the frock for you, Jenny, according to the tip-top fashion, and you are a good hand to make it for yourself.' 'It's joking you must be, dear uncle,' said Jenny; 'you did not really buy these things for me?' 'Joking,' said he, 'why would I be joking? Why wouldn't I make you a present when I'm able? Sure it's the first time.'

Well, Jenny and I looked at one another, and couldn't understand it at all, for it was true for him, it was the first time; he had never so much as proffered her a ribbon before. 'That was a good thought, wasn't it?' said he at last, finding we did not answer. Then says Jenny, 'I ought to be greatly obliged to you, and so I am; but I can't but think, dear uncle, when you laid out your money on such finery for me, that you forgot how low we are in the world, and how many things we are in want of at this present, and shall be in want of before the winter be over.' Paddy had little heed of what poor Jenny said; and, to cut a long story short, he got her to promise to dress herself for the party, and to the party she went. She didn't come home till very late, and a great account she gave of how fine every one was. Herself was the plainest amongst them; but by what Mrs Strypes told us afterwards, none became their dress like her. There were ever so many bachelors, clerks, and 'prentices, mostly all as smart as could be. You'd take them for gentlemen, Jenny said, only for the voice and speech.

The next morning, as I was getting the breakfast, who should come in but our poor lodger, with his arm all fractured: it was only the small bone of it, however, as the surgeon said. So, after it was set, he could go about with it in a sling, but not a hand's turn could he do at the factory for the present; so he kept in his own little room with his books and his papers. One evening he called me in, and, says he,

'I am out of work now, as you see, and no man can foresee what may happen to him; so here is the rent for the quarter; it is better for you to have it secure.'

'Sure, it's time enough to pay it when it comes due,' said I; 'maybe you might have occasion for the money, now you are disabled.'

'Never mind that,' said he; 'I know how to want as well as any body.'

And, indeed, from that time we noticed that it's little victuals he used, barring the bit of bread and the cup of coffee. He'd never willingly be without the coffee.

The next Saturday, just when Jenny had returned from the factory, in comes a messenger from Mrs Strypes, wanting her over in all haste. Well, she went, sure; and in about half an hour back she comes, quite red and scared like.

'Mother,' said she, 'I don't know what to make of Mrs Strypes. Would you believe it? there she had a beautiful new bonnet, trimmed and all, and a shawl worth a guinea, at the very least, ready for me to wear to-morrow going to chapel. It was all I could do to get away without her forcing them on me; and who do you think paid for them?—why, that very gentleman who danced with me the other night.' 'And why would he be buying such things for you?' said I, all amazed. 'Indeed, mother,' said she, 'that is more than I can tell; Mrs Strypes says it was only out of civility and good nature, and that he often does such things when he hears of a well-behaved industrious poor girl. But for all that, I don't like it, and on no account would I accept of a thing when I was not sure of the intention it was offered with.' 'You are quite right there, Jenny,' says I; 'better go in rags all the days of your life, than have it in people's power to tax you with taking presents from gentlemen; but if he be a gentleman, what business had he there, dancing with the like of you?' 'Mrs Strypes says gentlemen often do such things for diversion,' said Jenny. 'Any way it's queer, isn't it?' said I, turning to Mr Blake, who was sitting by the fire. 'Not so very queer neither, Mrs Gallagher,' says he, smiling; 'you would not find many young gentlemen, I fancy, who would object to dance with the like of her. I should say more on this subject, only that I see your daughter is so well guarded by prudence and modesty, that all warnings are needless.'

All this while we were getting lower and lower in the world, and it was my wonder that Paddy, who was so ready with his money when no one was asking for it, should never offer us a penny now in our distress, and the rent coming upon us along with every thing else. I believe I mentioned that our lodger had paid the quarter before it came due; so, as Jenny was always at me to be saving, I gave her the note to keep; but when our landlady came bagging at us about the rent, I said, 'Hand over that pound, Jenny, it will help to keep her quiet for a while.' With that she fetches it out, and gives it to her father. 'Never mind going down with it now,' says Paddy, 'keep it till to-morrow, and I will make it thirty shillings.' You may be sure we weren't sorry to hear that; so Christy put the note in his pocket for the night. I called to them as they were going out in the morning not to forget the rent. 'Never fear,' said Paddy, 'we'll settle it.'

Well, it might be about five in the evening, and Jenny not yet come back from the factory, when in comes Paddy, out of breath, and looking quite wild like. 'W'ere's Jenny?' says he; 'here's fine work, and if she can't explain it, we are all ruined.' 'For the love of mercy,' says I, 'what is the matter at all, or what do you mean?' 'Matter enough,' says he; 'there's Christy going to be taken up for passing a forged note.' With that I gave a great screech, and it was well but I fell out of my standing.' 'Ay, indeed,' said Paddy; 'and it was from Jenny he got that same note, and that's the reason I want to see her.' Just as he spoke, there comes a tap at the door, and in walks Mrs Strypes. 'Here's the lady,' says Paddy, 'to whom Christy gave the note, along with my ten shillings, in exchange for a thirty-shilling Bank of Ireland, because our landlady is scrupulesome of taking any other these times.' 'Well,' said Mrs Strypes, speaking very easy like, 'what does Miss Jenny say to this business? She can explain it, I hope?' 'She's not come in as yet,' said Paddy: then turning to me—'Hadn't you best step out, and see is there any sign of her.'

Well, out I goes as fast as my poor trembling feet could carry me, and before I had gone half-way down the street, I met Jenny. I stopped her, and told her all: she grew as pale as death, and—'Mother,' said she, 'sure it is not possible Mr Blake could play us such a trick.' Home she runs as for the bare life, and I as fast as I could after her. When I came in, Mrs Strypes was pulling the note out of her pocket to show it to Jenny. But the minute the girl cast her eyes on it—'This is not the note you got from my father,' said she. 'Indeed but it is, miss,' said the woman; 'I have witnesses who were present when he gave it, who can prove it; and besides, I made him put his mark upon it, for it seems he can't write.' 'Oh, then, this is not the note I gave him,' said Jenny, 'I could swear to that, for I put my own private mark upon it. Oh, what shall I do? What can I do?' 'I'll tell you what, Miss Jenny,' says Mrs Strypes, 'I don't know how it is between you and your father, but I'd be sorry to hurt either of you, for I have a great regard for you, though you didn't seem to take my kindness in good part. But as to this affair, I'm willing to let the matter drop, upon condition that you make me a reasonable compliment in return.' 'And what compliment can I make you, ma'am?' says Jenny. 'Four or five pounds will do,' says she. 'Four or five pounds, Mrs Strypes!' says Jenny. 'Why, ma'am, you must be laughing at me. You know, as well as I do, that you might as well ask me for five hundred.' 'Not if you will be guided by me, miss,' says she. 'There is a check for twenty pounds drawn in your favour, now lying in my house, and you can have the money to-morrow, if you choose to present it.' 'In my favour, Mrs Strypes!' said Jenny; 'what can you mean?' 'Why, I mean that the gentleman you treated so unsivilly, in return for his kindness, understanding you were in distress, left it for your benefit, and that of your family.' 'And how am I to repay him? By selling myself? Oh, I see it all now. But that I will never do—no, never.' 'Just as you like, miss,' said Mrs Strypes; but, in the mean time, your father must go to jail before night, unless you can clear him and acknowledge the note, and then it's you must be accountable.'

'Well,' said Jenny, 'I know what I'll do—I'll ask Mr Blake's advice.' So she goes and taps at Blake's door, when, to Paddy's surprise, it was opened, and Jenny begins to tell her story—'But,' says Blake, 'you needn't, Miss Jenny, for I know all about it, and more, perhaps, than you do yourself.'

Then in he comes, as proud and as stern as you please, and walks up to Mrs Strypes, and—'Madam,' says he, 'perhaps you are not aware that I heard every word of the conversation you held with that person there (pointing to Paddy) during Mrs Gallagher's absence, and am acquainted with your infamous plot to criminate an innocent man, and delude a virtuous girl; to all which I am ready to make oath in any court of justice. As to you, sir, you are, to the best of my belief, guilty of a felony; but, on account of your connexion with this family, I am unwilling to expose you, and I am satisfied to let the matter drop, provided your brother's innocence be distinctly acknowledged, and the good note returned.'

Well, you never in all your life saw two people look so confounded as Paddy and Mrs Strypes did at this speech: at last she plucked up courage, and, said she, 'I'd be glad to know what business you have to meddle in this affair? or who would mind the word of a vagabond, come from the Lord knows where?' 'Madam,' says he, 'I am a foreigner, it is true, but I am known to people of respectability in town, and have a character that, I will venture to say, will bear the strictest investigation. You know best whether you can say the same for yourself. I am ready to go with you, and the poor man whom you have detained upon false pretences, before a magistrate this minute.' Upon this she quailed a little, and, says she, 'There must be some mistake in the business. That gentleman there (pointing to Paddy) must explain it. I am no ways accountable; but as I find Mr Gallagher is completely cleared, I'll go back and have him discharged immediately.' 'And I will take the liberty of accompanying you, to see it done,' says Blake.

So away they went, leaving myself and Jenny so amazed at what had passed, that we didn't know rightly whether we were dreaming or no. In about half an hour, back comes Mr Blake, bringing my poor husband along with him.

With the joy of getting him safe again, we couldn't keep from crying; and if we didn't bless and pray for our lodger, it's a wonder, though how he came to manage it so clever, and he a stranger, we couldn't make out. Then he informed us that, sitting quite quiet with his books and papers, he could not but hear what Paddy and Mrs Strypes said when I was out, they all the time supposing him not at home, because he had locked his door and taken the key out, that the children might not disturb him. He heard Mrs Strypes ask Paddy how he contrived to change the one note for the other, when Paddy told her he had watched till Christy was asleep, and then did it. 'It is clear he is a villain—begging your pardon for saying so of a relation,' says Blake; 'and I would recommend you never again to let him enter your door.' We were ready enough to agree to this; but he had done for my poor husband already. Christy took to his bed that night, saying that, what with the fright, and what with the ungrateful behaviour of his brother, his heart was quite broke.

Mr Blake saw he had taken the fever, and said we must have a doctor for him. 'But how do you think,' says I, 'that I can pay a doctor, when sorrow a pound I have but that's to go for the rent?' 'Don't distress yourself about that,' said he, opening his hand and showing

Digitized by Google

me a note in it; 'here is a ten-pound note I got from the owner of the factory for a little invention of mine—a new way of stamping linen. That's what I used to be poring over in my little room. This will pay for the doctor.' So he brought one to see my poor Christy; but it was all to no good, for he sank daily, and soon died, telling me with his last breath that God would yet raise up friends for me. And that was true of Blake, for he both paid the doctor and got poor Christy buried. I could not but wonder, sure, at his goodness, and he a stranger; but mistrusted in my own mind it was not all on my account.

The very day after her father was buried, Jenny said, 'Mother, I must not be indulging my grief; I must go back to my work, and strive to support the family, for now we have no other dependence.' And back she went, though she was so weak she could hardly crawl. I did my best with the spinnin'; and with the sale of some of our little furniture, we contrived to weather it out till spring.

In the mean time, however, Mr Sunkins, a young man at the factory, made an offer to marry Jenny, but this she would on no account hear of. 'Oh Jenny,' says I, 'what's this for?' Are you going to be a trouble to me now for the first time in your life? But I see how it is—you are hankering after them that's not able to maintain you.' 'Mother,' said she, 'I'll never deny it; Mr Blake has gained my good will, and I am sure he did enough to deserve it. In my mind, one who earns his bread by honest industry, and never spends his earnings in vice or folly; who, if any accident should reduce him to poverty, would rather live on bread and water than get into debt, and be the cause of loss to others; who, when fortune or his own ingenuity throws a little matter in his way, instead of spending it on his own pleasures, is ready to share it with his friends in their distress; and above all, one who attends strictly to his religious duties, and has the good word and regard of his clergy—this is what I call a person worth caring for, and is what our lodger has proved himself to be.'

'And what do you know against the other?' said I. 'Why, mother,' said she, 'it's but a bad return for the young man's partiality to me to seek out faults in him; but I must just remind you that though he does not get downright drunk, I believe he seldom goes to bed perfectly sober. If I married him for the sake of his salary, I might be in a bad way after all, for I am sure we have seen enough of the consequences of drinking.'

Well, this was always the way with Jenny and me; she had so much to say, and so sensible seemingly, that I did not know what to answer her; but, says I, at last, 'You don't consider, Jenny, that this Blake is a stranger. We neither know what he is nor where he came from. He might pass any thing upon us.'

'He couldn't pass himself for honest and sober if he were not so,' said she; 'we should have found him out before now. As to the rest, I will make him give an account of himself this very evening, if you will please to hear him.' And, indeed, just as we had finished our supper, he tape at the door. 'Mrs Gallagher,' says he, sitting down by the fire, 'I suppose Jenny has told you what my wishes are—may I hope for your approbation and consent? I am informed that your daughter has had more advantageous offers, but she has been kind enough to give me hopes that the strength and sincerity of my attachment may prevail. What I want in wealth I will strive to make up by industry; and until my powers of body and mind fail, she shall never know want.' 'I'm entirely obliged to you, Mr Blake,' says I; 'and I never can forget your goodness to us in our distress. But you are from foreign parts, sir, and how do I know where you would be taking my poor girl to?' 'Your doubts are very natural, madam,' said he, 'and I will satisfy you immediately by relating my history, of which I have no reason to be ashamed.'

Then he begins and tells a long story. Myself can't repeat the half of it; but this was the sense of it at any rate:—

His father lived in Cork, where he used to be carrying on a little dealing. Then he took it in his head to go to a place they call Portugal, where he married a woman of the country that had some money, and was doing mighty well, still keeping business going; at last his wife died, leaving him with but one child, and that was our lodger. He never married again; but he and his son lived together quiet and easy, till a new king came in that country. Myself doesn't know what sort of a queer king he was at all, at all; he'd be putting the people in jail, not for any bad thing they would do, robbing or murdering, or the like, but just because he'd mislike the colour of their clothes, and because one that had a spite against Mr Blake (that is the father of our lodger) went and reported that he saw him in a white hat, or coat; then was the poor fellow clapped up in prison before you could look about you; and along with that, they took his little property from him, making out he was plotting *again* the king.

When the father was taken up, he sent a message privately to the son, bidding him make off with all speed to England, to some friends he had there, to get them to speak for him to the king, or his people, to let him out; but the son wasn't passing a week in London, when news came that, what with the vexation and the bad usage he got, the poor father had died in the prison. The son was like one distracted when he heard it. He took sick with the grief; and the sickness, and the living in that dear place, wasted his little substance. Then he bethought him that there was a merchant living in Dublin that owed his father some money, and that if he could recover it, it would be a great thing. So over he comes; but, as ill luck would have it, the merchant was not at home; he had gone on a voyage some place, but was expected back soon; so the poor boy kept on from month to month, still on the look-out for him, till his money getting scarcer and scarcer, he was fain to take up his lodging in our poor place.

When he had finished his history, he said, 'I don't want you to take all this on my word: that would not be reasonable; but Father Ryan will certify the truth of my story, and give you his opinion as to whether I am a fit person to be trusted with your daughter or not.'

Well, the next day, sure, I went to the priest and asked his advice in regard to Jenny.

'My advice to you, Mrs Gallagher,' said he, 'is, that you put no obstacle in the way of this marriage. The young people love one another; Blake is sober and honest. I will be responsible for the truth of his story; and it is my firm opinion that you will never have reason to repent of bestowing your daughter upon him.'

'I will never go past your reverence's word,' said I; 'I'll not be their hinderance.'

'From that time, our lodger gave us no peace till the day was fixed for the wedding. When Jenny was getting ready to go to the chapel, I got out the white frock for her, thinking she'd wear it.'

'Put it up, mother,' said she, 'for Antonio (that is Blake's name, and a queer name it is) can't abide the sight of it.'

So it was in the old cotton she was married. Well, I couldn't but fret, sure, in my own mind, to think of the poor place and poor entertainment I had for my son-in-law. It poured as if the skies would fall all that morning. So, when the priest had finished, I went to the chapel door to see was there any chance of the rain getting lighter, when Blake followed me.

'Mother,' said he, 'don't go yet, there is a coach coming to take us home.'

Well, I was delicate, sure, in saying any thing, but I couldn't but wonder in my own mind that he'd be spending his money on a coach, and we so poor, sure enough; however, up drives a hackney-coach, and in he makes us go, myself and Jenny, and our landlady's daughter, who was bridesmaid. Myself, not being used to the coach, didn't mind what way it was going, and Jenny was too confused to take notice; but, says the girl, popping her head out of the window, 'We are going wrong, Mr Blake.'

'Never mind,' says he, 'we shall come right at last.'

Well, what does the hackney man do at last, but draw up at the door of a respectable-looking house. Blake opens the coach door, and out he jumps, and makes us all alight, and go into a snug little parlour. Then he goes over to Jenny and kisses her, bidding her welcome to her new lodging, and the same to us all. Jenny and I looked at him, not knowing what to make of it, but thought, sure, it was some joke. 'I see you are all amazed,' said he, 'and think me half mad; but I hope to convince you that I am in my sober senses; that is,' said he, smiling, 'as far as a man can be, who is so much in love.'

'When I told you my history, I told you nothing but the truth, but I did not tell you the whole truth. That I reserved for the present moment. About a month ago, a letter arrived from Portugal, from a dear friend of my father's, who had been with him in the prison, and who was only just then released. This gentleman informed me that my father called him to his bedside a little before he died, and told him, as a great secret, that the king had not got all his property, as was supposed, for that some months before he was taken up, suspecting how things might turn out, he had exchanged the half of his property for gold, and when the troubles came, he had buried it in a private place in his garden, keeping it a secret from me, because he knew, by the love I bore him, I would have given up every thing to procure his release. Then my father gave directions how to find the treasure; and the first thing the gentleman did when he got out, was to seek for it, and get it remitted to England, and not till it was safe did he tell me a word about it; and then, I must own, I was glad to keep the secret, that I might prove to my friends (for as to myself I had no doubts) that my Jenny preferred me for my own sake, and not for that of my wealth.'

Then Blake told us that the money amounted to seven thousand pounds—no less, I assure you. I could hardly believe my ears when I heard such a sum mentioned. As for Jenny, I really believe she thought more of the compliment he paid her in choosing her, than of the money itself. I asked him how he came to think of one so much beneath him.

'Except in regard to fortune, which is no great matter in my mind,' said he, 'Jenny is in no respect beneath me. Though my father got on so well in the world, he was nothing more than the son of a man who kept a little shop in a back lane in Cork. Jenny is descended from an honest and respectable farmer's family; and as to education, if I had not seen something in her superior to the generality of girls in her station, I should never have attached myself to her, notwithstanding her beauty, which was, I own, what first attracted me. I observed such sweetness and modesty in her look, and such remarkable propriety in her manner and behaviour, that I was led to observe her more closely. After I came to lodge with you, I saw her well tried, and had the best opportunities of judging of her sense, temper, and discretion; so I thought I should be happy if I could obtain such a girl for a wife. My father's opinion, too, had great weight with me, for he always said that no country could exceed Ireland for the correct behaviour of the women.'

Well, I couldn't sleep that night for the joy and wonder at all I heard. The next day, Antonio told me that his plan was to settle himself at Cork, where there was a friend of his father's in a very safe way of business, who would be glad to have him for a partner, on account that he had such insight into the ways of foreigners, for it was with that same Portugal the man would be dealing.

'As to yourself, mother,' said he, 'I'll tell you what Jenny and I have settled, if it be agreeable to you. I believe you will not be sorry to quit Dublin. Father Ryan, our priest, has some land in a quiet retired part of Connaught, and he has promised to let you have a few acres at a reasonable rent; there is a cottage and out-houses on the land; and as both your father and husband were farmers, I think you must have sufficient knowledge to manage a small concern, particularly as the priest's father, who lives in the neighbourhood, and who is a skilful farmer, will give you his advice, and will plough your ground for you for a reasonable allowance.'

'Sure it's the thing in the world would please me best,' said I; 'wouldn't I be happy to be out of this wicked town, that was the death of my husband! The only thing that *cows* me is the fear of a bad crop, and that I mightn't be able to pay the rent, now that I have no one to back me.'

'Don't let that give you any uneasiness,' said he, 'for I intend to take the rent upon myself for your life. Is it not the least that I can do for my mother? and when your son is old enough, he can take more land on his own account.'

Well, if you'll believe me, I couldn't say one word to thank him, my heart was so full; but he saw it all in my face, I believe.

He wouldn't let us flit till the month of May, and then he paid the expenses of our journey here. We found the house repaired, and a fine chimney and windows, and a brick floor, just as you see it, ma'am. But when I went out to the yard, there, my dear life, was a beautiful cow in the byre, a pig in the stye, and all as snug, or rather a great deal snugger, than ever our own place at Rathkeel was; for there, to be sure, the walls were only propped up, and the roof but middling. Then I had my four acres of land, fenced and ditched as nice as a gentleman's place, and part of it ready set with potatoes and oats.

Well, if I didn't bless and pray for my son-in-law that night, it's a wonder.

We hadn't been settled here passing three months, when there comes a letter from Jenny from Cork, pressing me to go and see her, and bidding me bring George (that's my second little boy) with me, as she was determined to keep him and send him to school, as he was always apt and inclined for his book; and she said, if he turned out well, her husband would be the making of him.

You may believe I was proud and happy to see my girl in her own house, sitting in her own parlour, and every thing clean and genteel about her, and yet not a bit set up, but as humble as ever; for her husband told me how she hindered him to get a jaunting car for her, though many had it that couldn't so well afford it, saying, it was wholesomer and better for her to walk as she had been used to do, and that it would be wise for them to lay up some of their income for fear of any trouble coming. It was she that was happy to have me in her own house, and to make much of me.

'Mother,' said she, 'how can I ever be thankful enough to Heaven for all the blessings I enjoy! The having you so comfortably settled is one of my greatest causes of happiness.'

Well, I stayed a fortnight with her, and then came back to my own place, where Tommy, and little Kitty, and myself, live as snug and cosy as you could wish to see."

"Indeed," said Mrs Weston, when Nancy had finished her long story, "I am heartily rejoiced at the happy termination of your troubles, which is more peculiarly gratifying to me, because I think it may be in a great measure ascribed to the good conduct of my favourite and pupil, Jenny. Virtue does not often meet with the reward of so much temporal prosperity; but the favour of Heaven, and that peace of mind which the world can neither give nor take away, it is ever sure of obtaining."

BIOGRAPHIC SKETCHES.

M. THIERS.

M. Thiers, the present Prime Minister of France, like many other great and estimable individuals, has the merit of having raised himself from an humble origin to the eminence which he now enjoys. On coming into the world, as has been observed by a French writer, M. Thiers was not cradled on the knees of a duchess. On the contrary, he was ushered into existence in the humble abode of a locksmith, who was his father, in the city of Marseilles, on the 16th of April 1797. His mother belonged to an old commercial family, which, in the vicissitudes of the time, had fallen into extreme poverty. The events of a career which could raise the young Louis-Adolphe, in his 39th year, to the highest station in his native country, might be expected to be remarkable, and yet, for the purposes of the biographer, they are sufficiently ordinary. The causes of so rapid an advancement lie more in those commanding and very rare qualities which fit a man for a great party leader, than in striking or even tangible facts. Still the circumstances enabling him to develop those qualities must, it may be supposed, have many instructive if not romantic features, and such as they are, we shall endeavour to describe them.

In early boyhood, the relatives of M. Thiers's mother procured him a bursary in the Imperial Lyceum of Marseilles, where he received all the early part of his education. He is reported to have achieved many victories over his young competitors before the year 1815, when he proceeded to Aix for the purpose of pursuing the study of the law. There he met another youth of such parentage as his own, who had recently emerged from the Lyceum of Avignon, with whom he formed an intimacy, which, being founded on those mental sympathies calculated for endurance, has, to the honour and advantage of both parties, continued unabated to the present time. We allude to M. Mignet, whose name is celebrated as a more concise historian of the same great event which has exercised M. Thiers's talents. It would appear that the two friends, giving themselves up with ardour to the study of literature, philosophy, and history, treasured up little more of the Digest and the Civil Code than enabled them to pass their examinations. But Thiers, already evincing an impetuous and aspiring spirit, was likewise the leader of a party amongst his fellow-students, and provoked the frowns of the professors by his tirades against the government of the Restora-

Digitized by Google

tion. At this time an incident, sufficiently expressive of his position and capacity, occurred, which is worthy to be recorded.

A prize being announced for competition, M. Thiers resolved to enter the lists, and accordingly sent in his manuscript. The essay was found incomparably superior to any other, but unhappily the name of the author had transpired, or was suspected; and rather than adjudge the palm to the young Jacobin, as he was deemed, the learned heads of the institution abruptly postponed the competition till the following year. At the appointed period, the manuscript of M. Thiers again made its appearance; but in the interval a production of such surpassing merit had arrived from Paris, that the dilemma of the judges was obviated, and they eagerly crowned the metropolitan essay, awarding the second prize, however, to M. Thiers. Considerable was the horror felt by the Senatus Academicus, when, unsealing the packet wherein the name of the Parisian laureate was enveloped, it divulged none other than that of the hateful Thiers himself, who had adroitly contrived this deception on the solemn functionaries of his university.

Having taken his degree as advocate, M. Thiers entered upon the practice of his profession at Aix; but soon growing disgusted with so narrow a sphere, choked up, moreover, by high aristocratic prejudices, he set off one day, in company with his friend Mignet, to seek his fortune at Paris. The two wayfarers debouched on that immense metropolis buoyant with hopes and talents, but destitute alike of friends and money. The first months of their residence gave but little token of a brilliant future, if we may trust a writer* who thus describes their modest domicile:—

"It is now several years ago since I climbed, for the first time, the innumerable steps of a gloomy building, situated at the bottom of the obscure and uncleanly alley de Montesquieu, in one of the most densely populated and deafening quarters of Paris. It was with a lively feeling of interest that I opened, on the fourth floor, the begrimed pannels leading into a small chamber, which is worth the trouble of describing:—a low chest of drawers, a deal bed, curtains of white calico, two chairs, and a little black table, ricketty on its legs, composed the entire furnishing."

The manner in which M. Theirs raised himself from this situation of obscurity and poverty, exhibits his energy and powers in a striking light. It was at the commencement of the year 1823, when the repressive administration of Villèle was in full vigour. Manuel, the great orator, had just been violently expelled from the Chamber of Deputies, and he was, of course, the popular idol of the moment. M. Thiers saw that, to him, an ambitious plebeian, the event might prove auspicious. He went straightway to Manuel, himself a native of the south, and a man of frankness and feeling, who, appreciating the value of the talents offered him, forthwith presented Thiers to M. Lafitte, and obtained his admission amongst the contributors to the *Constitutionel*, then the predominant engine of the press. This opening he lost no time in turning to account. Eminently endowed with a capacity for literary warfare, he soon became distinguished for the vigour and hardihood of his articles; and as in France the occupation of a journalist is regarded with an estimation proportioned to its influence over society, the young contributor speedily found himself the object of high consideration. He passed into the most brilliant circles of the opposition, into the crowded saloons of Lafitte, Casimir Perier, the Count de Flahault, the Baron Louis, the great financier of the era, and even of M. de Talleyrand, who, albeit fastidious in his company, is stated to have detected with his keen glance the capabilities of the briefless advocate.

This introduction to society availed M. Thiers in facilitating the great undertaking upon which his eminence principally rests. Combining with a singular facility of composition an astonishing memory, great fluency and tact in conversation, and an admirable rapidity of comprehension, he found time to supply the exigencies of the daily press, to frequent drawing-rooms, to talk much, to hear more, and afterwards, in meditation and study, to adapt the fruit of his intercourse with actors in the grand revolutionary drama—remnants of the Constituent and Legislative Assemblies, the Convention, the Council of Five Hundred, the Legislative Body, and the Tribunate, statesmen, generals, diplomatists, and financiers—to promote and embellish his History of the French Revolution, upon which he had been for some time engaged. At length that well-known and great work, "The History of the French Revolution," made its appearance, and at once placed its author in the highest ranks of literary celebrity.

This work has run through numerous editions, and attained a popularity far surpassing any other publication on the same subject. Its principal merits consist in the easy and flowing style of narration, the distinct and apposite portraitures of men, the allocation of the most material and striking facts and incidents, the harmonious arrangement, and the profound appreciation of events. In a history necessarily containing so much of military detail, to those readers whose acquaintance with fire is confined to the domestic hearth, as a French wit expresses it, the succinct and lucid accounts of campaigns and battles in M. Thiers are particularly grateful. Moreover, as no human monument is free from faults, it behoves us to state that many serious objections have been urged, and with some justice, against that peculiar point of view under which M. Thiers, like his friend Mignet, contemplates some of the appalling atrocities of the Jacobin faction when in the ascendant. That the dangers of France, from inner and outward foes, demanded an unexampled display of energy, none can doubt; but it is inconsistent with justice and reason to deem inevitable or legitimatised, so to speak, by irresistible fatality, those wholesale slaughters of innocent and unoffending persons, which, so far from preparing the nation for liberty, served only to demoralise it, and throw it all palpitating at the feet of a despot. At the same time, this charge has been too rancorously enforced against the work, especially by those who look with almost a kindly eye upon the remorseless vengeance of kings, when wreaked against prostrate subjects: the accusation has, as usual with party malignity, been pushed far beyond what the truth or a candid interpretation of the historian's deductions warrant. The reflections scattered through the work every reader will estimate according to their weight; but it is perhaps one of its chief recommendations that it contains but few to interrupt the full flow of narrative, or dull the sparkling mirror of incident.

The appearance of his historical compilation, its rapid progress in public esteem, and the fortunate gift of a share in the *Constitutionel*, conferred upon him by an enthusiastic admirer, raised M. Thiers to comparative affluence. Leaving his garret in the alley of Montesquieu, he emerged at once as one of the most prominent men in France, in the two paramount fields of literature and politics. Growing discontented with the somewhat antiquated tone of the *Constitutionel*, he established in 1828 a new paper, more democratic in its principles, called the *National*. In this journal an unrelenting war was waged against the Polignac administration, which, often suppressing particular numbers, and adopting other partial remedies against the galling stings of Thiers and his assistants—Armand Carrel, and some of the most talented men of the liberal party—finally took the desperate measure of the Ordinances of July. The revolution of 1830, the result thereof, is known to all.

That event materially conduced to M. Thiers's advancement. Under the new government he was named counsellor of state, and intrusted, without any title, with the functions of secretary-general to the ministry of finance under Baron Louis. The first ministry of 1830 was composed of heterogeneous materials, which were speedily decomposed. Under the Laffitte administration, formed in November 1830, Thiers received the official title of under-secretary of state in the department to which he was already attached. It may be mentioned that he had previously published a pamphlet on Law's system, which, developing sound and comprehensive views of finance, recommended him to that branch of the public service. At the same time he was elected deputy for the town of Aix, his *alma mater*, and made his first appearance in the Chamber, where he experienced an almost universally unfavourable reception.

In person, M. Thiers is almost diminutive, with an expression of countenance, though intellectual, reflective, and sarcastic, far from possessing the traits of beauty. Moreover, the face itself, small in form, as befits the body, is encumbered with a pair of spectacles so large, that, when peering over the marble edge of the long narrow pulpit, yclept the tribune, whence all speakers address the chamber, it is described as appearing suspended to the two orbs of crystal. With such an exterior, presenting something of the ludicrous, so fatal to effect, especially in volatile France, M. Thiers, full of the impassioned eloquence of his favourite revolutionary orators, essayed to impart those thrilling emotions recorded of Mirabeau. The attempt provoked derision, but only for a moment. In his new sphere, as in the others he had passed through, he soon outshone competition. Subsiding into the oratory natural to him, simple, vigorous, and rapid, he approved himself one of the most formidable of parliamentary champions. Defending the ministry of Casimir-Perier, which succeeded Laffitte's, he was held to have compromised the principles of his party, and an estrangement then occurred between him and the ultra-liberals which has not yet been wholly repaired. The accusation of political inconsistency is one to which every public man is liable, and principally the ablest, for, with more comprehensive views, and a better appreciation of signs and changes, he models his action according to the exigencies of circumstances, the truest wisdom, instead of stubbornly dogmatising on theories obviously impracticable or unsuitable. At the same time, this reproach is certainly in no ordinary degree merited by the chief politicians in France at this period, as the reader will probably conclude if he should chance to consult an article entitled "Constitution of the Chamber of Deputies in France," which appeared in No. 393 of this Journal, wherein a more ample exposition of the parties dividing France is given than our present limits will permit.

Following M. Thiers in his high political career, we find it chequered by the usual absorbing alternations of office and opposition. From the 11th October 1832, when the first Soult cabinet was constructed, he continued a minister, with one short interval, until the 25th August 1836, in various capacities—as minister of the interior, minister of commerce and public works, and minister for foreign affairs, under various chiefs, Marshals Soult, Gérard, Mortier, and Broglié, and finally under himself, nominated President of the Council on the 22d February 1836. In August of that year, he passed into opposition, where he remained until again called by Louis Philippe, in the present year 1840, to the premiership, which, while we write, he still holds.

In speaking of M. Thiers's general attainments, we shall be brief. The mere fact of his position avouches his commanding eminence. In competition with all the talents of his age, he has outstripped them all. Not that he is the first of orators, for the legitimatist Berryer bears the palm; not that he is the most profound thinker, for the doctrinaire Guizot is the more searching philosopher; not that he is the most unbending politician, for the ultra-liberal Odillon-Barrot is more stern and consistent. But Thiers comprehends his countrymen better; can adapt himself better to men and things; and though perhaps about the last man to lay down his life for a principle, his origin, his sympathies, his whole career, identify him with the great majority of the nation. Thus, with his undoubted abilities, he becomes an influential deputy and a popular minister. The very fickleness wherewith his enemies upbraid him, proves him more incontestibly a genuine son of the Gallic soil.

And now, at the summit of the social ladder, wielding the power of France, exercising a weighty influence upon the destinies of his age and country, enjoying affluence, and blessed with an accomplished wife endowed with an ample dowry, the son of the artisan of Marseilles ought, in worldly estimation, to be happy, which we devoutly hope he is.

* M. Loève-Veimar: "Statesmen of France and England."

THE WEST INDIES SINCE THE ABOLITION OF SLAVERY.

JAMAICA—THE EMANCIPATION.

LITTLE, we believe, is accurately known respecting the condition and habits of the negro population of our West India possessions, since the period of their final emancipation from slavery two years ago; and as we think that correct information should be disseminated on the subject, we beg to offer the following to our readers. What we state may be depended on, as far as any human testimony is worthy of credit, for we draw it from official papers lately laid before the House of Commons, and now issued in a large volume, which has been printed by authority. The topic being deeply interesting, may with advantage occupy more than a single article. We shall at present confine ourselves to Jamaica, and take up the first head, which refers to the emancipation on the 1st of August 1838, and its immediate consequences.

In the year 1838, the governor of Jamaica was Sir Lionel Smith, who, to judge from his dispatches, is a person of amiable disposition, and who zealously entered into the cause of emancipation. In the month of July, he travelled through a considerable part of the island, explaining to the negroes the nature of the change which was soon to take place in their condition, and recommending them to labour for reasonable wages to the employers under whom they happened to live. The scope of these admonitions will be best understood by the following proclamation, addressed to the prædial apprentices by the governor:—

"In a few days more you will all become free labourers, the legislature of the island having relinquished the remaining two years of your apprenticeship.

The 1st of August next is the happy day when you will become free, under the same laws as other freemen, whether white, black, or coloured.

I, your governor, give you joy of this great blessing.

Remember that in freedom you will have to depend on your own exertions for your livelihood, and to maintain and bring up your families. You will work for such wages as you can agree upon with your employers.

It is their interest to treat you fairly.

It is your interest to be civil, respectful, and industrious.

Where you can agree and continue happy with your old masters, I strongly recommend you to remain on those properties on which you have been born, and where your parents are buried.

But you must not mistake, in supposing that your present houses, gardens, or provision grounds, are your own property.

They belong to the proprietors of the estates, and you will have to pay rent for them in money or labour, according as you and your employers may agree together.

Idle people, who will not take employment, but go wandering about the country, will be taken up as vagrants, and punished in the same manner as they are in England.

The ministers of religion have been kind friends to you; listen to them, they will keep you out of troubles and difficulties.

Recollect what is expected of you by the people of England, who have paid such a large price for your liberty.

They not only expect that you will behave yourselves as the queen's good subjects, by obeying the laws as I am happy to say you always have done as appren-

Digitized by Google

tices, but that the prosperity of the island will be increased by your willing labour greatly beyond what it ever was in slavery. Be honest towards all men; be kind to your wives and children; spare your wives from heavy field-work as much as you can; make them attend to their duties at home, in bringing up your children, and in taking care of your stock; above all, make your children attend divine service and school.

If you follow this advice, you will, under God's blessing, be happy and prosperous."

The happy day of freedom from slavery at length arrived, and was observed, by proclamation, as one of thanksgiving and prayer. Good order, decorum, and gratitude, were manifested by the whole of the labouring population. Sir L. Smith, in a dispatch to Lord Glenelg, dated August 13, writes as follows:—

"Not even the irregularity of a drunken individual occurred. Though joy beamed on every countenance, it was throughout the island tempered with solemn thankfulness to God; and the churches and chapels were every where filled with these happy people, in humble offerings of praise for the great blessing he has conferred upon them.

The island has continued perfectly tranquil. The labourers have not generally returned yet to plantation work; managers are endeavouring to give as low wages as they can, and the labourers hold out for better terms. This struggle was to be expected, and will, no doubt, settle down.

At Falmouth, in Trelawney, where there has always been a hostile spirit among the planters against the missionaries, some foolish persons proposed or threatened to hang the Rev. Mr Knibb in effigy. It got abroad, and magnified into a real intention of hanging that gentleman: his congregation assembled in great numbers, armed with cutlasses and sticks, determined to defend their favourite pastor. Nothing dangerous occurred, and the people gradually dispersed. * *

I have carefully abstained from interfering on the question of wages. In St Dorothy's, which I visited last week, they were much disappointed that I would not determine what they ought to receive. At Bushy Park, an estate of 700 negroes, they finally agreed to take 1s. 8d. currency, or 1s. sterling a-day; and they have, I believe, all returned to work. I am under no uneasiness whatever for the future tranquillity of the island."

The Bishop of Jamaica concurs in "bearing testimony to the peaceable and orderly behaviour of all classes, and particularly of the negroes, on this auspicious occasion."

There was thus every reason to expect that the negro population would have settled down quietly as free labourers, on payment of a fair rate of wages by their old employers; but a most distressing cause of discontent seems to have irritated them from the moment of emancipation, and produced serious consequences both to themselves and the planters. This was an almost universal dispute respecting the right of the negroes to remain in the houses and grounds which they had previously enjoyed while slaves. The third clause of the apprenticeship abolition law gave the free labourers the use of their houses and grounds for three months; that is, they could only be ejected after a three months' notice to quit, prescribed by the act. The planters, with few exceptions, seized on this as a means of obliging the labourers to work at low wages. Instead of endeavouring to conciliate the affection of these friendless beings, by allowing them to remain in their houses at a moderate rent, they immediately issued notices to quit, or demanded rents of so exorbitant an amount, that they often exceeded the entire wages which the negroes were offered for their labour. In many cases "rent for house and grounds was charged for every individual in a family." In other cases, labour was agreed to be taken in commutation of rent; but this led to endless quarrels, for managers did not scruple to turn a family of labourers adrift in order to get rid of demands for wages incurred; and when the negroes complained, they were told to seek redress where they pleased. Stipendiary magistrate O'Reilly, in the Vere district, reports the following disgraceful conduct of the planters:—"Another mode of recovering rent was attempted, but put a stop to by our first decisions and remarks thereon. A charge of L.4 or L.5 for rent was made against a labourer, but he was only sued before the justices for 40s., or generally something under, to make it appear as if that were the entire amount; get a decision for that and costs, and next week bring up the unfortunate being, and sue him for the balance, thus saddling the defendant with two sets of costs, and obviating the necessity of taking the case before the Court of Common Pleas; and I much fear that, before we were aware of the iniquity of the proceeding, some of these unjust verdicts were given, especially as they generally brought one of the most ignorant forward, who, not understanding his own rights, thought all was just, and the rest of the people, knowing the decision, and being threatened with a similar proceeding, have paid these demands."

Take another case, reported by magistrate Walsh:—"In the leeward of St Mary's, the employers will neither rent the cottages nor grounds; and if the wife of a hard-working man should prove heavy in pregnancy, they stop 10d. per day from the husband for every day that she is sick; and if the husband dare say a word, he is driven from the estate like a dog; this they do by ejectment before two county magistrates. And the same way, if the people send their children to school, 10d. for each child is demanded from the labourer. This is taxing Christian knowledge and education. In other instances they root up and cut down provisions, or drive the stock into their gardens, and if they complain to a stipendiary magistrate, they are ejected and driven from the estates; and even for those that have complained, little or no redress can be obtained, from the obscurity of the law, and the determination of the employers to oppose by persecution anything like equal justice."

After this evidence, the following statement by magistrate Daughtry of St Elizabeth's, will not excite surprise:—"Those masters who persisted in making exorbitant demands for rent, have lost, or are fast losing, their most efficient labourers. Others who require additional hands, and pay them fairly, are placing their pens in a better state than they were in during the apprenticeship. The system of a labourrent, which was at first the favourite scheme of the masters, is yielding to the far better plan of a money payment, although I regret to say that too often the sum demanded is still greatly out of proportion to the actual cost of a negro-house, and of the land he has in cultivation. The consequence is, that the minds of the people are fixed upon the object of obtaining homes of their own, which considerable numbers have, indeed, already done; but in the exercise of a providence which is one of their conspicuous characteristics, they are keeping in connexion with present advantages, till their own little places are in order to receive them."

It appears from the documents before us, that notwithstanding a report industriously circulated to the contrary, the negroes never entertained the slightest idea that they were entitled to retain unqualified possession of their houses and grounds after the period of emancipation. This slander they publicly denied in meetings called for the purpose. The following resolutions were passed at a public meeting at Montego Bay, June 1839:—

"That so far from supposing that we had any lawful claim to the houses and grounds, we have been fully and painfully taught our dependence, by notices to quit; by enormous demands of rent from husband, wife, and every child, though residing in one house; from the anomalous and unjust demand to pay additional rent for every day we, or any portion of our family, may be absent from work, whether occasioned by sickness or any other cause; from the summary ejectments which have been inflicted upon some of us; and from the demolition of houses, and utter destruction of provision-grounds, which others of us had to endure.

That in proof no such sentiment exists, or has existed, in our minds, we have paid, either by labour or in cash, exorbitant rents for our huts and grounds, having laboured at 1s. 8d. per diem, instead of 2s. 6d., the regular wages given to us during the apprenticeship, or from our masters from whom we were hired; and at which rate, upon the oaths of the overseers, our services have been valued as apprentices, and which we have had to pay for the purchase of our apprenticeship terms; thus allowing 10d. per diem for every able member in the family capable of hard work, and an equal proportion for every inferior member, as payment for the occupancy of the houses and grounds, although many of these houses were built by ourselves, and at our own expense, and others are of such a description as to be unfit for the residence of any human being.

That the parties who have made these representations at the Colonial Office must have been influenced by the most cruel feelings and ungenerous motives towards us, the peasantry of this colony."

Such were the declarations of the negroes, and their statements are borne out by every tittle of evidence before us. Mr Abbott, a Baptist missionary, in a communication to the Marquis of Normanby, June 11, 1839, observes:—"Since the abolition of the apprenticeship system, I have visited various parts of the island, and have met not fewer than 10,000 of the apprentices, addressed them in relation to their rights, privileges, and duties as freemen, and heard the free expression of their sentiments; and I have no hesitation in saying that the charges preferred against them, as a body, have no foundation in truth.

I freely admit that the attachment of the labourers to the places of their birth, and to the burial-places of their ancestors or offspring, is so strong that they would rather make any sacrifice than leave them; and of this too many managers have taken a disreputable advantage. I admit, further, that I have met with some who have refused to pay the rent demanded of them, when that demand has been exorbitant, and who have refused to work on the terms proposed to them, when those terms have been deemed unfair, and even to work at all for those masters who, during slavery, were distinguished only for cruelty.

You, my lord, do not need to be told that similar feelings are manifested by freemen in other countries, and will be, I think, disinclined to blame the newly freed men of this for daring to maintain their rights. But while I make these admissions, I do most solemnly assure your lordship that I have not met with any who have been unwilling to pay a fair rent for their houses and grounds, or to work for those who will treat them as human beings, for equitable remuneration.

That there are amongst the recently emancipated many idle, dishonest, and unworthy members of society, I am not disposed to deny. That there is at least an equal proportion of this stamp in the other classes of the community, who have fewer excuses for their crimes, is painfully manifest; and your lordship is well aware that the same may be said not only of the peasantry and mechanics, but of the aristocracy of highly-favoured England.

With reference to the charges against the people, I have only to add, that I can confidently state, not only from personal observation, but from the testimony of humane and influential masters, that where they are treated well they behave well; and while they reasonably seek to be paid for what they do, they are willing to pay for what they get."

Notwithstanding these causes of irritation, there was no want of labour to forward the crops; and no estates suffered except "from injudicious management, or from the impatient temper of the managers, or from the want of money to pay the people." According to the reports of the stipendiary magistrates, "the conduct of the peasantry continued peaceable and orderly in the extreme."—(Daly, April 22, 1839.) Stipendiary magistrate Fishbourne (Aug. 7, 1840) writes:—"The conduct of the people in the coffee-district during the last twelve months, has, in my opinion, fully evinced their fitness for freedom; and the daily increasing spirit of industry which more and more widely exhibits itself, and which appears firmly and enduringly rooted amongst the people, encourages me to look forward to the cheering prospect of augmented agricultural prosperity, with increased civilisation and general contentment. The anniversary of the commencement of freedom was distinguished by the assembling of immense numbers of the people in the various places of worship. A great improvement in their dress and general appearance was very visible. I have not heard of a single person being drunk or disorderly; and from what I have learned, I believe the day was celebrated by the emancipated population, throughout the whole parish, in a manner worthy of the great and memorable occasion. I regret to say, that at the parish church no white persons, except the Rev. W. Lindsay, who officiated, and myself, were present. Nor did any one of any colour, class, or sex attend, who was formerly the owner of slaves or apprentices."

The only deficiency of labour was on some of the sugar estates; but this, as far as we can gather from the evidence before us, was caused by the unreasonable and perverse conduct of the managers, who seem to have done all in their power to throw odium on the system of free labour, and to make the labourers unhappy. Still, in spite of every obstacle, the condition of the newly emancipated negroes continued, and is continuing, to improve, to a very remarkable degree. We shall, however, postpone any account of this gratifying state of affairs till next article.

MR FRASER'S TOUR IN THE EAST.

An excellent book of travels was given to the public some weeks since, from the pen of Mr J. Baillie Fraser, the author of various preceding works relative to eastern countries, and, among them, the peculiarly interesting romance of the "Kuzzilbash." In the present instance, Mr Fraser describes a journey (in 1834–35) through Mesopotamia, Koordistan, and other regions in Asiatic Turkey, some of them not before visited by Europeans.* The previous experience of the traveller, and his intimacy with the languages and manners of the east, where he has filled important official situations, give this publication a degree of weight rarely attached to books respecting distant countries. The true character of a people, or of individuals, and the real meaning of national customs and peculiarities, cannot be picked up at a passing glance, or solely by the medium of guides and interpreters, of whose fidelity and capabilities it is impossible to be always assured. The advantages which Mr Fraser possessed in these respects entitle his work to a high place among our authorities on oriental matters.

A journey from the city of Tabreez (or Tebris), in the north of Persia, through Asia Minor to Bagdad, and again from Bagdad to Persia, with a concluding tour homewards, by way of Constantinople, constitutes the material of the volumes before us. Perhaps the account of Bagdad is the most interesting portion of the work; but we so lately compiled from Mr Wellsted a description of that city and its peculiar situation at the very same period, that we shall at present limit our attention to the section of Mr Fraser's work relating to Tabreez and Koordistan. Tabreez was, in 1834, the abode of Mohamed Meerza, heir-apparent of the throne of Persia, and now its sovereign. The city consists of mean, mud-built, crowded houses, but is comparatively rich and thriving, as well as populous, being, indeed, the greatest trading mart in Persia. It is the entrepôt where the stream of exports and imports of central Asia meets; the gate by which European goods enter, and Asiatic goods issue. The presence of the heir of the empire, as governor of the province of Azerbijaun, of course, gave additional importance to the city, while Mr Fraser was there. He describes the prince, who was a young man of twenty-eight years of age, as in per-

* Travels in Koordistan, &c. 2 vols. R. Bentley: London.

Digitized by Google

son extremely corpulent, and a slave to huge feeding, one of the common characteristics of the great in Persia. The indolence of body and lethargy of mind caused by the habit in question, threw the whole power and authority in the rich and extensive province over which the prince had been placed, into the hands of a minister, called the *Kaymookam*, a most remarkable man in every respect. The following description of his appearance will perhaps bring the reader in mind of a certain absolute ruler or minister of Scotland in former days, the Duke of Lauderdale. "Conceive a man of somewhat more than middle size, exceedingly heavy and corpulent, with much rotundity of paunch, coarse features, small but very prominent eyes, so short-sighted as to suggest the idea of purblindness, yet keen and bright withal; a great ugly mouth, garnished with long, irregular, prominent, yellow fangs, which an hideous, habitual, and stupid gape always exposes to view—conceive all these, and you will say that they do not compose a very promising exterior; and certainly the external attributes of the Kaymookam would be more suitable to a stupid village boor than to the first statesman of an empire." To complete the similarity alluded to, the Kaymookam was an enormous feeder. "His feats in devouring melons and cucumbers, as commonly related, seem next to incredible. I have heard of his gobbling up seven mauns, or *fifty pounds*, of melons at a sitting."

Yet this man was an able statesman, capable of transacting an extraordinary amount of business; and, in short, as regarded talents, not unfitted for the station to which he was raised, of prime minister and virtual ruler of Persia. In the diplomatic art of lying and deceit, he was a most consummate adept. His word was trusted by nobody, and he trusted nobody, transacting all affairs in person. Mr Fraser went one day to visit him by appointment, and the following scene took place:—"I sat down, and in about fifteen minutes the bustle of servants and shuffling of slippers announced the great man's approach. In the mean time, however, the court before the windows had become full of people, of all sorts and degrees, khans, begs, meollahs, meerzas, merchants, soldiers, peasants, messengers going and messengers returning, &c., all of whom had some petition to present, or some request to prefer, and to all of whom, with exemplary patience, did his excellency address some compliment or word of salutation, while, with a patience no less praiseworthy, did I stand at the window watching the progress of this comet with the great tail. At length his eye fell on me, and incontinently did there issue from his mouth a whole volley of compliments and inquiries in the Persian fashion, with many assurances that 'my place had long been empty;' that 'I had brought light to his eyes;' and that 'he had a thousand things to say to me.' He then entered the room, scattering compliments like flowers on all sides, took a chair, ordering another to be placed near his own for me—made all the world sit down; turned to me, and, taking a roll of paper from a secretary, began instantly to write upon it fast, fast, leaving me with my mouth half agape to catch the expected communication, and prepare for my reply. This farce was continued for a considerable time, when up started a fellow at the bottom of the room, with a long story about some money he had been sent to collect, but which he swore a dozen men, and more along with him, would not be able to wrest from the people. His clamour or energy, to give it no stronger name, aroused the minister's attention; up went the eye from the paper, as if awakened from a dream, and began to blink at the man; but he instantly entered on the business, heard the statement, and directed what was to be done with infinite minuteness. The spell thus broken, papers and notes without number were thrust into the hands of two attendants, who passed them with ludicrous rapidity into the great man's hand. He took them mechanically, as it seemed, and began to read them. His manner of performing this operation is most curious. From extreme short-sightedness, he cannot distinguish a letter unless the writing be within an inch of his eye; so he draws the paper backwards and forwards, or up and down the range of that organ, touching his very nose; but as his sight, when the object is within proper range, is extremely quick, the sense of a piece of writing is gathered with a celerity that seems like intuition; and the mechanical part of the business is performed so rapidly, that one would swear he was gravely rubbing his nose with a piece of paper, instead of reading a letter." This scene was carried on for a long time, partly through ostentation, and partly because the minister thought it more prudent individually to undertake such a multiplicity of affairs, than to allow any assistants to share his secrets or his power. While observing the shower of notes and petitions that fell on the minister, Mr Fraser was more amused than annoyed. He had to give, not to get, information; and, in fact, any one (he says) who might attempt to worm aught out of the Kaymeokam, would certainly "come back shorn, while seeking wool—he would surely be well pumped himself."

The Kaymookam became prime minister of Persia when the Prince, Mahomed Meerza, ascended the throne in 1835. The affairs of the country fell into great confusion under him—an inevitable consequence of his jealous habit of concentrating all business in his own hands. At length, Mahomed Meerza found the domination of the minister insupportable, and caused him to be privately strangled. The poor wretch had been so long accustomed "to bestride king, kingdom, and all, like a colossus, whom no man dare touch for fear of annihilation," that he could not believe in the reality of his sentence, and struggled violently, but in vain, against its execution.

The Kaymookam, take him all in all, is the most amusing person to whom our author introduces us in his Persian sketches. In his passage through Koordistan, he saw much of interest. The subjoined description will give an idea of the appearance of the wild mountaineers called Koords, who inhabit this country:—"On their head they wear a large shawl of striped silk, red, white, and blue, with fringed ends, which is wound in the most graceful manner round their red skull-cap. Its ample folds are confined with some sort of band, and the long fringes hang down with a rich fantastic wildness; their true Saracenic features, and bright black eyes, gleam with peculiar lustre from under this head-tire. Their body-garments consist of a sort of ample vest and gown, with magnificent wide Turkish sleeves, over which is worn a jacket, often richly embroidered and furred, according to the owner's rank. Their lower man is enveloped in ample *shulwars*, not unlike those of the Mamluca, into which, in riding, they stuff the skirts of their more flowing garments. Around their waist, instead of a shawl, they wear a girdle fastened with monstrous silver clasps, which may be ornamented, according to the owner's taste, with jewels, and in which they stick, not only their Koordish dagger, but a pair of great brass or silver-knobbed pistols. From this, too, hang sundry powder-horns and shot-cases, cartridge-boxes, &c.; and over all they cast a sort of cloak, or *abba*, of camel's hair, white or black, or striped white, brown, and black, clasped on the breast, and floating picturesquely behind. When riding, they carry a small round shield, depending from the left shoulder, and grasp in their hand a long slender spear. If in war time, and they are going on an expedition, in addition to these arms they carry a gun, and occasionally three slender javelins in a case, which they can throw with great precision to the distance of thirty yards. Then they case themselves in armour, like knights of old, either in a shirt of linked mail, with helmet and armlets, or with a suit of plate armour, called *Char-Eineh*, consisting of four plates of inlaid and Damasked steel, made to fit back, breast, and sides, and which are a defence against any thing but a ball striking them directly."

So accoutered, these Koords, who have finely made and active persons, spend their days in perpetual robbery. They are systematic plunderers, and, like the Thugs, imagine their way of life to be perfectly proper and acceptable to Heaven. Not a Koord "will mount his horse to go on a party of robbery and murder, without ejaculating *Bismillah irruhman irruheem!*—'In the name of the most merciful and compassionate God!'" Meeting an old Koord chief, in the centre of the province, Mr Fraser had a long conversation with him, in which the old robber, with the greatest pathos, lamented that the trade of his race had somewhat fallen into decay in his days. "He dwelt upon the many frays he had been in, and the plunder he had taken, with a zest and eagerness which showed how strong the devil was yet in him. He told me he had been wounded at least a dozen times, in spite of the best of armour. 'I have armour of every sort,' said he 'and I used to wear it always; but I have learned to put very little trust in it—my trust is in Heaven!' said he, with as firm and satisfied a tone as if his cause was the most righteous upon earth. He joined with others in lamenting the evil days on which the present race of Koords had fallen. 'The golden times of Koordistan are gone,' he said; 'ride over the country, and what brilliancy, what spirit will you find! All the good horsemen and stout soldiers are dead, or have fled the land, or have taken to the plough per force, to make as much money as will pay the Pasha and feed their wives and children; and what is a soldier good for when once he has touched a plough!'" We may deplore the ideas which these people have about heaven; but, in truth, in doing so, we should be merely returning the feelings with which they regard us. An Arab sheikh of Mesopotamia, who lived precisely in the Koord fashion, being greatly delighted one day with a shot fired by Mr Fraser exclaimed, "Come, come, you're a good fellow; you had better become a Mussulmaun, and live with me." "How can that be, sheikh," returned our author, "when I have a wife and family at home!" "Oh," said the Arab, "give these up; only turn Mussulmaun, and I will give you all those, and more, here." On Mr Fraser again excusing himself, the worthy bandit of the desert turned round to his friends, and, pointing to the English traveller and his companions, said, with an air of profound compassion, "What a pity, now, that these poor fellows must go to *jehannum!*" (a place not to be named.) He then continued, addressing Mr Fraser with a moving air of remonstrance, "Oh, are you not afraid of your soul! Will you not think of saving it!"

These Arab tribes occupy a great part of Asia Minor, being roving plunderers like the Koords, but living in the desert plains, and not in the mountains. They are a more wretched people than the hill-robbers, in point of social comforts. Mr Fraser travelled among many tribes of them, and describes them interestingly. We have but room for one extract, however, illustrative of their character:—"It happened that an Englishman, travelling through Khuzistan, was received and entertained in the tent of the sheikh of an Arab tribe, his entertainer, the only member of the family at home being a daughter, who acted as hostess in her father's absence. At night, the inmates of the tent, including the stranger, retired to rest; but towards morning he was awakened by shrieks, and distinguished the voice of his young hostess exclaiming that she was murdered! All rushed to the spot, where they found the unfortunate girl in the agonies of death, her breast pierced with three deep stabs of a dagger. While gazing on the dying victim, and offering vain assistance, a voice was heard from a height close by, exclaiming: 'Yes, it is I! I have done it—praise be to God, I have murdered her!' All eyes were turned to the spot, whose there was seen an old woman standing and gesticulating with vehemence. A rush was made towards her, and she either ran or was borne back to the brink of the river on which the tents were pitched, from the high bank of which she fell into the deep stream; and, whether she perished or escaped, was seen no more.

On inquiry, it appeared that this sheikh, who now had to mourn the loss of a daughter, had once had a son, who, in some former fray, had been put to death by a *pehlewan* (or champion) of another tribe—an event which called forth all the virulence of the existing feud. Some short time afterwards, a stranger entered the camp, and was received with the customary cordiality of Arab hospitality. Unfortunately, he was recognised by some of the tribe as the very pehlewan who had put to death the son of their sheikh. What was to be done? He was now their guest, and by the laws of hospitality, and by Arab customs, could not be touched. The sheikh himself was absent, and the arguments of good faith and mercy were preponderating, when the young woman now in question entered the assembly, and upbraided the men with cowardice and cold-heartedness towards their chief. 'What!' said she, 'shall the murderer of your sheikh's son be in your hands and yet escape! Never let this be said—put him instantly to death, or renounce the name of men!' Still, however, a reluctance to infringe on, in so direct a manner, the laws of host and guest, restrained the hands and weapons of the men, in spite of the wrath that was boiling in their breasts; and possibly the force of that consideration might have prevailed, when the young girl herself, maddened at the sight of her brother's murderer, and the idea of his escaping, seized a sword and smote him. The sight of blood was irresistible; in a moment every weapon was drawn, and sheathed in the body of their unfortunate guest—he was literally cut in pieces.

The sheikh returned, and, shocked at the atrocious violation of hospitality, was furious at the perpetrators; fain would he have recalled the act or repaired the injury, but that was impossible. Time passed on, and the murder, like others of the sort, was forgotten by the tribe; but not by the mother of the slain. Resolved upon revenge, she had followed the hostile camp for years, and patiently watched an opportunity, which she found not until the fatal night when the Englishman, who relates the story, was by chance a guest in the tent of the sheikh, and witness to the consummation of her savage vengeance."

INDIAN RUBBER.

THE substance called Caoutchouc, or Indian Rubber, has of late years assumed much mercantile importance, and a brief account of its history, natural and commercial, may have some general interest.

Caoutchouc was first seen in Europe about the middle of the eighteenth century. It was then brought from Cayenne (in Guiana) and other provinces on the eastern coast of South America, and, from its valuable power of cleaning paper, was called Indian *rubber*. Caoutchouc is a juice, derived from a tree or shrub called *hevee* by the South Americans, and recognised by Linnæus to be a species of the *Jatropha*. The striking elasticity and insolubility of caoutchouc, which we believe to be the aboriginal name for the juice, caused it speedily to become an object of attention to chemists and others, who imagined, not incorrectly, that the secret of dissolving it might be turned to some account. As the use of it increased in the civilised world, the substance became naturally an object of research to voyagers also, and varieties of it were found in many tropical climes, particularly in some parts of China, on the coast of Guinea, in Sumatra, and other East Indian isles and provinces. The latter regions have ever since yielded a large proportion of the caoutchouc in use. Travellers have called the shrub from which the East Indian caoutchouc is procured, a *vine*—the *elastic-gum* vine—from its origin and appearance, though the name of gum or resin, commonly applied to the juice, is altogether a mistake. The shrub is a rambling plant, which grows to an immense length and height, supporting itself upon stronger trees, and passing from one to another for a distance, occasionally, of many hundred yards. Dr Roxburgh, a distinguished naturalist, examined the plant as it is found in Sumatra, and gave it the botanical name of *urceola elastica*. The urceola bears fruit and flowers as well as foliage, but its most prominent quality, which it shares with other plants of the thirtieth natural order of Linnæus, is that of yielding, on being cut, a milky juice, commonly of a poisonous nature.

Digitized by Google

Incisions are made in the bark of the urceola and heves to let the juice exude, which it is found to do most abundantly in the time of rain. It is at first of the exact appearance and consistence of milk, and, like that substance, soon separates into a light serous fluid and a thick coagulum. The first seems rapidly to evaporate, leaving the thicker part to assume a brown or blackish colour, and to get tough, cohesive, and elastic. Some writers say that this hardening takes place from simple exposure to the sun, while others assert that the gatherers effect it by a secret process. However this may be, the induration is quickly accomplished, and then the substance is ready for the common uses to which it is put, namely, rubbing and cleaning paper, making elastic bottles, surgical instruments, &c. It is brought to the market in the shape, for the most part, of rolled-up balls or bags, formed on brittle moulds. It is then devoid of smell, of a brown hue when cut into, and so elastic, that, on being cast on the ground, it will rebound several times. A ball weighing seven ounces, if simply dropped on hard ground from a height of fifteen feet, will rebound ten or twelve times, and, on the first occasion, to a height of seven feet. Such was the result of a simple experiment upon the elasticity of caoutchouc made by Dr Roxburgh.

It was stated that the apparent insolubility of caoutchouc by water, spirits, and other common menstruums, soon led to the belief that the discovery of some solvent of it would be a most important affair, as regarded the manufacture of water-proof articles of dress, and similar useful objects. It was known that the natives of Guiana made boots and bottles from it in a rude way. This application of the substance, however, was effected, of course, not by means of a solution, but by employing the recent and liquid juice. So early as the year 1768, we find the French Academy of Sciences attempting, but in vain, to discover a proper solvent for the dry caoutchouc. It was left for Mr Howison, a gentleman resident in the East Indies at the end of the eighteenth century,* to set an example to Europeans in this department of the useful arts, now become one of no slight consequence to the comforts of the civilised human being. Mr Howison contrived to make boots, gloves, and many of the like articles of dress, by first forming moulds of wax of the proper size and shape, and then coating them over with the liquid juice gathered for the purpose, and placed in air-tight bottles, in which it can be kept for a short time sufficiently soft. The experimenter found it necessary to apply repeated coatings, using his hand for spreading them, before the article could be brought to a sufficient thickness. In this way he made boots that were thoroughly waterproof, but he soon discovered that they lost shape, and, in short, that an article of elegant wear could never be thus made.

Mr Howison then thought of dipping in the juice an elastic cloth, in some degree corresponding with the elasticity of the caoutchouc, and into the textural interspaces of which that substance might be absorbed. He plunged Indian cotton stockings and gloves into the fluid, and hung them up to dry. The experiment was perfectly successful. The cloth quickly absorbed the juice, and when the article was dry, every fibre of the cotton had its coating, and the whole was completely waterproof, while scarcely less flexible than before. He dipped nankeens with the same result, and, in short, by giving the caoutchouc a basis of light cloth in place of using it alone, found that he could make a complete dress for himself—a dress which had the extraordinary properties of being impervious to rain, insoluble in fresh water or salt, unchangeable by the sun's rays, calculated to wear for an immense time, and not liable to be destroyed by any known insect.

Mr Howison's experiments attracted considerable attention, when communicated to the Asiatic Society, and through their publications to the world at large. Speculative minds devised a hundred important uses for the caoutchouc, besides the application of it to the waterproofing of common articles of dress. The manufacture of all the numerous instruments and articles requiring elasticity, the coating of canvass for tents and sails, the strengthening and preservation of ropes and fishing-nets, the perpetuation of paintings by means of varnishes and prepared cloth, were among the many purposes which it was proposed to accomplish by the aid of the caoutchouc, as we find from the remarks of an able writer of the year 1800, who drew up an account of Mr Howison's experiments. But the misfortune was, that neither the American nor the East Indian caoutchouc was soluble, at least in a sufficiently perfect degree, by any means known at the time; and the juice could not be conveyed to Europe in a fluid state. It dried so quickly in Mr Howison's hands, indeed, that if, in dipping his cloth, he allowed two layers to come in contact, they were thenceforth inseparable. On this account, the chemists of the day set to work most diligently, to discover a solvent for the dried caoutchouc. It was found that turpentine and empyreumatic oil were the two liquids that produced the principal effects as solvents; but there were important objections to their use, one being the great expense of the oil.

We mention these circumstances because this secret of the caoutchouc solvent was a very interesting one, and long in being discovered. Many a thoughtful and talented lover of science did not disdain to spend days and months in the pursuit of this chemical will-o'-the-wisp. We are aware of one such youthful student, now a distinguished medical professor of the Edinburgh University, who hired an attic in a mean and retired part of the city, purposely to prosecute his inquiries into the solubility of caoutchouc. It must be remembered that the accomplishment of this end was an object of peculiar interest to medical men, many of whose most important instruments are now formed partly or entirely of caoutchouc. The cause which compelled the young student alluded to to betake himself to a lonely and mean apartment for the carrying on of his experiments, deserves notice. The liquid substance which he was attempting to use for the solution of the caoutchouc, was of so strong and unpleasant an odour in its pure state, that the more refined people amongst whom he usually dwelt would not tolerate his experimenting within their bounds. His labours in the lonely attic were not fruitless. He succeeded in his object, and the solvent which he employed is now the agent in use in the manufacture of all waterproof caoutchouc articles. This agent was *spirit of tar*, or a spirituous distillation from the pitchy substance so called. We understand that the gentleman here mentioned claims the credit of having been the first to manufacture caoutchouc articles by the medium of the spirit of tar, and that he can point to an article in a scientific journal (Nicholson's, we believe), in which an account of the discovery was given by him. We are not certain whether any fellow-labourer in science can justly dispute with him the merit of priority in this respect, but we have at least seen beautiful instruments made by him from dissolved caoutchouc, long before similar articles were procurable from the common manufacturers of the present day.

Caoutchouc articles made by the solvent power of the distillation from tar, are now, it is almost needless to say, in common use in Britain. Waterproof *dresses* have been for some years manufactured by, and named after, Mr Mackintosh, a gentleman who has taken out a patent for this branch of practical science. An immense quantity of these are now made, the caoutchouc being introduced into all varieties of attire, but chiefly into cloaks, wading trousers, and other upper or outer articles of dress. With respect to the use of Indian rubber cloth, except for loose coverings, we entertain very serious objections. The closeness of texture prevents the exhalation of the insensible perspiration, and thus is apt to do a very serious injury to health. We think it our duty, therefore, to recommend that no Indian rubber garment should be used which in any way closes upon the person. As perfectly loose mantles or capes, the caoutchouc articles are inimitable, but there the merit of the invention rests. For some other purposes caoutchouc is excellent. Bottles which fill themselves by suction are made of it, and are peculiarly useful to medical men. The stomach-pump was an article little fit for use previous to that discovery, and now it is efficiently employed almost every day by police surgeons in cases of poisoning. There is a bad odour about new caoutchouc articles, but this in a short time disappears.

* Now Dr Howison of Crosburn House, Lanarkshire. An account of this gentleman's experiments was given in the Journal, No. 260.

SILVIO PELLICO'S RETURN HOME.

Silvio Pellico, an Italian gentleman, who, as most of our readers are aware, was inhumanly imprisoned for several years by the Austrian government on the charge of having committed a political offence, afterwards wrote an account of his sufferings, which has been widely circulated in most European languages.* His narrative, however, terminates rather abruptly, and to compensate this defect, he has lately prepared additional memoirs of his unfortunate history. One of the French journals gives a few chapters from the yet unissued work, and we translate a portion of these, not on account of any striking incidents contained in them, but because they seem to us to partake largely of that charm which the pure and amiable spirit of the writer throws around all the productions of his pen, and also because they depict minutely the feelings of the Italian scholar, on being restored to his family after *ten years'* imprisonment in a distant dungeon.

"My first night, after returning to my family, was spent in a state of feverish excitement, my mind being agitated by conflicting and tumultuous emotions, sometimes of a sad and sometimes of a joyful character. It was impossible for me to close my eyes. I wished to compose my thoughts, by turning them to God, and giving audible vent to words of gratitude and love; but, at every instant, the train of devotional feeling was interrupted by crowding recollections of the years of my captivity, of those who had been shut up before me, of the friends whom I had left yet in chains, of others who were absent or departed, of all my past illusions and the reflections which I had made in the hour of suffering, of the faith which divine grace had given me, and of my happiness in being released from prison, in revisiting my country, and finding my parents and my brothers once more. Each of these sources of distraction agitated me in a lively manner. To recover in part my tranquillity, I strove ever to turn my thoughts again to the Divine Being, whose sustaining hand I had felt in the most severe of my trials. But that multitude of remembrances did not cease to besiege me, and to transport my imagination more often into the midst of troubles than of consolations. In addition to this irresistible agitation of spirit, I began to experience a severe pain in the head, and such an oppression as almost prevented me from breathing. It seemed to me as if my enfeebled body could bear up no longer, and that this night was to be my last. I thanked God for having brought me alive into the house of my father, and permitting me to die there, if my hour was really come. Nevertheless, the thought of dying troubled me, and I could not suppress the wish that my days might be prolonged, to let me taste awhile the ineffable love of my family, and be a staff to my parents in their old age.

Towards morning, I breathed more easily, and enjoyed a light sleep; it was short, but did me much good. Awakening without headache, I arose quickly, though fatigued, feeling a joyful wish to assure myself that I did not dream, but was really in my paternal home. Clothing myself hastily, I passed into the next apartment, where I fell upon my knees, thinking that I could never be grateful enough for my chains being broken. The pleasing tears which fell from my eyes refreshed me greatly. I rose to my feet on hearing the steps of my mother, who came, in her solicitude, to see if I was awake, and to assure herself that I was not ill. I stept before her, my heart palpitating with filial love, and threw myself into her arms. To her anxious questions I gave encouraging answers, not distressing her by disclosing the way in which I had passed the night, but feigning, on the contrary, much more strength than I had.

The joys of that morning were not yet over. My beloved father and my good brothers entered; we again embraced one another, spoke words of hope and comfort, and talked of all that remained yet to be told between us. I felt revived and refreshed by the depth of their affection; but, after going out to hear service in the church of St Francis, my feebleness returned upon me, and I could with difficulty regain our home. My mother gave me some elixir drops, and I sat down to rest, and to talk, not only with her, but with my father and brothers, who came into the room every instant, as if to assure themselves anew of my presence. We could not satiate our eyes with the sight of one another, or forbear to ask and answer questions, in order that we might in some measure fill up the immense blank made by the ten years which I had passed far away from them. The day was thus occupied in recounting the details of my captivity to these sympathising friends, and in listening to their description of the anguish endured on my account by them. I went exhausted to bed, and again passed a night of sleepless suffering.

The same thing occurred again and again, until my mother beheld my rapidly decreasing strength, and laid upon me the injunction to preserve a rigorous silence. This was a wise step; but four months passed away ere I enjoyed nights untroubled by pain and sleeplessness. Even when I began to sleep better, one thing still harassed me. Every morning, just before dawn, the remembrance of my arrest, my trial, my condemnation to death, and the ten years of my captivity, came before me in the shape of a frightful dream, all the circumstances of which were vividly analogous to the real ones. But every day, also, I had the happy surprise of passing from the torments of a dungeon, or the terrors of death, to the joy of finding myself in the bosom of my family. While the body thus suffered, and slowly regained strength, the mind had also trials to undergo. How many beloved friends, alas! had I lost by death, in these ten years! how many others had fallen into severe distress! what errors, hates, and calumnies were abroad! The new revolutions of the day [1830] had much in them to alarm me for some young and generous spirits of Italy, who were emboldened by them to form schemes perilous to their welfare; and I felt, also, that the same circumstances would have deplorable consequences for those of my companions yet moaning in the cells of Spielberg. With the spirit of revolutionary ferment still abroad, small was their chance of liberty. One of them was a man bound to me by ties of brotherly love from the cradle. I speak of Pietro Borsieri, a person of lively and cultivated parts, belonging to a family in which I knew none but noble souls, and none but dear friends. I was bound by ties of friendship, not of so long standing, but close and enduring, to another captive, Frederic Confalonieri, a man for whom I could have died, so highly did I value his life, and with the best of reasons. I heard with pleasure of the release of Alexander Andryane, but that pleasure was mingled with sorrow, at the remembrance that Confalonieri had in him lost his dear friend, and was left in solitude within these horrible prison-walls."

[Pellico here defends himself from the charge of having ever desired revolutions at the cost of bloodshed, and proves that his opinions were moderate and mild. He then returns to the subject of his family, and the causes which led him originally to think of publishing his memoirs.]

"What comfort, meanwhile, I tasted in the bosom of my family! There my presence had given serenity to every countenance. I had been for so many years the sole object of their desires. Now these were satisfied, and they showed me that they were happy. In addition to theirs, I enjoyed the society of many dear friends, and, among others, of the Abbé Giordano, our parish pastor, a venerable man of eighty. To this

* Silvio Pellico's Imprisonments, translated into English, have been published in the "People's Editions" of the Messrs Chambers.

good priest I recounted the history of my confinement. The result was, that he advised me to publish my prison experiences. The idea startled me at first. Political passions seemed to me yet too ardent in Italy and all over Europe, for such a publication. 'My intentions will be misinterpreted,' said I; 'enemies will deny my statements, though I speak the exact truth; and my repose will be destroyed.' 'There are two kinds of repose,' answered the good father; 'the repose of the brave man, and that of the pusillanimous. The last is unworthy of you. In this book which I counsel you to write, you will exhibit the noble support derivable in adversity from a holy trust in God, a good conscience, and a right cause. Think of it well. If you have been permitted to earn a little reputation in literature, it is, doubtless, that you may be encouraged to compose a work which will benefit your fellow-men. Avoid the sloth of pusillanimity.' The good abbé's language made me reflect on the subject. I spoke of it to my mother, who was not learned, but of sound judgment. 'I see danger in it,' said she, 'and tremble. But pray, my son—pray that your mind may be directed into the right course.' Shortly afterwards, we spoke on the subject again. 'I believe that the work will have its utility, and that it should be written.' 'To the work, then, my son,' was the reply.

I wrote with a pleased activity the first chapters of my Imprisonment, and took an opportunity, one day, of reading them to an old friend, on whose judgment I placed some value. He was alarmed for me, and counselled me to suppress the work for some ten or fifteen years, till all parties were in a state of quietude. So many friends were of the same opinion, that even when the manuscript was completed, I would probably have allowed it to lie by for some years, but for my mother. 'Obey your conscience, my son,' said she; 'act according to your sense of right, and fear nothing.'

The work was published, and, during the two following weeks, many regarded me as guilty of an act of crime, or of great folly. Some said that I had published a book disgraceful to our age of enlightenment, and that my reputation was gone; others wrote to me, to say, that every tragedy of mine, which might thenceforth be represented, would be unmercifully hissed by the partisans of philosophy. Many who knew me turned away their heads on meeting me, to avoid speaking. All this was on account of the homage rendered to religion in the work. These clamours, however, soon fell to the ground, and a great number of my adversaries, seeing my book generally well received, confined themselves to the task of warring on me in secret, and endeavouring to undermine me in the estimation of men who honoured me with their friendship. But the work was reprinted abroad. Men pardoned the extreme simplicity of the style, on account of the incontestible character of veracity stamped upon every page. I received many flattering letters on account of it from compatriots and strangers.

My good abbé rejoiced as much as I in the success of the work which he had suggested. 'You ought,' said he, 'moreover, to profit by the favour you have gained with the public, to give them a little treatise on morals. Write a discourse to youth. Animate them to noble sentiments; I promise you that it will be read.' Again I referred the suggestion to my mother, and saw that she approved of it. Her only caution was, 'This book should breathe nothing but benevolence; avoid the tone of satire which moralists are too apt to catch.' My 'Discourse upon the Duties of Man' originated in this manner, and had the same success with my narrative. Some journals abused it, but as usual, I kept a profound silence. Was this patience? No, I cannot say it was; but all explanation or remonstrance would have been fruitless with men determined to make me out a wicked man.

After having composed twelve tragedies, of which I have only published eight, I have ceased to write for the stage, not feeling myself possessed of a rich enough mental fund for the delineation of character. In my youth, I had fondly hoped to place my name beside that of Alfieri; but I have awakened from that illusion, in spite of the applause I have gained. I occupy myself still with writing verses, but chiefly odes or elegies, to express my devotional feelings. I have also laboured for some time upon two historical tales, but have, in both cases, felt my ardour cooled, on beholding the infinite distance at which I was left by pre-existing works of this nature.

In short, I write much, but it is more for my own satisfaction, than in the confidence of producing any thing of value. At last I take up my pen, and, not knowing what to do with it, begin to a History of my own Life."

MISCONCEPTION ON RAILWAYS.

It is a singular fact in the early history of locomotive carriages, that their projectors assumed the existence of a difficulty which is now known to be wholly imaginary; and resorted to sundry laborious contrivances for overcoming an obstacle that had no existence, and which Nature herself, had she been asked, would have accomplished for them. They assumed that the adhesion of the smooth wheels of the carriage upon the equally smooth iron rail must necessarily be so slight, that, if it should be attempted to drag any considerable weight, the wheels might indeed be driven round, but that the carriage would fail to advance because of the continued *slipping* of the wheels. The remedies devised for this fancied counteraction were various. One was conceived so valuable, that a patent was taken out for it in 1811 by Mr Blenkinsop. It consisted, as the writer well remembers, of a rack placed on the outer side of the rail, into which a toothed wheel worked, and thus secured the progressive motion of the carriage. It was, however, wholly useless—it was an impediment: the simple adhesion of the wheels with the surface of the rails upon which they are moved being by an immutable law amply sufficient to secure the advance, not only of a heavy carriage, but of an enormous load dragged after it.—*Wade's British History.*

THE BATTLE OF MORGARTEN.

"In the year 1315, a rural tribe, of certain valleys begirt with high mountains, called Schwitz, revolted from its allegiance, and withheld the tribute and service due to Duke Leopold of Austria, who, being much angered, collected an army of 20,000 men.

* * * And on the day of St Othmar, Duke Leopold, endeavouring to pass into their country, was much hindered by the height and steepness of the mountain. For the knights on horseback, boiling with desire of action, and crowding into the first ranks, entirely prevented the infantry from ascending. But the Schwitzers, perceiving how much their enemy would be hampered by the difficulty of the way, went down against them from their lurking-places, and, attacking them like fish in a net, slew them without resistance."—*Vitodurani Chronicon.*

THE EVENING BEFORE THE BATTLE.

Why are those watchfires gleaming bright,
Morgarten, on thy beacon height?
And why are lights 'mid the evening gloom,
Flitting like spirits from tomb to tomb?
Why through the calm of each Alpine dell
Do the warlike notes of the trumpet swell?
And why is the scared flocks' mournful bleat
Drown'd in the trample of hurrying feet?
Why doth the war-whoop, wild and shrill,
Re-echo from the snow-clad hill,
And the sentry pace his lonely round,
O'er thine ancient hallow'd battle-ground?
The morn shall tell. That morning came,
Usher'd by smoke-wreath and by flame!

THE BATTLE.

The dawning sunlight beams
O'er Morgarten's hills of snow!
'Tis reflected back by a thousand streams;
But brighter yet in lurid gleams
From the valley stretch'd below.

On the mountain's hoary brow,
By the tombs of their fathers dead,
How many a Switzer's holy vow
Hath bound him to shed his life's blood now,
Where his sainted sires have bled!

Fiercely the Austrian foe
Rolls, like the coming tide—
As deep, as surely, and as slow,
His myriads o'er the plains below,
And up the mountain side.

But mark, upon the steep
Of Morgarten's loftiest height,
A dusky spot is seen to sweep
(Like darksome dreams o'er the soul of sleep)
On its snowy breast of white.

It stays its meteor course
O'er the Austrian tyrant's path;
And a distant murmur, deep and hoarse,
Tells to the foul invading force
Helvetia's gathering wrath.

Deep in Morgarten's snow
The heavy horsemen sank;
And many a gallant steed lay low,
And, struggling in his dying throe,
Broke the disorder'd rank.

'Twas then that from the height
That dark spot burst in flame—
Like thunderbolt across the night,
As swift, as deadly, and as bright,
Morgarten's heroes came!

On through the van they dash—
The pierced battalions reel!
Then, rapid as a lightning flash,
'Mid trumpet clang and weapon clash,
Upon the flanks they wheel!

Vain though the battle-cry
Rung high among the foe—
Though many a steel was glancing high,
And the flower of Switzer chivalry
Lay stretch'd upon the snow!

For far upon the plain
A dust-cloud marks the way
Of the coward hearts, whose blood should stain
The snow, where, trophies grim, remain
Their dead lord and his warrior train
Of that disastrous day.

Yet the shout of victory
Rings feebly o'er the hill,
For the patriot hearts which that morn beat high,
For vengeance and for liberty,
Chill'd in the strife of that dreadful day,
Upon the heath lie still!

THE NIGHT AFTER THE BATTLE.

There is a mourning o'er Morgarten's waters,
There is a wailing in her wilder'd dells;
And many a maiden of Helvetia's daughters
Her tale of anguish to the wild wind tells.

A stranger ear, amid those sounds of sadness
Which came upon the night wind heavily,
In vain had listen'd for the notes of gladness—
The triumphing which tells of victory.

Nought is heard save the death-song, sad replying
To the wind's moanings o'er that midnight wild,
Where many a maiden watch'd a loved one dying,
Or mother sorrow'd o'er her bleeding child.

Oh, war! when holiest, oh, infernal still!
Is this the ending of that death-won day,
To give a freedom to the lonely hill,
But snatch the souls which should be free away?

Too true, alas! Morgarten's wilds may tell
How many a hero sleeps beneath her snows;
For memory fails to mark the lonely dell
Which gives the victors of that day repose.

ODDS AND ENDS.

COLLECTED FROM VARIOUS SOURCES.

CHANCE DEFINITIONS.

Looks—The first billet-doux of love. *Happiness*—A fugitive and chimerical being, which every body runs after, but no one catches. *Sensibility*—A gift of heaven, to multiply the pleasures and pains of life. *Wisdom*—A shield that preserves its possessor from the perils with which his desires surround him. *Society*—A state of constant slavery, in which no one lives for himself or to himself. *Absence*—The sister of death. *Love*—An egotism, divided by two. *Military Glory*—Smoke on ruins. *Indifference*—Absence of all sentiment, or the feeling of the worthless. *Music*—An universal language, which harmoniously relates the reminiscences of the heart. *Honour*—The soul's patrimony. *Beauty*—A flower without smell when no quality of the heart accompanies it.

HUMAN WEAKNESS.

All men fear, dislike, and grieve; all men desire, hope, and rejoice; though, of course, different men feel those passions unequally. All men, however, are not susceptible of love, of hatred, of envy, or of despair. The strongest men, too, have their various weaknesses. Johnson united moral credulity to mental vigour, and he dishonoured his strength by arguing for victory rather than for truth.

READING IN CHILDHOOD.

Reading without intelligence injures the brain and stomach mechanically; reading with intelligence injures both in the less direct manner of nervous excitement; but either way, much reading and robust health are incompatible. Only let a child eager for knowledge be read to instead of allowing him to read himself, and the whole of the mechanical mischief is avoided; and again, let him be freely conversed with in a desultory manner, in the midst of active engagements and out of doors; and then, while an equal amount of information is conveyed, and in a form more readily assimilated by the mind, nearly all the mischiefs of excitement, as springing from study, are also avoided. In a word, let books in the hands, except as playthings, be as much as possible held back during the early period of education.—*Home Education.*

PEACE.

Peace is the natural effect of trade. Two nations who traffic with each other become reciprocally dependent; for if one has an interest in buying, the other has an interest in selling; and thus their union is founded on their mutual necessities.—*Montesquieu.*

WILL YOU TAKE A PINCH?

"Will you take a pinch?" said an acquaintance, offering his snuff-box to a fishmonger. "No, I thank you," replied the latter, "I have just had *one* from a lobster."

BREVITY AND WIT.

It is said that short dumpy people are more humorous than long lank folks, on the ground that *brevity* is the soul of wit.

AN ILLUSTRATION BY WAY OF DEFINITION.

"Pray, what *is* nonsense?" asked a wight, who talked little else. "Nonsense?" replied his friend; "why, sir, it's nonsense to bolt a door with a boiled carrot!"

CLEVER SCHOLARS.

"The boy at the head of the class will state what were the *dark ages* of the world." Boy hesitates. "Next—Master Smith, can't you tell what the dark ages were?" "I guess they were the ages just before the invention of *spectacles*." "Go to your seats."

THE POOR MAN.

When a poor man attempts to rise—attempts to show that there is no monopoly of genius, and that God hath given as free and noble a soul to the lowly as to the great—he is not only opposed by the class above him, but envy and scorn are but too often his portion among his fellows. They do not like to see themselves outstripped by one whom they have reckoned no better than themselves, and instead of encouraging, they damp his ardour, and grieve his heart with sneers, and cold, because envious, counsel. The next class above him love not to see a man who has nought to boast of but a noble soul, no treasures save those of mind, presuming to take his place among them, and there is one universal shout of "keep him down!" This upward struggle which the poverty-struck genius has to endure—the struggle against prejudice, and misrepresentation, and want, has daunted many a mind, and discouraged many a breast, and has kept many a man formed to be a light to the world in poverty and darkness to the end of his days. Because of this, many a noble spirit has concealed its own flame of brightness; many noble and free men, of whom the world was not worthy, have gone down into the grave, with all the wisdom of their souls untold—"have died, and made no sign."

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 454. SATURDAY, OCTOBER 10, 1840. PRICE THREE HALFPENCE.

THE POCO.

ALL who have read Voltaire's "Candide" must have a lively recollection of a certain Monsieur Pococurante, who turns away with contempt and disgust from every thing that is presented or proposed to him; whereupon the hero of the story makes the remark, "What a great man that Monsieur Pococurante must be—nothing pleases him!" The French philosopher here touches the root of a very remarkable feature of human character. The number of those who, from an irregular self-esteem, are malcontent with almost every thing, is very great. We propose that they should be called *pococurantes*, or, for shortness, *pocos*, though, we believe, the word has a more extensive meaning amongst the people to whose language it belongs.*

The Poco is remarkable for his comments on new public buildings. He has but one principle—never to admire. Is the building a Gothic church, then it resembles a big German toy. Is it a pillar, then it is like a great candlestick or churn. Is it a Grecian church with a dome in the St Paul's style, then it is like a vast pepper-caster. There is not any one building, however large in its scale or elegant in its parts, but he has some diminutive and ridiculous object of a familiar domestic kind, whereunto to liken it, so as to make it appear mean. He is also great in showing the inappropriateness of buildings to their objects and sites, as, for instance, "How absurd to have built that Corinthian monument to Burns—the most Doric of all poets!" or, "How ridiculous to set up an obelisk in that dense part of the town, where, to a stranger approaching, it will look like a factory chimney!" One thing may be observed; he is not very consistent. If it is intended to place a building low, he predicts its effect will be lost: if, next year, another is commenced on a hill, then its effect will be to spoil the hill. On a moment's reflection, we must withdraw the last charge against him, for in both of these remarks he is quite consistent with himself—in his character as a Poco.

On the occurrence of any city spectacle or exhibition, which all the people go to, expecting to have some pleasure in it, our Poco's bile is sure to be stirred. It is curious, too—he always goes like the rest. But, to appearance, it is only to find fault. Let us suppose it is a procession—say the queen going in state to open parliament. In such a case, he by no means likes the colour of the horses in the royal carriage: George IV.'s horses were a great deal better. Then the sovereign of England was considered entitled to *have* a stud. As for the procession, he has seen a far better in Blue Beard or Aladdin. A boy rogue splashes his gaiters, and he exclaims there is no police, though they actually form a large and conspicuous portion of the crowd. You drop with him into the National Gallery; but he has long done with pictures. There is no genuine art now-a-days. All flash, and flare, and daub. In the evening, you conduct him to the opera. It is one of the best nights of the season, and a crowded house. But never was heard such singing, or seen such dancing. Besides, there is something confoundedly shabby in that plan of giving backs to only one-half of the seats. And then the whole affair is a humbug—a parcel of rascally foreigners come to pick our pockets.

It is the same with natural objects of the kind which most are glad to go a good way to see. He makes a tour of the Scottish Highlands, but finds everything greatly overpraised. Loch Lomond is nothing to the Lake of Geneva. The vale of Glencroe, so rugged and sublime, appears to him dull and sombre. He would have liked to see the mountain sides enlivened, as in Switzerland, with cottages and patches of cultivated ground—provoking you to add in despair, "and lighted with gas;" but the Poco does not understand a joke, so this passes for unsaid. His main trick is to depreciate by comparison. You hint a little approbation of Ben Lomond, which you insinuate is nearly four thousand feet high. "Oh, my dear sir, what is Ben Lomond, or any other of your Scotch hills, to Mont Blanc? Think of fifteen thousand feet of height, and a top of perpetual snow!" When you speak in like manner of the Clyde—"Oh, my dear sir, what are any of your Scotch rivers to the Thames or Severn?" Were our Poco a Swiss, and treated with some praise of Mont Blanc, it is ten to one he would cite the Himaleh range. Were the Thames or the Severn spoken of praisingly in his presence, he would, in like manner, fly to the Danube. Were he German, again, and heard the Danube approved of, he would not be content till he had told you what a trifle it is to the Amazon. And so on. What he would do were he asked to admire the Himaleh range or the Amazon, or any other *greatest known thing of its kind*, the powers above can only know; we do not. We fear such a case would distress the Poco a good deal.

The Poco's taste in literature is very sublime. He condemns the whole taste of the age, leaving it of course to be surmised that he could himself produce, or at least can imagine, far better novels, plays, poems, philosophical writings, and so forth, than any at present in vogue. Periodical literature being fashionable, he finds that men fritter away their genius in small efforts; though, of course, were it otherwise, he would ridicule their large and solid works, and point out that a light essay, or even a song or a ballad, had often done more to enlighten and reform than folios of twenty years' elaboration. The productions of the day being most run upon, he furiously bewails that the excellent writers of the last century, the Popes, Swifts, Johnsons, &c., are now neglected; though here, also, were the case the reverse, he would be sure to rail at the miserable unattractiveness of all existing authors. The clever novelist being now the crack man, he asks, "But where are your philosophical writers? Scott and Bulwer are very good as story-tellers; but we have now no Adam Smiths." Of course, were it otherwise, he would be all grumble for the want of graceful fiction. When Boz was comparatively obscure, our Poco was delighted with him. "There," he cried, "there is an original writer at last!" But since everybody began to admire Boz, his tone is quite changed. He speaks of "that practice of selecting characters from the lowest scenes of life, and the effect which it must have in taking down the public taste;" and shows that, after all, he is a writer who sees only the minutiæ of external appearance, all the fine workings within escaping him. Of course, if we could suppose Mr Dickens to have written his many clever books without public approbation, our Poco would have been quite indignant at the age for allowing so bright a genius to languish in obscurity. His favourite authors, it may be readily supposed, are not the same with other men's favourite authors. Those whom he patronises are chiefly persecuted out-of-the-way writers—persons who were perhaps killed twenty or thirty years ago by single articles in quarterly reviews, and have never been heard of by the bulk of the world since; or individuals who have never had any but a local fame. Were any of these people to get the least into vogue, they would of course be instantly given up by our Poco.

The Poco is as peculiar in his line of politics as in anything else. No contingency or crisis of public affairs ever strikes him in the same way it does other people. He is of no party, for that would be acknowledging somebody else to be as right as himself. Malcontent as he is generally, he will not even join his fellow-creatures in a discontent; no, when there is a general discontent, our Poco is then malcontent with the discontented. When a large section of the community concentrates its attention upon some grievance, which it endeavours to have redressed, our Poco is sure to discover that the real thing which galls them is something quite different—probably something of so trivial a nature that no one besides himself ever thought of it; like the old soldier in Scott's tale discovering the cause of Claverhouse's defeat at Drumclog, in "that newfangled way of slinging their carabines." Ministries of all kinds are alike to our hero. They are always mere nincompoops. When a warlike policy is pursued, he apprehends the nation must soon sink under the necessary additional taxes; when the cabinet, like Lucius, have to confess that their thoughts are turned on peace, then the nation is now-a-days allowed to be kicked about by every third-rate power—very different from the times of yore, when the British lion never allowed a single hair of his tail to be plucked with impunity. He is always found engrossed by considerations of departments of state policy, which everybody else at the time supposes to be in good enough order; for instance, while all mankind are absorbed in the question, we shall say, of free trade, our Poco is altogether occupied in considering the finances. "If the finances are kept right, sir, all will be right. Britain stands or falls by the finances. No ministry ever yet throve which meddled with the finances. That was Necker's great fault in the French Revolution." In short, he is for the finances, and nothing but the finances; you could not pass him in conversation with a gentleman on the street, but, in the moment of transit, you would hear of the finances. There is a possible exception to the rule that the Poco is of no party. Whenever any faction gets worn down to something very small, so as to cease to be of the least account with the nation at large, then our Poco perhaps allows himself to join with it. But he is a bad partisan, being as likely to throw blame upon his own people as upon any other. At all their defeats, however clearly these may be owing simply to the overwhelming force of the opposing majority, he is sure to turn round upon them, and find the source of their discomfiture in some little peculiarity or point in their conduct, which has no more to do with it than the last change of the moon. He so dearly loves to give blame and find fault, that nothing, however intimately associated with him, can be free from the exercise of his ingenuity in that way. Were the very wife of his bosom to fall and break her leg, he would find it to be her own blame, from wearing that large bonnet.

An affair like the meeting of the British Association gives great scope for his peculiar passion. It is well known that the meetings of this body have at every place occasioned a general feeling of satisfaction both to the savans and the people whom they visited. These assemblages have been in fact signalised by an overflow of kind and agreeable feeling wherever they have yet taken place. This is enough to make them objects of particular disgust to our Poco. Would *he* be pleased with what pleases so many? No: that would be to reduce him to the common herd at once. He therefore takes every opportunity of railing at

* *Pococurante* (Italian), literally *a little carer*, signifies one who is very careless in his general demeanour, as well as one who cares little for his fellow-creatures, and for what others are accustomed to respect.

Digitized by Google

these meetings as mere vanity fairs. No science worthy of the name is brought into notice by them. Solemn grimace in the forenoon, and eating and drinking in the evening—that is the whole order of the day. How finely the natives are *done* by these quacks—for, long since, of course, all the real men of science withdrew from the affair in disgust. And a great deal more to the like purpose, all intended to show that people, instead of allowing themselves to be happy at these meetings, ought to stand sulkily aloof, as he does—though, were the example to be followed, and the British Association really to fall off in public esteem, he would for certain be the very man to stand up and rail at the world for its coldness towards the cause of science, and the little regard it pays, and has ever paid, to the men whose patient inquiries and experiments form the chief foundation of the nation's glory and happiness.

It is important to observe, that much of what the Poco says is only a profession of the moment, not the expression of a deeply-grounded feeling or opinion. For any man to be really affected by all the disgusts he seems to feel, would be a sad fate indeed, for then literally nothing *would* please him, and his ordinary sensations would be of the most painful kind. To do the Poco justice, he is a great pretender. In his privacy, he reads the proceedings of the British Association with much the same feelings as other people. All the time he is exclaiming that the country is ruined through the incapacity of its statesmen, he is buying largely in the three per cents. He may appear to have only two or three favourite authors, and those of the obscurest class, but in reality he has a well-filled library, and indulges in a wide range of miscellaneous reading. As to the scenery of his native country, we may leave our readers to judge if he can really be thought to undervalue it, when he never allows an autumn to pass without making a tour of the Cumberland or Scotch lakes, or of Wales, or some other romantic district—ay, and takes his wife and daughters along with him. We would advise you, also, not to be too easily led away by what he says of the opera, or of the street sights, for he goes to the one at least once a-week, and never misses a spectacle which other people think worth seeing. Such being his habits on these points, we may well conclude that most of the new public buildings give our Poco as much satisfaction as they give to other citizens, though, as already mentioned, he never allows himself to say one word in their praise. Here, indeed, is the hinge of the Poco's character. To praise is what he dreads, for that, he thinks, takes him down. Barring that, as our Irish friends say, he is much like other people in all sorts of respects.

The pride which forbids praise where it is due, is, however, a good deal to except. To speak seriously of it, it forms, we humbly think, by no means an amiable or estimable feature in a human being. To admire what is worthy of admiration, to express satisfaction where the best efforts have been made to secure it, is nothing more than justice, and it is what one man owes to another, the same as mutual forbearance from injury. In failing on these points, a great law is violated, and society must to some certain, though perhaps an inappreciable extent, be the worse for it. If the duty be done within moderation, and with a simple regard to justice, no one can be presumed to be degraded by it. Indeed, no one who was not under the influence of an excessive or morbid self-esteem, could presume himself to be in the least danger on this score. It is also worthy of observation, that Pocoism cannot be favourable to truth. We are so constituted, that it is not possible to affect permanently and habitually any feeling or mode of thinking, without becoming in some degree actually influenced by it. In as far, then, as any one affects to see things in a very peculiar light, or to esteem them differently from others, he is very apt to be really guilty, in some measure, of misjudging them. The very necessity of appearing consistent will force him often to act towards such things in the way he speaks of them, and thus serious error may be induced. Besides, the mere speaking of things in a particular false way, is likely to mislead many who, not having the power of judging for themselves, are ready to view every thing as they find others viewing it: to such persons the affected disdain of the Poco must appear as sound as the sober judgment of the impartial man, and his folly will lead to error accordingly.

While, in every point of view, we think Pocoism is to be condemned, we are well aware that it is not to be put down by arguments like the above. No; ridicule must be brought to bear upon it. It is for this reason that we have here applied to it a burlesque appellation, being of opinion that there may be much force in a name, and that the Poco, of all men, will be least able to stand out if he finds himself under a stigma which raises the general laugh against him. It is to be hoped that many will be cured by this paper; but, of course, more will not, and Pocoism will continue to exist till the extinction of all other human passions. Nevertheless, much good might, we think, be done by keeping alive the term in application to the fault, a very slight reference being needed after the thing has once been described and put under an easily recognisable appellation. We would therefore suggest, that, in all cases where a regard to good-breeding will allow of it, the simple word "poco" be gently breathed whenever any one is found guilty of the offence. Let the sound proceed, as it were casually, from the throat, and the offender will feel the check, without being under the necessity of resenting it. For still greater delicacy, one might hum the air, "Una voce *poco fa*," or finger it over on an adjacent piano, thus suggesting the idea by a nice process of association. The two first bars of the air, which any one might learn in as many minutes, would be quite sufficient for the purpose.

MADAME DE BRINVILLIERS.

STORY FROM THE CAUSES CELEBRES.

Mademoiselle d'Aubray, daughter of a respectable and wealthy gentleman, who held the rank of civil-lieutenant in France, was married, in the year 1651, to the Marquis de Brinvilliers, a man of rank and fortune. She brought to him a dowry of two hundred thousand livres, and he enjoyed an annual income of thirty thousand livres. The pair were thus amply provided with the means of enjoying, not only the necessaries and comforts, but also the luxuries of life; and every thing seemed to promise to them a long career of wedded happiness. The marchioness was remarkable for the sprightliness of her mind and the graces of her person. Her figure was slight, but well-formed, and her features regular and beautiful; while the mildness of her manners, and the tranquillity that sat on her brow, gave indications of a spirit unruffled by any of the stormier passions of humanity. But, as the beautiful description of the castle of Glamis, in Macbeth, with the allusion to the quiet sweetness of the air, and the peaceful labours of the "temple-haunting martlet" under the eaves, gives a more startling effect to the bloody horrors acted immediately thereafter within the walls, so did the opening promise of this woman's life contrast, in a fearfully vivid manner, with the after scenes in which she bore a part, and, indeed, in which she was the principal actor.

The Marquis de Brinvilliers was a colonel of cavalry in the regiment of Normandy, and had seen actual service in the wars. While so engaged, he had become acquainted with a captain of horse named Saint-Croix, or rather one who had assumed that name, being an illegitimate member of a noble French family. The marquis, subsequently to his marriage, met Saint-Croix, and renewed acquaintanceship with him. The captain was soon received as a domesticated visitant in the house of the marquis and marchioness, and hence flows the unhappy tale that is to be told. M. de Brinvilliers was a dissipated man, and much abroad, by which means his wife was left in the dangerous society of Saint-Croix, and formed a strong and criminal attachment to him. He was one but too ready to encourage and profit by such an aberration from rectitude, and, urged by him, the marchioness took advantage of her husband's conduct to sue for a separate maintenance, which she obtained. After this period, the connexion between her and Saint-Croix grew closer, so much so as to attract general notice. Her father M. d'Aubray, became aware of the circumstances, and perceiving the marquis to be seemingly indifferent on the subject, thought that he would best consult his daughter's good by getting Saint-Croix imprisoned. A lettre-de-cachet, or order for arrest, was a thing too easily procured in those days in France, by any one who had interest at court; and the young captain of horse was taken from the carriage of the marchioness and thrown into the Bastille.

This step had a most unfortunate and unforeseen issue. While in confinement, Saint-Croix became acquainted with an Italian named Exili, a man who followed the mystery of compounding poisons, one extensively studied in that age, and turned largely to profit and account. Exili initiated his fellow-captive into the secrets of the art, and, when both of them were liberated, at the end of a year, the diabolical instructions were continued, until the pupil became as great an adept as his teacher. On his release, Saint-Croix had not failed to renew his intercourse with the marchioness, but with so much circumspection, that even the father was deceived, and kept up a friendly footing with his daughter. When they met in private, Saint-Croix communicated to the marchioness the secrets taught him by Exili, and his lessons were not thrown away. Animated by cupidity and a desire of vengeance, this wretched and guilty pair concerted a scheme of cutting off M. d'Aubray and his whole family, the *father*, *brothers*, and *sister* of the marchioness. The horrible aspect of such a crime daunted not these two beings, rare in their wickedness, and worthy associates for one another. The object of the scheme, of course, was to put the marchioness in possession of all the property of her family; and Saint-Croix, imagining himself secure of her affections, did not doubt but that he would be master of all which owned her as mistress.

The first measures taken by Madame de Brinvilliers towards the execution of her design, are perhaps more frightful to think of than any other part of her conduct. With an inconceivable degree of coolness, this woman, young, well-educated, and seemingly of mild and gentle temperament, deliberately set about the trial of her mortal poisons upon living human beings, preparatorily to the use of them upon her own family. She introduced poison into biscuits, and gave them to poor persons, watching the effects they produced. Her experience in this way did not seem to her ample enough, however, and, according to a custom not uncommon among benevolent females in France, she went to the Hospital of the Hotel-Dieu, to administer in person her drugs, on a large scale. Though this fact afterwards came to light, the extent of the mischief done by her could not be decisively ascertained. Anxious apparently to witness still more fully the course of action of the poison, the marchioness also administered a dose to her waiting-maid, Frances Roussel, who became very ill in consequence, but ultimately recovered. Whilst working so much among these fatal drugs, the marchioness, by mistake, allowed a whole company to partake of a pigeon-pie, into which she had introduced her poisons. "Several of them died," Madame Sevigné tells us; "and the Chevalier du Guet, one of the party, lived on in agony for two or three years." The poison being slow of operation, no suspicion was aroused in these cases.

Having satisfied herself, in this fearful manner, of the kind and quantity of poison suited for her purpose, Madame de Brinvilliers committed the first of her previously purposed crimes. Her father went to his country-seat at Ossement, attended at his request by this unprincipled daughter. She put poison into a broth intended for him, and he took it. Violent vomitings and the severest pains were the consequence, and the marchioness looked on calmly, or at least with such a demeanour as prevented any shade of suspicion from lighting on her. Her father lived long enough to be carried to Paris for advice, but died shortly after arriving there, the daughter having several times repeated the dose. The two sons were next attacked, as standing between the marchioness and the inheritance of the family. The mind which had calmly compassed the crime of parricide, had no scruple in meditating fratricide. One of the brothers had succeeded his father as lieutenant-civil, and the other was a counsellor of parliament. Madame de Brinvilliers was upon friendly terms with both of them, and she took advantage of this to introduce into the service of the counsellor, who lived with his brother, a lacquey named La Chaussée, once a servant of Saint-Croix, and a fit agent for the completion of the murderous design. The fact, however, of his having served Saint-Croix was concealed. La Chaussée, for a high bribe, undertook to poison the brothers, and, soon after entering their household, he introduced poison into some wine and water to be taken by the eldest. But as soon as the latter had put it to his lips, he detected something unusual in the taste, and exclaimed, "Rascal, what have you given me! Would you have me poisoned!" This was said, however, without any idea that poison was really in the glass, and merely referred to want of cleanliness and care on the part of the servant. La Chaussée excused himself, by saying that some dregs of medicine had accidentally been in the glass, and had given it the taste complained of.

Still unsuspicious of any evil intended to them, far less anticipating it from a sister's hands, the lieutenant and counsellor kept La Chaussée in their service; and he was not long in making a new attempt, being urged to it by his impatient and unscrupulous employers. In April 1670, the brothers went to the country, and, while there, partook with some other gentlemen of a set banquet. A sweetbread pie was among the dishes, and the brothers, with one of their companions, ate freely of it. The three were immediately seized with vomiting, and suffered most severe pain, while those who had not ate of the dish felt no disorder. The unhappy brothers were of strong constitutions, and nature struggled long against the injury inflicted on it, but the issue of that poisoning was fatal to both. The lieutenant languished in torment up to the 17th of June, and then died. The counsellor survived the poisoning three months, and followed his brother to the tomb. An examination was made, respectively, of the bodies, and, in both cases, a portion of the stomach and intestines was found in an ulcerated and blackened state. The physicians did not hesitate to declare that the brothers had been poisoned, but suspicion never pointed to the true source, and indeed some unhappy accident was generally looked upon as the cause. So well had La Chaussée played his part, that the counsellor, totally unsuspicious of the man to the last, had left him a small legacy.

Three victims were thus removed. There were yet two other persons, however, who stood between the wretched authors of these crimes and the attainment of their full desires, namely, Mademoiselle d'Aubray and the Marquis de Brinvilliers. On the life of the

Digitized by Google

latter, the marchioness, eager to remove all obstacles from the way of her union with her paramour, contrived to make several attempts; but, if we may believe Madame de Sevigné, who was a contemporary, and living on the spot at the moment, Saint-Croix himself took steps to prevent the marchioness from succeeding in this portion of her designs, being averse to a formal union with a person so dangerous as his associate in guilt. But the Marquis de Brinvilliers tasted enough of the fatal drugs to injure his health deeply. As for Mademoiselle d'Aubray, whether put on her guard by the acknowledged end of her brothers, or from natural cautiousness, she did not fall beneath the deadly attempts of her younger sister, though these were often repeated.

It is difficult to say how many crimes these wretches would yet have committed, had not a strange and striking circumstance suddenly arrested them in the mid career of their guilt. Saint-Croix, not yet contented with his proficiency in the art of poisoning, was in the habit of exercising his genius in the art of compounding new drugs of the same kind, and arrived at a degree of skill therein which proved fatal to himself. One day, while engaged in mixing some of his preparations, and standing over the fumes with a mask of glass upon his face, the protecting vizor fell off, and the vapours killed him on the spot. His death being discovered by his servants, a magistrate was called in, and the effects taken in charge, the deceased being understood to be without friends. A casket was seen, which contained an open paper, and some sealed packets. The paper, which had plainly been drawn up with a view to the possibility of such an accident, contained the most solemn injunctions to those who should find it, to carry the casket to the Marchioness de Brinvilliers. "It belongs to her alone," said the paper, "and can be of use to no one else. If she be dead before me, then it is my desire that the casket be burnt, without being opened by any one. This I charge upon those who find it, as they would have peace on earth, and as they value their souls. This is my last will." The very solemnity of these instructions defeated their purpose, and caused the agents of justice to open the packet so much cared for. Poisons, and receipts for poisons, with directions to *use* them, constituted nearly the whole contents. A note from the marchioness to Saint-Croix, containing a promise of 30,000 livres, was also there, and some letters from the same party. These did not precisely disclose the truth, but were sufficient to excite strong suspicions. Meanwhile, the marchioness had heard of the decease of Saint-Croix, and came instantly to the spot. Probably aware of the existence of the paper, she demanded the casket. It was refused to her, and, in great anxiety, she endeavoured to bribe the officers. Finding all vain, she grew alarmed, went home, and, having made rapid preparations, fled towards Flanders, which she reached in safety.

A piece of matchless audacity on the part of La Chaussée, the valet, threw new light on the affair. This man came forward, and asserted that Saint-Croix had a large sum of money of his in charge, and also owed him long arrears of wages. The police were led to examine the past history of the man, and he soon broke down under the cross-examination to which he was subjected. The deaths of the D'Aubrays, while he served them, were remembered, and he was seized. His courage failed him when put to the question, and he horrified the public by disclosing the Marchioness de Brinvilliers to be the murderess of her two brothers, and the attempted assassin of her sister. La Chaussée was fully convicted, and executed. In the mean time, the retreat of the marchioness was discovered, and a body of criminal officers were sent to bring her to justice. But she was lodged in a convent of Liege, from which sanctuary it was informal to take her by force. An active officer, named Desgrais, devised a plan of overcoming this difficulty. He dressed himself as an abbé, was introduced to the convent, and formed an acquaintance with the marchioness. After a time, by pretending an affection for her and an unlimited devotion to her interests, Desgrais gained her confidence so far as to wile her beyond the convent walls, when she was at once seized, and hurried off to France.

In a casket in her possession, was found a confession, apparently intended for a priest, and containing a disclosure of all her crimes. These were more horrible than had been previously conjectured. She admitted the poisoning of her father (after several trials), her two brothers, and one of their children; and these admissions were universally credited, though she afterwards averred having written this in a state of frenzy. She also said in the paper, that, from mere childhood, she had lived a life of wickedness. On her way to Paris, she made several attempts to escape, and once endeavoured to poison herself; but she was brought to the capital, and convicted on trial, amid outcries of horror from the whole nation. Madame Sevigné describes her as the theme of universal talk during her imprisonment. After her condemnation, she retracted the professions of innocence made at her trial, and avowed her many murders, expressing great contrition for them, according to her confessor's statement. Nevertheless, she exhibited no compunction or fear at her execution, which Madame Sevigné thus describes:—"Paris, 17th July 1676. At last all is over. Brinvilliers is in the air: her miserable little body was thrown after the execution upon a great fire, and burnt to ashes. * * * * It was at six in the morning that she was led from prison in a shift, with a rope round her neck, and conveyed to Notre Dame, by way of public penance; after which she was put into a cart, and carried to execution between a priest and the executioner. She asked the priest by the way to place the executioner before her, that she might not see Desgrais, the knave (as she called him) who had seized her at Liege. The priest rebuked the sentiment. 'Ah, well, forgive me,' said she, 'and let the disagreeable sight remain.' She mounted the scaffold unaided, and died with courage."

Such was the end of this marvel of crime, who was but twenty-five years of age when she was stopped in her career. It would be charitable to suppose a tinge of insanity to have been at the foundation of her monstrous conduct; but truth compels us to say that no good grounds appear for sustaining that lenient view. The erroneous and most reprehensible practice which priests pursue, of exaggerating the natural remorse of the vilest criminals into a holy and saving penitence, had the effect, in the case of Brinvilliers, of actually making numbers of people regard her as little else than a saint at her dying hour, though the most worthless wretch who ever figured in a court of justice.

THE WEST INDIES SINCE THE ABOLITION OF SLAVERY.

JAMAICA—THE CONSEQUENCES OF EMANCIPATION.

THE immediate effects of the emancipation of the negroes in Jamaica, as already mentioned, were of so peaceful a nature as to hold out the best hopes of future prosperity to the island. The only cause of complaint was the perverse conduct of the managers of estates, in endeavouring to maintain a thraldom over their servants by exacting enormous rents for their houses and provision-grounds. The disquietude arising from this unfortunate policy lasted for six months at least after the day of liberation, and reacted most severely on the proprietors of the sugar plantations, for, while the quarrel existed, comparatively little was done to prepare the ground for the next crop of canes, and the produce, therefore, in 1839 was about a tenth less than formerly. This circumstance partly accounts for the present dearth of sugar.

At length the odious quarrel respecting rents and wages terminated. The peasantry, as we may now call them, diligently applied themselves to their work, which, in fact, they had been willing to perform, perhaps with some few exceptions, from the very first. When things began to right themselves, it was observed that fewer labourers wrought in the fields than formerly, and that they in general wrought only five days in the week. This excited many fears, and no little clamour. It was construed into a love of idleness in a portion of the population. Those who knew better, showed that it was simply a result of freedom; it was proved that the able-bodied man who was now free, in some instances did double his former amount of labour, the excess forming a provision for the weaker beings who depended on him for support. The following is magistrate Fishbourne's report on the subject:—"During slavery and apprenticeship, one-third of the people residing on estates were considered incapable of, and were exempted from, labour. Seventy out of one hundred slaves or apprentices was considered a fair proportion. Of those seventy, probably one-third was composed of the pregnant women, or mothers of large young families, the very old or very young, sickly or ulcerated individuals, and domestics, &c., who, if deducted, would leave about one-half of the gross strength of the estate, or about fifty effective labourers. The decrease, therefore, of the number of effective *field*-servants is not so large as those not acquainted with plantation economy might imagine, on being told that not above half the people on an estate now work in the fields.

Planters are unwilling to permit families to reside on their plantations, the females of which refuse to devote themselves to agricultural labour. The object is to increase the number of constant field-labourers: the effect, I have reason to believe, will be the reverse, for many respectable people are now availing themselves of opportunities of purchasing or leasing small pieces of land, where they are preparing to place their wives and children, and where they also will retire when they can quit the estates, without sacrificing the provisions now in the ground. Within the last three months, I have been consulted by a great many as to the necessary steps to be taken so as to secure themselves from molestation hereafter in their settlements."

Other magistrates corroborate the fact that the value of manual labour has greatly increased since it became free. Mr Grant (Feb. 1839) observes—"With regard to the expenditure on properties, I am confident that cultivation can be carried on at much less expense than under the former system." Here he enters into some calculations respecting the cost of cultivation on a property which had at one time 350 slaves. The expense of free labour which it required in five months was L.240, 14s. 4d., and for the same space of time, the expense of apprenticeship, or slave contingencies, would amount to L.725, leaving a balance in favour of the expense required for free labour of L.484, 5s. 8d.; "and the late deficiency law required five people, besides the overseer, doing militia duty, to be employed at salaries, and maintained on the property. The saving effected by the change in this particular is very great. The book-keepers are now dispensed with. The supercession of a free system has been a great relief to the owners of unproductive properties. They were bound to give the prescribed allowances to their slaves, without reference to their own profits. To illustrate this position, I can point out a property on which were settled 100 slaves. The lowest estimate of expenditure on their account is L.500 a-year, and the possession, notwithstanding the high price of produce, has of late years regularly increased the owner's debt. Since 1st August to 31st December, the labour account has amounted to L.99, 4s. 2d. The usual cultivation has been carried on and improved; the pastures, hitherto neglected, are cleaned; and about thirty acres of coffee, which had grown up to the state best described by 'ruinate,' have been opened. The produce, small as it is, now secured, will pay all the expenses of the plantation, and, even in this first year of experiment, place the proprietor on a better footing than under a continuance of the previous system he ever could have hoped for."

In the report of Messrs Lyon, Dillon, and Kelly, March 1839, a similar evidence is afforded:—"With regard to the assertion that the sum paid for labour is so high as to render it impossible that the returns of sugar-planting can sustain it, it is only necessary to say that experience has proved that the expenditure varies from L.3, 10s. to L.5 per hogshead. The planter, therefore, has it in his power to compute his expenditure against his profits; and, with sugar selling in the colony at 40s. to 54s. per hundred-weight, and rum from 6s. 8d. to 8s. 4d. per gallon, it may, without difficulty, be shown that the result must be extremely favourable to him."

The following is excellent, from Mr E. D. Baynes, April 3, 1839:—"In the midst of so much misrepresentation, and so much real or affected despondency on the part of the planter, the confidence of the great majority of the other classes of the community in the stability and security of property, remains unabated. Land, especially in the vicinage of towns, has risen, and is increasing in value. Mr Duncan Hamilton, of Retreat, in the parish of St John, who, four years since, assured me that he did not think he could get L.3000 for his property, has, within these few weeks, disposed of it to Mr Alexander Reid Scott, a storekeeper of Kingston, for the sum of L.10,000."

Mr Ramsay, April 6, of the same year, says—"During slavery and the apprenticeship, the jobber charged from L.10 to L.12 per acre for digging, with his slaves or apprentices, an acre of land into caneholes: now, at wages of 1s. 8d. per day, an acre of cane-holes may be dug for the sum of L.2, 10s. currency; at 2s. 1d. wages, it will cost L.3, 2s. 6d.; at 2s. 6d. wages, it will cost L.4, 10s.; and at 3s. 4d., the highest rate of wages that I have heard of, it will cost only L.5, just one-half what it cost in times past. The whole estimated expense of each negro to the planter, was from L.6 to L.7 per annum."

We come now to evidence produced by the stipendiary magistrates only a few months ago. The report of Mr Grant, June 10, contains the following valuable information. "I have remarked that the persons who are loudest in proclaiming the deplorable state of the country, are the very persons who grasp most firmly the property they have in it, and, if they have the means, are most willing to purchase more. This *may* be honest. They *may* be doing this without any sinister motive. I know one of them who purchased a property about three years ago. He was lately offered nearly treble the amount he gave for it. Did he take it? No; but in the same breath he would assert that the country was ruined.

In Clarendon, matters are going on pretty well, but there are some of the properties in the mountains of that parish on which the manufacture of sugar cannot be carried on with profit adequate to the outlay of money and trouble attendant on the cultivation and on the difficulties and expenses of the embarguidiar. It is well known that, during slavery and apprenticeship, the debts due on many properties mortgaged to English merchants accumulated annually. This, although detrimental to the interest of the *proprietor*, was not so to the *merchant*. It secured to him, at an *annual loss* to the proprietor, freight for his ships, interest for his money, commissions for his trouble, and the monopoly of the estate's supplies. It was, therefore, the interest of the *merchant* to keep up the cultivation of poor and badly situated properties, though they were profitless in every respect to the absent proprietor. Now, I fancy, matters will be different. The debts of the proprietor, instead of having diminished on their first amount, having accumulated to a greater sum than the estate is worth, the property will likely be sold, and another staple resorted to, maintaining a proper relation between expenditure and profit.

We will suppose that there is one-fourth less of the population at work in producing and manufacturing the staple productions, than under the slavery or apprenticeship systems. It is well known that, to prove the impossibility of successful agriculture, persons pointed to the diminution of field-labourers immediately subsequent to the 1st of August. A sufficient period of time has elapsed since the termination of the apprenticeship to prove the fallacy of such opinion or assertions. In the first place, no comparison can be drawn between the exertions of a slave and a free man, between compulsory and voluntary labour. It has happily been even already shown that the great stimulus to exertion is self-interest, that money is

Digitized by Google

found to be a far more powerful excitement to industry than any which has yet been had recourse to. If it is therefore proved that the result of the money stimulus has been extra exertion, it necessarily follows that fewer persons are required to carry on, under the voluntary system, cultivation to the same extent as that carried on under the compulsory."

We may close this department of the subject with the following extract from the report of Mr Lyon, July 31:—"At this period last year, while the result of free labour was a speculative matter, calculations were published by various parties on the probable expense and profit of sugar cultivation by free labour. In nearly all the data, it was presumed that no profit would be realised by those estates which made less than eighty hogsheads. The amount for contingencies inseparable from such manufacturing establishments, was computed to be nearly as great on these small estates as on larger ones. The experience of this crop has, however, shown that apprehension to have been delusory, as I have had opportunities of learning that where less than even eighty hogsheads have been made, a very considerable income has been realised. One estate in this parish, making seventy-five hogsheads, with a proportionate quantity of rum, has netted L.1000 sterling.

The capability of successfully cultivating the staples of the colony, under a free system, with judicious and economical management, having been proved by the experience of the past year, it will in future be requisite to observe and report upon the proper application of labour, and the judgment exhibited in the culture of lands, as a necessary prudence on the part of managers to ensure a permanent succession of prosperous harvests, and their own estimate of the prospects of interest which the future will realise for all existing investments of capital in colonial agriculture."

We are glad to turn to a line of evidence which, while generally testifying to the growing prosperity of Jamaica, throws much cheering light on the social progress of the peasantry. We believe we shall best please our readers by copying the extracts from the magistrates' reports from beginning to end, as they appear in the work before us:—

"The free children are, in the towns, usually sent to school; but, on the estates, the too general aversion of the managers to all steps taken to enlighten the minds or to ameliorate the condition of the peasantry, has led them to resist the establishment of schools on the properties under their charge. Hence, I regret to say, the negro villages too often abound in children fast approaching to puberty, who wander about in a state of nudity, untaught to do anything for themselves or others.

Every denomination of sectarians in the island, with the exception of Presbyterians and Independents, has a place of worship in Spanish Town. There are also various schools for the education of youth. That of the Rev. James M. Phillipps, the Baptist minister, is by far the best conducted and the most numerously attended."—(E. D. Baynes, Sept. 20, 1838.)

"The good effects of compensated labour are every day becoming more apparent. During the apprenticeship, a constant source of complaint was, that the young children were kept in ignorance and in idleness. The effect of a free system is clearly discernible on this point. There are in this parish twelve schools. These have become crowded with the children of such of the labourers as are able to keep them clean and spare their labour; and it is now no uncommon thing to see a mother, whose means are less, with her four or five children, busily employed in picking coffee from morning to night, to raise the funds to support and clothe, and, at intervals, to send them to school. It may not be improper here to mention, that the desire for religious instruction increases daily. There are in this parish thirteen places of worship, with full congregations."—(Grant, Nov. 20, 1838.)

"Several candid proprietors have lately informed me that they find their produce, in all its stages, far more secure than formerly.

The superior character and behaviour of instructed negroes is forcing from some, who have heretofore given the institutions of religion but little countenance, the value and importance of 'such safeguards,' especially, they say, 'in the present very peculiar and critical state of the island.'"—(Daughtry, Jan. 1, 1839.)

"The church and schools are crowded, and the greatest desire for religious and other instruction is evinced by the entire population. They never think it too late to learn; and it is curious sometimes to see a man about forty years of age or upwards learning his letters, or spelling words of two and three syllables. The number of marriages and baptisms increases daily. There is a great change in the apparel of the mass of the peasantry; and in their general demeanour they are most respectful."—(Grant, March 18, 1839.)

"The peasantry continue not only most anxious for the increase of religious and educational impulses, but bear all the burdens of instruction with cheerfulness; in proof of which, I beg leave to state to his excellency the governor the intention of those in this district under the pastoral care of the Rev. Mr Rowden, Wesleyan minister at Bath, who have agreed voluntarily to erect a new church at their own exclusive cost, and mean to convert the old chapel into a school for the education of the rising generation."—(Pryce, March 31, 1839.)

"The moral conduct of the labouring population warrants the highest commendation. Some months past, a great portion of them evinced a marked desire for religious instruction; and with a view of gratifying them in so desirable and praiseworthy an object, I applied to the Wesleyan body for one of their ministers to attend at my residence every Sabbath, which was readily acceded to; and it affords me infinite pleasure in stating that, within the last three weeks, from 100 to 150 congregate weekly: their demeanour on such occasions reflects the highest credit on them. District perfectly tranquil."—(Hamilton, June 8, 1839.)

"It is to be lamented that schools are not more numerous in this parish. There is one on this estate (Morland), and it is astonishing how far the children are advanced; some of the children, not more than four and five years of age, are able to read and spell very correctly."—(Mahon, June 12, 1839.)

"I have been present at some of their meetings, in which the warmest demonstration of loyalty to the crown, of esteem and affection for his excellency the governor, were manifested, and of their determination to obey the laws. Their meritorious conduct, I am of opinion, in a great measure is chiefly owing to the progress of education and moral influence. I have attended at the examination of one or two schools under the management of the Baptist missionaries, and have been much pleased at seeing such a vast number of children so far advanced in substantial education, and so well instructed in moral and religious duties. There are upwards of 2000 children receiving daily and weekly instruction under the superintendence of the missionaries in this parish."—(Kelly.)

In closing the present paper, we think little need be said respecting these most gratifying evidences of social advancement in the peasantry of Jamaica. Both from the official volume before us, and other testimony, we feel quite assured of the fact, that, for negroes and planters alike, the change from slavery to freedom has been highly advantageous, and its prospective benefits are unspeakable. Let it, however, be clearly understood by both parties, that it will be absolutely necessary for them to compete on a fair commercial principle only with the producers of sugar in other quarters of the world. At present the West Indies have next to a monopoly for the sale of their sugars in this country; and, as was lately shown by us, we are absolutely giving them a shilling for what can be got for sixpence elsewhere; or, to state it according to the aggregate amount of loss, the United Kingdom is paying L.5,000,000 annually, over and above the market price of sugar in other countries—all to sustain the West India interest. This is a thing so intolerable, and presses so heavily on the people of Britain, that it cannot be of much longer continuance. The West India proprietors and labourers must learn to compete in the sugar market by means of improved machinery, skill, and industry, and there is no doubt that, by these agencies alone, they will in a short time be able even to undersell the slave-owners of less favoured countries.

THE BARNACLE, OR TREE-GOOSE.

Till within the last hundred and fifty or two hundred years, there scarcely seems to have been a glimmering of common sense on any matter of natural history. There was little investigation into the actual truth of alleged facts, and to doubt popular opinion was never thought of even by the learned. Many of the notions current in those days on the subject of animal life, were exceedingly fanciful. It was supposed that bees could be generated from putrid substances; that young snakes could be raised like plants, by sowing crumbs of pounded old snakes in the ground, and occasionally watering them; that cats could see in the dark; that the eels which prevail in the marshes of Ely, in Cambridgeshire, were first planted there in consequence of the wives and children of certain recusant priests in the district being miraculously transformed into these animals; and that a particular species of geese, or barnacles, grew in shells depending from trees within reach of the tides. It has only been since men learned to reason from well ascertained facts, and not from random and traditional hear-say, that these and many other equally ridiculous chimeras have lost their hold on popular credulity. The rigid investigations of science put all such notions to flight.

The particulars of the barnacle or tree-goose delusion are worthy of noting. One of the most remarkable accounts, as well as one of the earliest and weightiest, respecting the barnacle, is that prefixed to Bellenden's Translation of Boece's Chronicles of Scotland, from which the following is an extract, with the language slightly modernised. "Next, to speak of the geese generated of the sea, named *clakis* (the old Scottish name for the barnacle). Some men believis that these clakis grow on trees by the nebs. But thair opinion is vane." From this notion entertained of it, the barnacle still bears the common name of the tree-goose. It was imagined that the young birds dropped into the water from the trees. "Howbeit these geese (continues the old writer) are bred mony sundry wayis, they are bred aye originally by nature of the seas. For all trees that are cast in the seas, in process of time appearis first worm-eaten, and in the small bores and holes thairof grows small worms. First, they show thair head and feet, and, last of all, they show thair plumis and winges. Finally, when they are comin to the just measure and quantity of geese, they flie in the air, as other fowlis do, as was notably proven in the year of God ane thousand four hundred and eighty, in sight of many people, beside the Castle of Pitaligo, when ane great tree was brocht by allusion and flux of the sea to land. This wonderful tree was brocht to the laird of the ground, who soon after gart divide it by ane saw. Appeared then ane multitude of worms, throwing themselves out of sundry holes and bores of this tree. Some of them were rude as they were but new shapin. Some had baith head, feet, and winges, but they had nae featheris. Some of them were perfect shapen fowlis." The writer then proceeds to mention other similar cases, and particularly that of the ship Christopher of Leith, the timber of which, when broken up, showed all the holes "full of geese." But the old scribe has also to produce a "notable example shawn afore our awn een." Being in the Western Isles, a companion of the writer chanced to lift from the sea-side "ane tangle hingan full of shells," and was astonished, on opening one, to find in it "na fish, but ane perfect shapen fowle. This clerk, knowing us right desirous of sic uncouth things, cam hastily with the said tangle, and openit it to us with all circumstances afore rehearsit." It is further explained, that it was from seeing "fruits that fell off the trees converted in a short time into geese," that some persons "believed thir geese to grow upon the trees;" a mistake altogether (says the writer), since it is a sea-worm, which eats into the fruit, that "grows into a goose."

Were this statement found in some single author, we might pass it by as a ridiculous mistake, or wilful falsehood, undeserving of notice. But the most learned writers of Europe, from the fifteenth to the eighteenth centuries, repeat the story, as for example, Gerard (in his Herbal), Saxo-Grammaticus, Arnoldus, and others of equal authority. It becomes, therefore, a curious question, to determine how the error arose, particularly as many writers aver having seen the strange birds alluded to. Gerard states, that what "his eyes have seen, and his hands touched, he shall declare." He then mentions a small isle on the coast of Lancashire, in which is found, on pieces of old timber, a "certain spume or froth, which in time breedeth into certain shells," like those of the muscle; and out of these shells, in due time, "come the legs of a bird hanging out, and as it groweth greater, it openeth the shell by degrees, till at length it is all come forth, and hangeth only by the bill; in short space after it cometh to full maturity, and falleth into the sea, where it gathereth feathers, and groweth to a fowl bigger than a mallard and lesser than a goose." This bird is spotted, he says, something like a magpie, and is sometimes called by the people a pie-annet, and sometimes a tree-goose. So far Gerard speaks apparently from report, but he also states that he himself found, near Dover, a shell, slightly different from the preceding, but with similar contents. He broke several, and found in some living things without shape, and "in others (says he), which were nearer come to perfection, I found living things that were very naked, in shape like a bird; in others the birds were covered with soft down, the shell half open, and the bird ready to fall out, which no doubt were the fowls called barnacles."

Another respectable eye-witness on this subject was Sir Robert Murray, a member of the privy-council of Scotland, and a member of the Royal Society at its first institution, who published in 1678 a narrative of what he saw on a visit to the Hebrides. In the "isle of East" (Uist) Sir Robert saw a dried log on the shore, with a multitude of little shells sticking to it, "having within them birds perfectly shaped, supposed to be barnacles. This bird, in every shell that I opened, I found so curiously and completely formed, that there appeared nothing wanting as to the external parts for making up a perfect sea-fowl. The little bill like that of a goose, the eyes marked, the head, neck, breast, wings, tail and feet formed; the feathers every where perfectly shaped, and blackish-coloured; and the feet like those of other water-fowl, to my best remembrance."

It is unnecessary to quote further authorities to show the prevalence of the belief that the barnacle-goose was produced, not after the fashion of its kind, but from a tree, like a ripe apple; or was brought to light by spontaneous generation, from the scum of the sea, or in a muscle shell. Perhaps the most striking proof of the universality of this notion is given by a decision of the Sorbonne in Paris—a body comprising the most learned men of France. These gentlemen adroitly took advantage of the admittedly wonderful origin of the barnacle-goose to give themselves and all true believers a good additional dish for lent. They declared that these geese were no longer to be considered as *birds*, and that therefore their flesh might with perfect propriety be eaten at all fasting seasons. This was a capital practical inference, extracted from a popular fallacy; for such it proved to be, as may readily be imagined. It is worthy of notice, that the translator of Boece, as well as Gerard and Sir Robert Murray, all of whom imagined themselves to have got ocular proof upon the subject, can only positively assert that they saw something in a shell no bigger than a muscle's, of the *shape and appearance of a small bird*, but cannot give the authority of their own eyesight for the conversion of these into actual full-grown birds. Nor did they see any of them in the transition state. "I never (says Sir R. Murray) saw any of the little birds alive, nor met with any body that did. Only, some

Digitized by Google

credible persons have assured me that they have seen some as big as their fist."

The venerable author of the History of Norway, Bishop Pontoppidan, who, from his having fallen into some little errors respecting krakens and sea-serpents, has long been unjustly stigmatised as a greedy swallower of the marvellous, is the first to show us by what a trifling circumstance the preceding writers, and the doctors of the Sorbonne, had been led to the conclusion that nature had departed from her ordinary course in the case of the barnacle. Speaking of the shell, the bishop says, "This peculiar creature is of about a finger's length and a half, and an inch broad, and pretty thick." It consists of two parts, the bishop tells us, the one end being composed of a soft, spongy, brown substance, attached by a hollow neck to the timber on which it usually is found, and the other end covered by a shell of two plates, smaller in size than a mussel shell. "When this shell is opened," continues the Norwegian prelate, "there is found in it the little creature reported to be a young wild-goose. Almost its whole substance, which is composed of small toughish membranes, represents some little crooked dark feathers, squeezed together, their ends running in a cluster; hence it has been supposed to be of the bird kind. At the extremity of the neck, also, there is something that looks like an extremely small bird's head; but one must take the *force of imagination* to help to make it look so; this I have constantly found on many examinations; and, in all mine inquiries, I cannot learn that any one has *ever seen any thing more*."

This is a case very like that of the three black crows. The shelled creature which yielded a lent goose for the doctors of the Sorbonne, that was neither flesh nor fowl, proves to be nothing but a part of a sea-insect of the molluscous order, and the whole foundation for the fallacy rested on such a resemblance to a feathered creature as it required a stretch of the imagination to discern. Yet sensible and learned men, going to look for the thing with the fallacy ready prepared in their heads, found no difficulty in coming to the conclusion that a marine insect was a young goose. Of the vast superstructure of writing and speculation raised upon this insignificant basis, we have given the reader a very slight outline; but more upon such a subject would be tedious. We shall quote only one other notable passage. It is from a whimsical work, entitled Franck's Northern Memoirs. Speaking of the Orkneys, the writer saith, "Now that barnicles, which are a sort of *wooden geese* (!), breed hereabouts, is *past dispute;* and that they fall off from the limbs and members of the fir-tree is *questionless;* and those so fortunate as to espouse the ocean or a river, by virtue of the solar heat, are destinated to live; but all others, so unfortunate as to fall upon dry land, are denied their nativity."

The molluscous animals, or class of animals, which gave rise to all this nonsense, are well known at the present day, being termed *cirripedes*, and having a strong analogy to *cuttle-fish*. The barnacle, or bernicle, is a well-known species of the goose tribe. The *anser leucopsis*, or common barnacle, has a white forehead and throat, and is abundant on the western coasts of Britain.

ABBOTSFORD.

More than one description of Abbotsford has appeared; but there is none in which it is described quite faithfully, or with the minuteness which it peculiarly calls for. I shall endeavour to supply the desideratum, to the best of my ability, and as far as a pretty careful study of the place will allow me.

The house is situated in a northern angle of Roxburghshire, at about thirty-four or thirty-five miles from Edinburgh, and a somewhat less distance from the English border, near the road southwards by Carlisle. The very laudatory style in which it has been described, usually misleads those who have not seen it, and therefore its first appearance is almost certain to be disappointing. The edifice, which is of a whitish sandstone, occupies a singularly inconvenient site on the face of a rather steep hill, which slopes in a north-westerly direction to the Tweed at its base, and forms one side of a narrow and by no means romantic vale. The front of the house is to the hill, and is almost close upon a public road, which winds along from Selkirk to Melrose, thus leaving a very circumscribed piece of ornamental ground for an approach; while the rear of the structure, so far as not shrouded by a rising plantation, has an outlook towards the valley beyond. The position is, in fact, an error, much of which is doubtless attributable to the way in which the mansion was erected, no great edifice having been originally contemplated, and every effort after the first being a struggle with unfavourable circumstances. The contriver of the place was also, no doubt, under a limitation which may be supposed to have only been *affected* by the Earl of Dunfermline (a great Scotch lawyer of two hundred years ago), when he caused to be inscribed on his very handsome house of Pinkie, that he built it "according to the measure, not of his mind, but his fortune" [*non ad animi, sed agelli, modum*]. When one sees Abbotsford, he becomes convinced that Scott did not build like a man possessing sufficient wealth to carry out his wishes.

Such as the house is, its best, or almost only good appearance, is from the opposite side of the vale, as we approach it by the road between Edinburgh and Selkirk. There the turreted outline, seen over the trees, is somewhat interesting. The approach on the other side is much less so. We find here only a common gateway, and no porter's lodge, the exterior aspect thus conveying an air of poverty, such as usually attaches to things belonging to men who aim at more than their fortune justifies, and have to pinch and spare on some articles, generally those of comfort. The mansion itself is externally a sad piece of patch-work—a small house extended into a large one, with miniature towers and battlements, and stuck over every here and there with carved stones, the fragments of other buildings, which have no business there, and degrade it to something of the character of a rockery or a made ruin, all taste having been sacrificed for the sake of preserving a quantity of detached antiquities. Amongst these uncouth objects, is a doorway half way up the building, without approach, and leading to nothing—but then it belonged to some old house of note: another is a plain old *headstone*, ravaged away from a neighbouring village churchyard, where it once recorded the virtues of a deceased shoemaker. Such things, it will readily be owned, are unfitted to appear on any part of the external walls of a gentleman's country house. The notion which they give of what we may call the domestic taste of Scott, is very startling, and far from pleasing.

To come now to detail. A court before the house has the garden on the east, and is encircled on the other two sides by a wall, adorned internally by a trellised arbour covered with creepers. In niches of this wall we find numerous carved medallions from the old Cross of Edinburgh, and Roman heads in bas-relief from the ancient station of Petreia, now called Penrith. The garden is separated from the court by a very handsome colonnade, the arches of which are filled up with cast-iron net-work, and the cornice carved with flowers, after the fashion of one on the cloisters of Melrose. The floor of the court is partly gravelled and partly grass-plotted, and presents two objects of interest, one on each side of the main door of the house. On the western side is to be seen a fine old stone fountain, the same which once had its station on the Cross of Edinburgh, and often played with wine at the entries of the sovereigns of Scotland in the days of old; while on the east side lies the effigy of Sir Walter's famous stag-hound, Maida, with the following inscription on the pedestal:—

> Maidæ marmoreæ dormis sub imagine Maida
> Ad januam domini: sit tibi terra levis.

This Englished by Sir Walter:—

> Beneath the sculptured form which late you wore,
> Sleep soundly, Maida, at your master's door.

An error in the Latin inscription, the first syllable of "januam" being a wrong quantity, attracted attention, and made some noise in the world a number of years ago. Mr Lockhart was the writer of the lines, but Sir Walter generously took the blame of the slip upon himself.

We must not forget that, outside the handsome arched gateway of the court, is to be seen a pair of *jougs*, brought from Thrieve Castle in Galloway, a seat of the Douglasses. These jougs are simply two semicircles of iron, which formed a species of stocks for the neck in old times, offenders being pinned up by them to a wall, in a way that must have been very uncomfortable indeed. Over a side-door, outside the gateway, may also be seen the sculptured countenance of honest Tom Purdie, Scott's favourite henchman, with the inscription, "Lord resave my sprit," upon an antique stone below.

The house itself comprehends the original cottage of small dimensions in which Washington Irving found Scott living so contentedly in 1817, and, towards the east, the addition of larger bulk which he made in 1821-2, when he conceived himself to be in the way of accumulating an ample fortune. It is chiefly in the principal floor of this additional part that any elegance is found. To begin with the beginning—the hall-door is sheltered by a projected porch in the form of an arch, copied from one in Linlithgow Palace. A pair of huge stag-horns are suspended under it, and branch out above the head of the visiter as he passes into the entrance-hall, a large and lofty apartment about forty feet long by half that breadth. The effect of this room is grand and impressive. Two windows admit the light from the court, and these are high and ample, but at the same time so completely covered with a variety of painted devices, that the hall is filled with a sort of rich and red twilight even at noon-day. Sir Walter called these windows his *Bellenden* ones, a phrase derived from the old war-cry of Buccleuch, and rendered applicable by their containing the heraldic blazonries of the "four great dignitaries" of the clan of Scott, namely, Lords Buccleuch, Montague, Polwarth, and Napier. The lower compartments of each window contain the shields of eight gentlemen of the same name, "of whom (says Sir Walter) I can muster sixteen bearing separate coats of arms. There is a little conceit in all this (he continues), but I have long got beyond the terror of 'Lord, what will all the people say, Mr Mayor, Mr Mayor?' and so I will have my Bellenden windows." The floor of the entrance-hall is of black and white Hebridean marble wrought in lozenge form, and the side walls are coated, to the height of seven feet, with a beautifully carved panelling of dark oak from the old kirk of Dunfermline. The roof is of stucco-work in imitation of the wainscoting, and comprehends a series of arches with dependent points, after the fashion of the ceilings of Melrose Abbey. Betwixt each arch is a shield, and the central part of the roof is occupied in this manner with the armorial bearings of Sir Walter Scott's paternal and maternal ancestors, sixteen in number, being the complete quarterings of a man of "gentle blood." Three shields, on the maternal side, are blanks, and painted over with blue clouds, the poet being unable to trace his pedigree in that line to the full length of his spaces. "Nox—alta—premit" ("oblivion has covered them") forms the appropriate inscription on these blank shields. Two other rows of escutcheons run along the sides of the roof, and present the heraldic distinctions of the families of Maxwell, Douglas, Johnstone, Kerr, Elliott, and others, whose names are set down in their proper places in deep red letters, having, on the whole, a fine and striking effect. An inscription running parallel with them tells you, in black-letter type and phraseology, that "These be ye coat armouris of ye clannis and chief menne of name, quha keepit ye marches of Scotland in ye dayes of auld. Trewe war they in their tyme, and in their defense God thaim defendyt."

The hall, thus wallod and windowed, contains a rich assortment of curiosities in the shape of cuirasses and suits of armour, helmets, shields, swords, lances, and other arms of all sorts and ages, flags, camp-kettles, cannon-balls, and numberless other articles, all of them interesting from antiquity or associations. Two prominent objects among these are a pair of erect figures in complete armour at the east end of the room. One of them presents a knight in full panoply, the suit, formed of large plates of shining steel, being a copy from one in the Tower of London, of the age of one of the last Henrys of England. A lance about twelve feet long is held by this figure, and also a sword, which last is a very curious relic. It is straight, narrow, and dark-coloured, having a very plain appearance until you examine it closely, when you find that it has once been the weapon of a king, and not unworthy of a king. The initials of Henry VIII. are upon it, and on the lower half is engraven a complete calendar of the days of the year. This has been a work evidently of immense labour, though one cannot see any great use in such a steel register. The other figure in armour is clad with pieces of various ages, and holds a most enormous two-handed sword, nearly the length of a man, which was got on Bosworth field. Such a weapon the Swiss are said to have used in fight, and certainly it would require a mountaineer of no common strength to wield it with effect.

On the side walls of the hall the visiter may behold two broken body-suits of Milanese chain-armour, composed of fine linked rings, of the kind that Cromwell is said to have worn under his dress. Two brightly-polished cuirasses, once borne on the breasts of Napoleon's cuirassiers, and a pair of beautiful French flags, form also conspicuous objects, being memorials of the field of Waterloo. Of the numerous moss-trooper helmets, executioners' swords, and the like, which cover the walls, it is unnecessary to speak in detail. Two cannon-balls from Flodden, the keys of the old Edinburgh Tolbooth, and Ralph Erskine's pulpit made into two small side tables, are the only other articles of interest which we shall specify. The relics of Flodden will bring to mind the unhappy time when the Flowers of the Forest "were a' wede away;" and the visiter may expect to be told, on looking at the Tolbooth keys, that these are the very articles which shut out from the light of day the erring but beauteous Effie Deans. Few will behold the relics of the old kirk of Dunfermline without remembering with interest the bold and famous dissentient by whose voice their substance has so often been thrilled, and whom a great party in our country reverence as their first guide and teacher. A memorial of a very different man is also here, and should not be overlooked. In the hall chimney, which is a beautiful model of one of the cloister-arches of Melrose, stands a massive grate, "which once belonged (to use Sir Walter's own words) to the old persecutor Bishop Sharpe, who was murdered on Magus Moor." Take it all in all, one must admit that Sir Walter did not deceive himself when, in the pride of his heart, he described to Terry his preparations for its embellishment, and exclaimed, "It will be a superb entrance gallery!" It is indeed so in every respect. Continuous with it on the east or north-east, we find first a sort of passage-closet, and then the writing-room or study of the poet—in short, the Lion's own den. The closet contains two notable objects, being figures in complete armour of Asiatic origin, the one a yellow Burmese suit of thick quilted stuff, and the other a beautiful suit of chain-armour, taken from the body of one of Tippoo Saib's body-guards at the capture of Seringapatam. The study is a small room, of some twenty or twenty-five feet square, furnished with books from ceiling to floor, and provided with a gallery, to render the higher shelves accessible. By a door into the upper part of this gallery, Sir Walter could come quietly from his bed-room to his work in the morning, and thus derived some help, no doubt,

Digitized by Google

in preserving his literary secret. Over the gallery railing are hung several skins of lions and "bearded pards," presents from Indian admirers. The furniture of the room is scanty, two chairs and a plain writing desk being nearly the extent of it. These, however, are remarkable articles. One of the chairs, a leathern arm one, is that in which Scott himself daily sat while "imping" so many "feathers on the wings of fame." The pen lies on the writing desk as he left it. The other chair is one of dark brown oak, made after an antique model in Hamilton Palace, and "covered with carved work representing rocks, heather, and thistles, emblematic of Scotland, and indented with brass, representing the Harp of the North, surrounded with laurels, targets, claymores, &c. The seat is covered with silk velvet." Mr Joseph Train, supervisor of excise, whose words have been here quoted, presented this chair to Sir Walter Scott. The following inscription, which is graven on a brass plate on the upright front of the chair, will tell what are the associations which render this article interesting. "THIS CHAIR, made of the only remaining wood of the house at ROBROYSTON, in which the matchless Sir William Wallace was 'done to death by felon hand, for guarding well his native land,' is most respectfully presented to Sir Walter Scott, as a small token of gratitude, by his devoted servant, Joseph Train." Robroyston, near Kirkintilloch, was the house in which Wallace was seized when betrayed by the false Monteith.

In the eastern angle of the study, a small low door leads to a closet seven feet high, looking out on the garden, and having the purposed character of an ancient oratory, which is finely sustained by the painted glass of the window. In this closet we find most affecting memorials of the poet. His walking-stick, his woodman's axe, his yeomanry dress and accoutrements, are hung upon the walls, and in a glass-case (which was found necessary to protect them from the over-ardent devotion of pilgrims) lie the last articles of attire which Sir Walter wore, consisting of a green country-coat with metal buttons, striped vest, and plaided trousers. His thick shoes and hat are likewise here, as well as his Celtic-Club uniform. These personal mementos of the poet rank among the most attractive objects in the building, and the nook in which they are kept corresponds well with the emotions which they are fitted to excite.

The other rooms of interest in Abbotsford lie on the side of the building looking to the water. Four rooms compose the suite, the dining-room on the west, followed towards the east by the armoury, drawing-room, and library, in succession. Passing towards the dining-room by the west end of the entrance-hall, the visiter traverses a part of the armoury (which runs across the house), and a small room, in which are miniatures and plate-likenesses of Lord Jeffrey, Professor Wilson, Sir A. Ferguson, Lord Kinedder, Prince Charles Stuart, Mrs Lockhart, Miss Anne Scott, and a few other persons. The dining-room is not large, but handsome in appearance, having a ceiling and furniture chiefly of oak (or an imitation of it), and one ample bow-window to admit the light. The walls are crowded with paintings, among which one of the trunkless and bleeding head of Queen Mary of Scotland, said to have been taken by Amyas Canrood on the morning after her decapitation, has an especial interest attached to it, as well on account of the celebrity of the subject, as from the doubts entertained regarding the existence of other authentic portraits of this unfortunate princess. Of the authenticity of the present beautiful painting, Sir Walter is said to have satisfied himself by inquiry, as far as that was possible. The face of Mary has the pallor of death upon it, but is at the same time wonderfully regular in contour, and gives us a perfect idea of the early beauties of the victim of Elizabeth. Portraits of Charles XII., of Fairfax the parliamentary general (on horseback), of Oliver Cromwell, of Sir Walter Raleigh, of Thomson the poet, of James Duke of Monmouth and (a beautiful oval of) his wife Anne, Duchess of Buccleugh, of Nell Gwynn, of Henrietta Maria and her husband Charles I., and of Anne Hyde, Duchess of York, are among the most prominent of the other oil paintings of the dining-room, some of them being large half-lengths, and others small-sized full-lengths. The fact of Sir Walter having placed them in his collection, not to speak of their intrinsic merits, argues much for the authenticity of all these pieces, as he was careful in inquiring into the origin of every one of his curiosities. He received the most of them, besides, as presents from very high sources. A portrait of his own great-grandfather also deserves notice. This individual was named Beardie from his having left his beard untrimmed after the execution of Charles I., and we see him here, accordingly, distinguished by

> "His amber beard, and flaxen hair,
> And reverend apostolic air."—*Marmion.*

Of two fine miniatures on the walls of Scott's dining-room, one gives us a spirited and characteristic likeness of Allan Ramsay, and the other of Claverhouse. This last painting exhibits a countenance of uncommon grace and beauty, corresponding less, assuredly, with the ferocious attributes ascribed to the man by the Covenanters, than with the chivalrous characteristics given to him in Old Mortality. A miniature of James Ballantyne appears also among the pictures already enumerated.

It would be unpardonable, in this glance at the pictures of Abbotsford, to pass over the chalk sketches of Charles Kirkpatrick Sharpe, productions held in very high estimation by the late owner. The most noticeable of these is a clever and amusing fancy drawing of "Queen Elizabeth dancing disposedly" before Sir James Melvil, the Scottish ambassador. To speak the truth, however, this sketch treats the English queen very unfairly. Elizabeth, at the time of the incident, which is an historical one, was little more than thirty years of age, and, upon the whole, a comely and personable woman, to whom music and dancing were not unsuitable amusements. The long, sharp nose, therefore, the pinched, wrinkled features, and the bony, scraggy figure, which we observe in the drawing, may make a very fit object of laughter, but form no fair representation of Elizabeth of England, as she was when she chose to go through her steps before Sir James Melvil. However, the sketch is certainly an admirable one in point of execution, and of conception also, if we could only suppose the incident taking place at a later period. The same ingenious gentleman presented two or three other sketches of a similar order to Sir Walter, illustrating the famous border incidents of Harden's marriage with Muckle-mou'd Meg of Elibank, the feast of the Spurs, and another similar scene. They are all amusing.

We have mentioned the dining-room as the most westerly of the four main apartments composing the ground floor of Abbotsford, on the side of the Tweed. But we ought not to have forgotten the existence beyond of a small breakfast parlour, which we shall take leave to describe in the words of Mr Lake, an American visiter to Abbotsford. "It looks to the Tweed on one side, and towards Yarrow and Ettrick on the other; a cheerful room, the walls being thickly covered with valuable and beautiful water-colour drawings, chiefly by Turner and Thomson of Duddingstone—the designs, in short, for the magnificent work entitled the 'Provincial Antiquities of Scotland.' There is one very grand oil-painting over the chimney-piece, of Fast Castle, by Thomson, alias the Wolf's Crag of the Bride of Lammermoor, one of the most majestic and melancholy sea-pieces I ever saw; and some large black-and-white drawings of the Vision of Don Roderick, by Sir James Stewart of Allanbank, are at one end of the parlour. The room contains some queer cabinets and boxes, and in a niche there is a bust of old Henry Mackenzie, by Joseph of Edinburgh." This description, though written a number of years ago, is still applicable.

We now arrive, in the course of our jottings on Abbotsford, at the armoury, an apartment so-called on the eastern side of the dining-room. But the remainder of this subject must be left over for another paper.

FARCICAL CEREMONIES AT THE HAIHUNGA IN NEW ZEALAND.

THE haihunga is a religious ceremony of the New Zealanders, designed to commemorate the actions of illustrious chiefs, and generally performed a year after the death of such chiefs, whose bones are on this occasion disinterred, cleaned, and then exposed to public view on a raised scaffold. Formerly, before the people had enjoyed the benefits of European intercourse, a great number of slaves and wives belonging to the deceased were sacrificed at the haihunga; but this is now given up, and the ceremony itself would probably have been abandoned ere now, but for the banquet and fair with which it is accompanied. Mr Polack, author of a late work on New Zealand,* attended many of these festivals, and in his work he gives the following amusing account of one of them—that of a much-esteemed warrior named Ti Koki:—

"Some native chiefs in our employment, who belonged to the tribe giving the feast, invited and accompanied us. Taking advantage of the flood tide, we rowed to the river *Káuákáua*, until it contracted so much in breadth, that we were obliged to make use of paddles; about a mile farther, the stream became too shallow for the boat, when the natives, who had decked themselves in European duck frocks and trousers, stripped themselves of the latter, which they left inside the boat, manually propelling it, thus lightened, for the distance of a quarter of a mile; we were then obliged to land. Previously to proceeding to the village where the festival was to be held, distant about half a mile, the natives stayed to arrange their painting and dressing. The gentlemen arranged the hair of each other; and being all sons of chiefs, placed with the *goát* of connoisseurs the plucked feathers of the albatross (*uianui*), gannet (*tára*), and other sea-fowl, in various parts. Red paint (*kokowai*), was much in requisition; a quantity of the mixture was arranged in a broken calabash, into which some of these antipodal exquisites dipped the entire head and face. One of them had painted one-half of his face longitudinally with this mixture, from the back of the head, forehead, downwards to his throat, the opposite half being rubricated with charcoal-dust, and the whole washed over with rancid shark-oil. The effect of the red and black joining in the centre, which was executed with much exactitude, so that each side of his nose wore a parti-colour, was ludicrous in the extreme. The purposes to which the European articles of dress were put were, to say the least, certainly foreign to the intention of the manufacturers in Glasgow, if they came from that emporium of industry, or of London, if 'town made.' One gentleman sported a black worsted stocking on one arm, and a white sock on the other; his nether man was encased in a pair of inexpressibles so arranged that the front buttoned up behind, leaving exposed to view an insertion in the seat, proving that the garments had not been repudiated too hastily by its original possessor. Another, whose sole article of dress was the apparition of a fashionable body coat, had encased his ample chest within it; but, though the perspiration streamed from every pore, this tight fit was buttoned, the wearer gasping for breath at each respiration he took; the rest of his person was in *puris naturalibus*. Another wore a shirt round his naked loins, as a pastry-cook would an apron, and round his throat a pair of duck trousers was tied in lieu of a handkerchief. Another party had put on a woman's gown, whereas his lady (for we had the dear sex with us) sported the trousers of her spouse—a circumstance that, from the natural turn of her temperament, was far from inappropriate. Some other articles of faded apparel, shrunk from the stature of their former possessors by continual ablution, completed the arrangements of the rest of this unique suite, who saw nothing inappropriate in their appearance, while, from its droll inconsistency, no European could refrain from laughter. The ladies had decorated their glossy ringlets with oil, and inserted the pretty flowers of the *kaikátoa* and *tawai* in their beautiful tresses, which hung down their backs in profusion. They made no use of the red earth. With the exception of the lady in trousers, they had dressed themselves in gowns and check shirts, over which were thrown their native garments, woven from the silken flax, which descended in ample folds to their feet.

On these preparations being completed, the gentlemen loaded their guns, whose locks and butts had been carefully burnished, and on arriving in the vicinity of the village, discharged them. On the report reaching the ears of the villagers, a number of them rushed forth to ascertain who the new comers were, and on learning that they were Europeans, a shout was raised, 'A white man! a white man!' (*Epákéha! Epákéha!*) This cry was reverberated a thousand times among the inmates of the village, who rushed forth, waving boughs of trees, garments, and discharging their ammunition, which was returned by our party. Between the village and the place where we stood, a broad rivulet irrigated the valley, at the brink of which a number of our hosts presented themselves, vociferously insisting on carrying us across on their shoulders. The claimants for this dubious honour became so numerous and unruly, that we had nearly fallen from the cropper of one of these steeds, but finally got a safe passage across, some attending supporters keeping us up behind, while each leg and foot was detained in the custody of two stout fellows who would not otherwise be contented. As we approached the village, a number of stout natives, wholly denuded of dress, rushed forward in a tumultuous manner to meet us, hallooing and roaring to the utmost extent of their well-practised lungs, a welcome (*airamai!*) The ladies also screeched in chorus a warm reception, and the dogs, those harbingers of joy and grief in a native village, with an instinct peculiarly refined, howled their welcome to the new-comers, whose particular notes they recognised with affectionate avidity.

On entering the village, a lane was formed of the immediate followers of the head chief, who sat on the ground with his back leaning against his hut, surrounded by a circle of venerable men, whose white flowing beards and grey heads attested the salubrity of the climate, and the fortune that had attended the tribe in escaping from the lures and violence of their enemies. E'Ruku, the chief, in conformity with the invariable custom of his people, sat in state to receive us, and though undistinguished by any peculiarity in dress from his attendants, his rank was easily recognised by the dignified bearing acquired by an habitual exercise of authority. After passing upon for a few seconds, the chief expressed his gratification at the visit paid to him. The old gentlemen around also expressed much satisfaction at the presence of the 'whity man,' whose presence was peculiarly agreeable, and whose tobacco was infinitely more so. This favourite narcotic was immediately requested by the attendant chiefs. We presented some to Ruku, who immediately gave a portion to each of his surrounding nobles, until, instead of the 'lion's share,' he retained not enough to satisfy an infant. The venerable fathers were aware of this; but, regarding us as the jackall on the occasion, and consequently provider for the lion, they very coolly pocketed (if a small pouch, three inches square, suspended by a greasy cord from the neck, deserves the term) their share, after priming their pipes for a present supply. Ruku, with some earnestness, regretted that he had wholly forgotten himself, but felt satisfied he had been enabled to supply his friends, even at the consequent loss he must individually feel. Aware that as long as any of this much-valued production remained in our possession, attempts would be made to procure it, we gave the chief all that remained, who, assured that no more was secreted behind, appropriated it to himself. We were afterwards introduced to the ladies of the several chiefs, whose nasal members we pressed with a vigour that

* Manners and Customs of the New Zealanders, with numerous cuts drawn on wood. By J. S. Polack, Esq. 2 vols. London: Madden and Co. 1840.

Digitized by Google

argued the respect felt towards the individual, and an assertion of the courtesy prescribed by the native *ton*. A glance at the company in this native carnival may not be deemed superfluous. The countenances of all the males were rubbed with red *kokowai*, which had been powdered fine and mixed with oil, whose fœtid effluvia made us glad to move to windward. Many had also enriched the crimson stains with broad bands of blue earth (*puruhawhiki*), that encircled the eyes like spectacles, a band across the nose serving to unite the colouring pigment. All present were decorated with feathers, some old chiefs having their heads resembling those unhappy wights who are tarred and feathered. Each of our retinue was presented to Ruku and the conscript fathers, who sat in conclave around him. Each presentation was accompanied by the pressing of noses (*e'ongi*) and expressions of 'Friend, welcome; how are you all?' &c. '*Ekoro airamai tenarihoko*,' in a whining tone, as if each were about to condole for the loss of their entire generation. The last who approached was a nephew to Ruku; they remained fast locked in mutual embrace, tears on both sides falling in plentiful effusion from their eyes and nose, so that I had much cause to congratulate myself on having already pressed the now indecorous proboscis of the chief. These requisite salutations being performed, the natives prepared for the dance of welcome, without which a guest would deem himself but indifferently received. All the males doffed their native garments, the villagers forming one party, and the visiters another. The males had purposely denuded themselves entirely. After pursuing each other like mad fellows for some time, interchanging blows, some of which were no jest, they separated from each other and hastily formed themselves into ranks, taking opposite places. This, from long practice, was immediately performed, when they rushed past each other to secure opposite places. In this melée various knock-down arguments, as such rough play has been termed, were used. The recipients appeared to return it in good earnest, with sticks, paddles, short spears, and whatever lay in their reach. After this had continued some time, each party returned to their places, not omitting, in this *dos à dos* movement, to give some sly hits to their opponents. The dance (*haka*) then commenced, amid the discharge of artillery. Each party formed an extended line of three ranks; the entire body of performers were mixed together, without reference to the rank they individually held in the community. The males were armed with muskets, which they brandished with much adroitness, so as to display the burnished stocks, on which much care had been expended. Those who were unable to procure this much-valued weapon, sported bayonets fixed to long spears, paddles, and even rail-fencing (*taiapa*). The females, single and married, widows and handmaids, added their efforts to this dance of welcome; but in order to give due effect and prepare for the exertion, they had stripped themselves to the waist, leaving themselves so far exposed to the gaze of their comrades, whose attention, be it said, was wholly confined to the dance. In the chant that accompanies a dance, proper time was kept, and admirably toned was the responsive chorus, whose effect must be heard to be appreciated, when issuing from the lips of a thousand performers, who, at the same moment, to give increased effect to the sound, accompany the voice with a clap performed by the flattened right hand on the left breast, the whole body of performers apparently actuated by one well-timed impulse. The implements in their hands are instantly brandished, accompanied by shouts, yelling, howling, 'long and loud,' that threaten hard to destroy the auricular organs of the audience. At the same time their countenances are distorted into every possible shape the muscles of the human face can admit of—a leader giving a new grimace, which is adopted instanter by all the performers, in the most exact unison, rolling the eyeballs to and fro in their sockets, so that at times the ball becomes almost inverted. This feat has the most diabolical appearance, when a stain of blue pigment encircles the orbit of vision. The long tresses of hair worn by both sexes, streaming loosely in the wind, and encircling countenances of a demoniacal cast, have an appearance that recalls to mind the Saxon traditions of our ancestors, or an army of Gorgons. The tongues of the performers were thrust out of their mouths, with an extension that rivalled the well-known chameleon, a feat accomplished by long habitual practice from early infancy. The whole effect gave an insight into the strong emotions these dances must produce in times of war, in raising the bravery of a party, and scaring an antagonist, as also heightening the implacable hatred the belligerents must feel towards each other. The opposite party returned the compliment in similar style, the old seigniors acquitting themselves as nimbly as their juniors. When the dance ceased, the lamentation (*tangi*) commenced, when this singular assemblage dissolved into tears, wailing and gnashing of teeth, with a promptitude equalled only by the transformations produced by the wand of Harlequin in a pantomime, or a ruthless enchanter in a fairy tale. The *tangi* on this occasion related solely to the loss of the deceased chief, and persons who had been gathered to their fathers during the year.

These lamentations extend to either sex. The method of performing it is by two persons sitting on the ground, when they press noses for some time together (at best an unpleasant coalition, but in cold seasons a perfect nuisance), and giving way to grief, by recalling to remembrance the virtues or endearing actions of the dead. With heads enclosed and hid within one garment, entwining each other, they burst forth simultaneously into a paroxysm of tears, giving vent to their absorbing grief by dismal moans and wailing. After this has continued some time, they join in a loud chant, interrupted by liquid streams issuing from the eyes and noses, commemorative of the past, the happiness that has vanished, and probable mishaps of the future. This Jeremiad is taken up by turns, groans are interchanged, and they work themselves up into great affliction.

This strange custom is not confined to apparent cause for grief; for to give an additional zest to the entertainment, sharp muscle-shells are made use of to excoriate the skin, and the consequence follows in streams of blood issuing from every part of the body, face, arms, breast, legs—no part having the preference of an escape from this brutal practice. Nor is this lamentation confined to such occasions; on any persons, known or related to each other, meeting after an absence of a few weeks, or on the illness of a friend or relative, the muscle-shell and the accompanying *tangi* are instantly put in requisition. So enamoured are these people of affliction, that the writer has been viewing a play (*takaro*) among the natives, when suddenly it has entered the afflicted head-piece of one of the performers to sit down to a *tangi*. The suitor for this display of misery has no sooner expressed his desire, than, with the vacillating habits of these people, the whole company, instantly squatting down on the ground, have commenced crying with 'might and main,' as if they were about to be deprived of existence now and hereafter. So copious is the effusion of blood and tears, that their scanty garments are soon saturated."

SONGS OF BERANGER.

SEVENTH ARTICLE.

THE translations from Beranger which have already appeared in this periodical, have been accompanied with a few remarks descriptive of the character and position in life of the poet; and his retirement from the busy world has also been referred to. In a letter to the Gascon bard, Jasmin, we find that retirement noticed by himself, in a style and tone of language which remind us in an interesting manner of Robert Burns, to whose independent spirit that of the great song-writer of France seems remarkably akin. The date of the letter is 1832. "You and others reproach me," says he to Jasmin, "with having been long silent. Obliged, in order to assure myself an independent existence, to sell my songs to the publishers, I also came under an engagement not to issue any new thing which might interfere with these purchased rights. I have, however, one other little collection of verses yet to give forth, and then will I take my final leave of the public. I am advanced in life, and am weary of the great world. My petty mission is fulfilled, and mankind have had enough of me. I must prepare for my retreat—'adjust my mantle, ere I fall.' Without the necessity of living, I would have broken silence more seldom; but as it is, the world may pardon some quiet months to a man who has never asked anything from his country, nor desired aught from power, and who at this hour has no wish, save for a morsel of bread and repose."

When the allies were last in France, Beranger conceived and produced a *Chant du Cosaque*, or "Song of Triumph for the Cossack," which could not greatly increase the content of the French at the presence, in their country, of an invading and conquering army—circumstances calculated to please no people of spirit. Our version may give an idea of the spirit of this chant, though not of its polish:—

THE SONG OF THE COSSACK.

Come, friend of the Cossack! bright courser, come forth,
And bound to the sound of the trump of the north!
For pillage still ready, and fearless of scathe,
Spring under me, steed, and lend pinions to death!
No gold there may be on thy saddle or bit,
But patience!—such prizes shall come to thee yet;
Thou faithful one, neigh, then, in haughtiest tones,
And prance with thy hoofs upon nations and thrones!

Peace, flying, to thee hath abandon'd the day;
The bulwarks of Europe are rent and away!
Come, bear me to treasures of wealth! and, for thee,
In the home of the arts shall thy stable soon be!
Come, drink of the rebel-waved Seine, then, once more,
Where the blood from thy hoofs has been twice lavé before.
Thou faithful one, neigh in thy haughtiest tones,
And prance with thy hoofs upon nations and thrones!

Priests, nobles, and princes upon us have cried,
When press'd by the poor ones they crush'd in their pride,
"Come, save us," they cry, "and our lords ye shall reign—
Slaves to you, we at home still may tyrants remain."
My lance I have lifted, and low it shall bring
The cross of the priest and the crown of the king!
Thou faithful one, neigh in thy haughtiest tones,
And prance with thy hoofs upon nations and thrones!

I saw a vast phantom aloft in the sky,
And it gazed on our host with a flame-kindled eye.
"My reign is renew'd!" cried the shadowy form,
And a huge sword it shook o'er the west, like a storm.
It was Attila's spirit—I knew it at once;
And the voice I obey, as should child of the Huns.
Thou faithful one, neigh, then, in haughtiest tones,
And prance with thy hoofs upon nations and thrones!

The fame on which Europe so proudly looks back—
Her knowledge, so weak in the hour of attack—
All, all in that dust shall be swallow'd and swamp'd,
Which rises wherever thy hoof may have tramp'd.
On, on in thy course, then!—destroy without pause
Their palaces, temples, tombs, monuments, and laws!
Neigh, faithful one, neigh in thy haughtiest tones,
And prance with thy hoofs upon nations and thrones!

The next piece now selected from Beranger's portfolio, is one very different in its individual character, yet springing from the same fundamental circumstances. The song alluded to is entitled *Le Violon Brisé*, "The Broken Violin." The scene, as the reader may readily discover, is supposed to take place as in the preceding instance, when the allied armies occupied France. Thus speaks a poor "itinerant performer on the violin:"—

THE BROKEN VIOLIN.

Come, my poor dog, and eat thy fill;
Eat thou, in spite of my despair.
One festive cake I here have still;
Black bread must be our morrow's fare.

Victors by guile, thus yesterday
Invading soldiers to me spoke—
"Strike up a dance!" I would not play,
And one of them my violin broke.

Ah, 'twas the village orchestra!
No sports henceforth, no joyous strain!
Who now to dance in shade will play?
Who will awake the loves again?

When morn arose in smiling pride,
My violin's strings, so briskly prest,
Were wont to tell to youthful bride
The coming of the spousal guest.

When curates even would stand by,
Its music made our dances please;
The mirth that from its strings would fly,
Might to king's blow have given ease.

When in that glory's day it rung
To notes that glory first inspired,
Ne'er dreamt I it could be unstrung
By stranger hand, with vengeance fired!

Come, my poor dog, and eat thy fill;
Eat thou, in spite of my despair.
One festive cake I here have still;
Black bread must be our morrow's fare.

Beneath the elm, or in the barn,
Now will the holiday seem long!
Can vintage-field or harvest corn
Be bless'd without an opening song?

My violin cheer'd the toilsome hours,
It charm'd away the poor man's ills;
Taxes, and storms, and great men's powers,
Through it fell harmless on our hills.

Feelings of haste it bid to sleep,
It bade the tear-drop cease to flow;
Ah, ne'er did regal sceptre sweep
So sweet a sway as my poor bow!

But these our foes must fly the land,
And they have fired me for the fray;
A musket now must in my hand
Replace what they have dash'd away.

And should I perish; then, perchance,
Some kindly friend will one day cry,
"He will'd not that a foe should dance
Above our graves in mockery!"

Come, my poor dog, and eat thy fill;
Eat thou, in spite of my despair.
One festive cake I here have still;
Black bread must be our morrow's fare.

There is surely genuine pathos in this picture. It has often been remarked, as a proof of the eminent powers of Beranger, that to whatever subject he directed his muse—whether he made it the medium of conveying political satire, of lashing social vices, or of stirring up national feeling—he always managed to infuse into his pieces such a degree of general interest and excellence, that they outlived the occasions which called them forth, and were justly admired by all lovers of mere poetical excellence. Of how few writings of a similar kind can this be said! Even the satirical poems of our own poet Moore, with all their wit and brilliancy, have fallen greatly into oblivion—their interest having declined with the hour that produced them. The "Chant du Cosaque," and the "Violon Brisé," retain a permanent place in poetry, though certainly written for a special and passing purpose. Of a more general cast is the following little piece, though still springing in some measure out of the extraordinary state of affairs in France during the career of the poet. A man of feeling and patriotism, indeed, could not escape having his fancies tinged and moulded in such a manner by the temporary condition of his countrymen and country. Many a poor victim of the long wars of Napoleon must have sung, in some such manner as this, to the winged heralds of the spring:—

THE SWALLOWS.

Captive on the Moorish shore,
Bent with chains, a warrior lay.
"Are ye here," he cried, "once more,
Birds who hate the winter's day?
Swallows, whom sweet hope pursues
Hither even across the sea,
Doubtless ye of France have news—
Speak, oh speak of home to me!

Three years have I pray'd for ruth
That some token ye would bear
From that vale which saw my youth
Nursed in dreams so sweet and fair.
Where a limpid stream winds round
Many a freshest lilac-tree,
Ye my cottage home have found—
Of that vale oh speak to me!

Digitized by Google

One of you perchance was born
'Neath the eaves of that dear cot!
Of the mother there forlorn,
You must then have mourn'd the lot.
Dying, she may hope in vain
My return each hour to see:
Then she lists—then weeps again—
Of her love oh speak to me!

Is my sister wedded yet?
Have you seen a nuptial throng
Of our village youngsters met,
Her to praise and bless in song?
And my youthful comrades—they
Who took arms with me in glee,
Have they reach'd their village, say?
Of these friends oh speak to me!

Ah! the stranger o'er their graves
Now may foot it through the vale—
Those who fill my hearth he braves,
Makes my mateless sister wail!
Mine no mother may be more!
Chains, still chains my lot must be
Swallows of my native shore,
Speak ye of its woes to me!

MY FIRST CAMPAIGN.

I JOINED the depôt at Chatham, and was introduced to some of my brother officers. What a new life this was to me, who had never stirred from my own quiet home before!—and now to change it for the bustle and noise of a garrison town. But I was not doomed to remain long there; the company to which I belonged was ordered to Ireland. At first my military life seemed all very pleasant, because it was new; in a short time I got tired, and often wished myself at home—but this was of no avail, and on we went.

And then the "crossing the Channel." My first appearance on any sea! I thought I was dying from the time I started. Oh, how ill I was! but I was most provoked that none of the other officers on board were ill; and that the men under "my command" should see me reduced to such a state, was galling in the extreme. But sea-sickness is no respecter of persons. How glad I was to hear the captain of our ship say, "We shall be in now in about ten minutes:" but what a long ten minutes did that seem; the rolling of the lazy vessel, the flapping of the sails, I thought never would finish. At last, we arrived near the shore, and by dint of towing and tugging, we were enabled to land without boats. How rejoiced I was again to find myself on *terra firma*. And these, thought I, are some of the pleasures of a soldier's life!

We proceeded to the barracks, and were very comfortable, and enjoyed our rest that night, for we had been constantly on the move for the last fortnight. We remained at Dublin three days, and then marched for our quarters, some forty or fifty miles distant from that city. The places we had to halt in were generally wretched dirty villages, and the people miserable and filthy in the extreme. After three days' march over bad roads, we arrived at our place of destination. How any one could have fixed on such a spot as that was to send troops to, I could never properly settle in my own mind. The village, or whatever it might be called, consisted of about a hundred or more huts, most of them built of mud. At the end of the "street," so I suppose I must call it, stood the barracks or barn for the soldiers. One apartment had been reserved for the officer commanding the troops; our captain and lieutenant had agreed to "exist" together, but unfortunate me, "the poor ensign," what was I to do? A vacant hut, next to the "barracks," was now assigned to me; and my heart misgave me when I heard what was to be my fate.

My mansion was built of mud, and the roof was covered by a sort of thatch, composed of rushes and dead leaves. I had two apartments on the *ground* floor, for there was no "boarding," or "flooring," barring the ground. My drawing-room opened into the street; the door of the said drawing-room having no fastening but an old rusty latch, so that a light puff of wind could open it. My "bed-room"—a bed-room without a bed in it! A quantity of straw, however, could be discerned in a corner, covered with soldiers' cloaks; and in this place I was to sleep—to dream sweet dreams, and to enjoy heavenly slumbers. However, I thought, such has been the fate of many a better soldier than myself, and about ten o'clock I retired to my elegantly furnished apartments. I ought to mention that there was no door between my two rooms, but a space had been left in one of the walls which served the purpose of one.

I undressed, and putting my cloak on for bed-clothes, I lay down. I kept my sword near me, for I confess I did not quite like the "open house" that I was obliged to keep. I did not intend to go to sleep for some time, but I suppose over-fatigue conquered my intentions, and in a few minutes, I imagine, I was snoring. However, the first sleep did not last long, what with the misery of the place, the excitement I was in, and the quantity of visiters I had about me (for I verily believe this hut must have been the head-quarters of all the mice in the village), I found it impossible to rest long. I turned round, however, and dozed and dreamed.

I thought I was at home in our own little parlour, and was enjoying a dinner with my parents. My mother was telling me every circumstance which had occurred since I left my home, and she was just in the midst of her long story, when a violent scream was heard—so loud it seemed, that I awoke suddenly. Where was I? What was the matter? I had been dreaming certainly, but that scream I heard was no dream. I listened, and heard a strange noise; see I could not, for there was no window in the room. I sat up on my straw bed.

Again I heard the same noise! I fancied I felt the cloaks move! That might be the mice; but, no—they moved again! I felt for my sword, but could not find it. Imagining that the start I had given when I awoke had forced the cloak over it, I put out my hand again to feel for it;—and, oh, horror of horrors! somebody, I was sure, lay murdered by my side! I felt again—it was cold, but it groaned! What should I do? I did not dare move! If it should be a murdered body, I would be taken up as a murderer. I was in a state of terror—I could bear the idea no longer, but screamed "Help! murder! thieves!"—any thing I could think of.

I got up, intending to run away; but, in my hurry, I fell over what I was sure was the corpse of some victim, for whose murder I should most assuredly be hanged. I screamed again and again, but move I dared not. At last my screams were heard by the sentinel on duty, and he had alarmed the guard; and soon I had the gratification of seeing lights approaching, for the door of my mansion was wide open.

Again I screamed "Murder! help!" and the soldiers came to my assistance. They lifted me up more dead than alive, and seated me on a bench outside my hut, and then, at my desire, proceeded to look for the "dead body."

A laugh was heard, and then another, till all who had come to my relief, expecting to find a "horrid tragedy," were one and all convulsed with laughter. I ventured to take a peep, and there, sure enough, was the cause, the innocent cause of my terror—a huge pig, that probably had for months made this her resting-place, had, as usual, come to her night's quarters; and finding another inhabitant in her bed, had given the squeaks which awoke me. My fright was soon over; but not wishing to have such a bedfellow again, I relinquished the "snug berth" to her, and returned to the barracks with the guard. So much for "My First Campaign."—*From "Amusement in High Life," a work lately published.*

PREDICTIONS OF THE WEATHER.

There is nothing more common than to predict the future state of the season from some single appearance in the early part of it, and yet there is nothing more unphilosophical or fallacious. An early blossom, an early bee, or an early swallow, or the early appearance of any other natural incident, is no evidence whatever of the kind of weather that is to come, though the belief that it is so is both very general and very obstinate. The appearance of these things is the effect of the weather, not the cause; and it is what we may call an external effect, that is, it does not enter into the chain of causation. The weather of to-day must always have some influence upon the weather of to-morrow; but its effects will not be altered in the smallest tittle, whether it does or does not call out of the cranny in which it has been hybernated, some wasp, or some swallow that was too weak for autumnal migration. Birds, blossoms, and butterflies, do not come in expectation of fine weather; if they did, the early ones would show that they see not far into futurity, for they generally come forth only to be destroyed. They come in consequence of the good weather which precedes their appearance; and they know no more of the future than a stone does. Man knows of to-morrow only as a rational being; and were it not that he reasons from experience and analogy, he would have no ground for saying that the sun of to-day is to set. The early leaf and the early blossom of this spring may be a consequence of the fine weather of last autumn, which ripened the wood, or forwarded the bud; and the early insect may be evidence that the winter has been mild: but not one of these, or any thing connected with plants or animals, taken in itself, throws light upon one moment of the future; and for once to suppose that it does, is to reverse the order and cause of effect, and put an end to all philosophy—to all common sense.—*Mudie.*

PORTUGUESE POLITENESS.

I remember a striking instance of the great extent to which mere ceremonial is carried by the Portuguese of the old school. I called one morning on a high dignitary of the church, and ascending a magnificent staircase, passed through a long suite of rooms to the apartment in which the reverend ecclesiastic was seated. Having concluded my visit, I bowed and departed; but turned, according to the invariable custom of the country, when I reached the door, and made another salutation; my host was slowly following me, and returned my inclination by one equally profound; when I arrived at the door of the second apartment, he was standing on the threshold of the first, and the ceremony again passed between us; when I had gained the third apartment he was occupying the place I had just left on the second; the same civilities were then renewed, and these polite reciprocations were continued till I had traversed the whole suite of apartments. At the bannisters I made a bow, and, as I supposed, a final salutation: but no—when I had reached the first landing-place, he was at the top of the stairs; when I stood on the second landing-place, he had descended to the first; and upon each and all of these occasions, our heads wagged with increasing humility. Our journey to the foot of the stairs was at length completed. I had now to pass through a long hall, divided by columns, to the front door, at which my carriage was standing. Whenever I reached one of these pillars, I turned and found his eminence waiting for the expected bow, which he immediately returned, continually progressing, and managing his paces so as to go through his share of the ceremony on the precise spot which had witnessed my last inclination. As I approached the hall door, our mutual salutations were no longer occasional, but absolutely perpetual; and ever and anon they still continued, after I had entered my carriage, as the bishop stood with uncovered head till it was driven away.—*Portugal and Galicia.*

NATURAL GAS.

There is now a project on foot for lighting Newcastle and Gateshead—the Newcastle and Shields Railway—and the towns of North and South Shields, Sunderland, and the Wearmouths—by means of the natural supply of gas at Wallsend! This gas, as all persons in these parts are well aware, has long been burned at the pit-mouth, man having wastefully refused to profit by the boon of which nature made him the offer. Some time ago, however, a Mr Douglas took out a patent for the useful application of these natural supplies of gas; and, more recently, he obtained a lease of the copious (we believe we may say inexhaustible) supply at Wallsend. His proposal to apply this gas to public purposes has for some months been under the consideration of many influential and enterprising gentlemen in Newcastle, who seem to be sanguine in their expectations of success and profit in this singular speculation. The gas, except that it is diluted with about ten per cent. of atmospheric air (an evil which is not without a remedy), is remarkably pure—much purer, we are assured, than the gas now consumed in Newcastle and Gateshead, being free from the offensive admixture which occasionally makes itself too familiar with one of the five senses. The facilities afforded by the railways which line the Tyne on both its banks, for the laying down of pipes to convey the gas to the towns at the *termini*, will be at once obvious to every one; while it will be seen with what readiness the railways themselves may be lighted.—*Gateshead Observer.*

THE EFFECTS OF POLITICAL CONTROVERSY.

There are pursuits in life, high in their character and eminently useful, which nevertheless have something in them that almost inevitably tends to take from the human disposition that amiableness of temper which is so essential to happiness. Prominent among these pursuits is that of politics. Whether a man be an actor in the political affairs of his country, or merely an attentive looker-on and a commentator, there is so much of misrepresentation, so much of effrontery, so much of injustice in all its forms, to be remarked upon, to be excused, or to be resented, that, in a man of quick sensibility, a bitter indifference or a passionate partisanship is almost sure to be the result. Both of these are unfavourable to virtue and happiness, and the first is the worse of the two. Time may wear out a man's passion and violence, and he may subside into philosophy; but he who acquires a habit of bitter contempt for the conduct of men, even in their most important concerns, and who thus despairs of any permanent triumph of justice or establishment of good, is likely to go to his grave a sneerer and a misanthrope. If, indeed, he be of a retiring and meditative disposition, this hopeless view of human affairs may resolve itself into mere melancholy and pity; but this will not be the result with such as continue to belong to active life. Every day will afford them fresh evidence of folly and fresh food for contempt; and they go upon their way with a bitter smile upon their lips, while cold scorn sits triumphant upon their hardened hearts.—*The Table-Talker.*

COMFORTABLE CIRCUMSTANCES FAVOUR FORESIGHT.

It is a most remarkable fact, totally at variance with what might *à priori* be expected, but confirmed by the universal experience of mankind, that the dominion of reason over the passions, the habit of foresight, and the power of forming a systematic plan for the conduct of life, are just in proportion *to the degree in which the danger of immediate want or the pressure of actual suffering have been removed from mankind.* The savage who has no stock whatever for his support—who is in danger of immediate starvation if his wonted supplies from the chase or his herds were to fail—is totally regardless of the future in every part of the world; while the rich man, whose subsistence and affluence are almost beyond the reach of chance, is incessantly disquieted about the manner in which his subsequent life is to be spent. The certain prospect of instant death to himself and all that are dear to him, from the occurrence of a very probable event, is unable to draw the attention of the one from the enjoyments of the moment; while the slight and improbable chance of a diminution in the smallest articles of *future* comfort, renders the other indifferent to the means of *present* enjoyment which are within his reach.—*Alison's Principles of Population.*

ERRATA IN RECENT NUMBERS.—In the article respecting New Zealand in No. 450, the Paisley Society is described as connected with the New Zealand Land Company. This, we are informed, is not the case.—In the article entitled "Gossip respecting the Carse of Gowrie," in No. 449, Forgandenny has been inadvertently substituted for Forgan.

CHAMBERS'
EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 455. SATURDAY, OCTOBER 17, 1840. PRICE THREE HALFPENCE.

RESERVATIONS.

IN the romance of the Abbot, the ex-superior of the monastery of Kennaquhair, a man represented by the author as possessing high talents and many noble features of character, gains admission to the Castle of Lochleven in the disguise of a common soldier, with the view of aiding in the escape of Queen Mary. In the presence of Mary, he is examined by the lady of Lochleven, one of whose first questions put to him is, "You hold, undoubtedly, the *true faith*?" "Do not doubt of it, madam," was the answer. On another query being put to him, touching his willingness to perform his new duties, the stranger replies, "In the cause of *the lady* before whom I stand, I fear nothing." The querist and respondent here referred to very different churches and ladies, and Queen Mary afterwards spoke admiringly of the address shown in the conversation. "Marked you not," said she to her private attendants, "how astuceously the good father eluded the questions of the woman Lochleven, telling her the very truth, which yet she received not as such?"

Though the author put these reported evasions into the mouth of one of his most estimable characters, he was fully aware that they did much less honour to the good father's probity than to his address, and he makes the ingenuous youth Roland Græme utter the reflection, that "the truth, when spoken for the purpose of deceiving, was little better than a lie in disguise." This will be generally acknowledged as a just comment upon the supposed occurrence.

We adduce the passage from the novel as a well-conceived case of a kind of false-speaking only too common in the world. An individual is under the influence of a particular set of ideas, which are well known to his neighbours. A second individual, perfectly aware of these ideas, and how the first individual will interpret particular terms used by him, uses terms which, while perfectly true as to himself and many other persons, are utterly false as to the person addressed, because they are by him received in a different sense, and therefore have the effect of misleading. Here it is of not the least consequence that the words would not be false to others: if they are false to the person addressed, and if the speaker knows they will be so, he unquestionably utters the same thing as a lie. His consciousness of the prepossessions of the first individual calls upon him either to give explanations suitable to the case, or to use language which has the same meaning with both parties: by no other means can he, in that case, act the part of an honest man. The intention and the effect being so clearly bad, what does it matter for the particular expedient employed?

An unfortunate English monarch, under the pressure of great difficulties arising from variances with his subjects, resorted to the plan of "reservations" as a means of escape. The Commons brought before him a bill of rights, seeking to define the ancient laws by which the liberties of the people were supposed to be established. The king endeavoured to appease them and evade the bill, by giving them his solemn word that he would rule according to the laws of the realm, having all the time his own interpretation of what these laws prescribed, while he knew that his subjects regarded them in a different light. As often happens, no one was deceived but the unhappy man who thought to be the deceiver: the only result was, that he so far lost the respect and confidence of his people. Afterwards, when quarrels took place respecting ecclesiastical arrangements, he repeatedly endeavoured to disarm his opponents by promising to settle every thing as it was by law established, by which he expected they would suppose him to mean their own forms, which had received an imperfect legal sanction, while in reality he referred to forms totally different, and, indeed, those very forms against which they were contending. As his difficulties increased, he resorted to more and more deceptious practices of the same kind, and even on one occasion deceived two parties at once in different negotiations. But what was the result? Let the bloody scaffold of Whitehall relate it. The life of Charles I. would never have been taken as it was, if he had not, by his mental reservations, impressed a general conviction that he could hold faith with no opponent, but would turn upon such opponents and rend them, the moment that they, upon however strict a bargain, had released him from restraint.

It is obviously quite as bad to allow expressions not meant to deceive to be taken up or understood in a wrong sense by another party, as it is to use particular expressions with the intention of deceiving. Bishop Burnet justly mentions it as a point of character highly creditable to a nobleman of the time of the civil war, that he would never allow his words to be accepted or interpreted otherwise than as he meant them. It must often happen that expressions accidentally let fall, are taken up by another party in such a sense as to seem wise, or kind, or witty, or something else reflecting credit on the sayer of them; no truly conscientious person would fail in such circumstances to explain that he did not mean them in that light, for, otherwise, he would be profiting by a praise that did not justly belong to him. Suppose that King Charles, instead of attempting to deceive his subjects, had only allowed them to deceive themselves by putting a certain favourable construction on what he said, different from what he meant, it is clear that his criminality would have been exactly the same as it really was. On the other hand, the petitioning party might have taken up his expressions in a light more favourable than he meant, with a secret design to interpret them afterwards in a wide sense useful to their own views: in that case, equally, the act would have been perfidious. It is not uncommon, in controversial writings, to see charges brought against individuals, which, with the greater part of the public, will have the effect of fixing a criminatory stigma, but which are, nevertheless, so artfully worded, that, if challenged, they may be explained away as meaning something different. These, it is needless to remark, differ only from open false charges, in their being presented in a cowardly manner. It is like the paltry expedient of the Delphic oracle, which would take advantage of even a grammatical peculiarity in its native language to ensure that what it said on any case would harmonise with the event. Looseness of language is the ordinary resource of mental reservers. If they can find a term sufficiently vague to have the appearance of including what they mentally exclude, and thus can deceive the enemy, they conceive themselves to have gained their end in a very happy manner. Alas! what greater rationality is there in such conduct of human beings than in that of the poor animal which hides its head in the sand, and then believes itself to be completely concealed from its pursuers!

There is another kind of mental reservation, which consists in telling only a part of the truth, notwithstanding that the concealment of the remainder is sure to have the effect of deceiving. It is to be feared there are few persons who, when a variance has taken place with a neighbour, are sufficiently candid to give a fair recital of the circumstances. Usually, they mentally bury or reserve whatever may tell for the opposite party. They may have a certain glimmering consciousness of the views and interests upon which the opposito party proceeded; but not only do they keep every trace of these out of their recital, but they do not even allow the consciousness of them to be a living thing in their own secret bosoms, trampling it down on all occasions when it seeks to raise its "still small voice." It is curious to see such a person labouring to convey his view of a case, sensible, perhaps, that it does not tell in a natural way, but struggling desperately, nevertheless, to make the hearer believe it, when, probably, the mention of one simple circumstance, which he pertinaciously chooses to conceal, would make all clear in an instant, and save him all this voluntarily imposed trouble. Hence the almost magical effect in clearing up a legal dispute, from hearing the explanation of an opposite party. The one little fact which was wanting to give the appearance of ordinary human motives to the conduct of the defendant is then supplied, and that instantly looks natural and plain, which lately seemed like something not of this world. If we look closely into the bickerings and disputes that are constantly taking place around us, whether of a public or private nature, we shall find that the principle of mental reservations supplies a key to most of them. Some little reservation of the truth, on one or both sides, is usually at the bottom of the whole mischief. Neither party may move openly in the face of justice, or support his cause by direct falsifications of the truth. There is merely, for the most part, a trifling misunderstanding, founded originally on a partial suppression of facts in some quarter or another, which gives a colour and countenance to the view taken by each. Once committed to a particular line of offence or defence, the parties are apt to go on, until it is impossible to confess the error without disgrace; and ruin, to one or to many, thus becomes, not unfrequently, the ultimate result.

It often happens that an individual possesses many estimable qualificatious, suiting him for a particular office or situation, but possesses also one qualification so extremely objectionable, as in itself to unfit him for the proposed function. He may, for example, possess all the requisites of a good schoolmaster, except temper; or he may be qualified for the superintendence of a factory in all respects, except that of being a good accountant. It is too common, we fear, in giving certificates of character to candidates for situations, to *reserve* the one objectionable peculiarity, while all the good qualifications are fully insisted on. It may be said that here no falsehood is told: certainly, this is true affirmatively. But is there not a negative falsification? Does not the writer of such a certificate leave it to be presumed that the candidate is entirely qualified, when he is only partially so, or rather positively, though by but one peculiarity, disqualified? If, upon the strength of such certificates, the candidate obtain the situation, his constituents will unquestionably find themselves deceived. It may be said, these constituents had it in their power to make further inquiries of a different kind, so as to find out the disqualifying circumstance. This might or might not be; the writer of the certificate was not certain that such inquiries would be made. He at least runs the chance of deceiving by his positive evidence, seeing that perhaps none of another nature may be sought for. We would say, then, that any one called on to write a certificate as to the qualifications of another, from the condition of a common servant upwards, is bound, if he give a certificate at all, not to conceal circumstances which he conscientiously believes to be of a disqualifying nature.

To all mental reservations, indeed, one very simple rule applies. We are not to ask ourselves, Is what I say capable of being made to appear true, or true as far as it goes? We are bound to say that which we believe does not deceive our neighbour.

STORY OF A BEAR HUNT IN THE PYRENEES.

At the distance of a league from Bagneres of Luchon, on the declivity of the hill, stands a small building, called the hospital, which serves as a halt or station for travellers journeying to Spain. In October 18—, a little higher up than the hospital, a small, temporary-looking hut was to be seen, supported and sheltered by a huge rock. It was covered with branches and dry leaves, and built with loose rough stones, constituting a rude but welcome refuge for the highland hunters. It was but the habitation of a day, being regularly destroyed and carried off by every winter's storm. The approaches of autumn are terrible in the Pyrenees; and at the time mentioned, a fearful storm was bursting over the mountain. It was evening; every object was buried in darkness; but through the chinks of the door of the hut, darted at times a few glimpses of light. This door was also occasionally opened; a man's head would then appear through the lightened aperture, and be immediately withdrawn. The appearance of the inside was rather picturesque. In the middle of the hut, on a roughly-made table, were promiscuously placed a large basin of milk, some smoked bacon, a piece of goat's cheese, and some maize-bread; on the right was an opening made in the rock, which served as a chimney. In this chimney lay, almost in one blaze of fire, the best part of a tree, with its branches and leaves, which brightly illuminated the centre of the hut, and glittered on the long polished barrels of the rifles, placed upright against the opposite wall. Before the fire, a deer's haunch was comfortably roasting; and around were stretched five highland hunters, with their caps of brown worsted, their knee-breeches of coarse brown cloth, and their long grey stockings. They had fled to the hut to save themselves from the storm, and were now awaiting the supper which was preparing. At the farthest extremity sat, reading attentively, by the light of a wick saturated with resin, a man who appeared not to be dressed like the rest of the hunters; his occupation, the expression of his countenance, and the respectful distance preserved towards him by the highlanders, sufficiently testified his superiority over them. At the other side was suspended the open and reeking carcass of a deer recently killed.

The crackling of the roasting meat, the hissing of the snow as it fell on the inflamed wood, the loud rumbling sounds of the frequent thunder-claps, repeated and increased by the echoes of the mountain, alone interrupted the silence which prevailed in the hut. There seemed some weight on the minds of the men; but at length one of them spoke aloud. "So, Janote, it was by the same bear which killed one of our friends before, that Baptiste was worried yesterday?" "Yes." "I shall kill him, Janete, or die; where was he seen yesterday?" "Near the glacier of La Maladetta." "I will go to-morrow morning, and encounter him; it shall not be said that this black skin has frightened us all, like a herd of chamois." "Peter," said Janote, "the snow has fallen for these two days, the hill is very dangerous, and Baptiste was surprised by the bear merely in consequence of his being caught by the cold; you had better not go to-morrow." "I shall go!" was the answer.

A gloomy pause now took place, after which the man seated at the extremity of the hut rose and came close to Peter. "Peter," said he, "how many children have you?" "Five." "You shall not go to-morrow." "But" —— "You shall not go!" These words were pronounced with so much authority, that Peter held down his head and remained silent. "Well then," said another, "I shall have the shot, for I have neither wife nor children." "Friend," replied the man, "who lives at the village, in the smith's house?" "My mother." "You shall not go." "But," rejoined Peter, "now that we have found out the villain's den, we ought to take advantage of the discovery." "He shall be killed!" "And by whom? by whom?" "By myself, my friends." "You! reverend sir?" they all exclaimed. "Yes, my friends; by myself. I am but a peasant, a highlander, like yourselves. I spent twenty years among the rocks of Catalonia before becoming a minister of God; and the man you now name in the village the Reverend Curate Riego, was once called Riego the Bear-hunter."

As he pronounced these words, the clergyman's countenance was animated with a singular expression of courage and energy. "I had come to the hill," continued he, "to admire the storm; Heaven, no doubt, has directed me to this hut to hear your regrets; and although I have not touched a rifle for fifteen years"—— "Fifteen years!" said Peter. "Yes, my friends; for blood, even an insect's blood, should never stain the hands of a minister of God; but what I intend to do to-morrow is merely to destroy what is hurtful and dangerous; and as I have neither children, wife, nor mother, I shall go, and fear not but I shall kill the beast." "Be careful, M. Riego," said Janote. "Fear not, my friend, I shall remember the days of my youth."

A young man, about twenty-two years of age, called Stephano, then approached the priest, and said to him, "But I, brother, shall I not go with you?" "You, Stephano!" replied the curate, "my mother's son!—no; you shall not come." "We shall all follow you together!" cried the hunters. "I do not want you, my friends; and, as the night is advancing, you had better take your supper, and go to rest."

Young Stephano did not repeat his request to his brother. The hunters instantly began their meal; for there was in M. Riego's voice an irresistible accent of command.

Half an hour afterwards, each man began to settle himself in some corner of the hut, wrapped up in a sheep or goat's skin; Stephano stretched himself nearest to the door; and very soon all was silence.

At the first dawn of day, Riego, fearing the hunters would insist on accompanying him, gently got up, and, choosing one of the rifles, stept out without being heard. He had put on a dress borrowed from one of the highlanders. On his head he wore the small, flat, blue *béret*; over his legs, the long leather gaiters usually worn by these hardy mountaineers; round his waist, a strong scarlet belt, in which he placed a knife, the thick, sharp blade of which was eight or nine inches long. He was not the same man. His step was at all times firm and erect, but slow; on this day, however, his energy amounted even to impatience. As soon as he was out of the hut, he examined the rifle with all the scrupulous attention of an experienced hunter; tried the lock, burnt some of the powder to ascertain its quality and dryness, loaded carefully with three balls, and was just starting, when, at ten yards before him, he perceived his young brother Stephano, ready equipped as a hunter. "What are you doing there?" said he. "I am waiting for you, brother." "Why?" "Because I want to go with you; and I must go." The curate answered not till after a moment's reflection—"Well, let it be so. Is your rifle loaded?" "Yes, brother." "Here are twelve balls, then, take them, and let us go."

The brothers started on their perilous adventure. After an hour's march, they passed the short rocky defile which separates France from Spain; and while threading its recesses, Riego would ever and anon raise his rifle to his shoulder, following steadily the course of some eagle, which was already abroad in the keen, clear morning air. But he fired not; for he deemed that there was no call upon him to shed any blood but that of the grizzly bear. At the termination of the defile, they found themselves in front of La Maladetta (*the accursed*), the finest glacier of the Pyrenees, but the most dangerous, also, as its not inappropriate name implies. When the glacier appeared, here a mass of glittering ice, and there deadened in hue by flakes of dun snow, Riego felt the enthusiasm of former days return upon him, and he could not help exclaiming joyfully, "The snow! the hills!" Turning to Stephano, the priest then exclaimed, "If Janote be right, the bear must be in that fir-wood to the left. We must climb the Maladetta, Stephano. Have you the iron hooks and the ropes?" "Yes, brother." "Come, then, get ready," said Riego.

In a few minutes, they had buckled the iron hooks to their hands, and had united their bodies by a rope about eight feet long, the purpose of which was, that one of them might sustain the other, in case of a slip. Thus secured, the brothers resumed their route. For half an hour, they toiled silently up the precarious ascent, and were near the place of their destination, when, all at once, the ice gave way beneath Stephano's feet, and he sunk downwards into a deep crevice. Dragged back by his companion's weight, the priest slid rapidly to the very edge of the same gulf; a second more, and he also would have been over! Both must have perished; but, gathering his whole strength, Riego dashed his iron grasper into the ice with such force, that he stopped suddenly. To loosen one of his hands, and turn the rope round his arm for the purpose of shortening it, was the work of an instant. He then exerted his strength in raising Stephano. Soon the young man's hands could grasp the edge of the hole; by and bye his whole chest appeared. "Courage! courage!" cried Riego, putting forth his whole powers upon a final effort, which, being aided by the youth's pressure on his own elbows, was successful. Stephano was freed from his danger; but he fell almost in a fainting state upon the snow. A mouthful of spirits, from the small store of provisions which the hunters had brought with them, restored Stephano to the power of motion; and the priest said to him in a cheerful voice, "Courage, brother!—you are all right again; let us move on!" Stephano replied, "Yes, brother," and resumed the march; but a great change had come over the young man. The narrow escape which he had made had overthrown his resolution. He walked on, pale, tottering, and exhausted—a different being, altogether, from what he had been a few moments before. Riego, who moved foremost, was too much occupied with the outlook for the bear, and with the difficulties of the path, to be fully sensible how much his brother was changed by the late accident. The bear was not to be seen at Maladetta when they reached it. The hunters then turned into the Spanish Pyrenees, which they entered by La Picada. Scarcely had they gone a few yards in this direction, when Riego stopped short, and, without turning round, made a sign to his companion to stand still also. The priest then laid his ear to the ground, and heard a low growling sound, which he immediately pronounced to be the snarl of the bear. "He is not far off," said Riego, in a whisper. "Let us mount this platform, and we are sure to see him. Follow me." The brothers ascended the platform in question by a narrow ridge, flanked on the right and left by a steep precipice. On the side opposite to where the hunters were, there was another precipitous pass. Having completed the ascent, the brothers looked round, and in a few moments saw an enormous bear, moving slowly down the dry rocky bed of a torrent. "Here he is!" cried the curate. "Stephano! make ready; he will immediately pass the corner before us, close to that fir-tree; fire at him there. Mark for the left shoulder—a little behind it! If you miss him, I will then shoot!"

Just as Riego concluded his directions, the bear came to the point mentioned. "Now, Stephano!" cried the curate. The young man fired; but whether from agitation, or the distance, he missed the animal, as appeared from the splinters of ice broken off by the side of the brute, which at once turned round, saw the hunters, and advanced towards them. He was at first little more than twenty yards distant, but fortunately the path took some turns, which made the space to be passed greater. At a favourable instant, calmly and steadily raising his gun, Riego fired. The brute, however, chanced to slip aside at the moment, and of the three balls, one only struck him in the flank. A terrific growl was the only reply to the shot, which was totally ineffective in retarding his course. "Some balls!" said Riego quietly, without turning his eye from the bear. Stephano spoke not. "Balls, Stephano!—in three minutes he will be upon us!" The young man had been feeling his pouch. "We are lost!" cried he, with a groan of despair; "the bag has been buried in the snow at Maladetta!"

The growls of the bear became more and more vivid. "We have no balls!" repeated the young man in tones of agony; "let us fly!—oh, let us fly, brother!" "Fly!" said the priest; "no—we cannot! In twenty seconds the monster would be up with us, were we to go down hill!" "Oh, blessed Virgin!" cried Stephano, falling on his knees in desperation.

"Come, no faint-heartedness, brother!" exclaimed the priest, speaking very quickly, but in his usual intrepid tones; "there is one resource. Show me your knife!—yes, it is long and sharp. Mark me!—in one minute the bear will be on this platform! I will walk up to him—he will rush on me. I will hold him tight; and do you stab him till he drops, in the left side, Stephano!"

"Yes, brother," was the young man's reply.

"Now, he comes!" cried the undaunted priest; "no unsteadiness, Stephano! Strike hard and true! Ha! the bears have felt Riego before now, and they shall not conquer me yet!"

The priest seemed almost happy in his fearlessness. But, alas! deplorably different was the condition of the poor young brother. The bear appeared. "To work! to work, Stephano!" cried the priest, as he stepped forward with open arms. The monster, rising on its hind legs, seized Riego with a suffocating grasp. A terrible struggle began between them. "Help, brother, help!" cried the priest in a voice of thunder. Alas! Stephano had lost all presence of mind. His legs shook under him; a film passed over his eyes; he could neither advance nor retreat. The agonies of helpless terror were upon him.

"Strike, brother, strike!" cried the priest in weaker tones. The bear howled in a terrific manner, its hideous head projected over the curate's shoulder, its eyes red as fire, and its paws tearing Riego's back, while they at the same time crushed him between them. The struggle had lasted a few seconds. Stephano, wild, insane almost, could not stir. "Help me, brother! save me!" cried the priest, his voice failing. At this last call, the young man seemed partly to recover his powers of action. He ran forward, and struck his knife against the side of the monster. But the blow came from a hand too unsteady to do any execution. The knife scarcely scratched the skin. The failure, and the near spectacle of the brute's open mouth and fierce eyes, overthrew Stephano's resolution utterly, and, dropping the knife from his nerveless grasp, he turned and fled from the spot.

"Brother! brother!" cried Riego in a choked voice, but Stephano was away. Alone with his enemy, the priest tried to draw his own knife from his belt, but the brute held him too tight. Gathering vigour from despair, the priest resolved that, if he perished, the monster should perish with him, and, step by step, he pushed the bear to the edge of the precipice. At this very instant a powerful voice was heard from above the platform, exclaiming, "Courage! courage!" and a man bounded down the rocks with fearful rapidity. But it was too late! The priest and his grizzly foe had reached the brink of the abyss; the bear's feet slipped, and both of them rolled down the steep locked in that mortal embrace. The eyes of the new comer could not follow them into the gulf.

The day following that on which this scene took place, was the epoch of a festival in the village of which Riego was curate. The people were assembled in their public room, and the generous daring of their pastor was the theme of every tongue. They lamented him deeply—for this much they had learned from Stephano, that the priest had perished in encountering

the bear. The young man, however, would tell no more; he kept a moody silence, and the people ascribed it to sorrow for the loss of a brother whom he was known to respect and love deeply. Things stood thus, when a young peasant from a neighbouring village entered the public room. He was the man who had witnessed Riego's fall, and he had also witnessed Stephano's flight and desertion. He told his tale, and in an instant cries of indignation burst from every tongue. "Away with him! drive him from the village!" were the exclamations of all. The unfortunate youth seemed in a condition of despair, which nothing could add to; and he was moving mutely away, when a man covered with bloody rags made his appearance. "Riego!" cried the astonished villagers. It was indeed the priest. Stephano fell on his knees before his brother in a state of speechless rapture, and, with looks of imploring entreaty, kissed his feet and knees. The priest looked on him with an aspect of affection and mild forgiveness. "Did you not fall over the precipice with the bear?" cried one of the people. "I did," said Riego; "but heaven protected me. My belt was caught by a sharp rock; the bear was forced to quit its hold, and perished alone at the bottom of the gulf."

Exclamations of joy now rung from every quarter. Stephano continued sobbing aloud. "My brother! oh, my brother!" was all he could say. "What meant those cries as I entered?" said the priest in a severe tone; "why would you send away the boy?" "Because the coward"—— "Coward! he is no coward!" cried Riego. "His presence of mind was destroyed by his having narrowly escaped death a few minutes before. Are you sure that the same effect would not have been produced on any one of yourselves? Surely none will blame him when I forgive and embrace him! And now, let us return thanks to God, and let the festival proceed."

Riego's wounds were soon healed. As for Stephano, by many a brave feat the young man has since wiped away the reproach which was drawn upon him by his want of firmness at the death-scene of the great bear.

GUIZOT'S ESSAY ON WASHINGTON.*

In an early number of the present periodical (No. 42), a complete though not lengthened memoir of Washington was given; and some particulars, also, of his family history appeared at a more recent period. It would be superfluous, therefore, to follow in a formal manner the narrative alluded to in the heading of this article, and which was drawn up by the distinguished French historian M. Guizot, for an edition of the papers of Washington, produced by the Parisian press some time since. We shall only extract here and there such anecdotes and passages as seem to throw something of a fresh light upon the career of the great Liberator of America, a being whose name must be revered until man himself becomes "but a name."

By those who are disposed to take the least favourable view of the career of George Washington, it is sometimes said that he was a Fabius in military matters—one who attained success by the negative course of evading action, rather than of acting; and, in short, who had consummate prudence, but was deficient in positive genius and ability. Leaving aside other arguments, it may well be said that it could be no negation of striking qualities which drew the eye of his country upon the son of an obscure country gentleman, in his early youth, and when he occupied no more important position than that of a subordinate officer of a provincial corps. "His abilities," says M. Guizot, "were not shown by the event alone—they were anticipated by his contemporaries. 'Your good health and fortune are the toast at every table,' wrote Colonel Fairfax, his first patron, to him in 1756. In 1759, when he was elected for the first time to the House of Burgesses of Virginia, on taking his seat, Mr Robinson, the speaker, expressed to him, with much warmth of colouring and strength of expression, the gratitude of that assembly for the services he had rendered his country. Washington rose to thank him for the compliment; but such was his confusion that he was unable to utter a word; he blushed, stammered, and trembled for a second: the speaker relieved him by a stroke of address—'Sit down, Mr Washington,' said he; 'your modesty equals your valour, and that surpasses the power of any language that I possess.'

Again, in 1774, on the eve of the great contest, Patrick Henry, one of the most ardent republicans in America, on returning home from that first congress which had been formed to prepare for the event, and upon being asked who was the first man in congress, replied, 'If you speak of eloquence, Mr Rutledge of South Carolina is by far the greatest orator; but if you speak of solid information and sound judgment, Colonel Washington is unquestionably the greatest man on that floor.'"

Undoubtedly, he had not the faculty of *displaying* his powers in a brilliant manner; he possessed not, as the last quotation shows, the gift of eloquence, so essential to the acquisition of a character for shining abilities by a public man. But can we doubt that hundreds, with stores far less copious than those which lay latent in the mind of Washington, have won that repute for brilliant talents which was denied to him, through his inability to bring out his stores so effectively? In war, he pursued the only course, it may be safely said, which could have saved his country; and it is hard, because he did so, that he should be charged as a man incapable of having acted otherwise, had occasion demanded it. The truth is, as M. Guizot well remarks, that "he knew a loftier and more difficult art than that of making war—he knew how to control it. War was never to him any thing but a *means*, constantly subordinate to his general and definitive object—success to the cause, and independence to the country." The most prominent features in Washington's character were, first, his deliberation in coming to any conclusion, and, second, his inflexible constancy in acting upon it. "When he had observed, reflected, and formed his opinion, nothing could disturb him in it: he never allowed himself to be placed or kept, by the opinions of other men, or by the desire of applause, or by the dread of contradiction, in a state of doubt or continual vacillation. He had faith in God and in himself: 'If any power on earth could, or the Great Power above would, erect the standard of infallibility in political opinion, there is no being that inhabits this terrestrial globe that would resort to it with more eagerness than myself, so long as I remain a servant of the public. But as I have found no better guide hitherto than upright intentions and close investigation, I shall adhere to those maxims while I keep the watch.' For he united to this firm and independent mind an intrepid heart, ever ready to act upon his convictions, and to bear the responsibility of his actions. 'What I admire in Christopher Columbus,' said Turgot, 'is, not that he discovered the New World, but that he started in search of it, trusting to his own opinion.' On all occasions, whether small or great, whether their consequences were proximate or remote, Washington, once convinced, never hesitated to advance upon the faith of his own conviction."

It has been doubted whether Washington was actually invited to assume the supreme power, or, in other words, to place himself permanently, whether as a Cromwell or a Bonaparte, a protector or an emperor, at the head of his country. He *was* so invited, and by those who elevated Cromwell and Bonaparte—the soldiery. "In 1782, he 'viewed with abhorrence and reprehended with severity' the very idea of assuming the supreme power and the crown, which were proffered him by certain disaffected officers. In a letter to Colonel Lewis Nicola—'I am much at a loss,' said he, 'to conceive what part of my conduct could have given encouragement to an address, which to me seems big with the greatest mischiefs that can befall my country. If I am not deceived in knowledge of myself, you could not have found a person to whom your schemes are more disagreeable. Let me conjure you, then, if you have any regard for your country, concern for yourself and posterity, or respect for me, to banish these thoughts from your mind, and never communicate, as from yourself or any one else, a sentiment of the like nature.'" Few, indeed, can do full justice to the forbearance of Washington on this occasion, for few among men can ever personally feel the force of a similar temptation. It is only by observing how all, or nearly all, of these so tried fell, that we can judge of the greatness of his conduct. In this respect he stands grandly aloof among the great spirits of the earth. There are, indeed, one or two, and but one or two, on the same elevation with him, and proudly eminent among these is Scotland's own Wallace!

Yet was Washington not left without his reward—a reward exceeding in his eyes all that sovereignty could have bestowed. When his country had gained its independence through his arm, he was called to the presidency, and left his country-seat of Mount Vernon to be installed at New York. "His journey was a triumph: along the road, and in the cities, the whole population rushed out to meet him, to salute him, to pray for him. He entered New York, attended by the commissioners of congress, in an ornamented barge, rowed by thirteen pilots in white uniforms, as the representatives of the thirteen states, amidst an enormous concourse of people assembled in the harbour and on the shore: but his frame of mind remained unchanged. 'The motion of the boat,' says he in his journal, 'the flags on the shipping, the strains of music, the roar of cannon, the loud acclamations of the people as I passed, filled my mind with emotions as painful as they were agreeable, for I thought on the scenes of a totally opposite character which would perhaps occur at some future day, in spite of all my efforts to do good."

Nearly a century and a half before, on the banks of the Thames, a like crowd and like demonstrations of joy attended the procession of Oliver Cromwell, the Protector of the Commonwealth of England. 'What crowds! what acclamations!' said the flatterers of the protector: and Cromwell replied, 'There would be more to see me hung!' An analogy how strange, a contrast how glorious, between the feelings and the language of the bad great man and the man great and good!"

It is worthy of note, that in nominating his cabinet-assistants, he selected able men from different parties, but afterwards gave sanction, by his practice, to a maxim of government often disputed. "Once engaged in business and with parties, the same man who had shown such latitude in the formation of his cabinet, adopted and enforced a vigorous uniformity of purpose and conduct in his administration. 'I shall not, whilst I have the honour to administer the government, bring a man into any office of consequence knowingly, whose political tenets are adverse to the measures which the general government are pursuing; for this, in my opinion, would be a sort of political suicide.'"

We shall close these brief extracts with a few sentences from M. Guizot's able and eloquent summary of the character of Washington. "He did the two greatest things which in politics it is permitted to man to attempt: he maintained by peace the independence of his country, which he had conquered by war; he founded a free government in the name of the principles of order, and by re-establishing their sway.

When he retired from public life, both these tasks were accomplished. He might then enjoy them. It matters little, in such high designs, at what cost of labour they have been perfected; there are no drops of toil which are not dried by such a wreath, upon the brow where God has placed it."

"Government," says M. Guizot again, "will always and every where be the greatest employment of the human faculties, and consequently that which demands the loftiest spirits. The honour and the interest of society are alike concerned in drawing and fixing them to the administration of its affairs; for no institutions, no political contrivances, can fill the place they ought to occupy.

On the other hand, in men who are worthy of this destiny, all weariness, all sadness, though it be warrantable, is weakness. Their mission is toil; their reward, the success of their works, but still in toil. Oftentimes they die, bent under the burden, before that meed is vouchsafed to them. Washington obtained it: he deserved and tasted success and repose. Of all great men, he was the most virtuous and the most happy: God has, in this world, no higher favours to bestow."

SKETCHES OF SUPERSTITIONS.

SPECTRAL ILLUSIONS.

The subject of spectral illusions, or, to use the common phraseology, apparitions or spectres, is now, in the estimation of scientific and properly informed men, one of the simplest and most intelligible to which the mind can be directed; while, to the ignorant, it still appears full of doubt and mystery. As the present periodical has always been conducted upon the principle, that a majority of its readers are comparatively uninformed upon the subjects selected for its columns, we propose in the present instance to discuss the question of apparitions in a very plain way, trusting, by explanation and anecdote, to make the matter as simple to the many, as we have stated it to be to the more enlightened few at the present day.

An apparition, spectre, ghost, or whatever it may be called, is vulgarly supposed to be a supernatural appearance—a thing occurring out of the common order of nature. No particular time or place is assigned for the appearance, but we may observe that the time is usually evening or night, and the place solitary, or apart from the busy haunts of man. According to old theories on the subject, the person who declared that he had seen such an appearance was either set down as the fabricator of an untruth, or his story was fondly believed, and in the latter case the supernatural incident was added to the mass of credible history. We shall now endeavour to set this conflict of testimony and opinion to rights. In all cases, it is quite possible for the declarant to speak the truth as respects what he saw, or thought he saw, and yet that no real apparition ever occurred. The whole affair, as we shall explain, is simply a delusion in sight, caused by some species of disease in the organs which regulate the vision.

Mental and bodily disorder, organic or functional, is now allowed by physicians to be the basis of all kinds of spectral illusion. Organic disorder of the body is that condition in which one or more organs are altered in structure by disease. Disease of the brain, which involves organic mental disorder, is properly disease of the body, but enduring lunacy or fatuity, existing (if they can do so) without disease in the structure of the brain, may also be called organic disorder of the mind. These explanations will show what is meant by that epithet, as applied either to affections of the mind or body. Functional disorder, again, of the mind or body, is that condition of things where the healthy action of the organ or organs, in part or whole, is impeded, without the existence of any disease of structure. It may be said that violent excitement of the imagination or passions constitutes functional mental disorder; "anger is a temporary madness," said the Romans wisely. As for functional bodily disorder, temporary affections of the digestive organs may be pointed to as common cases of such a species of physical derangement. All these disorders, and kinds of disorders, may appear in a complicated form, and, what is of most importance to our present argument, the *nervous system*, on which depends the action of the *senses*, the power of *volition*, and the operation of all the involuntary functions (such as the circulative and digestive functions), is, and must necessarily be, involved more or less deeply in all cases of constitutional disorder, organic or functional. These powers of the nerves, which form the

sole medium by which mind and body act and react on each other, give us a clue to the comprehension of those strange phenomena called spectral illusions, which depend on a combination of mental and physical impressions.

Organic mental disorder generates spectral illusions. Almost every lunatic tells you that he sees them, and with truth; they are seemingly present to his diseased perceptions. The same cause, simple insanity, partial or otherwise, and existing either with or without structural brain disease, has been, we truly believe, at the foundation of many more apparition-cases than any other cause. By far the greatest number of such cases ever put on record, have been connected with fanaticism in religious matters; and can there be a doubt that the majority of the poor creatures, men and women, who habitually subjected themselves, in the early centuries of the church, to macerations and lacerations, and saw signs and visions, were simply persons of partially deranged intellect? St Theresa, who lay entranced for whole days, and who, in the fervour of devotion, imagined that she was frequently addressed by the voice of God, and that our Saviour, St Peter, and St Paul, would often in person visit her solitude, is an example of this order of monomaniacs. That this individual, and others like her, should have been perfectly sensible on all other points, is a phenomenon in the pathology of mind too common to cause any wonder. We would ascribe, we repeat, a large class of apparition-cases, including these devotional ones, to simple mental derangement. The eye in such instances may take in a correct *impression* of external objects, but this is not all that is wanting. A correct *perception by the mind* is essential to healthy and natural vision, and this perception the deranged intellect cannot effect. A three-footed stool may then become a kneeling angel. We would therefore have such persons regarded, not in the uncharitable light of impostors, but of poor creatures who mistook natural hallucinations for supernatural.

Undoubtedly, however, many of those cases of spectral illusions which have made the deepest impression on mankind, have not arisen from organic mental disease on the part of the sight-seers. The lunatic is apt to betray his condition, and, that once recognised, his visions become of no weight. We have then to turn to other causes of spectre-seeing; and, first, let us notice the mode of operation, and effects of certain *functional* disorders of the system, operating on the visual perceptions through the nerves. A bodily disorder, which ought in itself to afford a solution of all apparitions, is that called *delirium tremens*. This is most commonly induced, in otherwise healthy subjects, by continued dissipation. So long (say medical authorities) as the drinker can take food, he is comparatively secure against the disease, but when his stomach rejects common nourishment, and he persists in taking stimulants, the effects are for the most part speedily visible, at least in peculiarly nervous constitutions. The first symptom is commonly a slight impairment of the healthy powers of the senses of hearing and seeing. A ringing in the ears probably takes place; then any common noise, such as the rattle of a cart on the street, assumes to the hearing a particular sound, and arranges itself into a certain tune perhaps, or certain words, which haunt the sufferer, and are by and bye rung into his ears on the recurrence of *every* noise. The proverb, "as the fool thinks, so the bell tinks," becomes very applicable in his case. His sense of seeing, in the mean while, begins to show equal disorder; figures float before him perpetually when his eyes are closed at night. By day, also, objects seem to move before him that are really stationary. The senses of touch, taste, and smell, are also involved in confusion. In this way the disturbance of the senses goes on, increasing always with the disorder of the alimentary function, until the unhappy drinker is at last visited, most probably in the twilight, by visionary figures, distinct in outline as living beings, and which seem to speak to him with the voice of life. At first he mistakes them for realities, but, soon discovering his error, is thrown into the deepest alarm. If he has the courage to approach and examine any one of the illusory figures, he probably finds that some fold of drapery, or some shadow, has been the object converted by his diseased sense into the apparition, and he may also find that the voice was but some simple household sound converted by his disordered ear into strange speech; for the senses, at least in the milder cases of this sort, rather *convert* than *create*, though the metamorphosed may differ widely from the real substance. The visitations and sufferings of the party may go on increasing, till he takes courage to speak to the physician, who, by great care, restores his alimentary organs to a state of health, and, in consequence, the visions slowly leave him. If, however, remedies are not applied in time, the party will probably sink under the influence of his disorder. The spectral figures and voices being solely and entirely the creation of his own fancy, will seem to do or say any thing that may be uppermost in that fancy at the moment, and will encourage him to self-murder by every possible argument—all emanating, of course, from his own brain. The whole consists merely of his *own fancies, bodied forth to him visibly and audibly*. His own poor head is the seat of all; there is nothing apart from him—nothing but vacancy.

Dr Alderson, a respectable physician, mentions his being called to a keeper of a public-house, who was in a state of great terror, and who described himself as having been haunted for some time with spectres. He had first noticed something to be wrong with him on being laughed at by a little girl for desiring her to lift some oyster shells from the floor. He himself stooped, but found none. Soon after, in the twilight, he saw a soldier enter the house, and, not liking his manner, desired him to go away; but receiving no answer, he sprang forward to seize the intruder, and to his horror found the shape to be but a phantom! The visitations increased by night and by day, till he could not distinguish real customers from imaginary ones, so definite and distinct were the latter in outline. Sometimes they took the forms of living friends, and sometimes of people long dead. Dr Alderson resorted to a course of treatment which restored the strength of the digestive organs, and gradually banished the spectres. At the close of the account, it is said that the man emphatically expressed himself to have now received "a perfect conviction of the nature of ghosts."

Many additional cases from Hibbert, Abercromby, and other writers, might be quoted, in which the visual impressions and perceptions were in a similar way affected by the influence of digestive derangement. But as no doubt can rationally exist on the point, from the comparative commonness of the disease, no more proof need be brought forward. However, the inference naturally deducible from these facts is too important to be overlooked. Here we find, by unquestionable medical evidence, that a man walking about in apparent bodily health, and mentally sane, may nevertheless be subject to most distinct visitations of spectral figures, some of them in the semblance of *dead* persons. We find this, we repeat, to be within the range of natural phenomena. Now, is it not more likely, in those cases where wonderful apparitions are reported to have been seen, that the whole was referable to such natural causes, than that the grave gave up its dead, or that the laws of the universe were specially broken in upon in any other way? Even with only one such admitted source of spectral illusions as the malady alluded to, we should certainly err in passing it by to seek for explanations in supernatural quarters. But in reality we have *many* causes or sources of them, and to these we shall now look, in continuation of our argument.

Among the other varieties of bodily ailments affecting either structure or function, which have been found to produce spectral illusions, fevers, inflammatory affections, epileptic attacks, hysteria, and disorders of the nerves generally, are among the most prominent. As regards fevers and inflammatory affections, particularly those of the brain, it is well known to almost every mother or member of a large family, that scarcely any severe case can occur without illusions of the sight to a greater or less extent. In hysteric and epileptic cases also, where fits or partial trances occur, the same phenomena are frequently observed. But we shall not enlarge on the effects produced by the influence of severe and obviously existing maladies, as it is in those cases only where the spectre-seer has exhibited *apparent* sanity of mind and body, that special wonder has been excited. It is so far of great importance, however, to notice that these diseases do produce the illusions, as in most cases it will be found on inquiry that the party subject to them, however sound to appearance at the time, *afterwards* displayed some of these complaints in full force; and we may then rationally explain the whole matter by supposing the seeds of the ailments to have early existed in a latent state. A German lady, of excellent talents and high character, published an account some years back of successive visions with which she had been honoured, as she believed, by Divine favour. Dr Crichton, however, author of an able work on Insanity, found that the lady was always affected with the *aura epileptica* during the prevalence of the illusions; or, in other words, that she was labouring under slight attacks of epilepsy. Thus simply was explained a series of phenomena which, from the high character for veracity of the subject of them, astonished a great part of Germany. Another case, where functional bodily disorder of a different and very simple kind was present in an unrecognisable state, and produced extraordinary illusions, was the famous one of Nicolai, the Berlin bookseller. This individual, when in a perfectly fit state to attend to his ordinary business, was suddenly visited one day, when casually excited by some annoying circumstance, by the figure of a person long dead. He asked his wife, who was present, if she saw it; she did not. The bookseller was at first much alarmed, but, being a man of sense and intelligence, he soon became convinced of the illusory yet natural character of the spectre, which subsequently, for a period of two whole years, appeared to him in great numbers, and with daily frequency. "I generally saw (says he) human forms of both sexes, but they took not the smallest notice of each other, moving as in a market-place, where all are eager to press through the crowd; at times, however, they seemed to be transacting business with one another. I also saw several times people on horseback, dogs, and birds. All these phantasms appeared to me in their natural size, and as distinct as if alive; none of the figures appeared particularly terrible, comical, or disgusting, most of them being of an indifferent shape, and some presenting a pleasing aspect. The longer these phantoms continued to visit me, the more frequently did they return." They also spoke to him repeatedly.

These phantasms lasted, as we have said, two years. The issue is peculiarly worthy of note. Nicolai had in former years fallen into the habit of periodical blood-letting by leeches, but had ventured to stop the practice previous to the accession of the phantasms, and during their prevalence he had only been advised to attend to the state of his digestive organs. After they had endured for the time mentioned, it was thought fit to renew the blood-letting. At eleven in the morning, while the room was crowded with the spectral figures, the leeches were applied. As the bleeding slowly proceeded, the figures grew dimmer and dimmer, and finally, by eight o'clock in the evening, they had all melted into thin air, never to re-appear! This most remarkable case, the first in which any individual dared calmly to come forward and avow such an affection, at the risk of incurring the charge of insanity, was founded, we thus see, simply on a plethoric or surcharged state of the blood-vessels. Nicolai deserves great credit for the philosophic composure with which he recorded the phenomena presented to him; but his statement, which has often been republished in this country, seems defective in some points, and, from the interest of the subject, we may be pardoned for presuming to notice these. Generally speaking, he represents his spectral visitants as things which came and went, and assumed various shapes, and appeared in certain numbers, *uninfluenced* directly *by himself*. The total dependence which they had upon his own fancy of the *moment*, is not put clearly before us, though, by the truthful accuracy of his narrative, he unconsciously makes that fact apparent every instant. The surcharged state of the vessels was the fundamental cause of the phantasms, but his own passing fancies moulded them for the passing moment into shape, regulated their numbers, and gave them words. How could it be otherwise? The whole panorama was exhibited on his own retina, and the working brain behind was the manager and scene-shifter of the show.

It need only be added, in further explanation of the subject, that the reason why spectral illusions are more frequent in solitary than in busy parts of the country, is, that in these secluded spots the fancy is apt to become diseased, or at least deeply affected, by external appearances. The raving of the wind in mountain glens, the silence and gloom of winter, the light and shade of summer—all work on the mind, and produce that species of functional disorder which leads to the delusions we have described.

The subject of particular apparitions, of banshies, of second sight, &c., must be left to another occasion. We have here but pointed out certain principles, which, with a little farther notice of the influence of the mind singly, will enable us to throw light, we trust, on most of the authentic cases of spectral illusions on record.

OCCASIONAL NOTES.

NAMES.

A LAMENTABLE meagreness of taste is displayed in this country in giving Christian names to children. The usual custom seems to consist in naming the infant *after* some friend or relative, no matter how offensive or prosaic the name may be. This is perhaps done by way of compliment, but, generally speaking, it is treated very lightly by the person supposed to be complimented, and the favour might as well be spared. Where the name is euphonious or well-sounding, there can be no harm in the practice, but where it is a harsh or too common appellation, a positive injury is inflicted on the child for life, all to satisfy a passing whim, or pay an imaginary compliment. It can be from no other cause than this that there is such a limited range of Christian names amongst us. We have *Johns* without end, and then in numerical proportion come *James, William, George, Thomas, Robert*, and two or three others, all which being repeated in nearly every family every new generation, there is the greatest difficulty in tracing descents for the sake of inheritance; and in those cases in which each male member of a family has several sons, all with precisely the same names, an utter confusion is introduced into the genealogy. We have thus, for example, known five cousins, all possessing the name *John* Thomson, and similar absurdities must be continually occurring within every other person's knowledge.

What we should propose being done in the matter of naming children is, for the parents to look about for a new and well-sounding name for their child, whether male or female, without any regard to the stupid old custom of calling infants after uncles, aunts, grandfathers, or grandmothers. Why not introduce more liberally into the common stock of Christian names some of the fine old Anglo-Saxon appellatives, such as Arthur, Athelstan, Alfred, Swynfen, Albert, Edmund, Egbert, Ethelbert, Edgar, Edwin, Cedric; or for females—Adela, Adeline, Agatha, Amanda, Alice, Matilda, Eleanor, Constance, &c. The fund of Roman, French, and other names, might also be drawn upon, as Adrian, Adolphe, Hortense, &c.

Digitized by Google

On a former occasion, we showed the impropriety of giving children two Christian names, or of giving a surname for a Christian name. But it indicates a much greater meanness of taste to call any child by the name or titular appellative of any member of the royal family. We lately heard of a gentleman in the metropolis who had called his three sons, respectively, Kent, Cambridge, and Sussex, a thing no doubt done for the purpose of creating a sensation among strangers. "Sussex, my dear, will you come this way?" or "Cambridge, I'll trouble you to hand me that book," sounds well when uttered by an elegant mamma in a promiscuous company, and for the moment raises the notion that one of the royal family is present. Such are the mean motives which sometimes influence parents in the naming of their children.

DRINKING WINE AT DINNER.

In high life, the practice of asking another "to drink wine with you," is quite worn out. It is only followed by an inferior order of persons in provincial towns, who are not yet aware that the change has taken place. The custom at first-rate tables has for some time been that which is followed on the continent; every one takes what he or she likes, without bothering neighbours. A servant usually hands round liquors. It is gratifying to observe that by this plan few take any wine, or at most only make a kind of sham of drinking. The use of intoxicating liquors at table is obviously declining in the best circles of society, and is kept up by the middle classes, not from a vicious taste, but from a wish to show off, and an idea of being hospitable. The sooner these ridiculous notions are corrected, the better.

SONGS OF JAMES HOGG.

It would be a difficult task properly to characterise in words the genius of the Ettrick Shepherd. The case is different with Burns; we can readily discern what were the leading features of his intellect, as developed throughout his poetry. But the Ettrick Shepherd had scarcely a single marked quality of mind in common with Burns; and, in saying so, we do not mean to undervalue the former in the slightest degree. The elder bard, it may be safely said, could as little have produced the Queen's Wake, Queen Hynde, Ringan and May, or many of the other highly imaginative pieces which Hogg gave forth, as the Shepherd could have written Tam O'Shanter, or the Cotter's Saturday Night. In their songs, these two Scottish poets differ as widely as in their larger productions. We do not find in the songs of Hogg that axiomatic pith, terse humour, and compressed beauty of sentiment, which appear in such pieces as "A Man's a man for a' that," "The Braw Wooer," and "Mary Morison." What we find in place of these qualities in the songs of the Ettrick Shepherd, it is not easy to tell, although it is undeniable that many of them possess a charm of no common kind, and one fitted to make them lastingly popular. A certain happy naïveté, or quaint simplicity of thought, expressed in the genuine Doric of Scotland, with frequent touches of tender and kindly feeling, and a flow of pleasing imagery, derived from homely natural objects and common rural occupations, may be described as perhaps the principal features characterising the songs of Hogg. Real humour is less apparent in any of them than odd turns and "queer" expressions, which supply its place, and produce much of its usual effect. The following stanza from a song written, in the poet's courting days, to the lady who afterwards became his wife, and who lives to lament his loss, will give a fair example of the happy turns alluded to:—

"Could this ill warld hae been contrived
To stand without mischievous women,
How peacefu' bodies might hae lived,
Released frae a' the ills see common;
But since it is the waefu' case
That man maun hae this teasing crony,
Why sic a sweet bewitching face?
Oh had she no been made sae bonny!"

As an example of the way in which he gives a lively point to verses by single expressions, we may quote another passage, from "My Love she's but a Lassie yet":—

"She's neither proud nor saucy yet,
She's neither plump nor gaucy yet;
But just a *jinking*,
Bonny blinking,
Hilty-skilty lassie yet."

Of the tender and kindly feeling, and the flow of homely yet pleasing imagery, characterising the songs of the Ettrick Shepherd, fine examples may be found in the "Wee Housie," "I hae naebody now," "When the kye comes hame," and "Oh Jeanie, there's naething to fear ye"—all of them pieces so well known, that their peculiarities will occur to the memory of every one. Of all the songs, however, expressive of serious emotion which the poet ever wrote, the following one, little known, seems to us one of the most affecting. It is entitled a "Father's Lament," and appears with a fine air attached to it in Bishop's Select Melodies:—

"How can you bid this heart be blythe,
When blythe this heart can never be?
I've lost the jewel from my crown—
Look round our circle, and you'll see
That there is ane out o' the ring
Who never can forgotten be—
Ay, there's a blank at my right hand,
That ne'er can be made up to me!

'Tis said as water wears the rock,
That time wears out the deepest line;
It may be true wi' hearts enow,
But never can apply to mine.
For I have learn'd to know and feel—
Though losses should forgotten be—
That still the blank at my right hand
Can never be made up to me!

I blame not Providence's sway,
For I have many joys beside,
And fain would I in grateful way
Enjoy the same, whate'er betide.
A mortal thing should ne'er repine,
But stoop to the supreme decree!
Yet, oh! the blank at my right hand
Can never be made up to me!"

In expressing the doubts, and fears, and pains of love, the Ettrick Shepherd is extremely happy, though he more often adopts a semi-burlesque tone, than the seriously-plaintive style of Burns. But the following stanzas, from a piece entitled "Bonny Mary," may be read after the Lass of Ballochmyle, without any risk of detriment to the reputation of Hogg:—

"Oh Mary! thou'rt sae mild and sweet,
My very being clings about thee;
This heart would rather cease to beat,
Than beat a lonely thing without thee.
How dear the lair on yon hill-cheek,
Where many a weary hour I tarry!
For there I see the twisting reek
Rise frae the cot where dwells my Mary.

When Phœbus keeks outower the muir,
His gowden locks a' streaming gaily—
When morn has breathed her fragrance pure,
And life and joy ring through the valley—
I drive my flocks to yonder brook,
The feeble in my arms I carry,
And every lammie's harmless look
Brings to my mind my bonny Mary.

The exile may forget his home,
Where blooming youth to manhood grew;
The bee forget the honey-comb,
Nor wi' the spring his toil renew;
The sun may lose his light and heat,
The planets in their rounds miscarry,
But my fond heart shall cease to beat
When I forget my bonny Mary."

This last verse will bring to recollection the closing one in the "Lament for Lord Glencairn:"—

"The bridegroom may forget the bride
Was made his wedded wife yestreen;
The monarch may forget the crown
That on his head an hour hath been;
The mother may forget the child
That smiles sae sweetly on her knee;
But I'll remember thee, Glencairn,
And a' that thou hast done for me!"

Certainly the images in the shepherd's stanza are not so forcible or appropriate as those of Burns, but they are, nevertheless, very beautiful. The following song, to the tune of "Over the Border," is among the most popular of the shepherd's lyrical productions:—

"Oh, my lassie, our joy to complete again,
Meet me again i' the gloaming, my dearie;
Low down in the dell let us meet again—
Oh, Jeanie, there's naething to fear ye!
Come, when the wee bat flits silent and eerie,
Come, when the pale face o' Nature looks weary;
Love be thy sure defence,
Beauty and innocence—
Oh, Jeanie, there's naething to fear ye!

Sweetly blaws the haw and the rowan tree,
Wild roses speck our thicket sae breery;
Still, still will our walk in the greenwood be—
Oh, Jeanie, there's naething to fear ye!
List when the blackbird o' singing grows weary,
List when the beetle-bee's bugle comes near ye,
Then come with fairy haste,
Light foot and beating breast—
Oh, Jeanie, there's naething to fear ye!

Far, far will the bogie and brownie be,
Beauty and truth, they darena come near it;
Kind love is the tie of our unity,
A' maun love it an' a maun revere it.
'Tis love makes the sang o' the woodland sae cheery,
Love gars a' nature look bonny that's near ye;
That makes the rose sae sweet,
Cowslip an' violet—
Oh, Jeanie, there's naething to fear ye!"

In such songs as "Cam ye by Athol," "Charlie is my darling," and some others that might be named, there is, upon the whole, little poetic merit, and the popularity of the pieces rests in no small degree on the national feeling incorporated in the composition. One circumstance materially distinguishes Hogg's poetry from that of Burns; the shepherd latterly wrote much that was below mediocrity, and evidently from an unpoetic motive. Urged on by magazine editors, publishers, and also his own necessities, he issued a multitude of perishable things, in place of concentrating his faculties upon works likely to live. Thus, the last ten years of Hogg's life may be said to have been devoted to destroying the fame which he had formerly, and under many difficulties, acquired.

These desultory remarks must be brought to a close, and we shall do so with another beautiful little piece from Hogg's song collection:—

A WIDOW'S WAIL.

"Oh thou art lovely yet, my boy,
Even in thy winding-sheet;
I canna leave thy comely clay,
An' features calm an' sweet!
I have no hope but for the day
That we shall meet again,
Since thou art gone, my bonny boy,
An' left me here alane!

I hoped thy sire's loved form to see,
To trace his looks in thine;
An' saw with joy thy sparkling ee
With kindling vigour shine!
I thought, when auld an' frail, I might
Wi' you an' yours remain;
But thou art fled, my bonny boy,
An' left me here alane!

Now closed an' set thy sparkling eye,
Thy kind wee heart is still,
An' thy dear spirit far away
Beyond the reach of ill!
Ah! fain wad I that comely clay
Reanimate again;
But thou art fled, my bonny boy,
An' left me here alane!

The flower now fading on the lea
Shall fresher rise to view—
The leaf just falling from the tree
The year will soon renew:
But lang may I weep o'er thy grave
Ere thou reviv'st again;
For thou art fled, my bonny boy,
An' left me here alane!"

MEDICAL QUACKERY.

A cleverly written pamphlet on medical quackery, by Dr Charles Cowan of Reading, has lately been brought under our notice, and affords us an opportunity of saying a few words on the subject. The manner in which thousands of persons in all parts of the United Kingdom, but England in particular, are absolutely cheated out of their money by venders of quack medicines, independently of the serious injury done to health by these pretended nostrums, is a great disgrace to our social condition. No circumstance that could be produced shows more clearly the state of ignorance among the mass of the people, than the existence of the vast delusion and credulity respecting these trumpery and often vicious preparations.

Shrewd as the English are in every matter of business, they may be described as children in all that pertains to the curing of disease. It would appear that any man, no matter who, will be almost certain to realise a fortune by manufacturing and selling pretended specifics for bodily complaints, provided he possess a sufficient share of impudence, advertise well, and keep up an imposing personal appearance. But it is not alone in England that the imposition is successful. Wherever there is a preponderance of English or descendants of English located, there the quack medicine-vender flourishes. All over the English-settled part of North America, and in the colonies, quacks are as successful as in the mother country. Every American newspaper which we see abounds with their advertisements. It has been calculated that 200,000 dollars are spent annually for advertising quack medicines in the United States. In Canada, Nova Scotia, New Brunswick, and the West Indies, the sum must also be considerable. The medicines are the same which deluge the advertising columns of the British press—elixirs, pills, purifiers of the blood, lotions, worm-cakes, dentrifices, &c. A peck of quack-prepared pills is believed to be consumed daily in Boston; but New York, being larger, takes half a bushel.

According to Dr Cowan, the facilities for extensively advertising are greater than is generally supposed. "The leading journals of the metropolis insert very few quack advertisements, for the simple reason that the proprietors themselves are not venders of patent medicines, and because they require cash for quack as well as for all other announcements. It is chiefly in the provincial papers, and in the less influential London journals, that the quack advertises, the proprietors of these frequently becoming joint-stock partners in his trade. The newspaper office is virtually his shop, and the sale of the nostrum is often the sole security for the payment of advertisements, the proprietors persisting in zealously advertising as the only means of securing remuneration. Many of the latter have large stocks of medicines on hand, which occasionally become valueless by the rapid sale of some more successful competitor for public favour. Journals just commencing, or of very inferior circula-

tion, not only insert puffs of the empiric on these terms, but sometimes deduct from the proceeds of sale only sufficient to meet the duty; and even this is occasionally paid by the newspaper proprietor himself, who seizes upon a quack advertisement as the only means of filling up his empty columns, and giving to his paper a fictitious appearance of importance and wide circulation. It is evident from this that the quack wields a fearful power in the public press; his expenses are often little more than nominal, while he secures the agency and interests of the newspaper proprietor in his behalf; and thus the very means by which the public mind should be directed and enlightened, is converted into a source of incalculable mischief." To this we may add a circumstance that has attracted our attention. The number of quack medicine advertisements in the English provincial papers is remarkably stationary; it usually varies from twenty to twenty-four in each newspaper, and you may observe the same announcements keeping their place for years. In the Scotch newspapers there are comparatively few of these advertisements, the people in the north, as we suppose, being less easily duped by the impudent falsehoods and extravagant absurdities of the race of newspaper empirics.

It is not denied that an advertised medicine contains a substance which may serve a good purpose in certain complaints. But the absurdity is, that in most cases the medicine is put forth as a specific for a wide range of diseases. We have pills offered to us which are to cure all kinds of "coughs, colds, asthmas, shortness of breath, oppression of the chest, dropsy, and consumption." It is clear that this is an impossibility. Some coughs, for instance, are the symptoms of pulmonary affections, while others proceed from the stomach. Now, is it reasonable to suppose that any one medicine is calculated for these opposite states of derangement? The impertinent thing about quacks is, that they strike almost entirely at symptoms; they speak of cough and asthma as if these were diseases in themselves, and not mere external signs of some species of functional or organic derangement. To cure a cough, we must first understand what it is that causes the cough, and the same in all other maladies.

Of what, it may be asked, are quack medicines generally composed—what is their precise character? The writer before us gives the most complete information on this point. "Quack medicines, almost without exception, are nothing more than the revived formulæ of some obsolete pharmacopœia, the prescription of some medical man of eminence, or a modern preparation with a new name, and sufficiently adulterated to render its recognition difficult. They are not, as the empiric would have one believe, profound discoveries of his own, the result of deep experimental research combined with exquisite chemical skill, but formulæ pirated from the regular profession, and puffed into notoriety by the use of medical words and phrases extracted from professional books. They form no real additions to the art of healing, while they are indebted for their popularity and sale to their occasional success, but more particularly to the secret and mysterious mode of their announcement, the extravagance of their pretentions, and their adaptation to the fancies and prejudices of a medically ignorant population. The really distinctive character of a quack medicine is this, that it is an ordinary remedy to which are ascribed extraordinary virtues; it is administered by the empiric without knowledge or discrimination, while the educated practitioner attaches to it no other qualities than what experience has confirmed, and adapts its employment to those peculiar conditions of the system where it may reasonably be expected to be of use."

To this is added an analysis of the composition of about thirty different specifics, pills, elixirs, drops, &c.; but we refrain from mentioning them, as the insertion of the names of the proprietors in any form in our pages would be attended with more harm than good.

Considering the extraordinary pretensions of quacks, it must be a matter of curiosity to know who they really are, or what they have been. We learn from Dr Cowan, that in many instances the names attached to the medicines are fictitious, or adopted from the name of some well-known practitioner; in this way we have the names of Armstrong, Boerhaave, *Ashley* Cooper, and others, as if these celebrated individuals testified to the virtues and sanctioned the indiscriminate employment of the stuff fathered upon them.

During the protectorate of Cromwell there were numerous instances of disbanded soldiers of the vilest character taking upon them the practice of physic. In the present day, the quack is usually a cunning knave, of no education, who, by sheer force of impudence, and tact in playing on a weak point in human nature, pushes himself forward from an humble to an exalted condition. Dr Thornton, writing in 1813, says, "It is a known fact, that thousands of children lose their lives annually by *worm cakes*, advertised by the legal and infamous destroyers of their fellow-creatures, who, for the sake of gain, are still suffered to go on in their work of death in an enlightened period; and, alas! no patriot has as yet stood up to remedy this growing evil. The calculation of the quack is this:—'I was in my youth a chimney-sweeper, next a scavenger, and now I am a tinker or mender of kettles; my brother, the cobbler, has made a decent livelihood, and is much respected, by turning from mending soles to converting souls. I have no mountebank to be sure, but I can circulate handbills. In London alone there are a million of people; if one dies in seven years, many are ill before this comes, and I may reckon 25,000 are ill. If my bill reaches one in 100, and this one buy only a guinea's worth of my stuff, this would give me L.2500 a-year. In the country I find 15,000,000 of people, and my stuff sells as well in the country as in town, or better, not needing to see the folk; and as I live upon onions, and follow my trade for a time, and will advertise more and more as I get on, the odds are very much against me, if, with the king's arms, authority of parliament, and extracts from the Gazettes, but that I ride at last in my coach!'—nor is his conjecture wrong."

Dr Cowan adduces the following instances from different authorities:—"A Dr Meyersbach started about 1770 as a water doctor; he had arrived from Germany in a starving condition, and was first an hostler at a riding-school. Not making money fast enough, he set up as a doctor, and was consulted by all classes. It is believed that he acquired a good fortune, with which he retired to his native country.

Le Flevre, another German, a broken wine-merchant, set up for a gout doctor, and was much noticed by the nobility. Under pretence of going to Germany for more of his powders, he quitted this country, and had the prudence never to return. He carried over about 10,000 guineas, obtained by subscription and otherwise. Living in the style of a prince, he drunk daily, as his first toast, 'To the credulous and stupid nobility, gentry, and opulent merchants of Great Britain!'

A mechanic was afflicted with a serious disease, to get rid of which he applied to a physician of eminence; he was accordingly furnished with a prescription, which wrought a most perfect and expeditious cure. So well pleased was the patient, that he procured the same medicine for an acquaintance, and a like happy result followed its administration. He then procured the different ingredients, and learned from the doctor the art of compounding them. He now set zealously to work, and with the assistance of his friends and coadjutors, circulated the reputation of what they called the newly discovered remedy, and its fame rapidly extended. A name was soon found, it was duly advertised, it obtained an increased sale, its proprietor received orders from abroad, and he now at once left the workshop, and assumed the name, title, and honours of a doctor. He can now count his millions (dollars), and laughs at the credulity and gullibility of those who have contributed to raise him from obscurity to eminence, and from poverty to princely independence.

Many adventurers in the pill trade in England have risen to wealth by this method. Among the list may be found several clergymen, as inventors of this class of medicines, although, probably, the most successful of late years, is a man who was a short time ago a barber, and shaved for a penny!"

"It cannot be wondered at that so many take up the trade of quackery, as it is one of the most profitable in which a man can embark. Five hundred or six hundred per cent. is deemed but a fair and reasonable remuneration for the outlay of capital. This may startle, but it is true. Let me ask any rational individual how persons, without a farthing in the world to begin trading with, have been able to build splendid mansions, drive a carriage and pair, keep their town and country houses, with elegantly laid-out gardens and conservatories, and spend from five to six thousand per annum on advertisements, which is the case with more than one of the present race of quack-medicine doctors, if the trade was not most profitable? On a recent examination at the Insolvent Court, it oozed out that every pound laid out in the manufacturing of their body-destroying trash, produced a clear profit of six pounds."*

"The fact is, that quack medicines, at the present moment, are among the most tempting and successful speculations to the needy, the unprincipled, and the avaricious; and success is nearly or wholly independent of the real utility of the remedy—but, on the extent of the publicity given to it, on the ingenuity with which it is adapted to the public prejudices and cravings, and on the persevering and reckless manner in which its pretended virtues are attested.

In some instances, it does seem to have occurred to the modern empiric that it would be scarcely safe to found his claims to such wonderful knowledge upon his individual researches, and he therefore transforms himself into a body corporate, and his house into a college—(how?) by the speedy and simple process of having the word painted in large letters upon the wall! Fearing that statements might be mistrusted if put forth in the name of the party deriving the sole emolument from the sale, so the ingenious device is adopted of giving them the appearance of emanating from an 'association,' or 'society,' 'establishment,' 'hall,' or 'college,' of learned persons, and they come before the public with all the additional authority of an imposing name and an imaginary combination of wisdom!"

Notwithstanding the numerous cases of death and personal injury produced by taking quack medicines in England, no pains whatsoever have been taken, either by the public or by the medical profession, to extirpate the nuisance. The press, with two or three exceptions, has been worse than silent on the subject; for it encourages the delusion by giving systematic publicity to paid puffs abounding in the grossest falsehoods. We cannot help feeling, also, that to the regular practitioners of medicine, no small share of the blame of this state of things is chargeable. The Latin jargon in which medical prescriptions are clothed, the degree of mystery often maintained with respect to what is simply a plain matter of science, and above all, the incomprehensible variety of practitioners in the profession, not to speak of the unseemly contentions of rival medical schools and corporations—all afford admirable scope for the quackish pretender, and we can hardly wonder at uninstructed people being so easily imposed upon. While, therefore, earnestly warning our readers against purchasing or using a single medicine advertised in the columns of a newspaper, and recommending them in all cases of disorders to apply at once to a respectable medical man for advice, we are decidedly of opinion that the medical profession stands greatly in need of reform, and this reform must take place before any solid change is to be expected in the custom of depending on quackish pretenders.

* Weekly Dispatch, February 24, 1839.

SIGHTS OF A FOREIGN FAIR.

Fairs in France are conducted with a much greater amount of fun and drollery than in England, perhaps for the reason that the French in general are better acquainted with the art of being joyous, and are more lively in their mirthfulness. Enter the field where a French fair is held, and the number of sights and sounds around you will astound both eye and ear. Peasants and citizens, men, women, and children, crush, press, elbow, and bawl without intermission. The whining of clarionets, the groaning of drums, the tinkling of cymbals, the piping of pan-reeds, and the explosion of fireworks, symphonise, pleasantly or unpleasantly as the state of your temper may be, with the voices of the visiting crowd, and the loud appeals of the dealers and tricksters there present. At every step, some of these latter personages, from booth, stall, or stage, tempt you to make purchases, or try your luck, or patronise an exhibition.

Go into one of these places of exhibition, and you shall be treated to a set of pictures, formed by the slides of a magic lantern, most amusing and instructive to behold. You shall there see "the Emperor of Russia, at the moment when he is engaged in reviewing the grand imperial army. He has his staff beside him. You observe a young girl approaching. She is saying, 'Sire, my father wishes me to marry one man, and I want to marry another.' The emperor is replying in these *remarkable* words, '*Aller-bierhoff!*' which means, that to suffering humanity sovereigns should always be compassionate." After the magic lantern exhibition, pass on, and you will come to a natural philosophy lecturer, or, as he calls himself, physician-general of the people of France. He is a man who really possesses some knowledge of experimental chemistry, and, with the help of an electrifying machine, and a few other instruments, astonishes the peasants with his experiments in physics. The theatre of his labours is a small circular space, enclosed with a rude wooden railing. On a table in the centre stands an air-pump, a voltaic pile, Leyden jars, and the various appendages of the electrifying machine. When he exhibits, the country people ask in amazement how this man can bottle up the thunder of heaven in a phial. The voice of the physician-general of France is sad and plaintive when he says, "With my acquirements I might be entertained in the palaces of kings." Poor fellow! he perhaps believes what he says. He is the most honest of the charlatans, and one must per force pity him, when one beholds his attire, which speaks of a sore struggle between pride and poverty.

But the multitude have little feeling for the poor experimenter, and crowd to the side of a family of dancers and jugglers, consisting of a husband, wife, and several children. The father commences the performances. He is dressed in a Turkish garb, or one that is called Turkish all over the world—excepting in Turkey. He takes a few brass balls, and tosses them into the air in various ways, which he respectively calls the Japanese, Hindoo, Malay, and Chinese modes. Every now and then he calls aloud, "Gentlemen, I am the sole and only person now travelling who performs these wonders." The children, meanwhile, are lying upon a carpet, and looking as easy and careless as if they were not destined by and bye to the perilous feat of standing on the point of their toes on the paternal chin. Their first exhibition consists of a set of fearful postures, of which the father speaks with amazed rapture. In due time, the turn of the woman comes, and the man introduces her thus: "Gentlemen, my wife now before you, called the Female Hercules, will close our exhibition by bearing on her chest this weight, exceeding five hundred pounds. But first, gentlemen, I shall do myself the honour to make the round of this respectable company, and hope to experience their generous bounty."

Move on to the next exhibition. Here we have a rope-dancing and tumbling party, with a master or conductor, and a merry-andrew or clown, to preface the business. "Master, what are you going to give me," says the clown, "for bringing all these people to look at you?" "Why, I will give you a piece of gingerbread, Mr Merryman, which will suit you very well," says the master. "No, I won't have it," returns the clown. "And why?" "Because it is just the colour

Digitized by Google

of your wife's face." "Ah, you impertinent rascal!" says the master, bestowing some cuffs on the merry-andrew, which make him roar lustily. "Gentlemen," continues the master, pointing to his blubbering fool, "would you believe what this fellow did the other day? I sent him for a pennyworth of snuff, and a halfpennyworth of salt; and the rascal brought home the snuff in the salt-can, and the salt in my snuff-box!" "Yes," says the clown, "and I did it on purpose—to make you give up snuffing. Look what a nose it has given you—it is as big as a pump-handle! Ah, master, if you had but an addition to your family, what a capital thing it would be for your nose!" "Why, pray sir?" "Because you would then have a *little one!*" "Rascal!" returns the master, "take that—and that—for your impertinence!" "Oh! oh! eh! give me my wages, and I'll leave you," cries the clown. "You leave me!" retorts the master, "you would starve—you have no trade!" "I have," says the clown; and he lies down on the ground in a gasping state. "What are you doing, you fool? get up!" "No," replies the clown, "I am busy at my trade. You wanted to know it. Don't you see I am *dying*?" But the master puts an end to these magnificent jokes, by commanding the merry-andrew to proclaim, after him, the nature of the performances about to commence, which order the clown executes, but blunders at every word, to the infinite delectation of the audience, and at the cost of many bitter glances, rebukes, and cuffs from the master. "Tell the company, Mr Merryman, that my wife, Madame Van Betten, will have the honour to perform a wonderful dance before them on the tight rope, *without a pole*; a performance in which she stands unrivalled, and which has won for her, at many illustrious courts, the title of the Queen of Rope-dancers. Yes, gentlemen, she has positively a patent under that title from his Majesty Leopold, King of the Belgians, and his Majesty Louis Philippe, King of the French," &c.

But time enough has been spent upon this particular exhibition. A rival one close by attracts the eye. Here, also, a master and clown are preluding in a spirited style. "Where do you come from, Mr Merryman?—pray, tell me and the company," says the master. "I was born," replies the clown, gravely, "at the village of Go-and-look-for-it." "Go-and-look-for-it!—why, is that place in France?" "Oh, to be sure; it is close by the town of Seek-it-out," says the fool. "Ay, indeed; and what were your parents, Mr Merryman?" "My father and grandfather both attained to a very elevated position in the world," says the clown. "Did they so, my friend?" "Yes, master, they were both hanged." And so go on the prologuing pair, till again the master has to announce that the audience may now have it in their power, for the trifling sum of one penny, to behold two of the greatest wonders of the age, namely, "the young and beautiful Adelina, aged eleven, three feet high, and weighing two hundred and fifty pounds (French); and her brother, the youthful Alexander, whose circumference exceeds that of an ordinary regimental bass-drum." These interesting objects are very attractive to the audience.

Among other sights of the fair, you will have it in your power to witness a regular dramatic representation, if you choose; but you will certainly prefer a glimpse at the puppets, at Punch—inimitable Punch! Him you will find in his glory; for though almost banished from England, he yet reigns in France. March forward. See! the curtain is just drawn up, and there is the hero, armed with his indispensable stick. He is clever, Master Punch, but cannot play alone, and here is his friend Matamore, a blustering captain, to keep him company. "Good-day, Punch," says Matamore. "Good-day," says Punch, in reply, and in saying so, he gives a rap upon the head of the other with that restless stick, which has fought so many battles, and won them all. "Have the goodness not to play any tricks, Mr Punch!" exclaims the captain. "To be sure not," says Punch, and gives another rap upon the same spot as before. "Punch, Punch! do you know," cries the captain, "whom you are insulting?—I am the conqueror in a hundred million of battles!" "To be sure you are," says Punch, and down comes the everlasting stick again. "Punch, you will make me angry!" exclaims the captain, feeling his head; "had I not sworn an oath against anger, I would already have exterminated you!" "Very likely," returns Punch, and the stick comes harder than ever upon the other's pate. "Oh! I am killed!" Rap, rap, goes the reckless stick of Punch, till the captain at length falls dead, calling upon the *police*. They enter, and condemn the murderous Punch to be hung. A gibbet is erected, and the criminal consigned to the hands of the executioner. But when the fatal moment arrives, Punch cannot get his head into the noose, the rope being now too long, and now too short. To show how easy the affair is, the simple executioner, at the prisoner's request, puts his own head into the noose, on which the remorseless Punch tucks him up at once, and gives him a conclusory dance in the air. The Evil One, however, enters at the close of all these tricks, and carries off Master Punch, after a severe struggle, to a place not to be named. This gives a perfect moral finish to the scene; justice is satisfied, society avenged, and the spectators depart, at once edified and delighted.

The reader's memory will tell him that Punch is the same over all the world.

Of the hundred and one other sights to be seen at a French fair, it would weary the reader to speak. It is the number of them, more than any peculiarity they have in character, that renders these scenes worthy of note, and that chiefly distinguishes them from similar occasions in our own country.*

* This sketch is abridged, with some slight alterations, from an article in the *Courrier de l'Europe*, a new French paper published in London.

LOSSES FROM WANT OF PROPER SANATORY REGULATIONS.

It is now perfectly well understood by persons who have investigated the subject, that there constantly exists in every large town an immense amount of human misery, arising from no other cause than a want of proper regulations as to general cleanliness, ventilation, and sewerage; or, as we might at once briefly express it, caused by *breathing foul air*. The fact is indeed indisputable, as far as there have been any inquiries on the subject; but to set the matter at rest, and to afford a proper basis for legislation, all the towns in Great Britain are now in course of being officially examined under the authority of a royal commission. To this sanatory inquiry we shall afterwards have ample opportunity of returning; in the mean time, in order to show what pecuniary losses ensue—laying all suffering out of the question—from the ravages of contagious diseases in large towns, we beg to lay before our readers the following interesting document. It is a letter from Dr Couper of Glasgow to E. Chadwick, Esq., Secretary to the Poor-Law Commissioners, describing how the losses publicly and privately incurred by diseases, *which by proper measures could be prevented*, are much greater than all the expenses that would be incurred to institute these measures.

"*Glasgow, August 7*, 1840.

Sir,—I have received yours of the 30th July, acknowledging receipt of my answers to your queries, and asking further for any proofs or illustrations that may occur to me in support of the proposition advanced by me, 'that proper sanatory measures would cost the public much less than is at present expended in treating the diseases and pauperism which the neglect of those measures occasions.' In reply I submit the following considerations:—

1. In the year 1836, which may be taken as an example, there were treated in the Glasgow Fever-House 3125 cases of fever, at an average expense of L.1, 10s. each, and at a total expense therefore to the public of L.4687, 10s.

Note.—In this estimate nothing is allowed for the cost of the Fever-House, which was erected a few years ago, at an expense to the public of more than L.6000.

2. Of the above number, 498 died, and of the latter at least three-fourths, or 373·5 must have been buried at the public charge, at an expense of 10s. each, or L.186, 15s.

3. During the same year, 716 pauper fever patients, exclusive of those sent to the Fever-House, were treated in their own houses, by the district surgeons, at an expense (including the salaries of the district surgeons, medicines, cordials, &c.) of, say, to the public, 8s. each, and at a total expense, therefore, of L.286, 8s.

4. Of the above-mentioned 716 patients, at least one-tenth, or seventy-one, must have died, and of the latter three-fourths, or 53·7, must have been buried at the public expense, at a charge of 10s. each, and at a total expense, therefore, of L.26, 13s. 6d.

Note.—This estimate of the proportion of paupers buried at public expense will not appear too great to any one who considers the fact stated in the Glasgow Mortality Bill for 1839, namely, that during that year 21·66 per cent. of all who died, of every class, in Glasgow, during that year, were buried at the public expense.

The above estimate, too, it is to be remarked, of paupers treated in their own houses, has reference to the *burgh* of Glasgow only, which contains considerably less than one-half of the whole population. The actual expense, therefore, under items 3 and 4, must have been more than double what is here stated.

5. Of the above-mentioned 3841 paupers, treated in the Fever-House and in their own houses together, each (including disease and convalescence) must, on an average, have been rendered unfit for work for six weeks. The loss thus sustained would, at 5s. per week, amount to L.5761, 10s.

6. Of the above 3841 paupers, many must have been heads of families, and their children and other dependants must have been supported at public expense during the six weeks' incapacity of their parents, &c. Of the 569 paupers who died, the children and other dependants must have become a more permanent burden on the public. It is impossible to estimate the amount, but it must have been considerable in the various shapes of increased poor-rates, police and bridewell assessments, contributions to charitable institutions, and private charity.

7. But in 1836 the total deaths from fever in Glasgow were 841; if from this number we deduct the 569 deaths occurring among paupers treated at the public expense as above, there remain 272 deaths occurring among persons who, it is to be presumed, were treated at their own expense. It is not probable that the mortality in that class would exceed one in ten, and therefore 272 deaths imply the existence of 2720 cases, which could scarcely be treated at a less expense for medical attendance, medicines, cordials, &c., than L.8 each, or double the expense of a pauper in the Fever-House. The total expense, therefore, would be L.8160.

8. The funeral charges of the 272 persons of this class who died would amount, at L.2 each, to L.544.

9. But the 2720 persons treated at their own expense would, like the paupers, be rendered incapable of following their usual employment for a period averaging six weeks, and the value of their labour during that time would consequently be lost. The amount cannot be estimated, but that it must be great will be apparent, if it be recollected that this class begins with the poorest operative who can pay for his own medical treatment, and ends with the most opulent citizen of Glasgow, including betwixt those extremes all sorts of artificers, shopmen, overseers, clerks, professional men, managers, and proprietors of manufacturing and mercantile establishments, in the cases of many of whom, an interruption of business for even one day is attended with serious pecuniary loss.

10. It would be taking a very limited view of the subject, to suppose that typhus fever is the only disease, the prevalence of which is materially increased by the neglect of sanatory measures. The case is the same with small-pox, measles, scarlet-fever, hooping-cough, dysentery, scrofula, and a multitude of anomalous affections, all of which operate in the same manner as typhus fever, although to a less extent, in occasioning pecuniary loss to the public.

It is scarcely necessary to add, that all the above estimates are merely approximations used to illustrate the opinion which I have advanced. The actual expenditure for a series of years under most of the above items could be ascertained by the committee now sitting at Glasgow, and I have no doubt it would, as to the year 1836, more often exceed than fall short of that above stated. The items estimated amount, it will be observed, to nearly L.20,000, and half as much more may be added for those which are not estimated. Believing as I do that this large amount of loss has been inflicted in a single year on the inhabitants of a single town, by diseases capable of being prevented, to a great extent, by sanatory measures, the cost of which would probably not amount to one-tenth of the estimated loss, I cannot help thinking, without reference to human suffering at all, that a law compelling the inhabitants to contribute to defray the expense of these sanatory measures would be desirable on the score of economy alone. I am, &c. JOHN COUPER."

GOODWIN SANDS NOW MARKED BY A BEACON.

The large reef of sand on the coast of Kent, usually known by the name of the Goodwin Sands, and which has so frequently proved fatal to vessels during stormy weather, has at length been marked by a beacon of a remarkable kind. For the sake of mariners, we copy an account of the erection of the beacon from the newspapers of the day.

"The task, undertaken by Captain Bullock, of her Majesty's steamer Boxer, of erecting a safety beacon on the Goodwin Sands, about seven miles from the town of Deal, has been successfully accomplished, by which it is hoped to avert the dreadful loss of life by shipwreck which has so frequently occurred in that part of the British Channel. This object was accomplished under the superintendence of Captain Bullock and that of Captain Boys, superintendant of the naval store department of Deal. The beacon they have succeeded in erecting consists of a column about forty feet above the level of the sea, having cleets and ropes attached to four of its sides, with holds for hands and feet. At the summit of the column is attached a gallery of hexagon form, made of trellis work, and capable of holding twenty persons at one time. Above the gallery, and in continuation of the column, is a flagstaff ten feet long, thus making the entire beacon fifty feet in height. The sides of the gallery are so constructed as to enable the persons in it to be covered in with sailcloth, which is reefed in and round it, and can be used at pleasure; as also an awning to pass over it, which is fixed to the flagstaff; thus entirely protecting any unfortunate mariner who may seek shelter on the column from foul and tempestuous weather. A barrel of fresh water, together with a painted bag enclosing a flag of distress, is stationed on the gallery, and the words 'hoist the flag' painted in the languages of all nations on boards stationed round the inner part of the gallery, so that the foreigner as well as native seaman may be enabled to show a signal of distress, and obtain help from shore, which is about seven miles distant from the beacon. The means by which the beacon has been erected in so extraordinary a place as the Goodwin Sands, are as follow:—The foundation of the column is several feet below the surface of the sand, and is secured in the centre of a stout oak platform, extending from it on either side several yards. This is secured by upwards of two tons of pig-iron ballast being lashed to it. In addition to this, eight stout iron bars, each six feet long, are driven obliquely on each quarter of the column, and two also put at a distance of twelve feet on each quarter, and chains attached to them, communicating with the upper part of the column and the gallery. The sands for three or four hours during the tides are high and dry, and present a fine tract of level extending for several miles. Great numbers of visiters from Ramsgate and Deal attended the erection of this tribute to humanity. The indefatigable exertions of Captain Bullock, Captain Boyes, Lieutenants Gull and Bowes, and the other officers and men engaged in the undertaking, are deserving of the highest praise, they being compelled to work for several hours up to their knees in water."

Column for the Boys.

[From a pretty little work, "The Hartopp Jubilee; or Profit from Play," by Mrs S. C. Hall. Darton & Clark: London.]

THE SELFISH BOY.

"THERE was not a lad in the school where my early days were spent, who had a better allowance than Gilbert Lane; he was the only son of wealthy and respectable parents. They were possessed of at least three thousand a-year, as Gilbert well knew, and certainly were most generous to their petted son, who had never been contradicted in his life, before he came to school.

At Raby House school, we had only twelve boys; our master was an honest, upright man, as fond of discipline as your friend the village schoolmaster, and, like him, not at all disposed 'to spare the rod, and spoil the child.'

Gilbert was not only a very handsome, but a very clever boy; he would hit off in ten minutes what would take any other lad twenty; and his long curling hair, of a bright gold colour, flowing over his shoulders, his large grey eyes and brilliant complexion, gained him the name of 'The Beauty,' a distinction lads in my time were not ambitious to obtain. He certainly was handsome; and would have been *very* handsome, but for an expression of cunning which lurked in the more hidden corners of his face; and though his brow was fair, it was not open. Such was the first impression he made on me; but my father had always said, 'My dear son, if you conceive a prejudice *against* a person at first sight, always be ready to lay it down; if in his favour, cling to it as long as you can, for it is our duty to avoid impressions against our fellow-creatures.'

No boy in the school brought so many boxes with him to Raby House as Gilbert Lane; and two of the little lads discovered that one of the chests contained apples, oranges, and, it was to be supposed, cakes. Gilbert, at his father's request, had a small room appropriated to his own use; and we boys were not sorry for it, for we were very happy in our chamber, and disliked the idea of a stranger much. Our master gave us a holiday in honour of the new pupil's arrival, and little Henry and Caleb were full of expectation of a feast, which they hoped would make its appearance from Gilbert's chest. Such, however, was not the case; but when we retired to bed, Caleb's quick ear caught the sound of munch, munch, munch, from Gilbert's room. After the lights had been extinguished, he applied his little eye to the key-hole—a proceeding which I highly disapproved of—and saw this selfish boy sitting in the bright moonlight, surrounded by oranges, cakes, and confectionery of all kinds, and eating, first of one, then of another, in a manner which filled the little observer with shame.

'I never thought any one *could* be so greedy,' he exclaimed. 'What signifies his new clothes, and fine silver buckles and large bows, and beautiful curly hair, which we all admired so much, if he has a narrow heart—a heart,' added the little fellow, 'no bigger than my little finger. I suppose he will not let me fly his kite, or play with his playthings!' All this was said in a whisper, for we ought to have been asleep. The next morning we wondered if Gilbert would eat his breakfast; and it did not escape our observation, that kind Mrs Moreton, the doctor's wife, pressed him frequently to take his bread and butter, but without effect.

'Poor fellow, he is fretting for his parents,' said the good lady; but we boys knew he had already breakfasted.

The very first day placed Gilbert Lane at the top of his class, and we saw that the new comer was a lad of no mean ability; but we also perceived that his selfishness was not confined to eating—he never then, or at any other time, gave a schoolmate the slightest assistance. If a word was missed, he was never the one to whisper it to the defaulter; he would never endeavour to screen a fault, or assist either a big or little boy out of a dilemma. He would stand by, and hear a fellow-pupil severely reprimanded for an occurrence which his kindness might have prevented, and he would even hear the reprimand with satisfaction.

'Gilbert,' I said to him one day—I was three years older than he—'Gilbert, you will never gain the hearts of boys or men, if you pursue this selfish course.' 'I don't care,' was his answer, 'for either the one or the other; I shall have lots of money, and my own way.'

It would take hours to describe to you the various ramifications of his selfishness; but it frequently brought its own punishment, to the destruction of the ease and enjoyment he so dearly loved. Once, I remember, he ate as usual by himself so large a quantity of plum-cake, that he was confined to his room for more than a week; no one pitied him but little Caleb. The child would steal in during play-hours, read to Gilbert, or sit silently watching while he slept—drawing or withdrawing the curtains so as to shade his eyes from the light, and tending him as if he had been a brother; indeed, to this day, I can never think of Caleb without a thrill of happiness, for what he was in childhood so was he in manhood—a noble, disinterested fellow; still living respected and beloved by all to whom he is known. When Gilbert grew better, he treated his little friend with rather more consideration, but still nothing could tempt him to forego his own comfort. 'I will not lend you my pencil, Caleb,' I heard him say, 'because I may want it before you have done with it; and I must not be inconvenienced.' It was painful to see any boy so heartless.

One day a letter was given to the good doctor while we were at dinner, and I heard him say to his wife, 'I must not tell him suddenly.'

'There is no danger of wounding his feelings,' she replied; 'don't you see he is eating his dinner.' 'Master Gilbert Lane,' said the doctor aloud, 'I am sorry to tell you that your mother is not well.' 'She has often colds at this season of the year, sir,' was the reply, and Gilbert went on finishing his roast beef. 'But she is seriously ill,' continued the doctor. 'Indeed, sir, I am very sorry for it,' and he laid down his knife and fork, after having delicately salted and eaten the last morsel. 'She is so ill, so *very ill*,' the master went on, evidently provoked at his coolness on such an occasion, 'that your father has sent the carriage for you; it is waiting at the entrance.' Gilbert turned a little pale, and half rose from his seat, as if to prepare for his departure; but the sight of his favourite pie, which was at that moment placed upon the table, made him waver in his determination—he stood uncertain how to act—the pie was cut—*he resumed his seat*—the boys murmured their disapprobation, and the master, fixing his eyes steadily upon him, said, 'Sir, your mother is dying, and the carriage is waiting.'

'Yes, sir; but *if you are good enough to help me first, I shall be done in a minute!*'

I shall never forget the groan of anger at this selfish heartlessness, which they had never imagined could be carried to such an extreme. Doctor Moreton's appreciation of the youth's talents had made him overlook several traits which unfortunately he considered of minor importance; for Gilbert had hardly taken the trouble to conceal his selfishness even from the doctor. If he had been placed with a master who considered greatness as *second* to goodness, I think the fault, instead of growing into a crime, might have been considerably decreased. The master was painfully shocked by this public display of wickedness, for such I must call it; and, with tears in his eyes, gave a reproof to him, and a lesson to us, which I never forgot: he said that the talent possessed by Master Lane made him the greater sinner, for that he was perfectly aware of the difference between good and evil. He drew tears even from the boy himself, who departed from the house with the dislike of all whose esteem, respect, and affection he must have commanded but for the ascendancy his besetting sin had obtained over him in every respect.

His mother, his too affectionate, too indulgent mother, died before his arrival. She had heard the sound of the carriage wheels in the court-yard; had extended her hand to meet his grasp; had turned the last light of her dying eyes towards the door; but the hand was stayed—the sight departed before he entered the room: two minutes sooner, he would have had her blessing!—that blessing he had lost in his anxiety—for what? a piece of pie!

Now, you must remember that this youth, this Gilbert Lane, possessed abilities of no common order; that he was intelligent, well-informed, and of graceful manners and address. But both his tutor and his father, and, above all, the servants, felt they were *only* company manners; and those immediately around him were perpetually subjected to annoyances which the residence of an intensely selfish person in a house is sure to create; his equals, when they became *intimates*, avoided him, and even his inferiors, if they obeyed his commands, spread the fame of his evil disposition over the country. Some tolerated him out of respect to his father, who, though a weak, was a kindly man; others because of his wealth, which is sure to command the outward attention of mean and grovelling minds; a few admired his abilities, but none loved Gilbert Lane for his own sake—*for his own sake* none loved him; and the experience of a long life has convinced me that it is necessary to the happiness of every living thing to be beloved: the meanest reptile that crawls the earth, however obnoxious it is to us, has something that loves it, a partner, or its own offspring, who see no deformity in the parent that cherishes their helplessness. Nothing, however, loved Gilbert Lane; the dogs that crouched round his feet, were so accustomed to feel his foot or the lash of his whip, when they inconvenienced him in the slightest degree, that they obeyed from fear. He had his own particular chairs, his favourite dishes, his *own* this, that, and the other, which no one was to interfere with; to his own father—his own kind, weak father, his once loving father—he had become a positive nuisance: what, then, must he have been to others? But Mr Lane could not continue in the state of discomfort to which his son had reduced him; he resolved to marry again; and when he communicated his determination to Gilbert, who was then about sixteen, his observation was 'Marry again, sir! you are not serious. Why, father, if *you* marry again, what is to become of *me*?'

It was my fate again to meet this selfish youth at Oxford. His beauty, and his great attainments, his anticipated wealth, won him distinction even there. But after a little time, that distinction was far more painful than pleasing.

'Lane could do this, and Lane could do that.' 'True—but he is so selfish!' was the invariable answer. Then, if a party was forming, 'Shall we ask Lane?' 'Oh, no, he spoils every thing, he is *so* selfish.'

In process of time his father had other children, and then came the rumour that Gilbert Lane's fortune would not be as large as was originally supposed. He knew this; and always alive to his own interests, obtained the hand of a very wealthy young lady, who, captivated by his beauty, and unacquainted with his previous character, consented, on a very short intimacy, to become his wife. She soon found that she was his victim; she became mother to five children, and died, I believe—if ever woman did—of a broken heart. Still he had plenty of riches; his children were admired—he liked whatever he had to be admired—but as they grew up, their feelings, their education, their advancement in life, were sacrificed to the selfishness of their father, and one by one they deserted him, all but one pale, patient girl, whom perhaps he had regarded the least of those whom God had given him.

Accustomed as he had been to indulge in what, I dare say, boys, you have heard called the 'pleasures of the table'—which are sure to bring *pains*—at an early age Gilbert Lane felt the tortures of the gout, and the agonies of continued headaches; neither his wealth nor his talents could remove these, which he had brought upon himself. His father was still a robust old man, while he was a decrepit young one; and he had the additional mortification of knowing that his step-brothers and sisters would inherit whatever portion of his father's property he could leave them; not that he wanted, for, as I have told you before, his wife's fortune had been ample.

Hearing of his extreme suffering, I called to see him. The servant, of whom I inquired particularly the state of his health, did not show any sympathy about it: 'Master was as usual.' When I entered his room, it was crowded with all the luxuries, which in themselves are harmless and elegant, but, when unaccompanied by cheerfulness and content, show like flowers in a sepulchre. He was seated in an easy chair, his feet encased in flannels, and resting on a sofa; his features were bloated. At a little distance sat his pale, fair daughter, the youngest of his family; she was about fourteen, and had evidently been reading to him, though her eyes were red from weeping. Almost under her dress crouched a little spaniel; and a basket of grapes was upon a stand by his side. He seemed glad to see me, and I believe he was, for selfishness such as his has few visiters; but our conversation soon flagged; he knew I could not have forgotten his unpopularity at school, his unpopularity at college, and he seemed as one prepared to receive reproof, and extenuate his conduct.

He began by finding fault with his father, who still lived—told me long stories of his sons' ingratitude, which brought tears into the eyes of his patient child, and then he fell to reproaching her: 'She never loved him,' he said. 'He was sure she wished for other company; he hated tears, she knew he did, and yet she was always weeping.'

Twenty times in half an hour did he make the poor girl adjust his pillows, and arrange his footstool, talking all the time of the ingratitude of a world upon which he had never bestowed a single blessing; upbraiding his daughter, more than once, with performing those offices coldly, which at all events she performed with a sweet willingness that won my heart. Then he would call the little dog to him; and the creature, though it would fawn and crouch, would not go near him, at which he complained most bitterly. He had commenced life in the expectation that all should bow down to his will; and disappointed in this, his selfishness deepened into a rooted hatred of that world which he believed at war with him. He said he was sure he should not live to be old. I knew that death would ere long be busy in his dwelling, *but not with him.*

The selfishness that could keep a son from the bedside of a dying mother, and make him think only of himself when a daughter was about to be taken for ever from the domestic hearth, needs no comment of mine.

My next visit was to his dying daughter. She was indeed a sweet, unselfish child. 'Do come and see poor papa, when I am gone,' she said, 'and teach him to look to heaven, as you have now taught me; *for in this world there will be no one to love him.*'"

"How very shocking," observed Mark, "it must be, to have no one to love one—no friend, no one at all to love one," repeated the boy more than once. "How very desolate, how very miserable it must be; no one to love one! Oh, sir, when that dear young lady died, how wretched that bad gentleman must have been!" "He was certainly," answered the clergyman, "very wretched; and died about five years ago, more neglected than you can imagine; he sent for me a few hours before his death, but it was too fearful an end to describe to you. My dear boys, the outline I have given is sufficient to show you the blackness, worthlessness, and misery of a SELFISH SPIRIT.

There is no true happiness in this world," observed the good clergyman, "except in the discharge of our duties, be they what they may. We can only live with advantage to ourselves, in proportion as we perform our duty to others. And the peasant who brings up his family by hard but most honourable industry, deserves as much praise, and as much respect, too, in his sphere, as the prince who rules a province with wisdom and goodness."

WAR AND PEACE.

The national joyousness of war may exceed that of peace, but its joys are more fallacious, if not criminal. It is a period of exertion, of high excitement, in which a consciousness of internal maladies is forgotten in the death-struggle for foreign mastery. Moreover, it is a season of spending, waste, and reckless prodigality. It is a delirious state—intoxicated by victories, if successful—bursting into rage, or sinking into despondency, if defeated. Peace, on the contrary, is less obnoxious to extremes. It is a time of quiet, of reckoning up, saving, and forethought. The smallest evils that exist are felt; all that are impending are imagined and magnified. War affords a ready excuse for every disorder, every public privation, every remedial postponement; but peace is the ordeal of rulers. Public burdens are nicely weighed, and the pretext for their continuance scrutinised. Not only is the physical condition of the people considered, but their laws, religion, political rights, and even morals, become the common topics of investigation. There is leisure for every thing, as well as disengaged talent, energy, and enterprise. The troubles and entanglements of peace are mostly the bitter fruits of war; but the glories of war can only be won by dissipating the blessings peace has accumulated. —*Wade's British History.*

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

NUMBER 456. SATURDAY, OCTOBER 24, 1840. PRICE THREE HALFPENCE.

THE LATE SCIENTIFIC MEETING AT GLASGOW—ITS EXTERNAL FEATURES.

It is now nine years since, at the suggestion, we believe, of Sir David Brewster, an assemblage of scientific men took place in the city of York, under the name of the British Association, with the design of holding similar meetings annually in other cities of the United Kingdom; the purpose being, in the first place, to afford to the cultivators of science throughout the British islands an opportunity of meeting and becoming acquainted with each other, as well as with such foreign philosophers as could be attracted to the meetings; in the second place, to enable men of science to combine for the investigation of particular objects which were acknowledged to be beyond the range of individual exertion and individual means, and, in various instances, to come with their collective weight before the government, for aid in pursuing those objects. The first meeting at York, the second at Oxford, and the third at Cambridge, were attended by a comparatively small number of learned persons; but they nevertheless were found to be so far successful in accomplishing the objects in view, and were at the same time so agreeable in themselves, both to the strangers who assembled, and to the native parties amongst whom the assemblies took place, that the British Association was already acknowledged to be a thing full of life, and likely to continue to live. The meeting at Edinburgh, in 1834, was the most brilliant that had taken place, both for the distinguished strangers who attended and the interest of the proceedings. It was honoured by the presence of M. Arago, perhaps the most eminent cultivator of physics now living, and of M. Agassiz, whose researches in the organic department of geology have placed him, at an age which may be called youth, in the highest rank of European science. As might have been expected in a city whose leading class is composed of the learned professions, an unprecedented number of resident members here joined the association; very great efforts were made to provide for the convenience of the body, by arranging suitable places of meeting; a hospitality amounting to something like "open house" was displayed by the citizens; and every possible facility was afforded for visiting museums, districts interesting on account of peculiar botanical and geological features, and even such places as could only be expected to gratify taste or curiosity. The general feeling on this occasion, we can well remember, was one of a most pleasing kind: the strangers were delighted with the picturesque city and the kind reception they experienced in it; the resident parties were equally gratified in indulging those benevolent and polite sentiments which gave such pleasure to the strangers: it was a little lull in the hurry of ordinary selfish pursuits, in which man was allowed to be to man all that he was perhaps intended to be by nature, but which he has been prevented from being habitually by the arrangements into which society has fallen. The next meeting at Dublin was also a brilliant one, and showed a still further advance in the prospects of the association. The meeting of 1836, in Bristol, was distinguished by the promulgation of the results of Mr Cross's experiments in the formation of crystals by slow electric action, one of the most deft imitations of nature's mysterious workings which has ever been practised. The subsequent meetings at Liverpool, Newcastle, and Birmingham, were all of them agreeable meetings, particularly that at Newcastle, where there was more than usual in the locality to interest men of science, as well as a greater power and disposition than is usually found in English provincial situations to appreciate the objects of the association. At all the meetings, papers on scientific subjects were read, and scientific discussions entered into, not always of course with the effect of adding matter of importance to the previously existing amount of human knowledge, but still upon the whole greatly promoting that object, or tending to favour it. Several objects have also been prosecuted by the collective power and funds of the association, particularly observations on temperature, and investigations in the subject of terrestrial magnetism. Some over-peremptory persons ask what single thing of note has ever yet resulted from the labours of this annual collection of savans. It will perhaps be of little avail, as far as they are concerned, to answer the question by pointing to an expedition now cruising in the Antarctic Ocean, in consequence of the efforts of the association, for the investigation of one of the most important physical phenomena of the globe—that unseen influence of which it seems to be merely an accidental and external result that the mariner is enabled by it to know his path on the unmarked surface of the deep. We can see other great ends in the way of being served by the British Association. By meeting every year in a new place, we conceive that men of science must themselves be greatly benefited, in as far as new features in the manufacturing and commercial system of the country, as well as in its moral condition, are brought under their notice. From the personal observation of such features, may we not reasonably expect that, in some instances, ingenuity will be stimulated to new inventions, philosophical knowledge brought to bear on things hitherto left to the imperfect management of "practical men," and philanthropy and legislative wisdom awakened to improvements in the moral affairs of the community? On the other hand, can we suppose that, in any British city, whether slumbering in a quiet rural district, or deafened by the din of incessant business and work, science and scientific men will, for one whole week, be the subject of exclusive thought and (shall we call it?) glorification, without awakening in many minds in that town faculties for scientific study which might have otherwise lain dormant, and imparting a general respect for that bright effluence of high intellects which too often languishes through the coldness, if not the positive hostility, of the unenlightened!

The meeting of the present year took place at Glasgow, one of the most interesting situations which the association has yet visited, both on account of the many great mechanical operations going on in it, and the physical features of the neighbourhood, amongst which may be included the numerous rich mines of coal and iron, and the geological character of the shores of the Firth of Clyde and the Island of Arran. For some weeks before, an active band of local secretaries had been engaged in making the necessary arrangements, and in raising a subscription to defray the expense of accommodating the association; a burden which the gentlemen at each place visited have hitherto taken upon themselves. We were informed that considerable difficulty was experienced in raising this subscription. Practical philosophers do not readily at any time render honour to those who only observe and speculate; the object had no special appeal to any political party; and a wicked London newspaper had imparted a disrespectful impression of the association. After all, the public spirit for which the citizens are remarkable came to the rescue, and L.2800 was collected, the Marquis of Breadalbane, the President-elect, giving the princely donation of L.400.

We arrived in Glasgow on Wednesday, the 16th September, being the day before the first meeting. We found that a large room in Hutcheson's Hospital, a central situation in the city, had been fitted up as a reception-room for the members. Boxes, like those of the money-takers at a theatre, had been constructed all round, with clerks and other officials posted in them, while large labels overhead gave information with respect to the various purposes for which these boxes were designed. Tickets were to be applied for at one place by resident members, at another by non-resident members; at a third, tickets for non-resident ladies were given out; a fourth booth was a register of addresses; a fifth a register of lodgings for strangers, and so forth—the business at every place being conducted with an appearance of anxiety to oblige, for which each stranger must have felt sincerely grateful. There were even officials going about, marked with bits of ribbon in their button-holes, to indicate that they were prepared to answer any query which any stranger might think proper to put to them. Altogether, the arrangements at this place were excellent, and such as could have scarcely been expected in any other than a city of high commercial character. The room was a scene of great bustle, full of dripping strangers just alighted from coaches or landed from steamers (for it was a day of heavy rain); yet all affairs proceeded as smoothly as in a bank or any public office of old standing.

Throughout the streets, various symptoms of the meeting struck the eye. At the entrance to Hutcheson's Hospital (which, by the way, is only a charity for old people, not a place for the treatment of disease), a very miscellaneous crowd had assembled to behold the strangers, as they successively arrived to get their tickets and give in their addresses. When an individual approached in a carriage, and especially if himself or the carriage bore a foreign or distinguished air, a great excitement prevailed, every one being eager to learn, while no one was able to tell, who or what he was. The names of some eminent English and foreign philosophers, who were expected, had been caught up by the mob, and accordingly every gentleman who drove up was liable to be taken for one or other of those persons. We heard several individuals alleged very confidently to be Quetelet, or Agassiz, or Sir John Herschel, whom we knew to be the most ludicrously opposite to those individuals in genius and attainments. Amidst the crowds upon the streets, it was easy to detect frequently occurring strangers, either by their dress and aspect, or by that wandering and curious gaze which strangers in a large city naturally indulge in, so different from the cool indifference and the steady straightforward movements of those accustomed to behold every neighbouring object every day. Lodgings were, for this afternoon, an almost exclusive object with the strangers; and on this point some anxiety was unavoidably felt. It was given out that bedrooms at good hotels were greatly raised in price, and scarcely to be had, and that very high sums were also expected for private lodgings. It must have been the mere expectation of a difficulty which was here operating, for in so large a city there could be no real difficulty in accommodating one or two thousand strangers. The expectation, however, was sufficient to keep up prices, and accordingly lodgings were in most instances unreasonably dear. We mention this only to introduce the remark that some arrangement for keeping down the price of lodgings at a reasonable level is greatly desirable for the success of the association itself, particularly as far as the gathering of foreign savans is concerned, most of these men being in the enjoyment of comparatively narrow incomes,

and therefore no more than prepared for the ordinary rates of expenditure in this comparatively affluent country. It must obviously be no inviting circumstance in the eyes of a Berlin or Copenhagen professor, that his colleague, on attending the association at Glasgow, paid from ten to twenty shillings for every night's lodging. For the convenience of the strangers, the tickets of admission given out at the Hospital contained on the obverse a neatly engraved plan of the city, on which were marked, in various colours, the places where the business of the association was to be carried on, while below was appended a list of places usually visited by strangers, and of the various banking offices. A reading-room of noble proportions, in the Exchange, was here marked as free to the strangers of the association during the week of the meetings. One or two other places were free; but we heard it remarked with surprise by members of the association, that none of the great factories were thrown open to them, as had been done at Newcastle and other places, though no doubt admittance would be granted, as usual, on particular applications being made. Still farther to guide strangers through the city, placards were stuck upon the corners of almost every street, with the words, "To the College," "To the Green," &c., the direction being marked by arrows. Thus, the necessity of asking one's way was, by a very simple process, completely obviated.

Next morning, "To the College" was the general impulse. Here the seven sections into which the association is divided were to hold their meetings in the various class-rooms, every day for a week, the hour of assembly being eleven. The college is a fine old suite of buildings, composed of several dingy but venerable courts, and situated in the more ancient quarter of the city. Its front, towards the High Street, is a very handsome façade of the time of the Commonwealth, with an arched portal in the centre, surmounted by the Scottish arms as borne in the reign of Charles II. The day was fine, and by ten o'clock the streets near the College, usually full of the working population alone, were seen thronged with groups of ladies and gentlemen moving towards the place of meeting. The wonderment of the squalid denizens of these streets at the unwonted figures mingling amongst them, was not the least interesting feature of the affair. At the head of every dusky alley, and at every shop door, along the High Street, stood a group of dirty women, with and without children in their arms, speculating on persons and things the most remote from the ordinary current of their ideas. The entrance to the College was beset by a larger group of a similar description, which lasted the whole week, and through which the police found it difficult to make avenues for the approach of the members and their lady friends. Every window near the College also contained its knot of gazers, all evidently full of excitement respecting this singular congregation of the wise and learned. Within the courts were now gathered troops of members, with their female associates, some appearing with the anxious and abstracted air of men who had to take part in the proceedings, others looking as men who have only met to be amused and entertained. Old acquaintances were seen greeting each other in the hearty manner of people who have long been apart; and many were seen undergoing the stiffer ceremony of being introduced to new friends. The miscellaneous character of most of the assemblages was striking. There were, in the first place, well-dressed English gentlemen in large proportion. There were more familiar figures of native merchants, manufacturers, physicians, and other professional persons. Country clergymen were there, in dark attire of homely cut, with rustier figures still of schoolmasters and "tutors." A few anomalous figures were scattered throughout, as an Asiatic in his proper costume, a moustached and long-haired German, or an eccentric native wearing his hair or his clothes in some fantastic fashion. Then there were gaily dressed Glasgow ladies, spectacled and unspectacled, all on the outlook for "the lions," particularly for their old friend Dr Chalmers. Add to these a few London reporters, with the bustling demeanour and knowing aspect of their class. Those who knew many of the company by sight, were able to recognise various persons remarkable for their schemes as to human improvement—for example, Mr Robert Owen, who carried a new world packed up in a roll of brown paper, and was looking, as usual, the most practical and plausible of men. It is remarkable, by the way, how very attractive the association seems to be for men of schemes and theories. There were no fewer than three present on this occasion, including the famous socialist, who think it only necessary to divide mankind into parcels of two thousand, in order to make them all that they ought to be. This is the more remarkable, as the association, consisting chiefly of men of physical science, seems to be a most unfavourable field for any who contemplate what is not capable of immediate practical demonstration.

The members, on entering, had been supplied with a printed programme of the day's proceedings. Those, therefore, who were interested in more than one department of science, were able to decide which section they should attend, according as the papers to be first read in each were to them of an attractive character. There was at first a rush to the section of mathematics and general physics, from its being held out that Sir John Herschel should there open the proceedings by reading a report of some recent observations in magnetism; but it was soon ascertained that Sir John had not arrived, and the superfluous attendance on this section was therefore quickly reduced. It may readily be supposed, that for the first day in particular, and in some degree throughout the whole meeting, the *personnel* of the association was what chiefly attracted the multitude. Finding that, in this respect, the geological section was peculiarly rich, many went thither, and there certainly was no ground for their being disappointed, for the very first men of the science were present. This section met in a large class-room, containing an elevated bench along the side wall, with forms ranged below, and, opposite the bench, black boards for demonstrations, while various large sheets, containing geological plans, maps, sections, and organic figures, were slung from ropes on each side, full in the view of the audience. The president and his committee occupied the elevated bench. There was Dr Buckland, a little clerical-looking man, with a round bald head and pale and somewhat massive features: there was Mr Lyell, a comparatively young man, with light and long brown hair, sparkling blue eyes, deep set beneath a prominent *knowing region*, and a chin of uncommon depth and prominence—wearing a brown surtout, and frequently using an eye-glass suspended from his neck. Mr De la Beche was also present, but we did not become acquainted with his figure. Near the president, Mr Greenough was usually placed, an elderly gentleman of fair complexion and prepossessing aspect. Mr Phillips, a light middle-aged man, in duck trousers and a black coat, usually took a position near the black board. A day or two afterwards, we found Mr Murchison added to this goodly assemblage: the author of the Silurian System is a tall military-looking man, of dark complexion and handsome aquiline features. Near the end of the week came M. Agassiz, a good-looking neatly dressed man of about thirty-two or three, with dark eyes, and cheeks more plump and rubicund than one usually expects in a student: he spoke in the French language, though not altogether unable to express himself in English. Some native geologists, of rising character, as Mr Maclaren and Mr Milne of Edinburgh, and Mr Smith of Jordanhill, added to the attractiveness of this section, which formed altogether an amusing commentary on the allegation of the newspaper above alluded to, that none but quacks now attend the British Association, the fact being that not one man of first-rate character in geological science was here wanting, except Mr Sedgewick, who was, by his own declaration, only prevented from attending by strict professional duty. The president of the section was the Marquis of Northampton, a person not merely ornamental, but who on various occasions showed himself well acquainted with the science, as might be expected, indeed, from one who holds the distinguished situation of President of the Royal Society. The Marquis is an elderly man, of a dark wiry complexion, and dressed very plainly in a long blue surtout. We occasionally observed in this section the Duke of Hamilton and the Marquis of Breadalbane, suggesting the idea of rank gladly coming to learn at the feet of science. Rank was here indeed confounded. The Duke of Argyll was content (and how honourable such contentment!) to hold a subordinate office in the mechanical section. We saw his grace come forward one day in the geological section, and communicate some information on a debated point, preceded and followed in the debate by men of various grades in life between the distinguished and the simply respectable.

The section of Mathematics and General Physics, though disappointed of the presence of Sir John Herschel, had brought together some eminent persons. We readily recognised Sir David Brewster, with his conspicuous white hair and saturnine complexion, still looking very healthy and active. Here also was Sir Thomas Macdougal Brisbane, who, for the sake of astronomical observation in a southern latitude, accepted the office of governor of New South Wales, where he accordingly reared an observatory, and pursued scientific investigations for some years. Sir Thomas, who is president of the Royal Society of Edinburgh, is a stout gentlemanly figure, of mild and prepossessing appearance. The rough aspect and powerful knowing organs of Mr Whewell were conspicuous in this section, as also the slender figure and lively nervous temperament of the youthful Professor Forbes. We unfortunately did not ascertain the bodily form of Major Sabine, nor that of Professor Airey, both of whom, however, were present. At a later period, this section was graced by the presence of Professor Encke of Berlin, the discoverer of the well-known comet of quick rotation, which, as Professor Airey elegantly remarked, "bears his name in every mouth but his own." In the section of Botany and Zoology, Dr Fleming, Sir William Hooker, and Sir William Jardine, were the most eminent figures. In that of Chemistry and Mineralogy, the chief persons were Dr Thomson of the Glasgow University, and Mr Johnston, a young but active and acute professor in the new University of Durham. The Medical Section was graced by the presence of Sir Charles Bell and Dr Abercrombie. The discoverer of the duplicity of the nerves is a short, elderly man, of pale complexion, with a strikingly active and enterprising aspect. The author of the agreeable work on the intellectual powers is also a short man, but of dark complexion and full massive face, and with a head of splendid proportions. We were little in the Mechanical Section, but found it presided over by Sir John Robison, a gentleman who, if he had no merits of his own, would be regarded with respect as the son of the author of the best treatise we have on Mechanical Philosophy, the late ingenious and extensively informed Professor Robison of Edinburgh. In this section we also found Mr Scott Russell, so well known for his experiments on the sailing of vessels; Mr Whitworth of Manchester, a practical mechanist, who, we have been told, has a large factory solely devoted to the making of his own inventions; Mr Fairbairn, also a most distinguished mechanist of Manchester; and M. Ardseer Cursetjee, an engineer in the service of the East India Company. The person last mentioned is a native of India, of dark complexion, and wearing his country's picturesque garb. In the Statistical Section, Lord Sandon, Colonel Sykes, and Mr Felkin, stood pre-eminent amongst the strangers; from Edinburgh had come Dr Chalmers and Dr Alison, charged with their opposite views on the poor-law question; while Glasgow contributed some most pains-taking and serviceable statists of its own, as Dr Cowan, Mr Miller, the superintendant of the city police, and Mr Watt—Dr Cleland being, we believe, absent from illness. It may here be mentioned, that a Phrenological Section, unconnected with the Association, met in another part of the town, and was attended by Mr Combe, Mr Simpson, Mr Deville, of London, and some other eminent cultivators of the new philosophy.

This brings us to observe one thing as specially remarkable at the sectional meetings, namely, that amongst those assembled there was a much greater proportion of intellectual-looking heads than there is ever seen in ordinary assemblies. By intellectual-looking heads, we of course mean heads of such size and elevation as the simplest experience, not to speak of any thing in the shape of a science, shows to be usually accompaniments of superior ability. In the assemblies where others were admitted besides members of the association, the smaller proportion of fine heads was very obvious. There was some interest for a stranger in casting his eye over the crowd, and reflecting on the quantity of mental power represented by those heads, and in considering, respecting any particular one whose owner was unknown to him, that possibly it had gained for its owner a wide-extended fame. It was impossible to look around on such an assembly with any thing like indifference, or to form a depreciatory idea of any one person present; for who could tell what cumulative greatness might be in the room at the moment, or how much might belong to any particular individual on whom the eye was for the moment fixed! We might think, respecting some one, that certainly the aspect was unimpressive and the figure uncouth, and next moment we might be told that that person was the celebrated Mr or Dr such-a-one, a man whose writings we had been accustomed for years to read with reverence and delight. Nor do we here alone regard men of fame, or those who may be enumerated in newspapers to create effect at a distance. To us there is something still more

Digitized by Google

interesting in reflecting on the many unknown and obscure individuals, who read, and observe, and pursue investigations in remote and unfavourable situations, but are perhaps forbidden by stringent circumstances from making a display before the world. To think of these solitary and ill-starred students coming forth from their solitudes to pass a week amidst those persons whom they are accustomed distantly to venerate, and in that atmosphere in which they would wish, but vainly wish, to spend their whole life, presents, we think, a more affecting view of a meeting of the British Association than almost any other idea connected with it. We felt this very deeply, and could not help saying to ourselves, as we beheld the many nameless persons who came as humble disciples to this shrine of science, that verily, even though the greatest masters had been, as was alleged, wanting, the association would have been doing good, in only bringing these modest individuals together, and giving them one week's taste of a life of science, apart from the soul-depressing cares in which they are usually involved.

We here conclude our superficial glance at the external features of the Glasgow meeting. Our next paper will contain a condensed view of a particular department of the proceedings.

A ROMANCE OF REALITY.

In the town of Havre-de-Grace, not many years ago, there lived an aged couple, Monsieur and Madame Dupré. In themselves, these personages were worthy and respected, but circumstances of a remarkable and romantic nature connected with their family, rendered them objects of peculiar interest not only to their neighbours and fellow-citizens, but to all who visited the town of Havre. One of the near relatives of this venerable pair was destined to a career in life such as we shall only find a parallel to in the pages of Arabian fiction.

Aline Dupré was born at Martinique in the year 1763. Her father possessed one of the best estates on the island, and spared no pains or expense in educating his daughter, whose rare natural qualities, both of person and mind, well merited the most careful development. At the age of fourteen, when womanly charms are almost matured in that clime, Aline was the pride of her family, and the admiration of the upper circles of the colony. In private society no one surpassed her in vivacity of spirit; in the ball-room, the graces of her person and movements were unrivalled; and she possessed musical talents well fitted to enhance and complete the impression made by her appearance and address. Such was Aline Dupré, when an unforeseen accident gave a sudden turn to her prospects and fortunes. Excited by oppression, real or imaginary, a numerous band of negroes made their escape from their masters, and spread the most serious alarm over the whole island. Profiting by the scantiness of the military force stationed there at the time, these runaways committed various outrages, and made threatening demonstrations at many different points, calling every where upon their fellow-slaves to join their standard. None of the negroes in the employ of M. Dupré had acceded to the insurgent band, but the station of that gentleman, and the high opinion entertained of his talents and activity, caused him to be pitched upon as the leader of the militia raised for the suppression of the mutineers. M. Dupré fulfilled with energy and success the duty intrusted to him. The fugitives were surrounded and captured, but only after a desperate struggle, in which M. Dupré received a mortal injury. He survived it long enough to permit him to receive from France the Cross of St Louis, which the governor of the colony, the Marquis de Bouillé, had requested for him. Soon after receiving this reward, M. Dupré died, recommending, with his last breath, his daughter Aline and his only son to the care of the governor.

The Marquis de Bouillé did not neglect the charge committed to him. It had been the purpose of the late M. Dupré to return to France, where he had a small patrimonial property, and where various members of his family were settled. This intention had been partly formed with the view of completing the education of Aline and her brother, and in the hope of seeing them well established there in life. The governor of Martinique determined to fulfil the wishes of the father in this respect. Finding the young Dupré, who was a year or two older than Aline, to have an inclination for a military life, the marquis arranged that he should go to France and enter the regiment of Bouillon, while the sister was to be placed for a time in the seminary of Saint Cyr, the highest institution then existing for persons of her sex. Aline and her brother accordingly embarked in a vessel bound for France. That vessel, however, *never reached its destination*. Its fate remained unknown for seven years, at the end of which time a letter, containing disclosures regarding it, was received by one of the friends of the Dupré family residing in France. This individual was a young lady who had spent some years of her youth in Martinique, and had been the playmate and dear friend of the young Aline. The letter alluded to was delivered by an ambassador of a great power, and it was from his sovereign—his crowned queen. That queen was Aline Dupré! The strange vicissitudes which placed Aline in this position were detailed, in the communication to her friend, nearly as follows.

The vessel which bore the brother and sister, intending to land on the western coast of France, reached the straits of Gibraltar in safety. Soon afterwards, however, when the passengers, attracted by the beauty of the evening in that latitude, had assembled in a group on deck, an old negress in attendance on Aline pointed out a dark spot on the sea at a distance. The captain was present at the moment, and was observed to grow pale as he turned his eye on the object pointed out. But he made no remark, and the passengers retired for the night. In the morning they found nothing but bustle and alarm on board. The vessel was pursued by a swift-sailing Algerine corsair, of a size which rendered it almost hopeless for a petty merchantman to attempt any resistance. Nevertheless, the crew took to their arms, resolved to sell their liberty dearly. The pirates were not long in coming up and boarding, and, as might have been anticipated, soon overpowered all opposition. Aline had kept close by the side of her brother, determined to perish with him if he fell; and when the capture took place, she was bound with him in the same chain. This association greatly lightened their sufferings on the occasion, but it did not last long. When the corsair reached the port of Algiers, an order was issued for the conveyance of all the male prisoners ashore, and the retention of the females. The language spoken around her was unintelligible to Aline, but she soon became sensible of the intended separation. Her agony was dreadful at the moment; the past mishap seemed to her insignificant in comparison with this crowning ill. She fell on her knees before the barbarians of the vessel, and used every entreaty, by words and gestures, which might have a chance of moving them to permit her accompanying her brother. Her tears and imploring looks fully expressed the meaning which her language could not convey, but they were totally disregarded, and her brother was carried off with his companions. All hope seemed to depart with him, and Aline fell down in a swoon.

Her insensibility, at least to a partial extent, was of long continuance, every return of her powers of reflection serving only to renew her grief, and throw her back into a state of lethargy, which rendered her heedless of all around her. Zara, meanwhile, the old negress, watched over her with incessant care. When Aline regained something like composure, she found herself on board of a different vessel, and again upon the open sea. Zara informed her that she had been purchased by an Armenian merchant, and was now on the way to Smyrna, whence, after taking on board some Circassian and Georgian captives, Achmet, as the merchant was called, intended to proceed to Constantinople. Zara likewise added, that Achmet seemed to take a strong interest in her restoration to health. This last piece of intelligence was any thing but pleasing to the poor captive, and her mind was so heavily oppressed with a foreboding dread of the fate that seemed to await her, that she resolved to escape from it at the cost of life. No other way of effecting this object was in her power save that of starving herself. For two days she maintained this determination; and was already beginning to feel her strength diminishing, when some proceedings on the part of Zara changed altogether the train of her thoughts. The old negress, like many of her race, affected a power of reading the cards, or of telling fortunes, and she artfully led her languid mistress to express a wish to know what would be her brother's fate, the subject ever uppermost in her thoughts. Zara used the opportunity given to her most dexterously. Consulting the cards, she assumed, after a time, an aspect of great joy. "Your brother will yet be free and great! The cards declare it! And by *you*—by *you* shall he be saved!" The suggestion of such a possibility made an instantaneous and striking impression upon Aline, and raised in her a new train of thought. Finally, she resolved to desist from her course of abstinence, and to preserve her life, in the hope that, whatever might be her own fate, she might yet have it in her power to alleviate the sufferings of her beloved brother.

When the vessel arrived at Smyrna, it chanced that, while Achmet was getting on board his other captives, he met the French consul in society, and mentioned his having with him a beautiful slave of French descent. The consul immediately requested to see her, and, after some difficulty, this was accomplished. On seeing Aline, Monsieur L. generously offered to purchase her from the Armenian, and set her at liberty. "My brother," said Aline; "will you set him, too, at liberty?" "Alas!" said the consul, "that is not possible. How could he now be found out? The intervention of the sultan alone, I fear, could avail to discover his retreat, and procure his freedom." "The sultan!" replied Aline, and for a few moments she remained in thought. "Well," continued she at length, "I *cannot*, and *will not*, since such is the case, accept of liberty for myself." The consul pressed her to alter her resolution, but the generous girl held firmly by her purpose. The slight hope which existed of her finding in Constantinople some means of liberating the poor captive of Algiers, kept her fixed in the determination of remaining with Achmet. It seemed to her as if some secret power urged her onwards to the Turkish capital.

But, as she sailed thither, doubts and fears took possession of her mind. Her whole chance of success was founded on the vague possibility of her personally seeing the sultan Abdul-Hamed, or some great courtier, from whom she might beg the life and liberty of her brother. But she remembered, and shuddered to remember, that she might become the purchased slave of some rich but obscure Turk, and might be shut out for ever from the light of day among strangers. With these thoughts in her mind, she proceeded to the presence of Achmet, and, assuming a firm and bold tone, she said, "Armenian, *your* fortune and *mine* are now in your hands. If I have observed aright, you do not confound me with these poor ignorant slaves, who have bodies, but no souls. Such as they subjugate the eyes, but not the heart. My character is different from theirs, and so will my destiny be. It will be a high one, and your fortunes shall rise with it. Introduce me to the presence of the sultan, and depend upon my eternal gratitude." Achmet seemed to be struck by these words, and the confident tone in which they were uttered. His manner assumed a semblance of respect very unusual between master and slave, and he expressed his intention to gratify the wishes of Aline if possible. Accordingly, when the vessel entered the port of Constantinople, and the party were conveyed to the house of Achmet, he showed his intentions by bringing to her one of the richest dresses to be found in the city, this being a proper preliminary step, as he thought, to the execution of her design. But Aline declined assuming the garb, and contented herself with one of the most simple kind. To his surprise, the Armenian was compelled to admit that her appearance was more captivating without than with the rich attire obtained for her.

Though Achmet seemed thus desirous of fulfilling her wishes, day after day passed away without any notice of the approach of that event on which Aline rested every hope of procuring her brother's liberation. At last, however, Achmet announced that it was impossible for himself to introduce his beautiful slave to the presence of the sultan in any way. "But do not despond," said he, "I have sold you, along with Zara, to Isaac-Aga, son of the old chief of the royal guards. He has promised to place you in the way of seeing the sultan." Aline at first thought that she was deceived with false promises, but such was not the case. Isaac-Aga was faithful to his word, and Aline obtained her wish. She was brought before the sultan. It is needless to linger on the issue. The skill of Aline in music was exerted to charm Abdul-Hamed, and not in vain. It was not long ere his passion for the accomplished captive grew so deep and strong, that he made her his legitimate wife; and she had also the pleasure of embracing her brother, liberated by the sultan's orders from the slave-chains of Algiers. Under the title of the Sultana Validé, Aline outlived Abdul-Hamed, to whom she bore the Sultan Mahmoud, father of the present youthful sultan, and but recently deceased. Mahmoud did not immediately succeed his father, but lived in seclusion during the intervening reigns of Selim and Mustapha. The civilised spirit of Mahmoud may in part be traced to the instructions of his mother, the Sultana Validé. She discovered the retreat of her relatives in France, and, as has been said, sent them letters, which were accompanied by magnificent presents. Monsieur and Madame Dupré, the aged pair described as residing at Havre-de-Grace, were her uncle and aunt, and shared liberally of her bounty. The Sultana Validé died in 1817, at the age of fifty-four.

[We find this romantic story told as a fact by M. Jouy, in his "Hermit in the Provinces," a work professing to detail authentic and curious matters relating to the various provinces of France. M. Jouy describes himself as receiving the present story from the lips of Monsieur and Madame Du***, who were aided in the narration by the actual letters of Aline.* If true, the story presents a parallel to that of the poor Scottish girl who became Empress of Morocco. The undeniably veracious history of the Empress Josephine, is also in several points similar to the present story.]

RETROSPECT OF A MILITARY LIFE.

One of the most promising and gratifying characteristics of the present age, it has always struck us, is the turn for writing which has become so prevalent among military men of all orders and grades. This may certainly be looked upon, and hailed, as a fair indication that those so engaged in the service of their country no longer resemble mere machines, but are converted into thinking, observant, and intelligent beings. The general humanising of the art and practice of war is the great and main result to be expected from the cultivation of the gentle pursuits of literature by the followers of the trump and drum; and such an improvement of war must obviously be the first step to its entire extinction. There are many other advantages, of a more direct kind, derivable from the same source. The soldier and the sailor necessarily see much of the world, and the recording of their observations is an important thing both for science and commerce. From the higher grades of the service we get such comprehensive details respecting countries and nations, as are calculated to affect the interest of communities on a great scale; while the records, again, which issue from the common ranks of the service, have usually a deep and permanent value, were it but from their showing to the world what war really is to the generality of those engaged in it, and to those

* The name set down Du*** by M. Jouy, we have called *Dupré*, for convenience of printing and reading.

Digitized by Google

around whose homes it rages. Often, too, the common soldier can tell more, and has ability enough, as well as his superiors, to notice things of much general interest and consequence.

Another pleasing proof of the spread of a taste for literature among the British soldiery, lies before us in the shape of a "Retrospect of Military Life," by a retired sergeant of the Forty-Second Highlanders.* Mr Anton originally enlisted as a private in the militia, and volunteered into the regular service towards the close of the Peninsular war. He embarked for Spain in August 1813, landed at Passages, and, after a short march, joined the sixth division of the army of Wellington, who was then manœuvring against Soult on the Spanish edge of the Pyrenees. Our author, previous to his volunteering, had married an amiable young woman, whom he gratefully mentions as having ungrudgingly followed his fortunes in war and in peace. There was ample occasion to try her patience in the very first few weeks of their campaigning. In the middle of October the rains fell heavily, and all that the pair had to shelter them, in the open fields, was a blanket thrown rudely on some branches, and secured, in tent-fashion, by cords and pegs. Around the tent "I had cut a trench," says our soldier, "to carry off the torrents which rushed against it from the declivity above." But the tempest blew down the frail structure on the first night of its erection, and bore the blanket where it was never seen again. "I and my trembling companion found shelter in the lee of a rock." A generous officer gave them a new blanket; and as there was a prospect of the army being for a short time stationary, the soldier set about erecting a new and more durable tent. He became, he says, a "perfect Robinson Crusoe," and laboured hard for three days, at spare hours, in digging a trench, four feet deep, to carry off the heavy rains, and in thatching his blanket with fern from the hills. As a crowning comfort, at the close of his toils, he even contrived to erect a sort of fire-place. "The fire was lighted for the *first* time. I was sitting on my knapsack taking a late dinner, quite at home, with the dish on my knee, for I had no table, when the drum beat '*Orders*.' I set down my dish (a wooden canteen, the one end of which was taken out) unfinished, attended the call, and heard that the camp was to be struck, and every thing ready to be moved off that night. I cannot express how vexed I was to leave my little habitation, my sole property, which I held by military right; but I was bound to follow my feudal superior. I had reared it at the expense of a blister on every finger, and I exulted as much over it, in secret, as the rich man in the Gospel did over his extensive possessions and his plentiful stores. On leaving the camp that night, many of the married people set fire to their huts, but I left mine with too much regret to become its incendiary; and my poor Mary shed tears as she looked back upon it, as a bower of happiness which she was leaving behind." Thus rudely was the soldier's dream of comfort dispelled!

The numberless toils and perils that attend both the soldier and the soldier's wife in service, are further shown by many anecdotes in this volume. All "free and accepted masons," from brother the grand-master to the last enrolled apprentice, will be pleased with the following incident. Our author's wife had taken charge of a little ass-colt with a couple of bundles, in kindness to another woman, when the army was passing the river Adour, by a partially broken bridge. She was alone, and got on the precarious structure after a portion of the troops had passed; "but before she got to the farther end, the stubborn animal stood still and would not move a foot. Another regiment was advancing, the passage was impeded, and what to do she knew not. She was in the act of removing the woman's bundles from the beast's back, and struggling to get out of the way, determined to leave the animal, when a grenadier of the advancing regiment, casting his eye on a finely polished horn with the masonic arms cut on it, and slung over her shoulder, stepped aside, saying, 'Poor creature, for the sake of what is slung by your side, I shall not see you left struggling there.' At the same time, handing his musket to one of his comrades, he lifted the colt in his arms and carried it to the end of the bridge. My poor wife thanked him with the tear in her eye, the only acknowledgment she could make for his kindness; but she has often thought of it since, and congratulated herself on having the good fortune to have that horn, empty as it was, with its talismanic hieroglyphics, slung by her side on that occasion, and thus to raise up a friend when she was so much in need of one."

Some regiments forded the river at a different place. "The wife of a sergeant of one of the regiments attempted to pass on a donkey, with a child in her arms, and owing to some sudden stumble or slip of the animal, the child gave a start and dropped into the stream; the distracted mother gave a shriek, leaped after the infant, and both were swept off by the rapid current, in the presence of the husband, who plunged into the water in hopes to recover them, but they were gone for ever, and he himself was with difficulty rescued."

Those thoughtless young lads whose fancy is caught by the well-polished shoes and glittering buckles, the waving plumes and snow-white belts, the neat tartans and the speckless scarlets, of the recruiters who walk the streets at home in ease, may read with advantage the subjoined delineation of what the same individuals become after a little campaigning. The Highland regiments began (says Mr Anton) to lose their kilted honours by degrees; some fell sick, and had the kilt made into trousers; others had patches in abundance; some had the elbows of their coats mended with grey cloth; others had one half the sleeve of a different colour from the body; and so on. "But this was of minor importance when compared to the want of shoes. As our march continued daily, no time was found to repair them, until completely worn out; this left a number to march with bare feet, or, as we termed it, *to pad the hoof*. It is impossible to describe the painful state that some of those shoeless men were in, crippling along the way, their feet cut or torn by sharp stones or brambles. To remedy the want of shoes, the raw hides of the newly-slaughtered bullocks were given to cut up, on purpose to form a sort of buskins for the barefooted soldiers. This served as a substitute for shoes, and enabled the wearers to march in the ranks of their respective companies." In addition to these discomforts, such perils as the following were common attendants of the soldier's lot. On the field of Toulouse, "a musket-ball struck my halberd in a line with my cheek; another passed between my arm and my side, and lodged in my knapsack; another struck the handle of my sword; and a fourth passed through my bonnet and knocked it off my head. Had the last ball been two inches lower, or I that much higher, the reader would have been saved the trouble of perusing this narrative." Speaking of the morn that followed the same terrible day, the writer continues—"The sun gladdens again the face of the heavens, and throws his welcome rays over the field where the wreck of two armies lies uninterred. Thus we fall, cutting off and being cut off, the slayers but not the enemies of our race. Look you to that, ye rulers of the earth!—*We* come but to obey." To that, indeed, the cold closet diplomatist would do well to look. His is the hand that kills; and so feels, we here see, the instrument he employs.

Shortly after the decisive action of Toulouse, our author and his comrades were ordered home, and finally quartered at Cork. The remarks of Mr Anton upon the Irish are brief but very judicious. The following comparison of Ireland to the Highlands, by one who knows the latter region (his native one) well, is too interesting to be omitted. "I must here remark, that there is rather a false idea abroad respecting 'Irish barbarism,' as it is called. In no two countries of the world do the manners and customs of the rural population resemble each other more closely, perhaps, than those of the Highlands of Scotland and those of Ireland. There is not a man from the north or west Highlands, and who had been a resident there forty or fifty years ago, but will acknowledge that nothing was more rare than to hear of a country fair having passed over without bloodshed or broken bones. I perfectly recollect hearing, when I was a boy, the people asking of those who were returning from the fairs of Keith, Glass, Auchindore, Sliach, &c., 'Well, wis thir ony feghts at the market the day?' (or yesterday). If the reply was in the affirmative, the questioner rubbed his hands, scratched his shoulder or elbow, itching with delight, saying, 'Ha! that's a sign o' gude times; we'll get cheap meal this year.' But if the reply was in the negative, then no joy was expressed; on the contrary, there was some remark about hard times, or 'Gude auld times,' adding, 'Fouk's gettin ower wise now-a-days;' 'God help us, the auld spirit's broken down,' and such like observations. And the questioner, in his fretfulness at being deprived of the news of a fight, would exclaim, 'Fare wis the Goulds fan ther wis nae feghtin' at Glass?' or 'Fare wis the Barclays fan ther wis nae feghtin' at Sliach?' and such like questions. This is still the case in Ireland, at least among the rural population; there are certain family names, noted for club-law, in the neighbourhood. But there is this difference: in Scotland we had no peace-preservers to raise a 'hue and cry' of murder when there were no lives lost; cuts and bumps were thought nothing of, and gave no alarm; but in Ireland it is the very reverse: the numerous tribe of attorneys are looking out for work—blood is murder, knocking down or tripping over is killing—and the report appears next day, in some neighbouring newspaper, representing the case in the blackest colours." It is gratifying to know that all these are things fast passing away in the beautiful "Green Isle," which is now, as Scotland was fifty years ago, fairly into the path of social advancement.

We cannot follow our soldier to Waterloo, whither he was suddenly called in 1815. He gives an animated description of the fields of Quatre Bras and Waterloo, as far as they fell under his personal observation. Animation is indeed carried to poetry in some parts of the narrative, and for this the author apologises at the close, by telling us that his diary was originally in verse. "To tell the truth, I thought it poetry. But what could be supposed to proceed from the pen of one who, during his life, had been almost a stranger to books, even to a dictionary? My scribbling vein was an amusement when on guard, and it was chiefly when on guard that I did write; and I seldom lay down on the bench or green turf to sleep, but sat writing and sometimes reading." After mentioning that his prose was a transposition from his rhyme-journal, he modestly says, that if some apostrophes be thought inconsistent with tasteful prose writing, "I am to blame, and humbly apologise."

In conclusion, we would recommend this little unpretending volume to public notice. If there were more of our soldiery who "sat upon the green turf" at their leisure hours, and kept journals of what they saw and heard in the tented field, excesses would more rarely stain our arms, and yet not less valour be shown in a rightful cause.

* W. H. Lizars, Edinburgh.

A WORD ON MEDICAL REFORM.

THE flourishing condition of medical quackery, as we stated on a late occasion, though mainly ascribable to the general ignorance and credulity of the people, is largely promoted by the badly regulated state of the whole medical profession. At the present moment, there exists no uniform or well-organised plan of educating, examining, and licensing practitioners for the whole united kingdom and its dependencies. The country at large is in the hands of a set of rival schools and privileged corporations, each of which lays claim to a monopoly of licensing for a particular district, and of excluding from practice in that district all who are educated and licensed elsewhere. To such a pitch is this mischievous arrangement carried, "that there are in the three kingdoms no fewer than seventeen bodies claiming chartered or statutory rights to confer degrees or diplomas, all of them differing from each other in their constitutions, all possessing the power of making by-laws for their own governance, and all in the habit of imposing different tests of the fitness of those whom they profess to admit into the medical profession."*

There are two great evils in the present state of things—the various rival associations are often at a kind of petty war with each other, to the scandal of the community; and there is a complexity or mystery about the medical character which unlearned folks cannot possibly make out. Some medical men are qualified to bleed and do other acts of surgery, some may prescribe medicines for diseases, but not make up or sell the medicines, and not bleed; some may bleed, and administer medicines which they make up; and some may make up and sell medicines, but not prescribe or bleed. We believe this is *something* like what exists in England, but we do not profess to be certain upon the point, for the whole affair is in such a curiously confused condition, that few know exactly how the matter stands. In the midst of the melée, the empiric, who cares nothing for corporations or their charters, sets up as a compounder and vender of his own nostrums, thus unceremoniously lopping off what ought to constitute a large item in the income of the respectable and well-educated physician.

It is not to be supposed that things can have come to this bad pass with the medical profession, without attracting the attention of those most intimately concerned in its reform. Already, most of the existing corporations have either directly petitioned the legislature for a correction of abuses, or countenanced such a step in others. The Scotch and Irish bodies have, as we believe, been most forward in the desire for an improved code of arrangements, with respect to examination and licensing. The Apothecaries' Company of England, which assumes more power and privilege than all the others put together, has presented the chief obstacle to the proposed changes. "It insists upon the right to punish Scotch or Irish medical men for practising their profession in England and Wales, while it has not the means of preventing the chemist and druggist, or mere buyer and seller of medicine, from practising *all the branches* of the profession. The Apothecaries' Company of Ireland is more like what it ought to be than that of England, in as far as its power merely extends over sellers and compounders of medicine; but strange also to say, in its desire for absolute monopoly, it has frequently attempted to prevent regularly educated surgeons and physicians from making up medicine and prescriptions for their own patients. Stranger still, it appears that, although all these bodies profess and pretend to so much superiority over each other, the medical student, whether he come forward with a view to practise as a physician, or surgeon, or an apothecary, must dissect in the same way, attend lectures at the same time, walk the hospitals in the same manner, read the same works upon the various subjects connected with his profession, and undergo an equally severe examination;—the only difference being, that by paying thirty or forty pounds he can be a physician [M.D.]; if he pays about twenty pounds, he can be a surgeon; and if six or ten pounds, he can be an apothecary."†

Various plans have been suggested by the more liberally disposed bodies for a complete reformation in the system, all founded on one leading and sound principle—that there should be established one re-

sponsible and competent tribunal in each of the three kingdoms, without whose license and enrolment no person should be legally acknowledged as a medical man; and further, that such license should be granted in every case upon precisely similar exercises, examinations, and fees, and that it should confer equal privileges throughout the British empire. There can be no question as to the extreme desirableness of a measure of this nature. Something else, however, would be required to reach the grand evil of medical quackery, and the issuing of empirical nostrums. For this end, one or two stringent regulations would be necessary. We would recommend that every thing like patent rights in medicines should be abolished, also the practice of issuing government labels; and that no person should be allowed to deal in or sell drugs without a certificate of competency from the medical board, and an annual license from the Excise, founded on such certificate. By this means, the most remote town in the country would be as effectually protected from ignorant druggellers as the metropolis.* It is not unlikely that the only serious impediment to this species of reform in medical affairs will be of a financial nature. At present £49,000 are realised annually to the public revenue, from stamps for labels, advertisement duties, &c., connected with quack medicines; and a considerable diminution in amount might reasonably be expected. But we feel satisfied, that under a right administration of diplomas, certificates, and licenses, no real loss would be incurred. Let us, at any rate, hope that no such petty considerations will furnish an excuse for longer postponing these highly desirable improvements in our medical system.

INCIDENT FROM THE NOTE-BOOK OF A BELGIAN TRAVELLER.

THERE is a remarkable and little-known district of Belgium, of considerable extent, called the *Campine*. It lies close upon the Dutch territory, and stretches away from the vicinity of Antwerp towards the province of Limbourg and southern Brabant. Campine partakes of the character of the deltoid lands formed beside it, from the washed-down matters of the Meuse and Rhine. It is sandy and heathy, with scanty capabilities either for tillage or pasturage. The people who inhabit it are a rude and primitive race, almost universally strong in person, though low-built, and far from handsome. They make up for the natural deficiencies of their district by a constant and inveterate pursuit of contraband trafficking. They are the great smugglers of Belgium—at least on that side of the country. Viewing him in his moments of repose, you would say that the inhabitant of the Campine was a dull, rough boor, half-knave half-fool; but let there come a chance and occasion for smuggling into the Belgian interior some bales of English merchandise, or boxes of Havannah cigars, or any other similar articles, and he is instantaneously converted into a totally different creature. His eye sparkles with fire, and his previously gloomy brow is lighted up with animation and intelligence; while his step, lately hesitating and timid, becomes firm and quick, and his whole frame seems endowed with new powers of activity. In short, he is now in his element, and the custom-house officer is a play-thing in his hands. Such is the force of early habit and training; for from generation to generation, the people of the Campine have been what they now are.

With pursuits so unavoidably precarious, these people cannot be a wealthy or luxurious race. They are clothed very simply indeed, and fare sparingly; a sort of *pap*, or porridge, being their principal food, and taken by them at all hours. Such as they are, the Campinois are worthy of a little more notice from travellers than they have received hitherto. Though closely adjacent to the most civilised portions of the world, the district has been quite overlooked, chiefly, perhaps, because its aspect and character hold forth little promise of interest to the tourist. The observations now made, however, will partly show the Campinois to be really a curious race. The peasantry or villagers are the class principally marked by the characteristics referred to, but the inhabitants of the towns of Lierre, Turnhout, and Herenthals, the largest in the Campine, are tinctured with similar features. It was in the village of Gheel, lying in the interior of the district, that the following incident took place, to the relation of which the preceding remarks are merely preliminary:—

I had started on foot from Turnhout at five in the morning, determined to penetrate into the interior of the country, and heedless how long I stayed there, provided my excursion was productive of interest. I had nothing of business in view; what business, indeed, could one have there? Hour after hour was spent in walking across heath after heath, till at length the sandy sameness of the country began to grow very wearisome, and I began almost to repent of having entered on a route totally unknown to me, and seemingly so interminable. Ten o'clock came, and as yet I had seen little either of man or man's habitations; but soon after that period, on climbing a barren mount, I suddenly saw before me a village, or rather a considerable town, standing alone, as it were, in the wilderness. On approaching the place more closely, it struck me that my eye had never lighted on an assortment of human dwellings so black, so odd-looking, or so ugly. At the same time, my state of weariness rendered them, on the whole, an agreeable enough sight, and I entered among the dingy, irregular piles, looking around me for something like an inn. While thus engaged, an elderly gentleman, one of the few persons in view, came up to me, and bowed several times so courteously and profoundly, that I not only returned his reiterated salutations, but also felt tempted to examine him attentively. He was a man apparently above sixty, with a smiling countenance, and a broad, open brow, on which, certainly, sat a sort of air of distinction. He was dressed respectably, in a black suit of an ancient cut. Altogether, there was such a degree of amiable frankness apparent in this stranger's look and manner, that, after returning his bows, I waited respectfully to hear his address, thinking to myself that the village could not probably afford me a person better fitted for a temporary companion than the one before me, and that I was peculiarly fortunate in the meeting.

"I see that you are a stranger, sir," said the old gentleman; "an Englishman? or German, perhaps?" I replied that I was a traveller from France. "A Frenchman! ah, better still," said the stranger; "I love the French. Simple as you see me here, sir, I have served Napoleon. What a man was there!—what a judge of men and of merit! I may say I was not undistinguished by Napoleon, sir."

Beginning now to think, from this significant opening, that I had met with an old gentleman whose self-conceited reminiscences of the past might be rather tedious, I congratulated him upon his good fortune in having served the "great man," and told him I was in search of an inn. "An inn!" said he; "a Frenchman, whom I have chanced to meet, go to an inn! Sir, simple as you see me here, I am the mayor of this village!" I again complimented the old gentleman upon his honours. "Honours!" said he, "sir, I was once governor of this whole province—prefect of the department of Deux Nethes. Napoleon loaded me with dignities, sir."

"Garrulous and testy!" *thought* I to myself. But I *said* something different, being willing to please the rural dignitary. "I am not surprised at your elevation, sir," remarked I to him, "since Napoleon was so accurate a judge of merit." "Ah," replied the stranger, "you are too polite; you make me blush. Between ourselves, however, I really think I have some right to be a little vain." "I do not doubt it, sir," said I; "a prefect of department under the great man has some right to a little vanity." "Prefect!—and much more than prefect, did not my modesty forbid me to tell you," said the old gentleman; "see here!" He then looked around cautiously, and, being satisfied seemingly with the glance, he drew from his pocket a small parcel, which he opened with great care, stripping it of many coverings. A riband of the Legion of Honour proved to be the article contained; and this he showed to me, saying, with an appearance of great emotion, "He gave me this, sir, with his own hands!" "Indeed!" said I, beginning to think my companion rather a remarkable man. "With his own hands," repeated the old gentleman. "And under what circumstances!—at Waterloo, sir!—yes, at Waterloo! I was by his side; the fatal cry arose, 'Save himself who can!' The great man turned to me, and exclaimed, 'Why did I neglect your advice!—this could not then have occurred!' After saying so, he took from his neck a riband of the Legion of Honour (which he always carried about with him for immediate rewards), and gave it to me, crying 'Adieu—most faithful of my friends, adieu!' We parted, not to meet again."

I began now to wonder much who this respectable though talkative old gentleman could be. Not being willing to ask his name, however, I only inquired what rank he had held in the army. "I never was a soldier," said he; "I served the emperor as minister"—— Here a start on my part led my communicative friend to repeat—"Yes, as *minister*. Did I not mention that? First as minister, then as prefect, and then as simple councillor, but never as soldier." "But you were at Waterloo!" said I, with growing amazement, forgetting my weariness and hunger completely in the wish to gratify my excited curiosity. "At Waterloo!" answered my village friend; "to be sure I was at Waterloo; but I was there as a simple volunteer. It was for my head, not my arm, that Napoleon esteemed me; and had he followed my counsels on that occasion, Wellington would have carried a different tale to England. 'Sire,' said I, at that critical moment when the Prussians came up, 'Sire, follow my advice'"——

The old gentleman had just reached this point of his narration, and I had just begun to suspect that, respectable as he appeared, he must be slightly crazed on some points, when suddenly a most boisterous laugh broke forth behind us, and brought the tale to a close. I turned to the new comer, and saw one of the most jolly-looking figures that had ever fallen under my notice. He was a man well advanced in years, but with the shoulders and apparent vigour of a Hercules, conjoined with the rotundity of an alderman. Never did I behold such a picture of robust health. The countenance was especially frank and happy-looking, and bespoke a man who would have his jest, even "under the ribs of death." My poor friend, the mayor, evidently dreaded his mirth, and moved off without saying a syllable, while I was looking at the new comer. The latter, who was dressed, by the bye, in a half-rural half-town fashion, laughed long and loudly, and then cried to me, "Look at your lunatic—how he runs!" "Lunatic!" said I; "is the mayor really deranged?" "Mayor!" cried my new friend in turn; "has he persuaded you, then, that he is a mayor? Perhaps he has also told you that he was once a prefect, and a minister—eh?" "He has told me so," said I, a little piqued at the roar of laughter with which the question was accompanied. "Your perspicacity must be remarkable," said my new friend coolly; "don't you know that you are at Gheel?" "I was not aware of that fact." "Well, you know it *now*," said the jolly stranger. "And what then?" returned I, with some coldness. "What then?" was the reply; "why, whence do you come, pray—from Bengal? Don't you know that at Gheel there are more people mad than otherwise?" "Pooh! now it is you who are attempting to play upon my credulity," said I. "Not a bit of it," said my companion; "look about you." I involuntarily did as I was desired.

"You see," continued my companion, "yonder little old woman, playing at nine-pins? *She* is mad. Her husband was a rich merchant of Verviers, who died, and left his business to her care. It was too much for her intellect. Her affairs grew confused, and she became insane. Believing that all her trade went away to Sedan and Louviers, she plays continually at nine-pins, and cries at every throw, 'Down goes Sedan!—down with Louviers!' You see (continued my companion) an old man in yonder garden? That man is more decisively mad than even the old woman. He was a mine proprietor, and ruined himself by attempts to extract wealth from a barren soil. Now, he digs all day with a spade, and says to himself every evening, 'To-morrow I shall have it!' Yonder is a girl dancing. She imagines herself Taglioni, and leaps before a tree all day till she is exhausted, when she asks the tree if it is satisfied, imagining it to be the Emperor Nicholas. Ha! ha! Yonder"——

Here I interrupted the catalogue. "What! is every body in sight of us insane? have you not done yet?" "Done!" said my companion, "why, there are a thousand or two of people in Gheel, and they are all mad! *We* are all mad; for I myself"—— "*You!*—come, I see you are disposed to have your jest out with me," said I. My companion here looked at me gravely. "Perhaps you do not think me mad," said he; "do you or do you not believe *me* to *be mad?*" My answer was brief. "You mock me by the question; certainly I *do not*."

Scarcely were the words out of my mouth, when my companion flew fiercely at me, and grasped my throat with the whole force of his powerful fists. I could make no resistance under such hands, and was rapidly growing insensible, when a man rushed up to us, and applied a stick lustily to the broad back of my assailant. The latter instantly let go his hold, and slunk hastily off like a beaten child. As soon as I had fairly recovered my breath and senses, I saw before me a stout and apparently respectable man in country attire. He first begged pardon for the attack which "his lunatic" had made upon me, and then civilly asked me to go with him to his house, to rest there until I fully recovered from my late alarm. "You are a physician, then, and the keeper of a lunatic asylum?" said I, suspiciously. "Oh, no," replied he, "I am a plain countryman. But are not you aware that, for two hundred years, Gheel has been a retreat on a large scale for lunatics? Every inhabitant has two or three of them in his house. They come hither from all parts of Belgium, and it is a kind of trade which, thanks to heaven, is very profitable and very easy to us."

"Easy! you astonish me," said I. "I should conceive it both troublesome and dangerous."

"Not at all," returned the man of Gheel. "Our women, and even our children, can manage the poor creatures. Some violent ones, indeed, are kept in confinement, and require it. But, with the most of them, we only need to find out their weak points at first, and then we can both avoid exciting them, and make them perfectly obedient. We let them go about, and they never abuse their liberty." "Pardon me, friend," said I; "but for your cane, that madman would soon have made me a lifeless witness to the contrary." "That madman," replied the man, "is good nature itself! but you have given him cause of irritation." "Not in the least," was my reply; "I only was too civil to him, for I would not say that he was mad." "There, now," said the Gheel man; "that is just the very point. *His* mania is to be *thought mad;* he is quite proud of being one of the mad folks of Gheel; and a most inoffensive kind of pride it is. But come with me, sir, and I will prove to you that Pierre is a most amusing companion, and a capital cook. Allow him but to be *mad*, and all is well."

I declined all invitations, however, feeling that my appetite for food was gone, never to return while I was in Gheel. How could I even be certain that I was *yet* out of the hands of the lunatic colonists? All that I desired from my inviter was to have a mode of

* A few years ago, we happened to drop into a small book-shop at a watering-place, the keeper of which sold drugs. While conversing with the shopkeeper, a poor woman entered and sought for a pennyworth of calomel, or as much as would answer as a dose for an infant. This was a demand which seemed rather puzzling to the shopkeeper, and in putting some particles of the white powder in a bit of paper, he appealed to us if we thought it was a right quantity. As the question was totally out of our way, we could offer no advice; and whether the dose proved too much or too little, we never had an opportunity of ascertaining

Digitized by Google

conveyance towards Antwerp pointed out to me. I was not long afterwards in Gheel.

And now, I would ask my readers if Campine be not a remarkable country, what with its smuggling and its lunatics! I would also bid them make certain, when entering unknown places, that half the population are not mad folks, and take care, also, not too hastily to deny the truth of a man's words, when he tells you that he is insane. Let him have his own way of it by all means. These are valuable morals, I imagine, derivable from the present humble story.

POPULAR INFORMATION ON POLITICAL ECONOMY.

EIGHTH ARTICLE.—MACHINERY.

It has usually been supposed that machinery abridges the sum of human labour, but this is a fallacy. If machines throw a certain number or class of operatives out of employment, they call up the energies of an equal if not greater number of individuals to make the machines. Say, for example, that a machine costs L.500, it will be found, upon an analysis of the price, that by far the greater portion goes to the workmen who helped to construct it from the raw material; probably L.450 out of the L.500 in reality goes into the pockets of the operatives. Hence, machinery, though abridging one kind of labour, prodigiously increases another.

Let us proceed into a deliberate investigation of this vital question, which admits of other views. Suppose that stockings knit by the wire cost 36s. per dozen pairs. Let us make the following distribution of this sum:—10s. for worsted, the material, 20s. for wages of labour, and 6s. for the manufacturer's profit. Suppose, now, that by the introduction of the stocking frame, nine-tenths of the labour expended on the dozen of stockings, and consequently of the wages, is saved—the sum paid for wages in the mere conversion of the worsted into stockings becoming only 2s. instead of 20s. In this case, if nothing were paid for the machine, there would be a direct saving of 18s. per dozen in the price of the stockings. Would the manufacturer pocket this sum? No—competition would prevent him from doing so; and in the general case, on every 30s. which he now pays for two dozen pairs, he will just make the same profit which he gained on the one dozen—namely, 6s. But to suppose a machine which costs nothing, is to put an impossible case. Before we find the cost price on which the manufacturer gets his profit, we must add the interest of the cost price of the machine, and compensation for tear and wear, to the price of the worsted and the wages of the labour. Let us rate these expenses connected with the employment of the machine at 5s. Here the cost price to the manufacturer is 20s. per dozen, and if we give him the same profit as before, the price to the consumer will be 24s. Where machinery has been introduced in the various stages which an article of consumption passes through, the alterations in price have been far more striking than in the instance here supposed. In 1786, cotton yarn of 100 hanks to the pound cost 38s. per pound. In 1796, it cost 19s.; in 1800, it cost 9s. 5d.; in 1807, 6s. 9d., and in 1832, 2s. 11d. As we come to a more advanced stage of the manufacture, the decrease is still more remarkable. In 1814, 72 seven-eighth calicoes cost L.1, 8s., and in 1831, 8s. 9d., being a fall of about 77 per cent. in the course of seventeen years.

Let us see now how far we are borne out in the proposition that it is the labour of man only that is paid for, that accomplished by the machine being gratuitous. The sum of five shillings upon the dozen pairs of stockings made by the machine, goes in a different direction from the money paid for hand-knit stockings, being paid neither for the worsted nor to the labourer who makes the stockings. To whom, then, does it go? Not to the manufacturer, for to him it is merely compensation for what he has disbursed. If we trace it back, we will find that the whole of it, with some partial exceptions to be hereafter stated, goes as wages of labour. The machine, we shall say, is made of iron. The turner, the metal caster, the smelter, are the persons to whom it will be found to have been paid; and thus the money no longer earned by the widow knitting at her cottage door, goes to support the family of the swarthy blacksmith. It is not lost to labour—it merely changes hands. But, some one may say, there are sixteen shillings per dozen on the stockings, which are now no longer paid—is not this sum lost to the labouring community? By no means. If the cheapness increases the demand for the article, the manufacturer makes more stockings, employing more carders, woolspinners, machine-makers, and stocking-makers. If the demand for the article does not increase, his capital will go in some other direction, and give employment to labour in a different department. There will not be the less room for the employment of capital that the poor get their stockings a third cheaper.

It thus appears that there is a distinction of the most important description between that part of the produce of labour which is effected by machinery, and that which is effected by human toil. The one is paid for, the other is not. The one absorbs part of the fund which the community can pay for the wages of labour, the other does not. In so far, therefore, as machinery tends to facilitate production, it is like a genial climate, or an increase in the fertility of the soil—a general blessing for which nothing is paid.

The more pains have been taken to show how this conclusion is arrived at, because a dangerous fallacy has frequently taken root among the working classes, to the effect that machinery is an invasion of their privileges—that it somehow or other turns into a different channel the money that should justly be spent among them. When abstractly entertained, these opinions have produced nothing worse than the usual profitless fruit of ignorance; but when allied to personal disappointment and hardship, they have given rise to the most calamitous operations on the human character and fortunes, demoralising and disorganising large masses of men, shaking the authority of the law, and instigating a barbarous war against human improvement. It will not, perhaps, much soften the disappointment of the starving labourer to know that the discovery which has thrown him out of employment, will add to the comfort and convenience of many others; but mankind are always seeking disinterested motives for their selfish proceedings, and those who act boldly and recklessly when they believe themselves to be, and get others to sympathise with them as, the victims of a general system of oppression, would shrink from committing the same outrages for no better motive than their own personal feeling or interest. To know that what he is destroying is the support and comfort of others, though it may inflict temporary injury on himself, would unnerve the arm of the machine-breaker more effectually than all the penal laws which the most despotic legislature could devise. Undoubtedly there has been much incidental misery occasioned to labourers by the introduction of machinery; the present state of the hand-loom weavers is a melancholy instance. Much of this, however, is attributable to the sort of ignorance we have been describing, and to a general want of intelligence regarding the most profitable investments for labour. The progress of knowledge alone can remedy this evil. It will not only enable the labourer to discover the best employment for his labour, but it will give him greater facilities in turning his hand from one species to another. All who have observed such matters, must have noticed that a man of intelligence, who has not been brought up to any mechanical trade, will perform a piece of work with much more facility than a dredging labourer, to whose peculiar department it does not precisely belong. During the present century, the workmen of this country have shown vast elasticity in change of pursuit. By far the greater part of the manufacturing population perform duties which were unknown forty years ago. As these have arisen with the progress of invention, hands ready to perform them have never been wanting. A vast number of these are individuals who have changed the nature of their labour probably more than once. It may thus fairly be argued, that, in the general case, more labourers are thrown out of work by their own stupid obstinacy than by the progress of invention.

With respect to the restricting of men to one kind of work, machinery acts in two directions. In the first place, it certainly has a tendency, when united with its invariable concomitant, the division of labour, to isolate the workman to a very narrow department, in comparison to the sphere of him who makes a saleable commodity with his own hands. On the other hand, however, it must teach a strictness of attention and nicety of operation, which will constitute a stock in trade to the labourer, to whatever he may turn his hand; while, in the variations to which it is constantly subject in the course of improvement, it accustoms him to change the routine of his employments, and enlarges his faculties.

We stated above that there were partial exceptions to the proposition, that the whole of the fund paid for machinery, in the case of stocking-making, goes as wages of labour. It is always satisfactory to sift such matters to their foundation; and, therefore, though most of our readers probably see pretty clearly that the use of machinery abstracts nothing from the fund spent on labour, it may be advantageous to examine more minutely the component parts of the sum expended on machinery. In the first place, in setting by itself what is given as the wages of labour, we must deduct the profits of the capital employed in the various stages, from the smelting of the ore to the finishing of the machine. It will be evident that this cannot, in the general case, make the sum spent on the labourer less than it would have been had the machine not existed, as the capital would have been employed in some other shape, connected with the production of the article made by the machine. Under the subject of labour, in a previous article, it was stated that there were just two circumstances which made a commodity valuable in the market, the one its having cost labour, the other its being limited in supply, or monopolised. Let us see how far monopoly may be an ingredient in the price of a machine. The most extensive general instance of monopoly in existence was mentioned as land; the money made by which is called rent. In machinery, rent may have been paid for the raw material to a greater or less extent; but, in the general case, not to any great proportion. In the case of a machine made of iron, the portion of rent paid will be for the ore from which the iron is smelted; a sum which, in the case of a machine which costs L.100, will frequently not exceed 5s. The man who makes use of a machine before his neighbours, enjoys a temporary monopoly during the interval which precedes their following his example; and it is the money so made that is generally the inducement to the manufacturer to change his method of production. The others are generally compelled to follow the example, from finding themselves undersold.

Let us glance for a moment at what the labourer gains by machinery. The impulse given by machinery to commerce and manufactures of every kind, the accumulation it makes of capital, and consequently of the means of paying for labour, can more easily be reflected on by any one who thinks for a moment on the subject, than strictly estimated. There are some departments in which machinery makes a positive and distinct addition to the sum expended on the support of labourers, by deducting from that paid for the keep of the inferior animals; take, for instance, steam threshing-mills and locomotive engines, whose the work of human labourers is made to supersede that of horses. It has been calculated that the Liverpool and Manchester Railway alone has put out of employment one thousand horses. The gain which may be thus supposed to be made by the working population is, however, trifling in comparison with the national advantages obtained by the labourers of those countries where machinery is in active operation. It is to the ingenuity and enlightened energy which has prompted the invention and employment of machinery, and to the capital which has facilitated its use, that Britain mainly owes its manufacturing superiority. It is by underselling them that one community can obtain a preference over others in the market of the world; and without a vigilant application of every artificial means of cheapening produce, we could never overcome those adventitious circumstances which leave many of our neighbours a more free opening to the general market than we possess. It was the rapid progress in the cheapness of our manufactures, through the instrumentality of machinery, that principally enabled us to baffle the celebrated Berlin Decrees of Napoleon. The steam-engine and the spinning-jenny—familiar and vulgar appellatives—stopped the progress of him who seemed destined to be the conqueror of the world. Penalties and cordons could not fight against the cheapness of our manufactures, or destroy the natural monopoly which that quality created. Formerly, we were supplied with cotton goods by the indolent and ill-paid hand-labourers of Hindostan; now, as has been already stated, through the instrumentality of capital working by machinery, we supply them with garments made of the cotton which they grow. They have a fertile soil, which produces the raw material—we have the fertile minds that ripen it for use. Labour with them is cheap, but the lowest expenditure that will support life will not enable them to compete with that land where the energy and genius of a Watt and an Arkwright enable individual men to do the work of millions.

Before closing this branch of the subject, let us offer the familiar example presented by what are termed the cheap literary publications. Take the case of the present sheet. According to the old mode of manufacturing paper by hand, and printing by hand, the price of the sheet to the public, the present circulation continuing, could not be made less than twopence-halfpenny; but as this price would cause a diminution of circulation of probably one-half, the price would necessarily require to be raised to threepence, or double what it is at present. We are far from saying that a diminution of our circulation would be a loss to the public, but we at least know that our friends among the operative classes would be at once virtually cut off from the perusal of this as well as any other cheap print. In point of fact, the cheap literature of the present age is a child of machinery. It could not possibly have existed thirty years ago.

It was formerly shown that the advantages of cheap labour were reaped principally by the working classes. This is more eminently the case with the more powerfully cheapening influence of machinery. It is impossible to form any estimate of the extent to which the comforts, and, if we may so term them, the elegancies, of the poor, are thus increased. We once heard a gentleman, accustomed to making minute estimates, calculate that the whole Sunday costume of a border peasant girl—a dress of the most fashionable order worn by the class—costs only 20s. Sixty years ago, a lady could not have dressed herself so well for L.5. To the poor, quantity of commodities is the first great requisite. With the rich, it is not quantity, but difficulty of procurement—in other words, expense—that is the recommendation. The object is not so much to possess articles ministering to bodily comfort—for these can generally be procured with a small portion of the wealth of a rich man—as to be able to show what others cannot obtain. The article which, once prized, is made common by the application of machinery, ceases to be coveted, and is

Digitized by Google

left as a blessing to the poor. Surely, when these things are duly considered, it will not be a long time ere we look back upon the practice of machine-breaking as one of the most astounding illustrations of popular delusion that the annals of human barbarism can produce.

NEW ZEALAND.

In a letter from Mr George Duppa to his father, Hollingbourne House, Kent, respecting his arrival in New Zealand, and lately published in the Spectator newspaper, the following descriptive passages occur. He writes from Port Nicholson:—

"Now for the beauties of the place. The harbour resembles rather an inland lake than an inlet of the sea, particularly when it is perfectly calm; which is not always the case—it being so equally and changeable a climate, as far as the wind is concerned, that we are frequently threatened with an upset when sailing about in our boat to bring our goods, or when on a fishing excursion: but she (I mean the boat) is very stiff, and I have acquired the art of managing her to such an extent as to secure my safety in her. But to return to the harbour: it is surrounded with mountainous hills, for that is the only way to describe them—being a species of neither mountain nor hill, and yet both. They are partly covered with a sort of bastard flax and long grass, which gives them rather a barren appearance; but it is fully compensated by the rich description of forest timber which covers the remainder. At the further end of the harbour is the mouth of the three rivers on which the town is to be built. They flow down a valley of level land, which is from four to six miles in breadth, and surrounded by hills most densely covered with timber; as is likewise the valley itself, excepting on the banks of the river, which have, at one time or other, been cleared by the natives for potato-gardens: but these gardens do not extend further than one hundred yards or so inland, and they are in some places still in a high state of cultivation; in others, rather more neglected, where the potatoes and cabbages have run to seed; in others again, which are by far the most frequent, they are covered with a species of willow, which is by no means difficult to eradicate. But, unfortunately, these spots have been reserved by the company for public purposes, for boulevards, or some such nonsense or other; the land immediately in the rear being covered with timber of such extraordinary dimensions as to require at least L.40 per acre to clear it. But this is business again. The scenery of these rivers, as you go paddling up them in a canoe, is most enchanting: the principal river is as broad as the Thames at Richmond, but too frequently interrupted by snags, which have in many places formed bars, which must be removed before it can become navigable for a boat of any size: but a canoe which does not draw more than one and a-half to two inches of water can of course go any where, and enable you to see it all—and a beautiful sight it is. Picture a most enchanting serpentine river, overshadowed by trees of richest verdure emblossomed by every colour, enlivened by the deep mellow and quaint notes of the ptui, or mocking-bird, besides those of hundreds of others equally rich and curious; and every now and then paroquets of the brightest greens and reds fluttering from bank to bank, and adding their chattering notes to the general concert: in fact, it is of little use my attempting to describe scenery so rich and varied in the limited space of a letter; to be fully appreciated, it must be seen. I trust, therefore, that your imagination will, to a certain extent, make amends for the meagreness of this description, and that the slender materials which I have furnished will give some notion of the site of our town, which for many purposes is most admirably adapted. As an agricultural district, it will not answer for many years, inasmuch as it requires too great an outlay of capital to do any thing with it; and I question much whether there is the hundred thousand acres of level land for those who have already come out. You will therefore say that the whole is a failure: but not so, for at Taranaki, distant overland about sixty miles, there are millions of acres of level land, which will not be nearly so expensive to clear, with a much better river running through it, but unfortunately a very poor harbour. The soil there is equally good as here—so report says. Previous to making up my mind for a removal thither, I intend going there myself; and if it should prove satisfactory, I shall choose my town-acres here (for this will always be the principal town), and my country sections there. * * * For an agriculturist, the first four or five years are those which will pay best, as we shall not be able to supply ourselves until the expiration of that time; and I well know that Sydney will not be able to spare us any in the mean time. Wheat is now selling there at L.10 per quarter, and was much higher a short time back. A friend of Sinclair's, a fellow-midshipman, who has been in this part of the world for the last four or five years, tells me that the Sydney agriculturists never calculate upon realising more than one out of three crops; so that I feel confident of our always having a good market for our produce. Oaten-hay *itself*, which can certainly be harvested here twice, and probably three times, in the course of the season, sells at L.18 the ton.

We shall not be able to choose our town allotments for the next three or four months, and at least a year will elapse before we have the chance of selecting our country sections; this comes of hurrying off so soon after the surveyors, which I protested against as far as was in my power when in London, but could find no one to second me. We are, however, allowed to squat, as it is termed in this part of the world, and have a right to remain on the land for the term of two years, although I intend bargaining for five years if I can, and by that means be enabled to clear a larger quantity of the land which is to be reserved for public purposes, and which consists chiefly of deserted native potato-grounds, requiring very little trouble to clear.

Several ships have arrived in the harbour from Sydney, with all sorts of goods on board; and to-day one has arrived with about forty head of cattle—very miserable-looking animals, not equal to the Welsh runts. The price they ask for them is L.30 per head; a price I do not intend to pay yet, for, in the first place, I do not see how they are to be kept, and in the second, I do not see how they are to be used. No—cattle will not answer at present, although it will pay to breed them a few years hence; for butcher-meat will bear a good price, as will likewise every description of agricultural produce. As soon as we have supplied ourselves, the Sydney market will take the surplus. A crop of wheat and a crop of potatoes, or any succulent crop, can always be reaped in one year, there being no frost to check the vegetation. Two crops of wheat might be had off the same land if there were any means of keeping it fed down until the blighting winds cease, which appear to blow during a short period of the year. In fact, the only thing against agriculture here, is the land being so densely covered with timber, and consequently so expensive to clear; but that is of course but a slight impediment to a large capital. For if it costs a man L.40 to clear an acre of land, which will produce him four quarters of wheat per acre (and I will warrant the soil being as capable of producing six quarters as any land in England), which, when made into flour, will sell at 6d. per pound—a price which it is fetching at present, and which it is likely to fetch for the next five years—he will have the whole, or nearly the whole, of his outlay returned to him at the expiration of six months; and thus be enabled to put another crop into the same land at a small expense. Once ploughing, with one pair of oxen and a light plough, will be sufficient; for I never saw land turn up so well in my life: it is like the finest garden mould, and perfectly free from weeds—a circumstance which is to be attributed to its having been so thickly covered with wood."

HEADS OF THE ABORIGINAL AMERICANS.

A paper in Silliman's *American Journal of Science and Arts* makes us acquainted with a very interesting book on the skulls of the original American nations, recently published at Philadelphia, by Dr S. G. Morton, professor of anatomy in that city.*

Dr Morton considers the aboriginal people of America, with the exception of the Esquimaux, as a distinct variety of the human species. Their principal external peculiarity is the skin, which is generally of a reddish hue, though varying much in different countries, some nations approaching white, and others black. It appears from the late interesting researches of Flourens, that the American skin, like that of the negroes, comprehends two layers in addition to those of the European races, and that in the outermost of these two layers the red colouring matter resides; from which Flourens argues that the white, the black, and the red races, are essentially distinct. If these conclusions be just, the speculations of Humboldt and others as to the migration of the Americans from Asia must be esteemed as unfounded, and we must henceforth regard this portion of mankind as an independent variety. An exception exists only with regard to the Esquimaux, who are of the Mongolian or Eastern-Asiatic variety, and have probably migrated to their present settlements from the elder continent.

Dr Morton subdivides the American or red variety into two families, just as the European variety is subdivided into Celtic, Teutonic, &c. He calls these—1st, the *American*, and, 2d, the *Toltecan*. The second were those people who attained a condition of semi-civilisation in Mexico and Peru, long before the discovery of America by the Europeans. They had forms of government and a regular priesthood, had made considerable advances in the arts, and have left many monuments of their ingenuity and united labours in temples, tombs, and miscellaneous sculptures. But this race does not now exist in any distinct form, and may be considered as extinct. The other family, specially called American, branches into several subordinate groups, to which the names Appalachian, Brazilian, Patagonian, and Fuegian, have been applied. All are remarkable as warlike, cruel, and unforgiving; they turn with aversion from the restraints of civilised life, and have made but trifling progress in mental cultivation or the useful arts. It is remarkable of both the American and Toltecan families, that they have been quite unable to stand their ground against even inferior numbers of Europeans, who must accordingly soon become the sole possessors of that great continent.

Considering the characteristics manifested by the American variety, it becomes a matter of most interesting inquiry in what natural peculiarities they differ from Europeans, for it is in such peculiarities that we are to look for the causes of so striking a mental inferiority.

The brain is the organ of the mind, and on the size of this organ, other conditions being equal, depends the comparative force of character of individuals. By "other conditions being equal," it is meant that of two brains, similar in constitutional character and activity, the larger is sure to produce in its possessor appearances of more vigorous character than the smaller will do. Hence it may be presumed that a considerable number of persons, or a nation, possessing large brains, will be for certain more powerful than the same number of persons possessing comparatively small brains. But general size of brain is not the only measure of human character. Different regions of the brain are charged with different functions, the intellectual faculties lying in the front or anterior lobe, the moral sentiments in the coronal surface, and the animal propensities in the posterior part. Hence it may be presumed that if the brains of one nation on an average are large in any one of these departments in proportion to what they are in other departments, that nation will be remarkable accordingly with respect to intellectual and moral character. These doctrines are as yet received by only a certain class of inquirers (the adherents of the philosophy of Gall and Spurzheim); but they appear to us founded in nature, and a remarkable proof of their truth is found in Dr Morton's researches in American aboriginal crania.

Having obtained a considerable number of the skulls of the various races of men, Dr Morton measured their internal capacity by means of white pepper seed, and found the following results:—

Races.	No. of skulls.	Mean internal capacity in cubic inches.	Largest in the series.	Smallest in the series.
1. Caucasian,	52	87	109	75
2. Mongolian,	10	83	93	69
3. Malay,	18	81	89	64
4. Aboriginal American,	147	80	100	60
5. Ethiopian,	29	78	94	65

It thus appears that the aboriginal Americans rank fourth with respect to the size of their brains, the Ethiopians being lowest and the Caucasians highest. The general results are strikingly in conformity to all we know of the history of the races, for the Caucasian race is that which has produced the most civilised nations, while the Mongolian, the next in order of capacity of cranium, has produced a number of nations which remain at a fixed point in semi-civilisation, the Malay is a degree more barbarous, and the American and Ethiopian the most barbarous of all.

The inquiries which Dr Morton has made amongst the Toltecan family, at first appear somewhat inconsistent with these results, but, when fully considered, they are found to be exactly what might have been expected. "From the Rio Gila in California," he says, "to the southern extremity of Peru, their architectural remains [that is, the architectural remains of the Toltecans] are every where encountered to surprise the traveller and confound the antiquary; amongst these are pyramids, temples, grottoes, bas-reliefs, and arabesques; while their roads, aqueducts, and fortifications, and the sites of their mining operations, sufficiently attest their attainments in the practical arts of life." The ingenious people who formed these works are generally understood to have ceased to exist, as the predominant people at least, about the eleventh century of our era, when the Incas began to reign in Peru. There are therefore ancient Peruvians and modern Peruvians, just as there have been ancient Britons and modern Britons. Vast quantities of the bodily remains of the ancient Peruvians are found in the desert of Atacama, which was their favourite place of sepulture for many ages, and where the united influence of a dry climate and a river abounding in salt has preserved many bodies in a mummy-like condition. Dr Morton examined many heads derived from this place, and found the entire internal capacity to be small, only 73 cubic inches, which is considerably below the average of the existing American aborigines. He found, however, that the amount of space in the intellectual and moral regions was considerably larger in proportion than in the latter class of crania, while the entire form of the head was more symmetrical and elegant. It therefore may be presumed that the ancient Peruvians were a people of gentle and refined character, well qualified to excel in works of art, but little qualified to maintain their ground against the grosser but more vigorous tribes residing in their neighbourhood, and who have accordingly overpowered and supplanted them.

* Crania Americana; or a Comparative View of the Skulls of various Aboriginal Nations of North and South America; to which is prefixed an Essay on the Varieties of the Human Species, illustrated by seventy-eight plates and a coloured Map. By Samuel George Morton, M.D., Professor of Anatomy in the Medical Department of Pennsylvania College at Philadelphia, &c. &c. Philadelphia: J. Dobson. London: Simpkin, Marshall, and Co. 1839.

LAIRD OF LOGAN.

[Under this title, which, in the west of Scotland, is equivalent to "Joe Miller," a collection of anecdotes and jokes is at present publishing in parts, by Blackie and Son, Glasgow. With not a little of rather a coarse taste, the Laird occasionally gives us a sparkling witticism or story, highly significant of national character. We offer two or three specimens.]

DAFT RAB HAMILTON.

Rab Hamilton, a half-crazed mendicant, was a regular Scotchman in his manner of address—moving round the object instead of making directly towards it, rather looking away from than at it, yet keeping a corner of his eye distinctly on it. If he happened to be in the presence of gentlemen, who often invited him to take a dram for the purpose of drawing him out, he would pretend to hear silver fall on the floor. "What's tat—deed is't—surely it was the jingling sound o' a shilling on the carpet—as sure's death, deed is't; but I dinna see't on the carpet—no—but ye can just gie me anither—I'm saying, deed is't—and you'll get it yoursel' after I'm awa."

AN IRISH DEBT.

The late Sir Walter Scott, meeting an Irish beggar in the street, who importuned him for sixpence, the then Great Unknown not having one, gave him a shilling, adding, with a laugh, "Now, remember you owe me sixpence." "Och, sure enough," said the beggar; "and may your honour live till I pay you."

TIT FOR TAT.

A pedlar halted at a public-house in the country, and at the landlady's request displayed nearly every article in his pack, for her examination. This he did cheerfully, expecting that a large purchase would be made. On inquiring what article the landlady would like to buy, she coolly replied, "Hoot, I dinna want to buy ony thing; I merely wanted a sight o' them." "I'm sorry ye'll no buy," said the pedlar; "but never mind, let's see half-a-mutchkin o' your best whisky." The stoup was instantly filled, and a voluntary piece of oaten cake placed beside it on the server. The pedlar kept warming himself at a brisk fire, and crumping the gratis cakes, while the landlady was allowed in courtesy to help herself and some female gossips, who had also been inspectors of the pack, to a tasting of the liquor; having drank his health, and guid sale to him, she filled up the glass and handed it to him. "Na, na," said he, "I want nane o' your whisky; I only asked ye for a sight o't!" So saying, he tightened his strap, and set off on the tramp.

A WONDERFUL PREACHER.

A country woman, whilst on a visit to a large manufacturing town in the west, went to hear a celebrated divine, whose field of labour lay there, and whose fame had often been sounded in the ears of the worthy dame. On her return, she was asked her opinion of "The star of the west," as he is often called. "Oh," said she, "he's a wonderfu' preacher—a great preacher." "Well, well, that's all true," said the other; "but what do you think of his views of doctrinal points, and his powers of expounding the scriptures?" "Oh," said the worthy critic, "I dinna ken; but he's just a wonderfu' man." "But what did he say?" "Oh, he just gaed on, and gaed on, and chappit on the Bible, and raised his twa hands abune his head, and then gaed on again, and gaed on again; and then he swat and rubbit his brow, and whan he stoppit, he looked as if he could have said mair than whan he began—oh, he's a wonderfu' grand preacher!"

SCOTCH ALL OVER.

The manse of Gargunnock, some half-century ago, was known for all the good things of the season, as Samuel Shool, the bellman, used to boast, when speaking of its generous-hearted mistress. Honest Samuel was fond of relating any thing to the credit of his benefactress in the manse. "I mind," said he, on one occasion, "ae Sabbath morning at the summer preachings, mair than thirty years sin', a sad pickle that the mistress was in, because Betty M'Quat had forgotten to howk some early potatoes on the Saturday night; for potatoes were a great rarity at the time. What was to be done? Betty was like to gae through the yirth about it; and quo' she, 'Mistress, I'll just tak the graip, and slip out and howk a wheen [dig a few]—naebody will ken; and gif it come to the minister's hearin', I'll take the sin and the blame o't on mysel'. 'Na, na, Betty, since I maun hae the rarity at the dinner this day, just gang awa out and pouter [scrape] a few frae the roots o' the shaws wi' your hands—take nae graip wi' ye—use nae warkloom made by the hand o' man on the day o' rest; if the minister sets on me about it, I'll just tell him that we only pouter'd them out the drill; there wasna a graip shank in the hand o' ony body about the house—surely a body may use their fingers without being found fau't wi'.'"

THE TRAVELLER NONPLUSSED.

Captain Basil Hall, whose written stories have charmed all who have read them, was one day endeavouring to enliven a remarkably stiff and dull dinner party, by a few oral relations of the same kind. He concluded one of a very extraordinary character, by saying, "Did you ever hear any story so wonderful as that?" and at the same moment his eye chanced to rest on a footboy opposite to him, who, without leaving a moment of interval, exclaimed, "Yes, man, there's a lass i' our kitchen, that kens a lass that has twa thoombs on ae hand!"

LITERATURE UNDER THE STUARTS.

The period of the English press, from the accession of James I. to the Orange revolution, is generally considered the least satisfactory in our literary history. In the reign of the first Stuart came an inundation of pedantry, which surrounded the court with verbal criticism and solemn quibble; the people, indeed, had their glorious dramatists, but Bacon was looked upon as an impracticable dreamer. Controversy, too, began to be rife, and the spirit at last exploded in such a torrent of civil and ecclesiastical violence in the next reign, as left no opening for science or belles-lettres. The press was absorbed by the productions of this contentious outbreak. There is in the British Museum a collection of two thousand volumes of tracts issued between the years 1640 and 1660, the whole number of which several publications amounts to the enormous quantity of thirty thousand. This most curious collection was made by a bookseller of the name of Tomlinson, in the times when the tracts were printed—was bargained for, but not bought by Charles II.—and was eventually bought by George III., and presented by him to the British Museum. The limited demand for any productions unconnected with controversial subjects may be inferred from the little popularity enjoyed by Milton's metrical publication, and the fact, mentioned by Dr Johnson, that from 1623 to 1664, the nation was satisfied with two editions of Shakspeare's plays, which probably together did not amount to one thousand copies. The cause of wholesome literature did not benefit by the Restoration; it was a transition from one extreme to another—from a conclave to a brothel; and it became a mere toy of a licentious king, his courtesans and gallants, who sought to divert their weariness with wits and authors, as monarchs were wont to do with their jesters. Charles II. and his followers brought hither the spirit of the literary parasites of Louis XIV., with whom the great were every thing and the people nothing, save a brute and random bolt, or slumbering shell in a mortar. Under this kind of favour, letters, with a few grand exceptions, put on the lowest garb in which they can be arrayed—were tricked out in meretricious finery—habiliments to excite the gross passions of human nature—to pander to the low appetites of the swell mob of St James's, or the hardly less degraded rabble that congregated nightly at Blackfriars or the Globe theatre in Southwark.—*Wade's British History.*

IMPROVEMENTS IN HEALTH-SEEKING.

Railroad travelling possesses many peculiarities, as well as advantages, over the common modes of conveyance. The velocity with which the train moves through the air is very refreshing, even in the hottest weather, where the run is for some miles. The vibration, or rather oscillatory motion communicated to the human frame, is very different to the swinging and jolting motions of the stage-coach, and is productive of more salutary effects. It equalises the circulation, promotes digestion, tranquillises the nerves (after the open country is gained), and often causes sound sleep during the succeeding night; the exercise of this kind of travelling being unaccompanied by that lassitude, aching, and fatigue, which, in weakly constitutions, prevents the nightly repose. The railroad bids fair to be a powerful remedial agent in many ailments to which the metropolitan and civic inhabitants are subject. The innumerable steam-boats plying on the river are another comparatively recent means of securing health to the metropolitans. The benefit derived from a trip for thirty miles down the river on a fine summer's day, is very great. The lively bustle of the river, the beautiful scenery on its banks, and the swift motion of the vessel through the water, all tend powerfully to alienate, for a time, the mind of the business-pressed citizen from his daily thoughts; and the refreshing breeze which is almost always on the river has a most healthful effect. By bringing men of different countries more into contact with one another, and by promoting the more complete interchange of opinion and community of feeling between the inhabitants of the same country, steam conveyances contribute to the health in another, though less direct way, but which to the reader of this book must be sufficiently obvious.—*Curtis on the Preservation of Health.*

HORSE POWER.

A horse, of the Clydesdale breed, has been employed, during fourteen years, by Sir C. Stuart Menteith, in drawing coal waggons on the ill-made turnpike road in the county of Dumfries, from Ayrshire to Dumfries. His usual load of coal has been 35 cwt., in a common light road waggon of the weight of 13 cwt., in a stage of four miles, which he performs three times every day, or twelve miles in the course of twenty-four hours daily. He has never been known to lie down during the last eight years, except twice, when he was in a state of sickness. Sir C. Stuart Menteith employs several more horses to perform the same work, and to draw an equal load upon the same road daily. From the experience Sir C. Stuart Menteith has had in the use of animal power upon common roads, he is of opinion that the most economical mode of employing horses in draught is to give every horse his own carriage, and that he should solely depend upon his own exertions in drawing the load, as otherwise it is well known that it is difficult to find either man or beast equally willing or capable to make the same exertion, or to have the same spirit or motion; and at the same time never to exceed six miles on one stage, and to be performed twice daily. In a stage of three miles and a half, Sir C. Stuart Menteith employs waggons weighing 18 cwt., in which horses draw three tons. The road is in general upon a declivity of one foot of fall for every eight, sixteen, or eighteen feet, with several ascents of one foot in every thirty feet, up which a horse draws the load of three tons, and a waggon of 18 cwt.; but in order to facilitate the ascent, a continuous line of sandstone railroad is first laid down, upon which a plate of iron, six inches wide, by a quarter of an inch thick, is fixed down. Sir C. Stuart Menteith has known horses to draw three tons of iron up an ascent of one foot in fourteen for a short distance; and he is of opinion, that when the pulls or ascents upon all the roads in this island shall be laid with a railroad applicable to the wheels of common road carriages, a horse will be enabled to draw the same load up the ascents that he can draw or work with upon the level parts of a road in a twenty mile stage. In order to enable a horse to bring a load of three tons down any rate of descent, a friction-break has been employed, similar to the one in common use in Belgium, from which Sir C. Stuart Menteith derived this important application. The break is a strong plank, fixed to the back of a cart or waggon, which, by means of a screw, the carter presses against the two hind wheels of the machine, so as to give a sufficiency of friction to retard the too rapid descent of the carriage. This plan has been employed with great success by Mr Croal, coach-proprietor in Edinburgh, from the suggestion of Sir C. Stuart Menteith, who has now used it more than fourteen years upon his coal waggons. The mode adopted by Mr Croal is to fix a lying axle to the plank pressing upon the hind-wheels of a coach, and which is turned by an upright shaft, with a bevel wheel, connecting the two shafts, and turned by a winch by the hand of the coach guard, without moving from his seat. Were this break applied to every coach, the lives and limbs of thousands would be preserved, as the guard would be able to stop horses when running away with a carriage—as it is thought that treble, as it were, of the weight of a coach is to be drawn, if the two hind-wheels are prevented from revolving by the break. This kind of break enables a coachman to drive with perfect security down a descent of any length, and at any rate of speed.

If the employment of horse waggons, weighing from 12 cwt. to 13 cwt. were adopted in conveying coal through the streets of London, one horse would do the work of two; at present, four immense horses draw three chaldrons of coal, or four tons one hundredweight, in a waggon weighing two tons; so that the shaft-horse is obliged to draw a weight of six tons in turning out of one street into another, which is the greatest cruelty to which a poor animal can be subjected. At the same time, railroads of cast iron should be laid down, for the wheels of carts or waggons, upon the narrow steep streets from the river Thames to the Strand, which would enable one horse to draw two tons up those streets, instead of using six horses, the present practice.—*Scotsman, June 1839.*

THE VOICE OF HOME TO THE PRODIGAL.

[BY MRS HEMANS.]

Oh! when wilt thou return
To thy spirit's early loves?
To the freshness of the morn,
To the stillness of the groves?

The summer-birds are calling
Thy household porch around,
And the merry waters falling,
With sweet laughter in their sound.

Oh! thou hast wander'd long
From thy home, without a guide,
And thy native woodland song
In thine alter'd heart hath died.

Thou hast flung the wealth away,
And the glory of thy spring;
And to thee the leaves' light play
Is a long-forgotten thing.

O'er the image of the sky
Which the lake's clear bosom wore
Darkly may shadows lie—
But not for evermore.

Give back thy heart again
To the freedom of the woods—
To the birds' triumphant strain,
To the mountain solitudes!

But when wilt thou return?
—Along thine own pure air
There are young sweet voices borne—
Oh! should not thine be there?

Still at thy father's board
There is kept a place for thee,
And, by thy smile restored,
Joy round the hearth shall be.

Still hath thy mother's eye,
Thy coming step to greet,
A look of days gone by,
Tender and gravely sweet.

Still, when the prayer is said,
For thee kind bosoms yearn;
For thee fond tears are shed—
Oh! when wilt thou return?

—*Works of Mrs Hemans.*

BARBAROUS PLEASURES.

There is often, in fact, no material difference between the enjoyments of the highest ranks and those of the rudest stages of society. If the life of many young English noblemen and an Iroquoise in the forest, or an Arab in the desert, are compared, it will be found that their real sources of happiness are nearly the same. The treasures of science, the refinements of taste, the luxuries of wealth, are in many cases disregarded or forgotten, and the real excitation of life depends upon the destruction of wild animals or the management of impetuous steeds. This is a fact which is matter of daily observation; and it furnishes a most instructive lesson as to the proportion established by nature between the active and the speculative part of mankind. The great majority in every class of society are incapable of receiving happiness from any other source but physical excitation; and every plan for human improvement which is founded on any other supposition, will necessarily fail. Nor is it without good reason that nature has established this disproportion between the studious and the active part of the species. The great mass of undertakings essential to the existence and the welfare of mankind, depend on physical exertion; and, unless the greater part of our fellow-creatures were disposed to that species of labour, and gratified with the enjoyments that attend it, the race would speedily perish, and the speculations of science disappear with the individuals who formed them.—*Alison's Principles of Population.* 1840.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 457. SATURDAY, OCTOBER 31, 1840. PRICE THREE HALFPENCE.

THE NEXT OF KIN.

IN a retired corner of Lancashire,* resided a poor widow of the name of Rokins, who had brought up a large family, and, previous to the death of her husband, enjoyed the satisfaction of seeing them all, except the youngest daughter, comfortably settled, according to their respective minds.

During the life of honest Jacob, the family had depended chiefly on his labour for support, which, besides being devoted to the earning of weekly wages from the neighbouring farmers, was also directed indefatigably to the culture of a small garden, of which the well-managed produce greatly increased their humble income, at the same time that it furnished a wholesome and certain provision for their table. At the period of his death, his widow, who was rather advanced in years, and had never boasted the robust health common to our northern peasantry, was become too weak even to assist the little Sophy in the care of the cottage; and, conscious of her own infirmity, and yielding to the pressure of present sorrow, notwithstanding the comparative comforts that surrounded her, and the little hoard amassed by frugal industry, she deemed the workhouse her inevitable destiny. The contemplation of such an evil, as she considered it, threatened to hasten the close of a life which had been passed in a hard and successful struggle for honest independence. It was too much; the thought preyed on her mind, and the poor woman became paralytic.

What was to be done? Sophy, though not brought up for regular service, was a strong, active, and, better still, a willing girl, and might have earned a tolerable maintenance for her mother and herself, by going out; but then her poor mother required constant attention, and the most affectionate care, and none of her married children could contrive either to take her under their roof, or contribute to her support at home. They contented themselves merely with observing, that "Soph might as well live with mother as a servant, as go out among strangers, and hire a stranger to bide wi' mother." How money was to be earned by this sagacious arrangement, they did not trouble themselves to inquire. They "spoke their minds on the matter," as they called it, and held that enough. Fortunately, their youngest sister thought there was also occasion to act.

Sophy had long been in the habit of assisting her father in the late and early labours of the garden; indeed, as her strength and stature increased, she had taken a considerable share therein, and latterly had always selected the supply for market, and arranged it in the panniers of their ancient donkey. "Why not," thought she, as she leant sorrowfully over her patient favourite, "try to make the produce of the garden still maintain my poor mother? Why not now carry these fine raspberries and scarlet beans to market, which our dear father took such pains to bring to perfection? Let us go, Neddy; for if we don't go now, father's customers will forget us, and we shall have to deal with strangers, who would take advantage of you and me."

The attempt was made; and from that moment Sophy cared nothing for hard-hearted overseers, or still more hard-hearted brothers and sisters. Night and morning she worked in her little garden, through all weathers, or travelled with her donkey to the market-town and gentlemen's houses round, with the most unflinching hardihood. But in spite of such laborious industry, in spite of her unwearied attention to a helpless invalid, there was not a neater cottage than Sophy's, or a prettier, tighter-looking lass than herself, in all the neighbourhood. Her frame was invigorated, not injured, by such toilsome exercise; her cheeks glowed with the brightest, though certainly not the fairest, hue of health; and her eyes beamed intelligently with gratitude to Heaven and modest self-approval. Her poor mother, though widowed and bed-ridden, was one of the happiest of old women; and although her helpless state required many comparatively expensive indulgencies, there was always something laid by, after the rent was paid, with a view of one day purchasing the cottage and its fertile bit of ground, and making it indeed their own.

Of course, a damsel who united such excellent qualifications to so much personal attraction, could not remain an indifferent object to the youth of her neighbourhood. Though Sophy never joined a village merrymaking, and scarcely ever rested from her toil, of a summer evening, to gossip with a neighbour, old or young, woman or man, she could not escape attentions and offers without end, from the disengaged of the village, many made by proxy, from thrifty fathers and mothers who wished to secure so eligible a helpmate to their children. Even the miller's son, it was whispered, though probably not by his wealthy parents' special desire, had paid his devoirs at the shrine of independence and filial affection, and received the unfailing answer, "No!"

Sophy Rokins was stanch to her principle. She lived for the mother whose life she felt she had saved, since the door of the workhouse would to her have been the door of the tomb, and nothing could induce her to leave her, or even to do any thing which might lessen her comfort and peace of mind.

However, scandal—for there is a species of that baneful weed flourishing even in the wilds of Lancashire—attributed these repeated refusals at least to more than one motive, if not entirely to another and very different one from filial piety. There was a hinted story of a travelling merchant or pedlar from "merry Carlisle," who had visited at the cottage in her father's lifetime, and even since his death, in the course of a yearly pilgrimage to the city of York—of a scene in an arbour—a ring and a lock of hair—even of a moonlight walk, and interchange of vows. And it was even so—at least as far as the basis of the rumour was concerned; for scandal, though never stopping at the truth, generally starts with it. The intelligent and sober Cumbrian *had* made the only tender impression on Sophy's magnanimous heart it ever had received; but, scandal—thou unfair historian!—he, too, had shared the firm refusal, and even, in addition, a cruel mandate, visited on no other applicant, never again to afflict her with his presence. She saw, with northern quickness, that her poor mother's half-extinguished spark of life might yet burn out the brightest part of her own and Graham's, and determined, with northern simplicity of attachment, that the man she loved should not be bound to waste that life for her. She had decided, in her humble mind, on a sacrifice of herself, and was content to abide by it, but incapable of wishing another to share it with her. Graham, however, wanted neither her acute penetration nor her strength of attachment; and her motives were not lost on him, though her injunction was religiously obeyed.

Time crept on. Sophy ceased to be courted or talked of; and as the story of the pedlar, for want of being truly developed, had always borne a semblance of self-denouncing inconsistency, it no longer formed a matter of speculation, even among ultra-scandal-dealers; the more so, as it was observed that the lady's charms were really on the wane, and that Graham annually visited the village, but not the cottage, as punctually as ever. Newer wonders supplied their taste for theory, and Sophy was left to Heaven and her own discretion.

Still the industrious and dutiful daughter rose daily with the morn, and, while daylight lasted, toiled in her well-ordered garden through wet and dry, heat and cold, or trotted with her donkey to the market-town. For upwards of eighteen years she pursued unwearied the same quiet simple course; at last the final stroke came on, and her mother died—closing her life in peace and satisfaction, and with her last breath blessing the daughter who had so dutifully and affectionately prolonged it.

The grief of the unsophisticated Sophy was sincere and poignant, at losing the parent to whom all her assiduity and energy had been so long devoted, and great, indeed, was her astonishment at the occurrence by which it was interrupted.

Scarcely were the remains of the aged invalid committed to the earth, when every one of her married sons and daughters—some of them now old men and women themselves, with grandchildren at their heels—came one after the other, upon the bewildered mourner, demanding to have the property of the deceased fairly divided between them, according to the law; which thus provides for the worldly wealth of those who are so unworldly wise as to die intestate. The sight of the expected plunder so sharpened their avidity, that some of them would actually have proceeded to turn poor Sophy out by force, had not their attention been suddenly arrested by the clamour of contention arising amongst themselves respecting the different portions of property which each wished to appropriate. The struggle appeared interminable; and even to the most excited, it was evident that many of the disputed objects stood a chance of being destroyed in the heat of argument. Seeing this, they at length became unanimous on one point, and that was, the expediency of submitting the affair to arbitration. With this enlightened view of the subject, they left the sorrow-stricken and astounded Sophy once more to peaceful possession of the cottage; but their rancour and cupidity were greatly increased, as they retreated, by observing the Cumbrian pedlar leaning thoughtfully on the garden paling, and evidently meditating on the scene of violence they had just so shamelessly exhibited.

It was the time of his annual visit, and he had passed through the churchyard that morning while service was being read over the widow's grave. Not wishing that the taunts he could easily predict awaited him, should reach the ears of the doubly-afflicted and friendless Sophy, he turned quickly on an angle of the road leading to the town, and avoided the hostile party. The latter, who had but a moment before been so thoroughly divided on the question of *meum* and *tuum*, now united in the most social manner in common cause against him whom they knew to have once been a devoted, and whom they suspected to be still a favoured, suitor of their unfortunate relation. It was unanimously decided that no time was to be lost—that the law must be had recourse to; but that, of two lawyers in the town (who lived chiefly on the work each cut out for the other), it was necessary to take counsel before they made an election. Happily, they were again unanimous as to the propriety of consulting Mr Gordon of the mill on this important subject.

* This tale, and that entitled "The Flitting," in No. 453, were written some years ago by an individual since dead. In the manuscript, as laid before us by his widow, the name of the county has only the initial L——; but disliking blank names, we venture to fill it up as above, believing from other circumstances that Lancashire must have been meant by the author.

Gordon was a man who prospered himself, and whose advice, *when taken*, always prospered too. Among the merely cunning, he held the reputation of being "a sharp man;" the wiser part of his admirers knew that he was a just one—that his sense of equity equalled, indeed assisted, his penetration and discernment. Nature had endowed him, amongst many other valuable qualifications, with such a portion of good sense as taught him to turn all the rest to the utmost advantage; his was, in fact, a self-cultivated understanding, which extorted involuntary respect alike from those whose worldly condition made them *fancy* themselves his superiors, and those whose unenlightened minds could show them no reason why they *were* his inferiors. None, however, held him in more just estimation than Graham Wilson. Theirs were kindred minds, similarly favoured by nature, and expanded by circumstances. Graham had not turned the angle of the road, before it occurred to him also that Mr Gordon was the proper person to settle the matter of Widow Rokins's property. He quickly reached the mill, and in ten minutes' time, these two clear-headed and well-intentioned men had determined on the course to be pursued with the senseless and unnatural claimants of the widow's little property. Sophy, as before hinted, had, some sixteen years back, been more than a mere favourite with him who was now master of the mill; but that was long gone by, and a steady comely dame had as long borne the name of Mrs Gordon, and presided over its domestic comforts, and was now called mother by more than half a dozen rosy urchins. Nothing but a generous instinct to succour the friendless, and assist injured worth to repel its enemies, actuated him now in his readiness to second the pedlar's anxious interference.

Setting out instantly to seek some of the unjust oppressors, he met the whole party about to invade his premises. The moment they perceived him, each being eager to speak first, they all burst forth at once, proclaiming every one their business after his or her peculiar fashion; and all with so much vehemence, and in such a grating dialect, that Mr Gordon would have been but little enlightened on the motive of their visit, had he not heard it nearly all before in his interview with the pedlar.

At the first break in their eloquence, he assured them that he had always felt the strongest interest in the family of Jacob Rokins, and would therefore willingly undertake to arbitrate the affair, as he was convinced, and could easily convince them, that either of the legal gentlemen of the village would not leave a stick for the just heirs of the property, if once suffered to lay hands on it; and he therefore requested the party to meet him that day week at Sophy's cottage, then and there to make distinctly, and after more mature consideration, their respective claims, when, if not satisfied with his decision, they could but resort to the lawyers afterwards. This proposal was received with thanks, and the host of claimants withdrew.

Meanwhile, Sophy resumed her usual career of toilsome industry, but with a deep-rooted hopelessness and dejection which she had never felt before. Little had she ever anticipated that, in losing the parent whom she had laboured so meritoriously to support, she should lose, too, the means of supporting herself. She found herself all at once, as it were, thrown upon the world, and instructed practically in the mystery of what that world was. It was no longer now, as when her father died; she was not now a girl, fit to be moulded to anything. "Unless I could hire myself as a gardener," thought she, "service is quite out of the question." And, for the first time in her life, she felt inclined to ask herself whether she had done well in rejecting so many opportunities of settling herself by marriage. She felt, perhaps, for one desponding moment, that her life was no longer of any value to any one, and, after her unkind relations should have turned her from her garden, of no use even to herself; but the recollection of having fulfilled one duty firmly and consistently—of having rescued her dying mother from the dread of a workhouse, and lengthened out her declining days in ease and happiness—quickly returned, and as quickly the thought of Graham banished the beginning of regret for any of the comfortable village homes she might, like her sisters, have now been mistress of. Even in the midst of the self-denying mandate which she laid on Graham Wilson, even while observing the exactness with which it was obeyed, there had still existed a secret hope, unacknowledged even to her own heart, that he would be content to cherish her memory faithfully as she did his. She had always heard of his annual appearance in the village, and by some means ascertained that he continued single. Some tender speculations on the self-forbidden subject were unconsciously supporting her under the weight of her new affliction, when the object of them suddenly stood before her, altered indeed, but not to be a moment doubted by affection that had never harboured any other image. "Sophy!" "Graham!—*my* Graham!" And the poor woman, though not given to expressions of feminine emotion, threw herself into his opened arms, and wept and laughed alternately. She felt like a deserted child that had found a parent. But this is merely a rough narrative of an "ower true tale," not a record of sentiment, and least of all a love-story; so we cannot undertake to dwell on this scene farther than to say, that Graham explained, in the clearest and shortest terms possible, as soon as she was capable of listening, how the case stood with regard to the claims of her relations—the step he and they had, with such different motives, simultaneously taken in consulting miller Gordon, and that worthy man's determination to settle the cause himself there, in the very scene of their contention. He also stated that, though more than ever anxious to make her his, he had not then sufficient funds in hand to secure the humblest dwelling to them, even in his own mountain village, where money went so far, having lost the fruits of twelve years' toil and self-denial by the breaking of the bank in which he had deposited his slowly accumulating gains, since the death of his parents, whom he formerly used to support. But to Sophy—a second time in her life all difficulties and distress seemed to vanish before her. In a moment she had found herself possessed of two friends, one powerful to protect her, and one, better still, kind and faithful, to value and require her services, and thereby to render life valuable to her.

The visit of the pedlar to his old sweetheart was very soon reported and speculated on throughout the neighbourhood; and as soon as it was known to have taken place, the jealous relatives watched the widow's cottage, as though they thought Graham peradventure might stow the whole in his pack; but before they could muster force to arrest his progress, he evaded their pursuit as effectually as he had done the morning after the funeral.

At last the day of expectation came; and Mr Gordon, after quietly hearing all Sophy's simple story, without making any comment to her on it, awaited the arrival of the rapacious multitude, seated with much composure and dignity in the old high-backed leather chair, in the chimney corner.

But who shall describe the scene of that arrival!—who depict the varied, eager, or malignant expressions of the family countenance!—or who single out the various assertions of right with which each preferred his or her own claim, and disputed that of the others to this or that different portion of the property! Lost alike in a Babel of Lancashire dialect, and the hoarse tones of rage and arrogance, there was no longer any unity among them, except in all agreeing to endeavour to annihilate Sophy's right even to an equal share. The grating and nasal sounds of the fore-mentioned dialect orthography would but faintly represent. Let rather such readers as have ever had the felicity of hearing it in its purity, imagine its peculiar harmony on the present occasion. "Mr Gordon, sir! I'm sure poor mother meant my goodman to have all the garden tools and things, for I know his father always said he should, and who'd a thought o' *she* taking to that kind of employ like?" "*Who indeed?*" remarked the arbitrator.

"I only claims the bed and bedding things, and poor dear mother's clothes, and all the small linen, and that," cried the eldest daughter, "beside our share on it all when it comes to be sold." "No, Betsey Dymoak, you can never want thay things; it's I as"—— "Hold your peace, Mrs Rokins; you and your husband wants just every thing for yourselves; let Mr Gordon decide," shouted the second son. "Please, Mr Gordon—Mr Gordon—I *only* claims that looking-glass and the clock, and that there bright-rubb'd table and the big meal-chest," screamed Sally Turner, the third daughter. "I don't wish for *nothing else* but the family Bible and the silver cup grandfather won at the archery, and the six christening spoons, just for the credit of the family, as they're mine by right," said the eldest son. "And I wants the old clock there and the looking-glass, and father's gardening books, and just a few trifling things, pure out of respect for mother's memory," yelled the youngest. "No, Tom! you haves no right wi' any o' them, and the looking-glass I *will have*, for I was always the best." "Deil take you for a greedy old gossip, Sally Turner," retorted her sister's husband, Jock Brummett; "and hold your clapper, Hannah Dowkins—it's no use talking what you'll have, and what you'll have, till we show'd Mr Gordon the appraisement, and see'd how much the sale of the estate will fetch a-piece for us in hard money." This long and learned speech, uttered with more than stentorian power, interrupted the uproar so successfully, that Gordon seized the opportunity to open the proceedings, first of all requesting implicit attention to what he was about to say, and candid answers to all the questions he should see fit to ask. He looked at the appraiser's estimate of the "estate," and at one glance was able to inform the thirteen disputants NEXT OF KIN, that by the time that Sophy's share and the expenses of the sale, &c., were paid, three pounds a-piece would be the utmost that remained for them. "But now," he said, "let me ask how it is, that this land, having been purchased almost entirely by your sister Sophy's earnings, the property is not hers?" "She only worked for mother as a servant, Mr Gordon. She never had no property of her own whatever. The property were always mother's, and were bought afore ever she com'd o' age, Mr Gordon."

"Then, indeed, as *next of kin*, it ought in law to be *fairly* divided among you." Great exultation was shown by the litigants, who thought in their hearts a second Daniel had "come to judgment," while poor Sophy hung her head, and began to feel hope again forsaking her. "But, still, my good friends," resumed Mr Gordon, "as a friend, I ask you, is it not cruel and unreasonable for you, who have been so long independent of your mother, and for whom your father and she did all they could at your respective marriages, to seek to deprive your sister Sophy, who has always lived with her, and supplied her with the means of support she has so long depended on, to turn her adrift, in a manner now, too, that she is unfit for any other work?"

"Please, sir, I was going to observe"—said the fourth daughter. "If you please, Mr Gordon, sir," cried the eldest, "I was always mother's favourite, and that vile"—— "And that vile Sophy," interrupted the second son, "is a-going to disgrace us all, Mr Gordon, and throw away the property on a low-lived, drunken, sneaking Scotch pedlar, Mr Gordon, sir, and that's why we're so anxious like to"—— "A nasty, vulgar, drunken, sneaking fellow," shrieked all her sisters. "We knows her well," screamed a brother's wife; "she kept company wi' un years ago, Mr Gordon, till no decent young woman would keep company with her." "And she's a most undootiful daughter," said Mrs Turner; "for she was always away from *poor dear* mother, gossiping in the town, or musing herself in her garden, Mr Gordon." "Any how, I undertakes to see to the credit of the family, Mr Gordon," said the eldest son; "and it *must* and *shall* be provided for! A nasty drunken lout!"

"Well, you understand the 'credit of the family' best, no doubt [fresh triumph]; but, after all, this will be but a useless trifle, split amongst so many, for you must know there are many other relatives who also have a claim, if you succeed in proving yours; while, undivided, it is to her a comfortable livelihood."

"But out of respect to mother's memory, Mr Gordon, we all wants to have some of her bits of sticks, and you sees yourself it is ourn in law."

"Well, well! But how comes it, my good friends, with all this respect for poor mother's memory, none of you opened your doors to her when your father died, or even assisted your sister, who was then very young, to support her?"

"La, sir, we all has large families of our own, and"—— "But have you *ever* done *any thing for your* mother?" "La, Mr Gordon, sir, *to be sure* we has. I knows I gi'd her a handkercher one day, and that's why I wants"—— "And I sent her a basket of apples, when she grew bad last autumn"—— "And I most always came in and wound up the old clock for her, for I was afeer'd Sophy, with her rough hand, might ruin it like." "And, I'm sure, my little Jim often took her water-cresses and the like." "And I sent her a pound of honey, only just afore she died." "And I—And I—And I"—— "Were equally munificent and attentive no doubt," interrupted Mr Gordon, now turning to the two last speakers, Mrs Brummett and Mrs Dymock, both women of nearly sixty, whom he reproached with so much severity, for their want of filial tenderness and sisterly affection, that one matron burst into an hysteric fit of crying on the spot, and the other withdrew to her own dwelling, to invigorate her spirits with the contents of a certain charmed bottle, potent on such occasions.

"And now, then," said the miller, addressing himself chiefly to the eldest son, "you say your sister has worked (like man, or a horse rather, *I* say she has worked) merely as a servant to your mother, all this time?"

"Mother and we always considered so, Mr Gordon; —and *all* the neighbours, Mr Gordon."

"Very well! Sophy, how old are you? Rather above one-and-twenty, I suppose?"

"Four-and-thirty, sir! I beant asham'd o' my age!" cried the poor creature, in a kind of half shriek, half laugh.

"Indeed, *you* need not be, Sophy," cried Mr Gordon, considerably affected. "Now, what is the lowest possible hire a girl or woman ever receives for service in these parts?"

"Sixpence a-week and a shilling a-week, sir."

"Well, rating your sister's wages only at a shilling a-week (which she has never been paid), the estate would be now indebted to her for wages, far more than it is ever likely to clear by sale! Now, what say you? This is perfectly good in law, on your own admission. Shall we refer it to the lawyers, and let them bring it into court?—or shall we entreat your excellent sister to let us settle matters on the spot, and to content herself, which I know she will do, with being left in undisputed possession of her twice-purchased property?"

It is needless to dwell on the chop-fallen looks of the claimants to Widow Rokins's estate, nor the sullen acquiescence which interest instantly induced them to make with the latter proposition of Mr Gordon. One after another, they all resigned their claims, as hastily and eagerly as they had before preferred them. Neither need we expatiate much on the restored tranquillity of poor Sophy's countenance, the benevolent intelligence of Mr Gordon's, nor the delighted and uncontrollable exultation of the constant pedlar, who, by previous agreement with the arbitrator, entered just at that moment. Suffice it to record that Sophy, after shaking hands with all her rival kindred, and insisting on their receiving Graham as a brother, generously and kindly presented each with some article of furniture or apparel, according to the wishes she had heard expressed; as for her gratitude to Mr Gordon, that is impossible to describe; it could only be equalled by her admiration of his judgment and wisdom.

As soon after this memorable arbitration as regard for her mother's memory permitted, she bestowed her toil-worn hand on her faithful and long-loved Graham. Mr and Mrs Gordon acted as bridesman and brideswoman at the ceremony; and though "four-and-thirty," never was bride more blessed in the reciprocity of esteem and confidence, and the possession of perfect sympathy; nor ever did bridegroom more exultingly lead from the altar all the wealth and accomplishments of nobility, united to all the graces of eighteen.

From that day Graham Wilson renounced his travelling, but he has added a small side-room to the cottage, as a kind of private shop, where he accommodates his old customers of the village with the usual wares, though his time is principally devoted to assisting Mrs Wilson in the care of the pig and poultry, and the culture of her

Digitized by Google

garden, to which his general knowledge has added considerable improvement. The market is supplied more admirably and punctually than ever; but whatever is sweetest of the flowers, most perfect of the vegetables, and fairest of the fruits, is constantly offered up at the shrine of gratitude, to Mr and Mrs Gordon of the mill. However, there is still enough, not only for themselves and the casual wanderer, but to regale occasionally their village neighbours, and even their NEXT OF KIN.

THE BRITISH ASSOCIATION AT GLASGOW.

ILLUSTRATIONS OF THE CONDITION OF THE POOR.

At the sittings of the Statistical Section, during the week of the association, several papers were read in illustration of the condition of the poorer classes in Glasgow and other parts of Scotland. These papers had a high and distinct interest of their own; and we propose here giving, without interruption, a view of the leading facts brought out in them.

At the first meeting of the section, Thursday, September 17, Mr Miller, superintendant of the police of Glasgow, read a paper on the crime and criminal classes of the city. We may mention that Mr Miller is a man of somewhat remarkable history, having been induced, by a natural bent of mind, to desert a profession in which he was prospering, in order to devote himself, for a smaller income, to the office he now holds. Having thus the advantage of a talent suitable for his peculiar duties, he has put the police on an excellent footing, and manages all its affairs with a thoughtful energy and accuracy, which his fellow-citizens speak of in the highest terms. The paper read by Mr Miller proved him to possess an enlightened and philanthropic mind. He stated the population within the police district to be about 175,000, and the number of criminal cases in the year 1839, to be 7687, the male offenders being three to one of the females. The crimes are chiefly petty thefts; the value of the property stolen in 1839 was about L.7663, of which a portion, to the amount of L.1260, was recovered. "Many of the persons convicted of theft are not habitual thieves; some are wives deserted by their husbands; some are children deserted by their parents; and many are led to the commission of offences by intemperance." Of women given up altogether to an infamous course of life, the number is 1400, of whose career the average duration is estimated at about five years. "For the most part, they live in great wretchedness—their personal habits are filthy—they have miserable homes—they are seldom in bed till far in the morning—they are without wholesome diet—they are constantly drinking the worst description of spirituous liquors—and they are exposed to disease in its worst forms." The picture which Mr Miller statistically drew of a portion of the town where these and the other depraved classes chiefly dwell, was astounding—a close cluster of narrow filthy lanes, honeycombed with mean unfurnished apartments, in which a dozen persons will live in a space measuring perhaps twelve by eight feet, without so much as a window, and often with no bedding superior to a bundle of shavings. Three-fourths of the crime in the city, in Mr Miller's opinion, arises from habits of drunkenness, for the indulgence of which there are in the city 2300 licensed public-houses, mostly of a very mean description, being about 1 for every 117 of the population. There are 33 licensed pawnbrokers, and about 400 of an inferior description, usually distinguished as brokers, who make a practice of giving money for articles by way of purchase, on an understanding that, if not previously sold to other persons, they may be retrieved by paying an advanced price. We shall afterwards see, from another paper, to what an extent the poor are robbed by this class of low tradespeople. Mr Miller showed how much criminals are favoured in eluding justice, by the five several jurisdictions into which the cluster of population called Glasgow is divided, and urged strongly the propriety of having one jurisdiction only. He concluded his series of details by remarking on the inefficacy of punishment to check criminals. "When crime," he says, "has been committed, and especially after conviction and punishment, the character of the delinquent is almost always irretrievably lost. Though he were so disposed, he has no way of obtaining honest employment, for no one will take him without a character, and he is shunned by all. Necessity, therefore, compels him, though it may be against his own inclination, to continue the guilty career he has commenced. He proceeds from bad to worse, until finally arrested by the hand of justice, and made to expiate his crimes in exile, or on the scaffold. Thousands of unhappy individuals, who have once swerved from the path of rectitude, would gladly return to a virtuous course of life, if they had the power; and it is certainly deeply to be deplored that no adequate means have hitherto been provided for remedying so great an evil. The most effectual mode appears to be—the formation of a workhouse, or a house of industry set apart for the accommodation of the criminal part of the population of the city, where, by a confinement of some duration, and by regular tuition and industrial occupation, habits of industry and morality may be formed, and the inmates fitted for again mingling with the respectable portion of the community; and it should be a part of the plan of such an establishment, that after an inmate has approved himself satisfactorily to the directors, means should be taken of finding him honest employment on again entering the world. The present mode of punishment for crime is not merely *useless*—it is absolutely *prejudicial* to a very great extent, and tends materially to increase the evil it is intended to alleviate. The great mass of offenders, when convicted, are sent to jail, or to Bridewell, for periods varying from five to sixty days, and hence, from the shortness of the period, they are no sooner placed within the walls than their minds are occupied with the prospect of a speedy deliverance. Attempts are, no doubt, made to instruct them, and they are put to some description of work; but, for the most part, such endeavours are completely in vain, as virtuous principles and industrious habits cannot be formed in a day. They come out of prison really in a more hardened state than before, and with a deeper sense of their destitute condition; and, at all events, if any good impressions have been made, they are soon obliterated; for, at the very threshold of the prison, they are met by bands of their old associates ready to welcome them, and as they have no calling to which to turn, nor any honest mode of obtaining shelter and subsistence, they are forced once more to mingle with the guilty crowd, and do as they do."

Dr Cowan, a medical practitioner in Glasgow, read* an elaborate and most instructive paper on the disease and mortality of the city during the few past years. From this it appears, in the first place, that Glasgow, in its widest sense, is now estimated to contain a population of 272,006, which of course makes it the second city of the empire in this particular respect. It has risen to this amount from 151,540 in the year 1822. Indeed, no city, even in America, that we are acquainted with, has increased so rapidly in population, during the last thirty years, as Glasgow. In 1822, the mortality was 3408, or one in about 44¼ of the population; in 1825, it was 4571, or as one in about 36¼. In 1828, the mortality increased to 5534, which, at the then amount of the population, was one in 33—a proportion alarmingly high. Since then, however, the inhabitants of this great city have suffered still more severely. In the year of the Asiatic cholera, 1832, when the population was 209,230, the mortality reached the enormous amount of 9654, or one in about 21¼; and again in a year of severe fever, 1837, when the population was estimated at 253,006, it reached 10,270, or one in about 24¼. It would appear as if, after such disastrous periods, the mortality becomes for some time lessened. After 1832, it rebounded to one in 36, and after 1837 to one in 37, or thereabouts. Probably this is in some measure owing to the effect of severe epidemics in carrying off so many of the least healthy of the people. It is to be remarked, that in these results no account is taken of still-born children, who in the eighteen years before 1840, amounted to 8763. The proportion of the still-born is startlingly high, being, in 1830, 471 out of 6868, or about a fourteenth. In this fact alone, we cannot help thinking we behold a strong proof of the amount of misery and error prevailing in Glasgow.

The average annual mortality in Glasgow was, for the period between 1822 and 1830, both inclusive, 1 in 38¼; for the period between 1831 and 1839, also both inclusive, 1 in nearly 32. At the latter date, if it were habitual, Glasgow would stand forth as one of the cities most fatal to human life in Europe. Another fact is most remarkable, that, of the deaths during these eighteen years, 43 per cent., *or not much short of the one-half, are of children under five years of age, and 18 per cent. under one year of age.* It further appears, from minute evidence, that in the years of unusually great mortality, there is a larger proportion of deaths amongst the adult population, *showing how fatal the epidemics are to heads of families.* From one-fourth to one-fifth of the funerals in Glasgow are at the public expense—an impressive fact, as Dr Cowan well calls it, seeing how it *connects poverty with mortality.*

To account for the great mortality of the last nine years in Glasgow, Dr Cowan speaks of—"the rapid increase in the amount of the labouring population, without any corresponding amount of accommodation being provided for them—the density, and still increasing density, of that population—the state of the districts which it inhabits—the fluctuations of trade, and in the prices of provisions—the lamentable 'strikes' in consequence of combination among the workmen, by which the means of subsistence have been suddenly withdrawn from large masses—the recklessness and addiction to the use of ardent spirits, at once the cause and the effect of destitution—and the prevalence of epidemic diseases both among the adult and infantile portion of the community."

Some notice of the huddled state of the *miserable classes* in Glasgow, has been presented in our notice of Mr Miller's paper. It remains to be mentioned that a great part of the *labouring population* live in the central parts of the town, not so much huddled up, certainly, into small apartments as the miserable classes, but yet very densely packed together, their houses being in narrow lanes, which the sun rarely penetrates, and which, for want of sewerage, are constantly exhaling the effluvium of filth and decaying organic matter. This closeness and the results of defective sewerage, no doubt operate greatly in reducing the health of the people. The effect of reduced means, whether from the fluctuations of trade, or "strikes," can be only too easily traced in the mortality bills. Fever, it must be understood, is an epidemic rarely, if ever, absent from Glasgow; and it is the cause of a large proportion of the deaths. It existed throughout 1836, but to what for Glasgow may be called no alarming extent, until the month of November, when a commercial embarrassment took place, and many persons were consequently thrown out of employment. The season, moreover, was winter, and provisions were high in price. The consequence was, that in the four months ensuing upon the 1st of December, the fatal cases of fever were 696, the number during the previous four months having been only 315. In April 1837, eight thousand individuals were thrown out of employment by a strike of the cotton-spinners; and the mortality from the fever *reached its maximum in the ensuing month.* The attention of the wealthier classes was then drawn to the state of the poor, for it was seen that their own lives were now in considerable danger. Accordingly, a Relief Committee was established, and large funds collected. A soup kitchen was set on foot, from which 18,500 individuals were daily supplied. Employment was procured for 3072 males. Clothes and blankets were distributed. In short, such measures were taken to alleviate the destitution of the unemployed poor, that the severity of the fever was mitigated, and it began gradually to decline. On several other occasions, the same results have followed from the same causes. "In 1817, 1818, and 1819, when fever first prevailed in Glasgow to an alarming extent, its ravages were preceded by two bad harvests, and want of employment for the labouring poor; and to prove the extent of the distress, not among the pauper class, but among the industrious poor, it appeared in 1820 that 2043 heads of families pawned 7380 articles, on which they raised L.740. Of these heads of families, 1946 were Scotch, and 97 English or Irish; but the fact most deserving of attention is, that 1375 had never applied for, nor received, charity of any description, though they knew that funds had been voluntarily raised to a large amount. * * And what were the articles pawned?—blankets, sheets, clothing of every description; all the little articles of household furniture having been previously sold, without the hope of ever redeeming them."

It is now proper to advert to the *amount* of fever which has of late years existed in Glasgow; and here we are presented with a view of misery such as no other city in the empire could exhibit, and more resembling, perhaps, the sweeping calamities of eastern climes, than any thing usually seen in our generally more favoured country. In Glasgow, there is a large infirmary, with a fever hospital attached; the poor are also attended at their own houses by certain physicians appointed for the purpose. It is only the cases in the hospital and those privately attended in the above way, that come within the range of Dr Cowan's observations: there must, of course, have been many other cases, attended as usual at the expense of the parties, and we also learn that there were many cases calling for, but not obtaining public aid, in consequence of the want of hospital accommodation. Even, however, when we limit our view to the cases gratuitously treated, the results are appalling. It appears that the fever patients treated in the hospital, were, from 1795 till 1809, inclusive (a period during which the population of the city was comparatively moderate), 1072, or about 11 per cent. of the whole cases of disease treated in the infirmary. From 1810 till 1824, inclusive (a similar space of 15 years, but during which the population was becoming dense), the cases were 7085, or about 32 per cent. of the whole cases. But during the last fifteen years, they have been 27,141, or 52 per cent. of the whole cases. From 1827 till 1839, inclusive, 9665 additional cases were treated privately and gratuitously by the city surgeons. During the five years from 1835 till 1839, inclusive, the deaths from fever in Glasgow were 4788, and the cases in that period are calculated to have been 55,949, of which no less than 21,800 are supposed to have occurred in 1837, being one for about every nine persons in the city! "The mind," says Dr Cowan, "cannot contemplate without horror the amount of human misery which the above statement so forcibly expresses."

Scarlet fever is also a very fatal epidemic in Glasgow, having in the last five years carried off 1056 persons, while the cases are calculated to have been 12,672. Small-pox, in the same period, has swept away 2044, and measles 2448. In these diseases, the victims are, all except a small portion, under ten years of age—the reverse of what is observed in the contagious fever, where fully five-sixths are above the age of ten.

What is most striking about these statistics is, that in London and other large cities in England, fever is not nearly so fatal a disease, and prevails comparatively to a small extent. In those cities, there is as much noxious exhalation, and as great density of population, as in Glasgow; to what, then, can the difference be attributed? Dr Cowan, Dr Alison, and a few other philanthropic inquirers, can discover no answer to this question, but in the destitution which is allowed to exist in Scotland amongst the poorer classes, while in England (among the native population) such a thing can never prevail to any extent, the poor-law there making sure that no one need to remain in a starving condition if he chooses to apply for relief. In the instance of the commercial embarrassment of 1836, had it taken place anywhere in England, the unemployed would have been

* At the meeting of Monday, September 21.

Digitized by Google

maintained by the public, and one great cause of fever would not have existed. The same would have been the case with the numerous second-class working-people whom the strike of the spinners in April 1837 threw upon the world. These would have been sustained till it pleased the spinners to resume their work. In Scotland, however, where none but the old and infirm get any public relief, and even they very little, a horde of unemployed people massed up in a dense city immediately becomes a focus of pestilential disease, spreading outwards to the wealthier classes, who then pay with their lives for the erroneous theory on which their institutions are founded, and only become convinced of the necessity of doing something for the poor when they see the mischief take place on a sufficiently large scale, unfortunately taking no warning from the past for the future, but allowing every thing to go on as before, as soon as the danger has been temporarily reduced.

A paper not much less elaborate than that of Dr Cowan, was read* by Dr Alison "on the Practical Operation of the Scottish System of Management of the Poor," from which, however, we have only room to glean a few facts. The number of vagrant beggars in Scotland was shown to be great: at an average, 845 enter the town of Peterhead every year. They take refuge in large towns in winter, and in summer wander through the country, begging by day, and sleeping in out-houses at night. In a parish in the Old Town of Edinburgh, containing 2500 persons, 103 families, or nearly a fifth of the whole people, were lately found by a church missionary in a destitute state. Of 120 such families reported on by two of the city missionaries, only 30 had any parish relief. Again, of 57 very destitute families, only 10 had such assistance. Twenty-six persons accustomed to visit the poor in the Old Town, gave their testimony to the extent of the destitution, its effect in sending all kinds of furniture and clothing to the pawnbroker, and its being, in a large proportion of instances, quite independent of intemperance, the frequently-recurring want of work (that is, the redundancy of the population) being apparently the leading cause of the evil. Dr Alison adduced grounds for his opinion that the fever which ravages Edinburgh as well as Glasgow, is more the result of, or favoured by, destitution, than the result of noxious effluvia or density of population.†

In a long paper read afterwards,‡ Dr Chalmers took the same view of the actual condition of the poor in Scotland, but endeavoured to show that a compulsory provision is not necessary. He described a course of procedure which he followed some years ago in the parish of St John's, which is one of the poorest in Glasgow, he being then its pastor. Dismissing all legal provision, he looked for pecuniary means only to the collections at his church door, which, if we recollect rightly, he stated to amount to L.400 per annum. The population of the parish was about 10,000. He depended chiefly on the sympathy which the poor feel for the poor, the affection which individuals feel for their relations, and the principle in all men that they will rather work than starve. His agency for working out his system consisted of a number of officers whom he called deacons, members of his congregation and generally persons in respectable circumstances, residing, some within the parish, and some throughout the city. Each deacon had a particular small district under his charge. To him any destitute person in the district applied for relief. The first step taken by a deacon, on an application for relief being made, was to inquire if the applicant could not get work. If he could not, work was, if possible, obtained for him, the deacons having, from their place in society, considerable facilities in procuring employment. Should this expedient fail, the next was to see if the applicant had any friends who would contribute to his support till he was again able to maintain himself. This part of the plan met generally with such success as to convey a favourable impression of the kindness subsisting amongst relatives in the district. It was also found that neighbours, unrelated to the parties, would do much to alleviate the condition of the destitute. Dr Chalmers described the plan as altogether so successful, that there was a constant flowing in of poor into his parish, in order to enjoy its benefits. Yet, during the four years in which he superintended its operation, there were only as many additional poor upon the roll as called for an expenditure in all of L.32, or L.8 a-year at an average. The general result he indeed described to be, that, by merely a minute system of inspection, and a little management in obtaining work and throwing as many as possible upon their own resources, or upon relatives and neighbours, the poor were supported with comparatively a very small expenditure of money.

A good deal of discussion followed the reading of this paper, but to little purpose. The only strong objection presented was one by Dr Alison, that nothing had been done to prove to the section that the destitute of the parish were really and adequately supplied, or that, during the late disastrous years, the condition of this parish was better than that of others. Some others might have been pressed. For example, there is no assurance that in each parish the church collections would be sufficient: in St John's, the sum collected was unusually large, in consequence of a popular preacher attracting a congregation of ladies and gentlemen from all parts of a large city. Also, while the utility of such an agency may be admitted, the country cannot be satisfied that such an agency is every where, and within every parish, to be had, or that each particular clergyman in the land is able or willing to frame and keep it in action. Again, there is no certain dependence to be placed on relatives and neighbours. These may do much for an unfortunate person; but they will scarcely do all that is necessary, as is in fact shown by the present system, which mainly consists in leaving the poor to be supported by the next class above them, the result of which is that they are, in general, barely kept in life, while the object desired by the advocates of the compulsory system is, that all shall be fed up to the point of health, though not with the comforts or enjoyments of the independent labourer, and that this should be done, not at the expense of the benevolent alone, or of any class in particular, but by an assessment laid equitably upon all. It was strongly urged against Dr Chalmers, at the close of the meetings, that among the most destitute of the people in Scotland, who are continually migrating in search of employment, the care for relations is practically found to be much *less* than in any of the superior ranks of society; that many such destitute families receive little or no religious instruction, simply on account of want of decent clothing; and that many such families have been reduced to this condition by causes over which they have had as little control as over the visitations of disease, for which he avowed that he thought provision ought to be made by assessment; and also (what he himself admitted), that in this lowest class, habituated to one form or another of beggary, population advances with the most rapid strides.

On the whole, it appeared but too plainly, from the statements made on this occasion, that the condition of the poorest class of our countrymen is neither satisfactory, nor, as compared with other nations (particularly England, Holland, or Germany), creditable to our national character; and that a searching inquiry into the facts, and an impartial consideration of remedial measures, has become a national duty.

* Friday, September 18.

† All those evils in the great towns were shown to be very much dependent on a continued influx of poor families from other parts of the country, and on the law of three years' settlement, and the miserably scanty provision for the poor in many parts of the country precluding the possibility of a mere equal diffusion of the burden of pauperism over Scotland.

OCCASIONAL NOTES.

TEACHERS' SALARIES.

In advertisements for teachers, the ludicrous contrast of almost universal accomplishment against diminutive salary continues to be frequently exhibited. In one newspaper, we lately found an advertisement for a parish-schoolmaster, who is required to be able "to instruct in Latin, grammar, writing, arithmetic, and geography;" and it is added, that "a knowledge of the French language will be a recommendation. The salary to be about L.26 per annum, besides the fees for scholars (perhaps 80 at 2s. a-quarter each), and there is a free house and garden." Something like L.58 a-year (or 22s. 6d. a-week), besides a shabby cottage for a residence, along with a cabbage garden, are here offered for the services of a highly educated man of first-rate character; the said highly favoured individual being of course required to settle down for life in an out-of-the-way part of the world, where there is no prospect of promotion. Another advertisement in the same paper is for a master "to teach the usual branches of elementary education in a village school," for which he is to have the extraordinarily large sum of L.50 per annum (or 19s. a-week). In the same paper there are several other advertisements for teachers, but, with commendable modesty, they do not mention the amount of salary. In one, in which the teacher is to instruct in all the usual branches, and besides, "conduct a Sabbath evening school"—in other words, to work seven days a-week—he is "to have a small salary;" very *small*, we have no doubt; perhaps, at a guess, 8s. a-week, besides an empty lodging.

To make all this the more ridiculous, there are advertisements in the same columns requiring the services of young men as clerks, overseers, &c., to whom salaries are promised on a reasonable scale of allowance. A sub-manager for an iron-work is offered "from one to two hundred pounds per annum, with a house;" a person to look after blast-furnaces is to get "L.100 and a house;" and for a clerk to a railway contractor, "the salary is to be liberal." We again ask the needless question, Is it to be expected that men of good abilities and attainments are to adopt the profession of the teacher, at wretched salaries, when they can get good salaries in other professions?

It is not unworthy of notice, that, of late years, the condition of teachers has in some situations been worse than it even used to be at the time when education was attracting little attention. We advert in particular to several of the burghs of our own country, where the magistracies, having the lavishness of the old system before their eyes, are animated by an ultra disposition to pinch, pare, and screw down. We have heard of the salaries in some places being so reduced, that the teachers are now strikingly inferior in qualifications, or at least younger and less experienced men than formerly. This is bad policy, which must soon tell upon the reputation of the schools in question.

A HINT FOR MAP-MAKERS.

Those who, in this country, prepare maps for the guidance of tourists, would do well to look into Keller's Map of Switzerland, a foreign production, but sold, we believe, in England. This map is made to tell of many things which are usually only noticed in the books accompanying maps, and all this without confusing the eye of the peruser, as might be expected, with an unusual quantity of writing. The object is attained by a set of neat signs or marks, the explanations of which are given on a slip of paper pasted on the case of the map. There are at least thirty such signs, and amongst them we find not only indications of the chief towns of districts, cathedral towns, battle-fields, &c., which are sometimes given in our own maps, but things denoting mines, factories, fine views, inns, bridges, post-houses, and so forth. As much intelligence is accordingly conveyed on the face of this map as would otherwise occupy a volume.

While on this subject, we cannot resist the opportunity of rendering our humble meed of praise to the ingenuity and industry of the late Mr Drummond, under-secretary for Ireland, as exemplified in the maps of that country prepared for the commission on the proposed Irish railways. These maps are on a large scale, and beautifully engraved and coloured. Each is designed to present Ireland in a certain aspect. For example, one is to illustrate the comparative populousness of different districts of the country; another is to show the various amounts of travelling in different districts, as manifested by tax returns; a third, the various degrees in which districts are devoted to manufactures; and so on. All this is done by employing different depths of colouring at the different places, so that the elements of consideration required by the commissioners for their guidance may be said to meet their eyes in a moment. While lauding the ingenuity of the author of these maps, it must ever be regretted that the excessive labour undergone in their construction proved destructive to his life, and deprived the country of one of the most valuable minds devoted to its service.

GAS BURNERS.

About six months ago, a paper was read before the Scottish Society of Arts by Dr Andrew Fyfe, respecting the comparative illuminating power of different kinds of gas burners, from which some useful information was derived. The following is an abstract from the proceedings of the society on the subject:—

"In trying the comparative illuminating powers of different gas-burners, Dr Fyfe stated that he took a single jet-burner, burning with a flame of five inches in length as the standard, in which case he had it so adjusted as to burn exactly one foot per hour. Assuming the light given by this burner, as thus used, to be as - - - - 100

The light given by a fish-tail for an equal consumpt of gas is -	140
By a bat-wing, about - -	164
By an argand (24 holes) -	180

Accordingly, for equal consumpts of gas, the additional light given, over and above that afforded by a jet, is, by the fish-tail 40, by the bat-wing upwards of 60, and by an argand 80 per cent. For this purpose, however, it is necessary to use the fish-tail and bat-wing burning with their full supply of gas, and to have the argand with a flame of about three inches. On increasing the number of holes in the argand, though the quantity of gas consumed becomes greater, the comparative illuminating power is not augmented; the increase in light being merely proportionate to the enlarged expenditure. From the numerous experiments which he had performed, Dr Fyfe stated that he had come to the conclusion that the argand is by far the most economical method of consuming gas when illumination is the only object, and provided, of course, so much light is required; and that the single jet is the most unprofitable, and ought never to be used. When the light of a single jet only is required, he mentioned that it is much better to have a burner with two or three holes so near each other that there shall be only one flame. When this is so used as to give the light of a jet, it consumes from 10 to 20 per cent. less of gas, thus causing a great saving to those who burn by meter."

UN-LOCOMOTIVE CHARACTER OF FARMERS.

The following observations on a somewhat remarkable point in the character of British farmers, occur in a letter of a traveller published in a late London newspaper:—

"This leads me to add an observation upon a somewhat singular matter of fact connected with my experience as a traveller. In the course of my journeyings abroad, which have occupied, at different times, some years of my life, and during which I have visited the four quarters of the globe, I never either met with an English farmer, or became acquainted with any person who had. Every other class of my countrymen have fallen in my way; the manufacturer, the wholesale and retail dealer, the shop assistant, the merchant's clerk, men of all callings and professions, are to be met with abroad; but the British farmer is never encountered, unless on board an emigrant ship destined for America, or some other country containing new settlements. Yet whose business affords so much leisure as that of the farmer!—and who so likely to derive pleasure or profit from travel-

Digitized by Google

ling, as he who would be able at every revolution of the wheels of his carriage to observe some new fact bearing upon his own pursuit, and to compare it with what he had left at home? An English farmer who made the tour of Belgium, France, and Switzerland, would acquire more knowledge and experience than by attending a thousand meetings of agricultural societies in England."

The writer surmises that, as it is from no want of leisure or motives of self-interest and pleasure that farm-tenants are never found abroad, it must be from want of means; and he converts this surmise to his own purpose, as reflecting on the insufficiency of "protection" to create wealth. Whatever "protection" may do, we cannot but see that the great mass of British farmers are capitalists on so small a scale, that they could not be expected readily to afford the expenses of a continental journey. Many, on the other hand, are capitalists on so large a scale, that they might be expected to travel abroad like other persons of the same degree of wealth; but the minds of the agricultural class are not enterprising or active in this particular direction. The languor of mind consequent on rural quiet and a limited and unvaried range of duties, is sufficient to make the British farmer so little of a traveller. We may mention that we know *one* Scottish farmer who has travelled over the Continent in quest of information.

BIOGRAPHIC SKETCHES.

MRS PIOZZI.

Few females have been fated to associate their names so intimately and lastingly with the literary history of England, as Hester Lynch Salusbury, better known under her successive marital names of Mrs Thrale and Mrs Piozzi. This arose partly, it is undeniable, from the accidents of fortune and position, but, independently of these circumstances, this lady had a sufficiency of personal merit to render her history a matter of interest on her own account alone. She was born in 1740, and was the daughter of John Salusbury, Esq. of Bodville, in Caernarvonshire. Miss Salusbury received an excellent education under the care of the learned Doctor Collyer, and made unusual proficiency, considering her sex, in classical literature. The Hebrew, Greek, and Latin languages, were among her acquisitions in this department.

In her twenty-fourth year, Miss Salusbury married Henry Thrale, Esq., an eminent brewer in Southwark, and a man of education and talent. He was acquainted with the well-known critic and dramatist, Arthur Murphy, by whom he was introduced, soon after his marriage, to Dr Samuel Johnson, then in the full blow of his fame. The decided literary tastes, both of Mr and Mrs Thrale, led to a mutual attraction between them and Dr Johnson, and he was their frequent guest from the first hour of their acquaintance. Ere long, the connexion grew closer, Johnson being invited, in 1766, to take up his residence with them at Streatham altogether—an invitation which he willingly accepted. Boswell represents this as a happy event for the great lexicographer. "He had at Mr Thrale's all the comforts and luxuries of life; his melancholy was diverted, and his irregular habits lessened, by association with an agreeable and well-ordered family." For fifteen years, this connexion continued with, upon the whole, mutual satisfaction to guest and entertainers, impaired only on occasions by the rough and dogmatic manners of Dr Johnson. But when Mr Thrale died in 1781, the case was altered. The doctor had always been easily kept in check by the presence of the mild but manly Thrale, for whom he had a sincere and rooted respect. Now, however, he assumed the dominion of the family circle, and exercised his power in such a way that Mrs Thrale could not see any of her own friends at her house, without subjecting them to the chance of meeting with bearish rudeness and insult. In her "Anecdotes," published afterwards, she mentions, in proof of this statement, that two quiet and respectable gentlemen came one day to dine with her at Streatham. One of them, a Quaker, chanced to tell an anecdote respecting the red-hot balls thrown at the siege of Gibraltar, which had just taken place. When he had done, "I would advise you, sir," said Johnson, with a cold sneer, "never to relate this story again. You can scarce imagine how *very poor a figure* you make in the telling of it." The abashed and unassuming Quaker never again ventured to open his mouth but in a whisper throughout the evening, and, even then, he spoke only to his friend who had come with him. When the two visiters departed, and Johnson was left alone with Mrs Thrale, "I did not quarrel with those fellows," said he, with a satisfied sense of his own forbearance. "They gave you no cause of offence," replied Mrs Thrale. "No offence!" returned the doctor, with an altered voice; "and is it nothing to sit *whispering* together when I am present, without even directing their discourse towards *me*, or offering *me* a share in the conversation?"

This story will prepare the reader for learning that the connexion between Mrs Thrale and Johnson did not last long after Mr Thrale's death. It is to her credit, however, that she did not hurriedly or rudely part with a man, possessed of virtues so great and numerous, and so far transcending, on the whole, his failings. Three years after the death of her husband, she went to Bath, for the advantage, partly, of her health, and partly that she might be for a time freed from the yoke which had become so heavy. At Bath, she met a music-master, named Piozzi, an Italian by birth, and a man of respectability, though not the equal, certainly, in fortune or station, of herself. However, she married him, and Johnson and she parted for ever. The fact of Piozzi being a foreigner and a musician, as well as the consciousness, no doubt, of the altered position in which the marriage would place himself with respect to the Thrale family—all this conspired to make the match odious to the doctor, and some have asserted (what others deny) that in a letter to herself he called it a "most ignominious business." But the lady's mind was made up. Johnson took leave of her mildly, and, indeed, affectingly, after all was concluded. "What you have done," he said, "however I may lament it, I have no pretence to resent, as it has not been injurious to me; I therefore breathe out one sigh more of tenderness, perhaps useless, but at least sincere. I wish that God may grant you every blessing."

Mrs Thrale became Mrs Piozzi in 1784. Her name was too famous in the literary circles to permit of her escape from the pellets of the wit-mongers of the day, though there was certainly nothing very wonderful in the re-marriage of a woman of forty, even with a person a little below her in rank. Peter Pindar treats this marriage-matter in a very humorous way, in his piece called Bozzy and Piozzi, where he paints a contention between James Boswell and the lady, as rival candidates for the honour of biographising Dr Johnson. The lady is made to defend her escape from widowhood thus emphatically:—

> What was my marriage, sir, to you, or him?
> *He* tell me what to do! a pretty whim!
> *He* to propriety (the beast!) exhort!
> As well might elephants preside at court!
> * * * * *
> Tell me, James Boswell, what's the world to me?
> The folks who paid respects to Mrs Thrale,
> Fed on her pork, poor souls! and swilled her ale,
> May sicken at Piozzi; nine in ten
> Turn up the nose of scorn;—what then?
> They keep their company, and I my meat.

It was true, as the satirist hints, that the world, guided or biassed by regard for Johnson, did very generally condemn the match. Mrs Piozzi freed herself from their immediate sneers by going abroad with her husband. At the close of 1784, they visited France, and subsequently passed through Germany and Italy. They settled ultimately, for a time, at Florence. Here Mrs Piozzi's fixed literary tastes led to the congregation of a congenial knot of English gentlemen and ladies, who, chiefly for their own amusement, published a volume, called the "Florence Miscellany," to which they all contributed. Mrs Piozzi was a leader in the business, and many pieces, of no slight merit, appeared at this time from her pen. One in particular may be adverted to, as worthy of notice, namely, the "Three Warnings," a pointed allegorical piece, which has found a place in almost all subsequent collections of poetry. The contributions to this miscellany constituted Mrs Piozzi's first appearances in print. She had for a coadjutor at Florence the famous Della Crusca (Mr Merry), "on whose coming over to England," says Mr Gifford, "a poetical amatory fever spread through the land and its periodicals—Laura, Maria, Carlos, Orlando, Adelaide, and a thousand other nameless names, caught the infection; and from one end of the kingdom to the other, all was nonsense and Della Crusca." Mrs Piozzi was of a grade superior to these scribblers, and ought never to have been accounted of their number.

After visiting every part of Italy, Mrs Piozzi returned with her husband to England. In a fanciful moment, she imitated Dean Swift by composing some light verses at Dover, of which the merit is the rhyming. They run thus:—

> He whom fair winds have wafted over,
> First hails his native land at Dover,
> And doubts not but he shall discover
> Pleasure in every path round Dover;
> Envies the happy crows which hover
> About old Shakspeare's cliff at Dover;
> From this fond dream he'll soon recover,
> When debts shall drive him back to Dover;
> Hoping, though poor, to live in clover,
> Once safely past the straits at Dover; &c.

And so on. The fruit of her continental journey was a two-volume work of travels, which is written in a lively style, but did not take any very permanent hold on the public attention. The wonder with which a traveller is struck by the customs and sights of a foreign country, is one of the main requisites for drawing up a perfect account of them. Seeing much with her husband's eyes, Mrs Piozzi seems to have been led into the *pococurante* train of sentiment. For a while, however, her work was popular.

In 1786, Mrs Piozzi published her well-known volume of "Anecdotes of Dr Johnson." The great interest of the subject would alone have made this book a favourite, but the authoress ought not to be deprived of the share of merit justly due to her, as a narrator of much acuteness of observation and liveliness of fancy. Smarting as she then was under the neglect which Johnson's open disapproval of her marriage had brought upon her from the circles in which she had previously shone, it is scarcely to be wondered at that she should have allowed the shades of her former friend's character to come out pretty broadly on her canvass; but we believe she cannot be proved to have told any untruths, and she over and over again admits the greatness of his virtues. In the year 1788, she published a second work relating to Johnson, being a series of Letters which had passed between herself and him. These are very interesting; and had not Boswell's unique production given us a view so wonderfully minute of the doctor's character, would have been held as a most important contribution to literary history. Boswell, however, superseded and threw into the shade all other works upon the subject of which he treated. But Mrs Piozzi has still the merit of having produced a pleasing record of many incidents in the life of a remarkable man.

Her next work was one published in 1794, and entitled "British Synonymy; or an attempt at regulating the choice of words in familiar conversation." Mr Gifford passes a very harsh censure on this work, harsher than justice called for, though certainly the lady was not possessed of that profound knowledge requisite for the complete fulfilment of the task which she had chosen for herself. In place of giving any specimen of the prose compositions of Mrs Piozzi, however, in support of the favourable view which we take of her talents, we prefer to give a passage from her poetry. The following piece was not published till after her decease, and appeared in the "Literary Gazette:"—

DUTY AND PLEASURE.

> Duty and Pleasure, long at strife,
> Met in the common walks of life.
> "Pray don't disturb me—get you gone!"
> Cries Duty in a serious tone.
> Then, with a smile, "Keep off, my dear,
> Nor force me to be thus severe."
> "Dear sir," cries Pleasure, "you're so grave;
> You make yourself a perfect slave.
> I can't think why we disagree;
> You may turn Methodist for me.
> But, if you'll neither laugh nor play,
> At least don't stop me in my way.
> Yet sure one moment you might steal,
> To see the lovely Miss O'Neill.
> One hour to relaxation give:
> Oh, lend *one* hour from life to *live!*
> And here's a bird, and there's a flower—
> Dear Duty, walk a little slower!"
> "My morning's task is not half done,"
> Cries Duty, with an inward groan;
> "False colours on each object spread;
> I know not where or how I'm led:
> Your bragg'd enjoyments mount the wind,
> And leave their venom'd stings behind.
> Where are you flown?"—— Voices around
> Cry, "Pleasure long hath left the ground.
> Old age advances; haste away,
> Nor lose the light of parting day!
> See! sickness follows, sorrow threats;
> Waste no more time in vain regrets.
> Oh, Duty! one more effort given
> May reach, perhaps, the gates of Heaven,
> *Where only*, each with each delighted,
> Pleasure and Duty live united."

In 1801, Mrs Piozzi gave to the world another couple of volumes, entitled "Retrospection; or a review of the most striking events of the last eighteen hundred years," &c. This was the last important work of the subject of our memoir, who lost her second husband in 1809, and from that period, up to the close of her life in 1823, resided constantly at Clifton, near Bath. Her last years were cheerful and happy; and, as may be imagined, she was an object of much interest to all around her, being one of the few living memorials of the flourishing age of Johnson, Goldsmith, and Burke. She retained so much of the health and spirit of youth up to the last, that, in her 82d year, she gave a ball to her friends, and led down the first dance in person.

AN ENTHUSIASTIC NATURALIST.

The following passage occurs in a letter of Wilson, the American ornithologist, to a friend, and contains a pleasing portrait of the amiable and enthusiastic spirit of the author:—

"That lovely season is now approaching, when the garden, woods, and fields, will again display their foliage and flowers. Every day we may expect strangers, flocking from the south, to fill our woods with harmony. The pencil of Nature is now at work, and outlines, tints, and gradations of lights and shades, that baffle all description, will soon be spread before us by that great Master, our most benevolent friend and Father. Let us cheerfully participate in the feast he is preparing for all our senses. Let us survey those millions of green strangers, just peeping into day, as so many happy messengers come to proclaim the power and munificence of the Creator. I confess that I was always an enthusiast in my admiration of the rural scenery of nature; but since your example and encouragement have set me to attempt to imitate her productions, I see new beauties in every bird, plant, or flower, I contemplate; and find my ideas of the incomprehensible First Cause still more exalted, the more minutely I examine his works.

I sometimes smile to think that while others are immersed in deep schemes of speculation and aggrandisement, in building towns and purchasing plantations, I am entranced in contemplation over the plumage of a lark, or gazing, like a despairing lover, on the lineaments of an owl. While others are hoarding up their bags of money, without the power of enjoying it, I am collecting, without injuring my conscience or wounding my peace of mind, those beautiful specimens of Nature's works, that are for ever pleasing. I have had live crows, hawks, and owls, opossums, squirrels, snakes, lizards, &c., so that my room has sometimes reminded me of Noah's

Digitized by Google

ark; but Noah had a wife in one corner of it, and in this particular our parallel does not altogether tally. I receive every subject of natural history that is brought me; and though they do not march into my ark from all quarters, as they did into that of our great ancestor, yet I find means, by the distribution of a few fivepenny *bits*, to make them find the way fast enough. A boy, not long ago, brought me a large basket full of crows. I expect his next load will be bullfrogs, if I don't soon issue orders to the contrary. One of my boys caught a mouse in school, a few days ago, and directly marched up to me with his prisoner. I set about drawing it that evening, and all the while the pantings of its little heart showed it to be in the most extreme agonies of fear. I had intended to kill it, in order to fix it in the claws of a stuffed owl, but happening to spill a few drops of water near where it was tied, it lapped it up with such eagerness, and looked in my face with such an eye of supplicating terror, as perfectly overcame me. I immediately untied it, and restored it to life and liberty. The agonies of a prisoner at the stake, while the fire and instruments of torture are preparing, could not be more severe than the sufferings of that poor mouse; and, insignificant as the object was, I felt at that moment the sweet sensations that mercy leaves on the mind when she triumphs over cruelty."

SKETCHES OF SUPERSTITIONS.

SPECTRAL ILLUSIONS.

In a preceding paper, reference was made to various authentic cases, in which disorder of the system, mental and bodily, had produced illusions of a spectral character. Our general and leading object, it was then stated, was to show that all similar phenomena may be traced to the same causes, and this principle will be kept in view in continuing the subject.

Disease in the brain, organic mental disorder, hysterical and epileptic affections, deranged digestion (producing *delirium tremens*), and a plethoric state of the blood-vessels, were pointed out as capable of causing spectral illusions. An unsound state of the organ of vision itself may also cause them. Dr Abercrombie mentions two cases strikingly illustrative of this fact. In one of these, a gentleman of high mental endowments, and of the age of eighty, enjoying uninterrupted health, and very temperate in his habits, was the person subject to the illusions. For twelve years this gentleman had daily visitations of spectral figures, attired often in foreign dresses, such as Roman, Turkish, and Grecian, and presenting all varieties of the human countenance, in its gradations from childhood to old age. Sometimes faces only were visible, and the countenance of the gentleman himself not unfrequently appeared among them. One old and arch-looking lady was the most constant visiter, and she always wore a tartan plaid of an antique cut. These illusory appearances were rather amusing than otherwise, being for the most part of a pleasing character. [In our former paper, the principle that regulated the illusions in this respect was pointed out. A man of quiet life, temperate habits, and cheerful disposition, such as the old gentleman now alluded to, could not but have ordinarily an agreeable train of fancies; and hence the spectra were necessarily pleasing in character, since they consisted merely of an embodiment of these fancies, through some peculiar disorder of the system, upon the retina or optic nerve.] The second case mentioned by Dr Abercrombie was one even more remarkable than the preceding. "A gentleman of sound mind, in good health, and engaged in active business, has all his life been the sport of spectral illusions to such an extent that, in meeting a friend on the street, he has first to appeal to the sense of touch before he can determine whether or not the appearance is real. He can call up figures at will by a steady process of mental conception, and the figure may either be something real or the composition of his own fancy." Another member of the family was subject to the same deluaive impressions.

These very curious cases indicate, we think, a defective condition of the retina, which may be held as one distinct and specific source of spectral deceptions. That defective condition seems to consist in an unusual sensitiveness, rendering the organ liable to have figures called up upon it by the stimulus of the fancy, as if impressed by actual external objects. In ordinary circumstances, on a friend being vividly called to one's remembrance, one can mentally form a complete conception of his face and figure in their minutest lineaments. "My father!" says Hamlet, "methinks I see him now!" "Where, my lord?" "In my *mind's eye*, Horatio." In Hamlet's case, an apparition is described as having followed this delineation by the memory, and so may a vivid impression of any figure or object be transferred from the mind to the retina, where the latter organ is permanently or temporarily in a weak or peculiarly sensitive state. In this way the spectral illusions seem to have been habitually caused in the two cases described. There the defect in the retina was the fundamental or ultimate cause of their existence, and the fancy of the individual the power which regulated their frequency and character. Slighter cases of this nature are of comparatively common occurrence—cases in which the retina is for a short time so affected as to give the impression of an apparition. Every one is aware that a peculiarly bright or shining object, if long gazed upon, does not leave the retina as soon as the eye is withdrawn from it. It remains upon the nerve for a considerable time afterwards, at least in outline, as may be observed by closing the eyelids on such occasions. This retentive power, when aided by the imagination, and perhaps by a little bodily derangement with which the senses sympathise, may be carried so far as to produce an actual and forcible spectral illusion. A gentleman, who had gazed long and earnestly on a small and beautiful portrait of the Virgin and Child, was startled, immediately on turning his eye from the picture, by seeing a woman and infant at the other end o his chamber of the full size of life. A particular circumstance, however, disclosed in a moment the source of the appearance. The picture was a three parts' length, and the apparitional figures also wanted the lower fourth of the body, thus showing that the figures had merely been retained on the tablet of the eye. But the retina may retain an impression much longer than in this case; or rather may recall, after a considerable time, an impression that has been very vividly made at the first. A servant girl living in a family where there were some phrenological busts, and, among others, a conspicuous one of Curran, awoke her bed companion one morning with the alarming information that the ghost of Curran stood at the foot of the bed dressed in a sailor's jacket, and having on his pale face the unwonted and unbustlike ornament of an immense pair of black whiskers. The other servant could see nothing, though the apparition seemed to her companion to remain visible for some minutes. On the tale being told, a pretty strong light was thrown on the matter. The master of the house had a yacht, and its sailors at that period were frequently about the premises. Going to bed much fatigued, and having her dreaming thoughts divided between her household duties and some gay whiskered beau of the yacht, the girl's fancy had dressed up Curran's bust, an object most familiar to her retina, in the way mentioned, giving him the sailor's person and whiskers as a fitting appendage. Had the object called up to the eye in this case, instead of being a bust of Curran, chanced to be a portrait of some wicked ancestor or ancestress of the family, as might easily have occurred from the greater comparative impression made on the mind by portraits of that cast, then should we have had a splendid instance of the preternatural appearance of a spirit stung by remorse, and haunting restlessly the scene of its mortal guilt. The girl, without imposture, might have conscientiously reiterated her conviction of the reality of the vision, and the possession of a haunted chamber would have most certainly been assigned to the mansion, inspiring such terror that renewals of the illusion might really have taken place in consequence. Where the whole affair is not a fiction in such haunted-chamber cases, some solution of this kind may be with certainty applied.

It appears, then, from the cases described, that the eye, through defectiveness of its parts, or through the power of the retina in retaining or recalling vivid impressions, may itself be the main agent in producing spectral illusions. From one particular circumstance, we may generally tell at once whether or not the eye is the organ in fault on such occasions. In Dr Abercrombie's cases, the spectral figures *never spoke*. This is equivalent to a positive indication that the sense of hearing was not involved in the derangement; in short, that the eye, and not the whole of the senses, or general system, constituted the seat of the defect. This is an important medical diagnostic.

Our readers have now seen, that there are various modes in which the system may be so disturbed as to produce spectral illusions, and that, in the majority of these cases, the parties subject to them might seem to be not only of sound mind, but in perfect bodily health. Another mode of explaining cases of this description may now be indicated. Many of the apparitions which have been vouched for by those subjected to them, have certainly been neither more nor less than *vivid dreams*. Practically, the phenomena of dreams are so well known to every one, that it is needless to enlarge upon the force and impressiveness which they may occasionally assume. When they bear upon an interesting and important subject, it is peculiarly natural that they should deeply affect the mind, and perhaps leave the parties to whom they occurred, in permanent doubt as to whether they were merely dreams, or supernatural visitations. We shall here quote a case remarkably in point, and one which is not mentioned in English works on this subject; it is told by the compiler of Les Causes Célèbres. Two young noblemen, the Marquisses De Rambouillet and De Precy, belonging to two of the first families of France, made an agreement, in the warmth of their friendship, that the one who died first should return to the other with tidings of the world to come. Soon afterwards, De Rambouillet went to the wars in Flanders, while De Precy remained at Paris, stricken by a fever. Lying alone in bed, and severely ill, De Precy one day heard a rustling of his bed-curtains, and, turning round, saw his friend De Rambouillet, in full military attire. The sick man sprung over the bed to welcome his friend, but the other receded, and said that he had come to fulfil his promise, having been killed on that very day. He further said that it behoved De Precy to think more of the after-world, as all that was said of it was true, and as he himself would die in his first battle. De Precy was then left by the phantom; and it was afterwards found that De Rambouillet had fallen on that day. De Precy recovered, went to the wars, and died in his first combat.

Here, after a compact—the very conception of which argues credulousness or weakness of mind—we not only have one of the parties left in anxiety about the other, but left in a violent fever, and aware that his friend was engaged in a bloody war. That a spectral illusion should occur in such a case, is a thing not at all to be wondered at, as little as the direction and shape that the sick man's wanderings took. The fulfilment of the prophecy is the point of interest; and regarding it we would simply use the words of Dr Hibbert, in referring to the story of Lord Balcarras and Viscount Dundee. Lord Balcarras was confined as a Jacobite in the castle of Edinburgh, while Dundee was fighting for the same cause, and, on one occasion, the apparition of the latter came to the bedside of Balcarras, looked at him steadfastly, leaned for some time on the mantel-piece, and then walked away. It afterwards appeared that Dundee fell just about the time at Killiecrankie. "With regard to this point," says Dr Hibbert, "it must be considered that, agreeably to the well-known doctrine of chances, the event (of Dundee's death) might as well occur then as at any other time; while a far greater proportion of other apparitions, less fortunate in such a supposed confirmation of their supernatural origin, are allowed quietly to sink into oblivion." This observation applies equally as well to the case of De Precy as to that of Balcarras, each of whom knew that his friend was then hotly campaigning, and could most probably even guess, from the latest bulletins, on what day the hostile armies would decisively meet. We are not told whether or not Balcarras, like De Precy, was in ill health, but the Scottish lord was confined on a charge of high treason, and on Dundee's life or death, victory or defeat, the fate of the prisoner must have been felt by himself to rest. This was enough to give his lordship a vivid dream, and even to give him a waking portraiture of Dundee, after the fashion of the bust of Curran case.

But though explanations may thus be given of the common run of apparition cases, it may seem to some that there are particular cases not to be so accounted for. Of this nature, such readers may say, is the well-warranted story of the Irish lady of rank, who, having married a second time, was visited in the night-time by the spirit of her first husband, from whom she received a notification of the appointed period of her own death. The lady was at first terrified, but regained her courage. "How shall I know to-morrow morn," said she boldly to the spectre, "that this is not a delusion of the senses—that I indeed am visited by a spirit?" "Let this be a token to thee for life," said the visitant, and, grasping the arm of the lady for an instant, disappeared. In the morning, a dark mark, as if of a fresh burn, was seen on the wrist, and the lady kept the scar covered over while she lived. She died at the time prophesied.

This story is told with great unction by some memoir writers, and the circumstances are said to have been long kept secret by the lady's family. For argument's sake, let us admit the most striking points of the case to be true. As for the circumstance of her death at the time foretold, it is well known how powerful imagination is in causing fulfilment in these cases; and, at all events, one instance of such a fulfilment is no great marvel amid hundreds of failures. But the black mark—what of it? We confess to the reader, that if we had actually seen the scar upon the hand of the lady, we should not have been one step nearer to the admission of supernatural agency. A most respectable merchant-captain told Sir Walter Scott the following story, which will well illustrate the point under consideration. While lying in the Tagus, a man belonging to his ship was murdered by a Portuguese, and a report soon spread that the spirit of the deceased haunted the vessel. The captain found, on making inquiry, that one of his own mates, an honest, sensible Irishman, was the chief evidence respecting the ghost. The mate affirmed that the spectre took him from bed every night, led him about the ship, and, in short, worried his life out. The captain knew not what to think of this, but he privately resolved to watch the mate by night. He did so, and, at the hour of twelve, saw the man start up with ghastly looks, and light a candle; after which he went to the galley, where he stood staring wildly for a time, as if on some horrible object. He then lifted a can filled with water, sprinkled some of it about, and, appearing much relieved, went quietly back to his bed. Next morning, on being asked if he had been annoyed in the night, he said "Yes; I was led by the ghost to the galley, but I got hold, in some way or other, of a jar of *holy water*, and freed myself, by sprinkling it about, from the presence of the horrible phantom." The captain now told the truth as observed, and the mate, though much surprised, believed it. He was *never* visited by the ghost again, the deception of his own dreaming fancy being thus discovered.

Had the mate burnt his hand with the candle, and, by the same mode of reasoning which led him to believe in the banishment of the ghost by holy water, formed the conclusion that the spectre had touched his hand to imprint on it a perpetual mark, what would have been said of the matter by his comrades and himself in the morning, supposing no watching to have taken place? They would assuredly have held the scar as an indubitable proof of the supernatural visitation, and the story would have remained as darkly mysterious as could be desired. If the reader imagines that the pain must have awakened the somnambulist, we beg to point to a well-authenticated incident, stated to have occurred in England but a few weeks

Digitized by Google

ago. A respectable young man rose from his bed, and went out in his sleep by a high window, dislocating his shoulder by the fall he received. He afterwards contrived to place a ladder against the wall, reascended, and went to bed. For the first time did he learn the truth, when, in the morning, the open window, the ladder, and his disjointed arm, told him that the occurrences which he believed to have taken place in a dream, had been so far a reality. It is also well known with what ease and rapidity the mind can *invest* circumstances in sleep to accord with any passing *sensation*. A dream that seems to involve a long and complex train of circumstances, will sometimes occupy not more than a single moment of time—the whole is a rapid shoot of a half-awakened fancy. For instance, a pistol report, that actually awakened a sleeper, has been known to give him an instantaneous yet seemingly extended series of adventures, including a quarrel, a challenge, and a *duel*. Metaphysicians have long been aware of these phenomena.

The reader will have no difficulty in seeing the applicability of these circumstances to those apparition-cases where such a thing as a *mark* is shown as a proof of a supernatural visitation. The Irish lady may readily have risen in her sleep, burnt her hand against the bed-room grate, and, conscious of an unpleasing sensation, though not awakened by it, her fancy may have formed the whole *story* of the preternatural visitation, precisely as the Irish mate invented the circumstances connected with the holy water. When we find that such an explanation of the matter is accordant with observed and unquestionable facts, it would be irrational to overlook it, and seek a solution in a supposed breach of the laws of nature.

Besides, let us think of the apparent reasons for the majority of spectral communications, supposing them to be supernatural. Can we deem it accordant with the dignity of that great Power which orders the universe, that a spirit should be sent to warn a libertine lordling of the hour of his death, as was held to be done in the famous case of Lord Lyttleton? Or that a spiritual messenger should be commissioned to walk about an old manor-house, dressed in a white sheet, and dragging clanking chains, for no better purpose than to frighten old women and servant girls, as said to be done in all haunted-chamber cases? Or that a supernatural being should be charged with the notable task of tapping on bed-heads, pulling down plates, and making a clatter among tea-cups, as in the case of the Stockwell ghost, and a thousand others? The supposition is monstrous. If to any one inhabitant of this earth—a petty atom, occupying a speck of a place on a ball which is itself an insignificant unit among millions of spheres—if to such a one a supernatural communication was deigned, certainly it would be for some purpose worthy of the all-wise Communicator, and fraught with importance to the recipient of the message, as well, perhaps, as to his whole race. Keeping this in mind, how absurd do the majority of our apparition stories appear!

BLACK HUGH CAMPBELL.

AN ANECDOTE.

General Stewart, in his work on the Highland Regiments, presents a pleasing picture of the relation which existed, in those corps, between the officers and men. The former being generally the sons and other near relatives of the chiefs, and the latter the sons of the clansmen and tenantry, matters remained much on the same footing between the parties as while the whole resided in their native glens. Regimental discipline was comparatively little regarded, being in fact superseded or rendered unnecessary by the devoted attachment of the soldiers to the officers, and their genuine anxiety to act a brave and honourable part in their military career. Animated by high feelings of affection and duty, the Highlanders made excellent though somewhat irregular soldiers. It is lamentable to have to relate that the government did not sufficiently appreciate the character of these men, and often violated the engagements under which they had entered the militia and volunteer service, by draughting them into the line and sending them to foreign stations. It was with reference to this custom, that the late Sir Ewen Cameron, head of the Camerons, broke one day in upon the Duke of York with the stormy defiance: "You may tell your faither to send us to [here he mentioned a very terrible place] if he likes—and *we'll gang tu*—but he daurna dhraft us!"—a defiance not altogether without some serious meaning, when we remember that Ewen's uncle was one of a few who, not many years before, had shook the British throne. With all the fine sentiment which existed between the officers and men, it could not nevertheless be, but that sometimes most unmilitary-like proceedings would take place in the Highland corps; and one of these it is now our purpose to relate.

Old Campbell of G——, in Argyllshire, had sent so many sons as captains into the army, each attended by a company of his clansmen, that his territory had become almost depopulated. Under these circumstances, when his youngest son came from college, he thought of devoting him to some peaceful profession; but just at this juncture the American war broke out; a fresh call was made upon the Highlands, and the laird, making a desperate effort, was able to raise one other company, which he sent with the young man to take its place in a feeble corps posted in a town upon the borders of the low country.

The raising and constitution of this company, which gave so much joy to the old heart of the father, hurled a corresponding mass of confusion on the young head of the son. The latter discovered, when rather late, that even at home, in those stirring times, there was something more intricate in the study of the art of war than the pleasant dream of love and idleness, which he had fancied to form the "be all" and the "end all" of a military life. The mysteries of fortification and tactics were hard indeed in the initiation. But these were trivial to the perplexities arising from the Highland habits of his men. Being naturally looked upon as responsible for their conduct, some of the notions on which they acted proved equally prejudicial to his peace and patience. Amongst other things, their contempt for strict discipline was only paralleled by their dislike to strict attendance. They seemed to have entered the service on the single understanding of obtaining "leave of absence" whenever they pleased; and "leave of absence" they would have. Shamus o' ta' muckle mouth, for instance, had suddenly got notice that divers of his wedders had gone a wool-gathering for themselves, "and, to be shurely, how could he stay?" Evan Mohr had "ta pit up ta sheillin' for hir nainsell's wife, and her wife's bhairns, and it was impossible *she* could bhide!" After this fashion, the young laird soon found it a moral impossibility to get more than a tithe of his Highlanders to render his majesty simultaneous service. Ere long, therefore, he was fain to issue, through his favourite sergeant, positive injunctions against even the making of applications for furlough, except on great emergencies. The men, then, we believe, resorted to the simple expedient termed "French leave."

Another source of the young chief's distractions, but one which he conveniently devolved on his subordinates, arose from the difficulty of distinguishing amongst the Campbells those whose Christian names chanced to correspond. Without some device, the predominant patronymic "Hugh," which amongst the men themselves (who could have specified to the splinter of a hairsbreadth the relationship of each to the other) was no source of inconvenience, would have led, in the muster-roll, to unutterable confusion. Every day, therefore, as the drill-sergeant arrived at the many Hugh Campbells, of all shapes and dimensions, arranged en parade, he simply supplied an affix or prefix, with the tacit assent of the parties concerned. The most obvious epithets came first, such as "*Muckle* Hugh Cammel" and "*Little* Hugh Cammel," "*Red* Hugh Cammel," "*Black* Hugh Cammel," and "*Brown* Hugh Cammel," and so on through every *hue* in creation, until the wit of man could name no more; and then the indefatigable sergeant would sink his sonorous voice as he entered on the more commonplace soubriquets of "Hugh Cammell, *summer wan*," "Hugh Cammell, *summer twa*," till the end of the chapter. These refinements were utterly lost on the captain, who deemed the precious distinctions to be distinctions without a difference. Some people were malicious enough, however, to attribute his perplexities, his obtuseness, and a certain air of apathy in his demeanour, to an innocent young lady dwelling near the barracks.

In consequence of the interdict laid on the demands for furlough, a keen competition arose amongst the men for the favour of their superiors. They hoped that by standing well there, they might possibly have the order occasionally relaxed in their behalf, or at least have their irregularities more lightly considered. Amongst those who adopted this policy, none was more zealous in practising it than the individual who has been specified as *Little* Hugh Campbell. The light active figure of this man had drawn, on more than one occasion, an encomium from the lips of the captain, whose mind was probably resting on a subject for softer praise. The rule against applying for furlough was not only suspended in favour of this person, known to the captain, in his indifference to the distinctions of the muster-roll, simply as Hugh Campbell; but he was to have his reasonable desires in that respect as soon as asked.

Little Hugh Campbell was not long master of the knowledge of this favour, when he availed himself of it. Inspired by the conviction of its being the proud reward of merit, he was returning one evening, in eager haste to be once more at his post, from a hay-cutting, the scene whereof lay in the immediate vicinity of quarters. Unhappy man that he was!—whom should he encounter but his lawful superior the captain, in full regimentals, with a dashing young lady hanging on either arm! The captain had just been vaunting of the distinguished appearance of his corps, especially of that section of it that owed fealty to his lofty house. Now, Little Hugh was in all respects, at this moment, the *beau ideal* of a tatterdemalion. He was habited in a worn-out philabeg, whose longitudinal dimensions alone rendered it unfit for its office; an old military coat, which looked only the more miserable from the gaiety of its original colour; and he was, moreover, most admirably besmeared with the accumulated traces of many a hot day's haymaking, during which his person had never tasted of ablution. However much Little Hugh might dread to face his captain in this atrocious plight, there was nothing for it but to offer the passing salute. *It was not returned!* The circumstance was one so unusual to Little Hugh, that it frightened him into a forgetfulness of his condition; and reflecting only on the possibility of the captain's conceiving him to have passed without the customary ceremony, he judged it expedient to overtake him without delay; which done, he made no scruple of rendering assurance doubly sure, by tapping his superior's shoulder. The captain turned abruptly at the intrusion, and Hugh, upon the instant, bent his wretched body before him. The captain had not been unmindful of his previous obeisance in passing, with which he could, under the circumstances, have gladly dispensed. His conviction now was that the fellow before him, whom he fully recognised, intended a deliberate insult. He raised his foot in vengeance for a kick; but of this movement Little Hugh knew nothing. His duty (as he conceived it to be) discharged, he had turned quickly away, impressed with the reasonable belief that enough of him at that season might be quite as good as a feast.

"Bless me, Captain Campbell!" exclaimed the ladies in a breath, "surely *that* was not one of *your* men?" It was enough to drive the young hero mad. Disposing, therefore, of the fair ones as fast as etiquette would permit, and burning with indignation, he sought the barracks. Instantly on reaching his apartments, he commanded the attendance of Sergeant Campbell. With accustomed promptitude, that athletic dignitary of the drill presented his muscular self before his officer.

"Sergeant!" began the captain in a rage, "Hugh Campbell was out of barracks to day?"

"To be surely," assented the sergeant—for many of the name had, to his certain knowledge, been strolling off duty; and, aware that the individual identity of the precise person indicated would not be so easily settled with the captain, he took refuge in this general acquiescence.

"Then," responded the captain with vehemence, "send him to the guard-house immediately!"

To hear was to obey with the sergeant, when he knew how. In this instance he had avoided Scylla, and fallen on Charybdis. He had avowed his knowledge of a fact of which he was ignorant, and now he was called upon to act on his avowal.

"Please yer honour"—— stammered the sergeant; but he stopped short, with a clear notion of being fairly detected, as his eye caught the look of mingled astonishment and anger turned on him by Captain Campbell.

"Well, sir?" growled the captain.

"An it please you, your worship," inquired the sergeant deprecatingly, "*which* of them?"

"Which of them?" echoed the captain in a pet; and then, summoning the entire force of his lungs, he vociferated, "Idiot! did I not tell you—Hugh Campbell?"

"But, please your honour," persisted the sergeant, taking up the wrong end of the muster-roll first, on a very shrewd surmise of the truth, "was it Hugh Cammel, *summer wan*—or Hugh Cammel, *summer twa*—or Hugh Cammel, *summer three*—or Hugh Cammel, *summer fower*; or was it *Muckle* Hugh Cammel, yer honor, or *Little* Hugh Cammel, or *Red* Hugh Cammel, or *Black* Hugh Ca"——

"Stop!—stop there!" cried the captain, rising and pacing the apartment to soothe his ire, as the full recollection of his dingy bowing acquaintance rushed back on him with the cognomen "black"—"stop there!—*that's* the very man! The *black-hole*, I think, will just suit the black rascal."

The sergeant wondered; but it was none of his business; he had played long enough with the lightning already. So, accompanied by a file of the guard, he entered the barrack dormitory, for it was now late, with what dispatch he could; and, sword in hand, he thundered forth the name of "*Black* Hugh Cammell." A second summons was necessary ere he was answered by the brief acknowledgment, "She's here," vented in tones betokening both chagrin and surprise.

"*Black* Hugh Campbell," said the sergeant peremptorily, "you're ordhered to the gaard-hous!"

"Fast ta teevil for wad she du wi' me at ta gaard-hous at sic a time o' night?" remonstrated Hugh.

"*Black* Hugh Cammell," reiterated the sergeant, with mounting dignity, "you are ordhered to the gaard-hous; and you most shust go to the black-hole, because you are ordhered!"

Remonstrance being fruitless, Black Hugh was lugged unwillingly away, and, half awake, and scarcely half dressed, was instantly immured in the adjoining hermitage, familiarly known as the black-hole. It was not without abundance of Highland ejaculations, expressive of rage, that the honest fellow submitted to his unmerited fate.

Days passed gloomily away, and Black Hugh Campbell appeared not amidst his comrades. No charge of any kind had been preferred against him; but such was the awe with which the simple mountaineers regarded the commands of the son of their chief, that scarce a murmur arose in which the prisoner's name was whispered. In fact, the captain, resolved upon punishment, but disinclined, for reasons of his own, to prefer a regular charge, had made up his mind that the matter should rest where it was during his good will and pleasure; and there it probably would have rested while the captain's pique endured, had not an accident disclosed the situation of the prisoner.

Digitized by Google

An officious gentleman from the mess-room, having taken a fancy to visit the guard unseasonably, and purely for the pleasure of making the men turn out to salute him, caught them napping, as he expected. As certain dolorous sounds, however, were emanating from the prison hard by, curiosity induced him, before beginning to exercise his authority, to listen to the voice of lamentation. This, as the reader may well conjecture, was the disconsolate wail of his friend, *Black* Hugh Campbell, who was mournfully haranguing the walls of his dungeon. As the officer listened, he thus proceeded with his soliloquy :—

"Hoogh ! ta teevil o' this can pe porn ; tare was ta first week tat ta captain pegan to ca' her *muckle* Hugh Cammel, she was shust hawled awa tu ta ospital ! An' syne anither week, be't reason be't nane, an' he ca'at her Hugh Cammel *summer wan*, an' sent her tu ta awkward squad ! An' syne she's ordhered oot on gaard, wi' a' her paggage, for Hugh Cammel *summer twa :* an'" ——

"Who's there ?" inquired the officer.

"Tare !" cried the Celt, starting to his feet with surprise, and using the privilege of his country by answering one question with another ; "Ay, to be surely, wha's *tare ?*"

"I say, who's there ?" repeated the officer.

"An' wha'd pe speirin' ?" rejoined Hugh.

"I ask you, sir—who are you ?" insisted the officer.

"Her nainsell—Plack Hugh Cammel," answered the prisoner subduedly, distinguishing the tones of authority.

The officer knew the speaker very well. "Why, Hugh, my lad," said he, "you used to be a well-behaved soldier. How came you here ?"

"She couldna shust say ; ye see, she wasna shust telt."

"Told !" exclaimed the interrogator ; "not told ! You surely know what you have been about ?"

"Hoot," cried the soldier, "fa'at cud her nainsell peen apoot—teevil a thing ; they shust clappit her here for shust naething !"

"But—you had committed some offence. You had forgot yourself in some way or other. How long have you been here ?"

"Maybe twa days, maybe three ; unless she could tell, she cudna shust say ; there's nae day free nicht here."

"This is very strange," said the officer. "I must inquire into it." At his back, aroused by the altercation, stood the guard as stiff as a row of lamp-posts. He did not stay to rebuke them, for Black Hugh Campbell, although he subsequently became the narrator of this story, was, it may be stated, a general favourite. The officer, forthwith, sought the retreat of Sergeant Campbell, and roused that functionary from his blest repose.

"Sergeant ! you've got a man in the guard-house."

"Shurely—to be shurely," said the sergeant dryly.

"Black Hugh Campbell," said the officer.

"Yes, and shurely," said the sergeant.

"Now, I should like to know the charge on which he is confined," observed the officer.

"Sharge !" ejaculated the sergeant with Highland sarcasm ; "by ordhers of Captain Campbell."

"Very well," replied the major (for such was the officer's rank), catching fire at the insolence of Captain Campbell's *factotum*, the sergeant ; "Captain Campbell certainly arrests his men upon public grounds. Show me to the captain ; this affair appears mysterious."

Marshalled by the sturdy sergeant, and arrived in presence of Captain Campbell, the major began by apologising for the untimely nature of his visit, and ended by detailing the circumstances that had occasioned it.

The captain perceived that the hour for concealment of the offence for which he intended Campbell should suffer, was over. He therefore recited, not without acrimony, the insulting part played towards him by the supposed offender. But, as often happens, his anger evaporated, with a consciousness of the irregularities into which he had fallen in seeking his revenge. And he added, with a smile, which the major accepted as a signal to relieve himself of an immoderate fit of hitherto suppressed laughter, that he believed *Black* Hugh Campbell had already suffered sufficient punishment, and might be liberated without delay.

Our dark Celt thus regained his liberty ; and here our tale might have come to a close, for, with the equanimity of a Turk, Hugh would have been satisfied with any confinement, directed by the sovereign authority of his captain. Neither would the major have said more upon the point, much as he respected the rights of a good soldier, and Black Hugh was certainly a promising one. But there was another concerned in the business, whose brains just entertained the conception that his commander had been insulted egregiously by Black Hugh Campbell. This was the worthy sergeant. The tornado of native abuse and incoherent threats with which Black Hugh was consequently assailed by his liberator, would certainly have ended in "trial by battle," had he not eloquently demonstrated to the sergeant "tat it cudna' pe her !"

The result, however, provided Captain Campbell with a morning salutation from *Black* Hugh, as, in spite of every opposition on the part of the captain's servant, he made good his way into his private quarters. The captain entertained enough of alarm, on ascertaining who was the intruder, to have his pistols at hand as Black Hugh entered the room. But what was the surprise of the former, when, in place of the dirty little varlet who had done him such foul disgrace, the fine figure of *Black* Hugh Campbell met his gaze ! It needed no eloquence to convince the captain "tat it cudna' pe her," although much breath was spent on the subject by his visiter.

Sergeant Campbell was again in requisition ; but as he was proceeding to recount the distinguishing characteristics of those rejoicing in the common name of Hugh Campbell, the captain became doubtful of his ability to appreciate the sergeant's descriptions any more. Many of the parties were put to the question, and still the general point established was "tat it cudna' pe her." The sergeant was ultimately saddled with the responsibility of detecting the real Simon *impure*. But as the nature of the offence by no means thoroughly transpired, whilst *Little* Hugh, with a profundity of native cunning, kept his own secret, suspicion settled down on no individual, although it alighted on many. It was known, however, that the captain had been insulted—the Highland blood was roused—impeachments were showered around like gages at a tilt. In short, within the lapse of half an hour, the whole fraternity of the Campbells were engaged in a general *melée*, in the barrack-yard, with dirk, claymore, and bayonet. To quell the fray, the regiment was beat to arms ; the combatants were disarmed ; and, in the sequel, never did that or any other guard-house contain an equal number of the name of Hugh Campbell. It was observed, that, from that day forth, the captain was infinitely better acquainted with the muster-roll. If, however, his studies ever suggested to him the real style and title of the author of the imaginary insult, to use the emphatic language of Black Hugh Campbell, he kept it "under her thumb."

DR BUCKLAND ON AGRICULTURE IN CONNEXION WITH GEOLOGY.

At a social meeting of the Nithsdale Agricultural Society at Thornhill, Dumfriesshire, on the 15th of September last, Dr Buckland, who was present as a guest, being then on his way to the meeting of the British Association at Glasgow, gratified the company by a brief exposition of some points in which Geology gives light to Agriculture. We find the following abstract of his remarks in the *Dumfries Herald* :—"The stomach of the animal was a laboratory, by which hay, grass, and corn, were converted into roast beef ; but how were animals in their turn, and other substances of the earth, to be changed into corn, grass, and hay, that necessary pabulum, without which all the successive generations of animals would be lean and die ? Here the geologist and the agriculturist met. The two great points for the improver to secure were, *first*, dry land ; and, *secondly*, the necessary compound of the four or five elementary substances which enter into the composition of every good soil. From chemical and mineralogical analysis, it had been found that, in alluvial land, confessedly the most fertile of all, the main component parts were *lime*, *silex*, *iron*, and *magnesia*, with some *manganese ;* and therefore, of course, it became the chief feature of all improvement of the land, to secure the proper proportions of these ingredients, so as to produce as nearly as possible a result the same as alluvial soil, in which they were found in most efficient combination. *Silex* entered into the composition of every thing, though it was deficient in the slate countries. There was more of it in oats than in any other grain. The oat-fed Scotchman had, therefore, more flint in his body than the natives of any other country ; and hence, no doubt, the great superiority of the Scotch regiments. (Much laughter). *Manganese* was comparatively a rare ingredient, but there was not a man in that room with hair on his head who had not *manganese* in him. But no matter where, and in what proportion, these substances were found, nature had given us the limestone to make up or correct almost every other ingredient of soil. The learned professor then minutely pointed out the *rationale* of the use of lime. In Lincolnshire, an agriculturist, in improving a peat bog, had induced every property of soil upon it, but without adding lime. The first season of crop there was plenty of straw and husks upon it, but no corn. He was admonished of the deficiency ; added lime ; and next year had the finest oats in the country. This was quite parallel with the enterprising experiments of his own friend, Sir Charles Menteath, who had converted a useless peat bog into a meadow worth L.4 an acre."

THE SIGHING-ROOMS AT THE COLONIAL OFFICE.

There are some rooms in the Colonial Office, with old and meagre furniture, book-cases crammed with colonial gazettes and newspapers, tables covered with baize, and some old and crazy chairs scattered about, in which those who have personal applications to make are doomed to wait until the interview can be obtained. Here, if perchance you should some day be forced to tarry, you will find strange, anxious-looking beings, who pace to and fro in impatience, or sit dejected at the table, unable in the agitation of their thoughts to find any occupation to while away their hours, and starting every time that the door opens, in hopes that the messenger is come to announce that their turn is arrived. These are men with colonial grievances. The very messengers know them, their business, and its hopelessness, and eye them with pity as they bid them wait their long and habitual period of attendance. No experienced eye can mistake the faces, once expressive of health, and confidence, and energy, now worn by hopes deferred, and the listlessness of prolonged dependence. One is a recalled governor, boiling over with a sense of mortified pride and frustrated policy ; another, a judge, recalled for daring to resist the compact of his colony ; another, a merchant, whose property has been destroyed by some job or oversight ; another, the organ of the remonstrances of some colonial parliament ; another, a widow struggling for some pension, on which her hopes of existence hang ; and perhaps another is a man whose project is under consideration. Every one of these has passed hours in that dull but anxious attendance, and knows every nook and corner of this scene of his sufferings. The grievance originated probably long years ago, and, bandied about between colony and home, by letter or by interview, has dragged on its existence thus far. One comes to have an interview with the Chief Secretary ; one, who has tried Chief and Under-Secretaries in their turn, is now doomed to waste his remonstrances on some clerk. One has been waiting days to have his first interview ; another, weeks to have his answer to his memorial ; another, months in expectation of the result of a reference to the colony ; and some reckon the period of their suffering by years. Some are silent ; some utter aloud their hopes or fears, and pour out their tale to their fellow-sufferers ; some endeavour to conciliate by their meekness ; some give vent to their rage, when, after hours of attendance, the messenger summons in their stead some sleek contented-looking visiter, who has sent up his name only the moment before, but whose importance as a member of Parliament, or of some powerful interest or society, obtains him an instant interview. And if by chance you should see one of them at last receive the long-desired summons, you will be struck at the nervous reluctance with which he avails himself of the permission. After a short conference, you will generally see him return with disappointment stamped on his brow, and, quitting the office, wend his lonely way home to despair, or perhaps to return to his colony and rebel. These chambers of wo are called *the Sighing-Rooms ;* and those who recoil from the sight of human suffering should shun the ill-omened precincts.—*From a late pamphlet.*

[The above may be a true picture, yet it might have been fair to add that men in office are dreadfully annoyed with calls upon their time, by persons who have either no proper claim upon them, or who wish to have crotchets patronised. If the head functionaries in government offices were to receive readily all who choose to seek an interview with them, their whole time would be occupied, and the proper business of the country neglected. The bulk of people whom one meets with have no idea of the value of time, and are most heedless in intruding their visits on persons who are fully occupied.]

THE TWIN SISTERS.

Stand both before me ; for, when one is gone,
I scarce can tell which is the absent one :
To stray asunder ye should aye be loath,
So much alike ye are—so lovely both !

Together ye are peerless, but apart
Each may be match'd by each ; to rule the heart
Keep, gentle cherube, a conjoined sway ;
Our love's divided when there's one away !

Oh ! wherefore both so lovely ? wherefore came
Such beauty separate and yet the same ?
Was it too great for one alone to bear,
That each comes laden with an equal share ?

It may be, Nature, anxious to excel,
Moulded one lovely face and loved it well,
Then, hopeless to achieve a higher aim,
Sought but to form one more, in all the same !

Or haply 'twas in kindness to the one,
That Nature would not trust her forth alone,
Lest she should mar her looks with vanity
To think none other was so fair as she !

If you but hold a mirror up to each,
'Twill name its sister in its lisping speech ;
And still, while equal loveliness is theirs,
May one see only what the other shares !

Beauty that only looks upon itself
Becomes unlovely ; yet, thou little elf,
Not e'en thy sister should be praised by thee,
Lest the harsh world pronounce it vanity !

Talk not to others of her silken hair,
Lest they should say, "Thou know'st thine own as fair !"
Nor praise the lustre of her light blue eye,
Lest thy own glance win back the flattery !

Ah me ! I wonder if alike ye'll prove,
When ripen'd into votaries of love !
Then will sad lovers, puzzled which to choose,
Find solace in the thought, "Can both refuse ?"

Then will the promise which the one has named
Be haply often from the other claim'd,
And the fond wish of secret whisperer,
Be met with—"Oh, it was my sister, sir !"

Go, go your ways, and in your little breasts
Still bear the innocence your joy attests !
Go, wander forth 'neath childhood's sunny sky,
And gather flowers whose fragrance will not die !

—*From the Scotsman.* J. H.

MANAGEMENT OF PIGS.

The following experiment has been made by a gentleman of Norfolk. Six pigs of nearly equal weight were put to keeping at the same time, and treated the same as to food and litter for seven weeks. Three of them were left to shift for themselves as to *cleanliness ;* the other three were kept as clean as possible by a man employed for the purpose with a curry-comb and brush. The last consumed in seven weeks fewer peas by five bushels than the other three, yet weighed more when killed by two stone and four pounds upon the average. —*Wade's British History.*

LONDON : Published, with permission of the proprietors, by W. S. ORR, Paternoster Row ; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents ; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

CHAMBERS'
EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 458. SATURDAY, NOVEMBER 7, 1840. PRICE THREE HALFPENCE.

THE SOIRÉE MUSICALE.

It is just ten. A moderately-sized drawing-room, in a demi-fashionable terrace, is stuffed with from sixty to eighty persons, most of them standing, pressing and elbowing each other, uttering surly monosyllables, scarcely able to move an arm. The solitary lustre diffuses no very brilliant light around it. Tea, coffee, ices, jellies, and sorbettes, circulate with no manner of profusion. Mrs Genteel, seeing and hearing, right and left, a few significant and ill-concealed yawns, exclaims, as if animated by a sudden recollection, "Upon my word, I think it is time we should begin the music."

"But, mamma, mamma," says Miss Cecilia Beethoven Genteel, her eldest daughter, a young lady of twenty, who plays the piano-forte passably well, and has even composed a waltz *à la Strauss*, and a quadrille *à la Musard*—"you forget, mamma, that Mr Quaver Roulade is not yet come, and you know that without him we can never begin the concert."

"Oh la—no!" said her younger sisters.

"The truth of the matter's this," was the undertoned remark of a young man who seemed not to care a rush about music—"Roulade must always be the first and the last to make himself heard." The youth curled his lip with the least in the world of a contemptuous expression, and passed to a small sleeping-room on the same floor, which was transmuted, "for this night only," into a little *salon de jeu*, and took his place at a whist table.

A gentleman, who was introduced this evening for the first time to Mrs Genteel's circle, inquired of one of the initiated near him who this Mr Quaver Roulade was, who appeared to enjoy so vast a degree of consideration in Mrs Genteel's family.

"Roulade!" replied the person thus addressed; "you must take care how you speak of him. It is right that you should know that Mr Roulade is a very important personage, necessary, nay indispensable, at all musical parties of a certain pretension. He is disputed, contended, fought for, in twenty different drawing-rooms; at least, so he says. He is the son of a fashionable undertaker; but his grave functions have impressed no air of solemnity on his looks, nor have they bespread his person with the hues of mourning. By no means. Roulade is a *dilettante* by nature—a genuine *fanatico per la musica*. Not an opera comes out, of which he does not retail the tenor songs. All the repertory of Rubini has passed through his throat: in short, he is Rubini—*minus* the voice! Judge for yourself. He usually waits until he has been very much pressed, before he sings, that being the usage, though he is all the time violently controlling his crotchets. Musical amateurs, too, are always the better of a slight cough. How else excuse their false notes? Roulade always commences by assuring the company that he has a bad cold. But the moment he is launched, like a ten-oared gig manned by Westminster school-boys, he never stops. He makes it a matter of conscience to satisfy all tastes except the true one. He is a music-machine run mad—a barrel-organ with tunes interminable. He gives you no more breathing-room than himself; *time* is out of the question; of that he is but little solicitous. He would sing a whole trio to his own cheek, if it were possible; and not even Donizetti could compose operas enough to keep him going. In short, he is the plague of all unfortunate young ladies who have learned to touch the piano-forte (which means, I believe, all her majesty's female subjects, without exception), when he solicits of them the favour to accompany him; good manners render it impossible that they could refuse him; and it will be strange, indeed, if Roulade does not keep their hands full. I'll lay any wager in reason that he comes here only because Miss Cecilia Genteel is clever in accompanying; and it is not at all impossible that he will ask her hand in marriage, if for no other reason, for this—that he may be enabled to attach definitively to his person and his voice so distinguished an *accompagnatrice*."

"You treat him severely enough. He is probably one of your friends?"

"Why, for that matter, I never refuse him a shake of the hand."

The stranger felt persuaded that the distinguished amateur, whose arrival was expected with so much impatience, was calumniated by some unsuccessful rival. Presently a servant announced, "Mr Quaver Roulade."

At the mention of this philharmonic name, a considerable sensation pervaded the assemblage, and every head was stretched towards the door. Matrons agitated their fans and turbans; young maids simpered, spied, and looked pleased. The new arrival entered the room with all the self-satisfied assurance which his popularity in society warranted—with the air, in short, of a man who says to himself, "I do you too much honour to set foot amongst you." The person of such a man deserves to be analysed.

A figure somewhat over the middle size; shoulders like those of a porter; a *blonde* complexion, heightened for the nonce with a sprinkling of rouge, to repair the ravage of a score of balls, attended within the same number of days; a large and somewhat unmeaning face, in a "frame" of thick black whisker (the red roots contrasting strangely, to an inquisitorial eye, with the factitious colour); hair trained into ringlets over the entire surface of the head, like that of an opera Cupid, and descending down his shoulders almost as far as an ancient tail; a nose furnished with wings and open nostrils; great mobility of eye-brow; and a languishing eye, indicating by its expression the habitual practice of warbling passionate operatic *morceaux*, and tender ballads. His neck was loosely girded by a slight cravat, arranged so that the action of the throat might not be in the slightest degree impeded. A gold eye-glass fell upon a satin waistcoat, flowered with silver; "continuations" altogether suitable. An album, splendidly bound in red morocco, which the Troubadour held in his hand, and which was all filled with the newest music, completed his brilliant *ensemble*.

"My dear Mr Roulade, you have come rather late," said Mrs Genteel. "You are determined that people shall long for your arrival."

"Is it possible, Mrs Genteel, that your party can have taken the slightest notice of my absence?"

Here Miss Cecilia stepped forward and said, "Indeed, Mr Roulade, we could not think of beginning without you."

Roulade, propitiated by this well-flung incense, bowed and said, "Had you done so, I should have been deprived of the very great pleasure of hearing you throughout."

"You are very good to say so, Mr Roulade—but—indeed—I have not composed any thing new of late."

"How! not even a waltz? Ah! come now, Miss Cecilia, do favour us."

"I t—t—tried yesterday," said Miss Cecilia, with a blush and a simper.

"Charming! I'm sure you'll enchant us."

Roulade rushed towards the piano-forte, opened it, arranged the wax-lights in the most favourable position, gallantly offered his hand to Miss Cecilia Beethoven Genteel, and took his seat by her side, interrupting her performance each instant with the customary phrases of admiration—"*Brava!*—what grace!—what lightness!—what a delicious movement! *Bra—!*—Charming! Ah, *molto ben!* *Bravissima!—issima!*" The make-believe was complete on both sides. For not a note did Roulade listen to; and the waltz being excessively insignificant in itself, a mere reminiscence of Miss Cecilia's *solfeggio*, Roulade was enchanted with the expectation that his performance would shine out the more brilliant by comparison. The tactics of an amateur singer are as skilful as those of a general. He knows how to husband his forces, to deploy them into line at the fitting time, and to keep as a *corps de reserve* the most triumphant portion of his array. He will commence probably with a fashionable song, afterwards give something vulgar, and conclude with a difficult *scena* from the opera most in vogue, or some marvellous piece of *bravura*. All is calculated with him in the meting out of his sweet sounds; and never did diplomatist negotiate more effectually to bring about a point of policy than he to carry off the honours of the *soirée*.

Earnestly invited to sing, Roulade implored Mrs Genteel to excuse him, for he had come so hurriedly that he was still out of breath, and found himself incapable of sounding a single note. This was all a figment. The truth was, that Roulade wanted in the first instance to get rid of the little boarding-school misses and their little voices. In consequence of this refusal, three or four young ladies took their seats, one after another, at the piano, and gave forth the contents of their musical budget. "Di tanti palpiti!" was squealed; "Zitti, zitti, piano!" squalled; and one little minx had the effrontery to execute "Di piacer!" without benefit of time or clergy. What a ridiculous rage is that which has set in of late years for Italian vocal performances! Bread-and-butter misses making cat's meat of the divinest musical *morceaux*, in a language they can neither comprehend nor pronounce! The thing is absolutely atrocious. To ears accustomed to the glorious organs of the opera, it is utterly intolerable; and there is no one thing which makes us more shockingly ridiculous in the eyes of foreigners, than this most inane and ludicrous pretension. I had rather hear a buxom country lass sing "Harvest home," or "Peas upon a trencher," while she is milking her cow, than the best specimen I have ever heard of these boarding-schooled, under-aged, English-Italian singers.

At the second of these perpetrations, Roulade suffered a gesture of annoyance to escape him; at the third, he shifted nervously to and fro on his chair; at the fourth, he appeared quite agitated, took off and put on his delicate kid gloves several times in succession, and passed his hand rapidly through his well-trained ringlets. Unable to restrain himself any longer, he at length said to the mistress of the house, "The fact is, Mrs Genteel, that I am peculiarly unfortunate this evening. These are all my favourite songs that the young ladies have been singing. I had brought them in my album, but I am now deprived of every one of them; and I must therefore entreat of you not to reckon upon me to-night."

Here the young man, whose observation I recorded in the commencement of this paper, approached the amateur, and with beautiful *sang froid* expressed all the regrets which he felt, adding that "it was beyond all question impossible that, amongst the music of Miss Cecilia Genteel, he would not find some air to suit his voice."

A general chorus of approbation followed this suggestion. Every corner of the room was searched; and

Digitized by Google

the titles were read over of a vast number of songs, which must have found themselves no little astonished to see the light again. "Away, away to the mountain brow!" "Bells upon the wind," "I've been roaming," "The light of other days," "My dark-haired girl" (unfortunately, Miss Cecilia Genteel had light hair), "Rise, gentle moon!" (Miss Cecilia declared that this latter song was detestable, &c. &c.) Roulade, meanwhile, lost the better part of his assurance; for, poor wretch! he saw himself exposed to the sad alternative of either not singing at all, or striving to boggle through airs of which he scarcely knew a note. The truth may as well be out at once: Roulade knew next to nothing of music, and was obliged to strike for a whole week with one finger upon a piano-forte, in order to catch with accuracy the most trivial air. Oh, singular piece of good fortune! here is "We met!" and Roulade knows it—"We met!"—that triumph of sentimental maidens musical—that melody which is so exquisite (though hackneyed) in the mouth of a beautiful woman. Now, Roulade was any thing in the world but a beauty, though unmasculine enough in appearance. But he always spoke like one who was capable of every thing, and he proved it on this occasion.

A profound silence reigned throughout the apartment. Miss Cecilia Genteel took her seat at the piano-forte. Roulade coughed slightly in his handkerchief, took off his glove, and permitted the company to obtain, as if by accident, a glimpse of a fine antique cameo, which he wore, together with a large brilliant, on the little finger of his left hand. His right hand, concealed by the altar of Polyhymnia—commonly called piano—was ready to beat the time, without being perceived by a living soul. He raised his eyes towards heaven, dilated his already expansive nostrils, pitched as large a portion as he could muster of feeling and sentiment into all his features, made a bewildered gesture with his left hand, and commenced the famous

"We met—'twas in a crowd—and I thought he would shun me;
He came—I could not breathe—for his eye was upon me!
He spoke—his"——

Here the singer, who had occupied himself too much with the pantomimic part of his performance, forgot the words.

"Words were cold!" exclaimed at least a dozen voices.

"Words were cold!" articulated Roulade, stooping to read the printed words. In an energetic, and, as it were, triumphant voice, he exclaimed,

—"But his smile was unalter'd!"

And, then, louder still, with a mighty *rinforzando*,

"I knew how much he felt, for his deep-toned voice falter'd!"

The deuce was in it, if Quaver's voice faltered; for the pretended tenor had a barytone voice, and his high notes escaped from him more like strangled shrieks than anything that musicians wot of. Sometimes it was a low C, bellowed forth as if from a trombone, sometimes a G above the line, squeaked as if by an asthmatic flageolet. Now you would swear that you heard a bull, and now a grasshopper. At one moment he seemed to draw up his voice from the bottom of his boots, at another down from the topmost recesses of his head. Now he plunged his chin deep into his cravat, set up a rumbling in his intestines, like a volcano or a ventriloquist; and anon he suddenly threw back his head, expanding his chest and his arms, with the inspired air and attitude of a Rubini. If you shut your eyes, you would imagine that you heard a dust performed by the parish clerk and a child in the choir. It is unnecessary that I should make particular mention of all Roulade's false notes, of all his doubtful notes, of all his notes flattened towards the end, of all his infamous shakes, his mock grace-notes, his rascally *fioriture!* His principal merit consisted in the marvellously pathetic pantomime, with which, rolling his eyes like saucers, and shaking as if in an epilepsy, he bellowed forth like the victim roasting in Phalaris's bull,

"The world may think me gay, *for my feelings I smother!*"

And wound up all, clasping his hands, as, with redoubled ardour, he made the ceiling ring with the pathetic finale—

"Oh, thou hast been the cause of this anguish, my mother!"

Loud and long resounded the applause with which the Goths (of which, in musical matters, nine-tenths of every English assemblage is composed) complimented the singer's efforts. Congratulations poured in from every side. An encore was prayed; but this Roulade resisted, for his object was to develop fresh musical treasures. Then the company implored him not to step with a single song. Mrs Genteel carried him a jelly, and almost thrust it down his throat. "Good!" said the young man whom I have previously introduced to my readers, in an under tone, "they do well to give him something *to sweeten his voice.*" Then coming forward, and accosting Roulade, with truly Cromwellian hypocrisy, "Ah, Mr Roulade," said he, "you have indeed sung that song charmingly. Before I had the pleasure of hearing you, I imagined that 'We met' could only be sung effectively by a female voice; but you have made it change its sex. What shall we have the pleasure of hearing from you next?"

"I don't know—can't say precisely," said Roulade. "But, since the company desire it, I shall try the first thing that comes to hand."

The grossest flattery, nay, the most downright mockery, is accepted as certain truth by that most weak-headed of mortals while the fit is on him—an amateur singer. During the next half hour, Roulade *dispatched* "She wore a wreath of roses"—"A baby lay sleeping"—"*Buona notte*"—"She sat within the abbey walls"—"Isle of beauty"—"Teach me to forget"—"*La Biondina*"—"Happy land"—"Our first and dearest home," and some two or three more of the choicest favourites of the modern Rosa-Matilda school. The ears of his audience at length began to grow fatigued, and then Roulade's exercise was varied by taking a part with Miss Cecilia Genteel in such novel duets as "I know a bank," "Love in thine eyes," "Ye banks and braes," and (name it not in the Royal Academy of Music) the magnificent *Sona la tromba*, from Il Puritani. *There* was murder, if ever there was a musical Greenacre. To think of the glorious battle-call which the magnificent organs of Lablache and Tamburini make stir the bosoms of the opera audience like a clarion, squeaked by Mr Quaver Roulade's cracked fiddle of a voice, and Miss Cecilia Genteel's penny trumpet!

Verily, I shall take my hat, and leave at once; for I have had more than enough of a *soirée musicale*; and Quaver Roulade takes his hat and his leave at the same time.

Roulade being in requisition in more than one drawing-room, remembered an engagement at Cut'emout Terrace, New Road; and being now satiated with applause, squinted at the clock. This being perceived by half a score of people at once, all the young ladies in the room besieged his skirts, and implored Roulade not to leave them. But the hero of the gamut was immoveable in his resolution to depart. He stammered forth some excuses, took up his album, which he hoped to sing all through at his second *soirée*, and straightway evaporated.

It was now past midnight; and Roulade's papa's horses being all engaged that day in the country, or very much knocked up by a multiplicity of funerals, an epidemic at that time prevailing, to his great chagrin he had been unable to sport his cab. He had proceeded only a few yards from Mrs Genteel's door, when some drops of rain began to fall. Roulade ran forward on the tips of his patent-leathers towards the nearest cab-stand, where

"Smack went the whip, round went the wheels,"

pleasantly saluting his ear with the hope of a dry conveyance. Horror on horrors! The last of the vehicles was just rolling off with a fare, and Roulade was constrained to foot it. But, worse and worse! the celestial flood-gates seemed to be opened, cataracts descending, and torrents falling. Spouts and the roofs of houses poured forth a hissing stream, and Roulade swam rather than walked right through the bosom of this unforeseen deluge. Notwithstanding his great eagerness to keep his second engagement, and discharge his lungs of the contents of his album, he was forced to sound a retreat. Still his musical fervour was such, that he hesitated between his domicile and Cut'emout Terrace. In the very midst of this perplexing quandary, a streamlet formed by the rain, a sort of metropolitan Rubicon, presented itself before him. There was but one thing for it—Cæsar-like to bound over the obstacle. Roulade did so, but, alas! let fall *en passant* his precious morocco-bound and glittering album, which the muddy and guttery stream carried off in its bosom—

—"Like the rainbow's lovely form,
Evanishing amid the storm!"

Poor Roulade! His disasters did not end even here. Unfortunate barytone-tenor, upon this fatal night he caught a violent cold, which laid him up for several days, and finished by taking away that voice which constituted his most attractive ornament. Ever after, his recreant throat rebelled against all the efforts of its master to extract from it the smallest sound which even Roulade's audacity could palm off for music. With his voice, he lost, of course, four-fifths of his invitations, and, what was much more, the well-endowed hand of Miss Cecilia Genteel, who married a genuine tenor, that was fortunate enough to make timely seizure of the succession left vacant by the breaking-up of Roulade's organ.

Following the universal rule in such cases, Roulade fell into the ranks of discontented melomaniacs. Never was an opera performed at one of the theatres that he did not attend. Never did he hear an air without venting his spleen in some such piece of supercilious criticism as "vicious method"—"slender voice"—"execrable taste," &c. &c. He is a regular frequenter of Fop's Alley, at the opera; and though the *divine four* should be doing their utmost, the like of which the world never heard before, or *by four*, he is sure to have some impertinence to pass off on his neighbours for criticism.

I shall conclude by laying it down as a general rule, that amateur singers, when they sing, murder music—when they have lost their voices, abuse it.

POPULAR INFORMATION ON POLITICAL ECONOMY.

NINTH ARTICLE.—MODES OF SPENDING.

In all discussions on political economy, it is necessary to preserve a distinction between the moral and what may be called the purely economical lights in which each subject may be viewed. The effect of a particular operation on the morals of society must be kept distinct from its simple physical influence in making it rich or poor. When this distinction is not kept in view, perpetual explanations are necessary to let it be known that, in estimating the profit or loss of any system of human action, those of a moral nature are not taken into view. The distinction is easily preserved in the other sciences. No one, for instance, ever confounds the natural history of horses with the moral influence of driving a chariot, or the botanical analysis of grain with the effects of distillation on society. The majority of the phenomena of political economy, however, operate through certain moral qualities on which we must calculate; we must, for instance, keep in view the almost universal desire of gain, the parental love of offspring, prejudices in time and place, &c., as the naturalist estimates the operation of the laws of nature. It is almost needless to say, that upon the operation of these moral laws of nature (if we may so term them), we cannot look with the same abstract indifference as on the physical. While we are thinking and writing on them, they are themselves operating within us, and influencing our thoughts and deeds. It would not at first sight appear, but there is in reality scarcely a branch in political economy in which it is more necessary to keep the moral and the economic branches of the question more completely distinct than in this one of expenditure.

Capital was stated in a previous article to be the result of accumulated labour. The method by which the property created by labour is so accumulated, is by producing more commodities than the amount consumed, and reserving a portion. In other words, it is by using the existing capital in such a manner as that, instead of being consumed, it may not only replace itself, but bring an addition with it. Capital so used is said to be profitably employed—the addition said to be made by it to the existing property is called profits. This is a subject which by itself occupies a very prominent and interesting position in political economy, and which deserves a separate notice. It is proposed to confine the present article more directly to the subject of the distinctions between profitable and unprofitable expenditure.

It is a very common and not unnatural feeling among mankind in general, that the proprietor of wealth is the source of its creation, and that in the dispenser of money they look upon one but for whom it would not have had existence. If the rich man has, by his own industry, genius, or success in trade, made his own fortune, the supposition is founded in truth; but he who has contributed nothing to the creation of the wealth he enjoys, is its mere recipient and distributor. The property came into existence without his intervention, and had he never lived, it would not the less have existed in some other person's hands. Having, then, no merit in bringing it into being, all that the successor to riches can do for society with respect to his property, is to use it beneficially. There are circumstances frequently in the very nature of the property which interfere with the performance of such a service. Its size is a material impediment. The proprietor of an unwieldy large fortune has no inducement to employ it profitably. He cannot keep a watch on his own expenditure, and therefore a large portion of it is wasted or unworthily distributed. In a country where feudal practices linger, such as our own, it is indeed among the rules of society that a certain portion of such fortunes shall be thus wasted; that it is beneath the dignity of the possessor to reckon too carefully about his houses, dependants, and equipages. It is never once considered whether the money he gives brings a suitable return either to himself or to any other portion of the human race. If the merits of the individual were at all concerned in the existence of the fortune, it

Digitized by Google

might rather be said, then, that such a person did injury than benefit to society. The riches would have existed had he not lived, and they might have been in hands that would have employed them better. Suppose his fortune to possess the character of a large landed estate. The rent which constitutes the proprietor's riches is created by the industry of the workman, and the skill and capital of the farmer laid out on the tillage of the soil. That soil would have existed to prompt their exertions had it been divided among twenty proprietors instead of belonging to one; and not only would the return in rent have probably been larger (for the small proprietor has generally greater inducements to bring land under tillage than the large), but the rent received would have been undoubtedly more frugally and circumspectly spent. Thus it appears that, as the wealth arising from great estates is generally spent, it does less than its proportion of good. Any law tending to prohibit, or even to discourage, the accumulation of large fortunes, would be prejudicial to society, by removing an inducement to enterprise and exertion; but, undoubtedly, a law which directly interferes for the creation of unwieldy large estates, or for the protraction of their existence—such a law, for instance, as the entail system in Scotland—is directly injurious to society.

When the man of large fortune happens to be seized with or driven into a fit of extravagance, his merits as a benefactor are held to be in a state of peculiar activity. He is then under the operation of impulses of active and energetic benevolence, creating and distributing blessings around him. When a great entertainment is given, which calls forth the exertions of the dress-maker, the perfumer, the wine-merchant, and the pastry cook, there are endless congratulations about "impulse to trade," "benefit to the community," "do a great deal of good indeed," "circulate money," "employment to poor people," &c. Surely, if all this good is really created by the enjoyments of the aristocracy, those of them who refuse to bless mankind at so easy and pleasing a rate, are guilty of much cruelty, or at least supine indifference to their fellow-creatures. But perhaps if we inquire a little into the real character of these impulses to trade, we shall find that those who act otherwise are not such enemies to society as they naturally appear in the eyes of the merchant who would fain be supplying them with costly wines, or the milliners, who think the ladies of the house do not spend what they should on feminine finery. The mistake so prevalent on this subject is a natural offspring of the selfishness of mankind. The persons who are employed by a man's wealth being turned into the channel of dissipation, are undoubtedly benefited by his taste in expenditure, in as far as his debts are paid. These, then, are clamorous to the world about the benefits they receive at his hands; and as those from whom the expenditure is diverted by its taking this direction—those among whom his money would have been spent had he followed a different career—are not in court to state their own case, the world takes the others at their word, and joins in their gratulations. The mistake on which all this proceeds is, that money is spent by this means which would not be spent otherwise. Before the invention of the banking system, when coin was hoarded in the earth, the supposition was not inapplicable. In a commercial community, however, it is a general proposition that no considerable sum of money remains unused. Suppose the landed proprietor to have some thousands of pounds in his hands, which he does not wish to lay out on baubles and dissipation, his object will be to find an investment. Perhaps he buys stock in a railway or canal, or mining company; in this case his money, after having employed workmen, and conveyed or created useful commodities, will generally return to him with a profit, from which further funds accumulate for the same or other purposes. Perhaps the saving man lends out his money. If the borrower spend it in frivolities, it cannot be worse employed than if the original owner had done so. But in the general case, the borrower will be an employer of capital—say a cotton-spinner or a farmer—and then the money having paid wages to labourers, and brought into existence clothing or food, after being replaced, yields a profit to the employer, and another to the lender, under the name of interest. The principal benefit done to society, in an economic point of view, by the person who spends his fortune on gaieties, is, that he gives support to human beings; but the number will not be so great as would have been supported by the money had it been used in the way of trade, because it will not be so economically managed, and very few of the human beings will be producers; the money spent in the general case not only not affording profit, but not replacing itself. A small part may perhaps replace itself with profit. The wine merchant and the pastry-cook may invest the money they receive in their business, but the portion that takes this direction must be but a comparatively small one of the money dissipated abroad. Into the moral operation of what is thus spent—the encouragement to idleness and dissipation, and the seduction from useful and steady pursuits to more pleasing and precarious ones—it is not our purpose to enter. We may, however, remark, that the obligations which a love of pleasure induces men to incur, are among the most likely to be beyond their power to fulfil; in other words, that it is in dissipation that the greater portion of bad debts are incurred. Were the advantages derived from the active expenditure of money, in this form, as substantial as they are imagined to be, they would be far more than counteracted by the havoc created among the industrious by unpaid bills.

The narrow, self-regarding views which have, as above noticed, given the credit of general benefactors to those who have employed certain classes of tradesmen, have often led to the adoption of curious views as to the place where expenditure should occur. In the general case, a man's expenditure will be equally beneficial to his race, wherever it may take place; but some shopkeepers occasionally think otherwise—they hold that it should be spent among themselves, and they sometimes get a portion of the public to join them. If a man has a uniform income, which he will spend annually on a butcher, baker, or tailor, his money will produce, in the general case, the greatest quantity of advantage to the recipients if he always remain in the same place. The respective tradesmen who have a set of regular customers, know how much raw material to lay in, how many hands to employ, and how much income they may put themselves in the way of spending. A law, however, tending to enforce the benefit of perpetual residence in one place, besides many other evils, would be an infringement on civil liberty not to be endured; nor would it be of much perceptible service in a populous and affluent country, where the inducements which have brought one to reside in a place will generally call a successor on his departure. Any act of the government, however, which should have the effect of removing a large and rich body—the court and legislature, for instance—from the place where they have been in the habit of congregating, would cause great evil and injustice. It has often been said—and petitions have been presented to Parliament on the subject—that the legislature and the court ought to be occasionally convened in Edinburgh or Dublin. From their not being so, the present race of tradesmen in these cities experience no injustice; but from a removal, those of London would suffer much injury. It is said their custom should be distributed—Scotland and Ireland should have their turn, &c. Now, no man is injured by never receiving that which he has never acted on the anticipation of getting. The tradesmen of Westminster (some of them, by the way, from Edinburgh, some from Dublin) set up their business in that place for the purpose of supplying the demand which the existence of the court and legislature in its neighbourhood was likely to occasion; and if the position of any class of tradesmen ought to be taken into consideration, in fixing the seat of legislation, it is theirs. The inconveniencies, however, of a permanent change of place, such as took place in the case of Scotland and Ireland, would not be productive of so much evil as might be anticipated. The tradesmen in the new locality might have the start, but those of the old one would soon migrate.

The chief evils of what is called absenteeism, arise from such a change in the seat of expenditure. A landed proprietor employs a grocer, a baker, a carpenter, and, perhaps, a tailor, in a small village on his estate, and when he leaves the spot, their income will be so far depreciated, that they cannot live there, but must seek their fortune elsewhere. How far such an event will be productive of much mischief, must depend on circumstances. In a popular view, however, the evils of absenteeism are vastly exaggerated. It seems to be considered, that when the landlord is gone, the whole industry and enterprise of the spot go with him. The rent, however, which the landlord chooses to enjoy elsewhere, is but a small part of the riches produced on his property. In the creation of the rent, the neighbourhood is benefited to an extent to which the spending of it in the vicinity is a bagatelle. Before the farmer can pay it, he must have expended, perhaps, three or four times its amount in a manner so profitable, as not only to produce the rent itself, but to support himself and his family after feeding a number of labourers. What the farmer spends in such a manner that it is replaced with profit, is three or four times as much as what the landlord would spend unprofitably. In so far as the proprietor chooses to spend a portion of the rent on improving his property, the expenditure is undoubtedly profitable; but, in general, his agents and stewards will look after these matters in his absence. In one case, indeed, the departure of a proprietor would occasion serious loss to his neighbourhood—the case where he employs his rent in farming, manufacturing, or some other profitable speculation, which cannot be conducted in his absence. In this case the money he spends, instead of assisting in the support of a few isolated individuals, will, perhaps, after feeding a large number of workmen, be giving its annual contribution, in the shape of profits, to the increase of the capital of the country. It is seldom, however, that men of this description desert their pursuits unless they become unprofitable.

Again it may be necessary to remind the reader of the distinction that must be observed between the purely economic and the moral considerations which apply to this subject. It must be on the latter that the extent to which unprofitable expenditure ought to exist, must in a great measure depend. It is difficult to conceive a state of society in which all the money spent replaces itself with a profit; and, indeed, such an arrangement would seem to defeat the object of the accumulation of property, which is the increase of the comforts and enjoyments of the community. In a well-regulated state, indeed, the extent to which unproductive expenditure exists, in the obtainment of rational enjoyments, will be an index to the general prosperity that exists within it, and of which all its members will more or less partake.

NAPOLEON'S THREE WARNINGS.

The celebrated Fouché, Duke of Otranto, was retained but a short time, it is well known, in the service of the Bourbons, after their restoration to the throne of France. He retired to the town of Aix, in Provence, and there lived in affluent ease upon the gains of his long and busy career. Curiosity attracted many visiters around this remarkable man, and he was habitually free in communicating his reminiscences of the great events which it had been his lot to witness. On one occasion, the company assembled in his saloon heard from his lips the following story.

By degrees, as Napoleon assumed the power and authority of a king, every thing about him, even in the days of the consulate, began to wear a court-like appearance. All the old monarchical habitudes were revived one by one. Among other revivals of this kind, the custom of attending mass previous to the hour of audience, was restored by Bonaparte, and he himself was punctual in his appearances at the chapel of Saint-Cloud on such occasions. Nothing could be more mundane than the mode of performing these religious services. The actresses of the opera were the chorists, and great crowds of busy talkative people were in the habit of frequenting the gallery of the chapel, from the windows of which the First Consul and Josephine could be seen, with their suites and friends. The whole formed merely a daily exhibition of the consular court to the people.

At one particular time, the punctuality of Bonaparte in his attendance on mass was rather distressing to his wife. The quick and jealous Josephine had discovered that the eye of her husband was too much directed to a window in the gallery, where there regularly appeared the form and face of a young girl of uncommon beauty. The chestnut tresses, brilliant eyes, and graceful figure of this personage, caused the more uneasiness to the consul's wife, as the stranger's glances were bent not less often upon Bonaparte than his were upon her. "Who is that young girl?" said Josephine one day at the close of the service; "what can she seek from the First Consul? I observed her to drop a billet just now at his feet. He picked it up; I saw him." No one could tell Josephine who the object of her notice precisely was, though there were some who declared her to be an emigrant lately returned, and one who probably was desirous of the intervention of the First Consul in favour of her family. With such guesses as this, the consul's wife was obliged to rest satisfied for the time.

After the audience of that same day had passed, Bonaparte expressed a wish for a drive in the park, and accordingly went out, attended by his wife, his brother Joseph, Duroc, Cambaceres, and Hortense Beauharnois, wife of Louis Bonaparte. The King of Prussia had just presented Napoleon with a superb set of horses, four in number, and these were harnessed to an open chariot for the party. The consul took it into his head to drive in person, and mounted into the coachman's place. The chariot set off, but, just as it was turning into the park, it went crash against a stone at the gate, and the First Consul was thrown to the ground. He attempted to rise, but again fell prostrate in a stunned or insensible condition. Meanwhile, the horses sprung forward with the chariot, and were only stopped when Duroc, at the risk of his life, threw himself out and seized the loose reins. Josephine was taken out in a swooning state. The rest of the party speedily returned to the First Consul, and carried him back to his apartments. On recovering his senses fully, the first thing which he did was to put his hand into his pocket and pull out the slip of paper dropped at his feet in the chapel. Leaning over his shoulder, Josephine read upon it these words—"*Do not drive out in your carriage to-day.*"

"This can have no allusion to our late accident," said Bonaparte. "No one could foresee that I was to play the part of coachman to-day, or that I should be awkward enough to drive against a stone. Go, Duroc, and examine the chariot."

Duroc obeyed. Soon afterwards he returned very pale, and took the First Consul aside. "Citizen-consul," said he, "had you not struck the stone, and stopped our drive, we had all been lost!" "How so?" was the reply. "There was in the carriage, concealed behind the back-seat, a bomb—a real, massive bomb, charged with ragged pieces of iron, and with a slow match attached to it—kindled! Things had been so arranged, that, in a quarter of an hour, we should have been scattered among the trees of the park of Saint-Cloud. There must be treachery close at hand. Fouché must be told of this—Dubois must be warned!" "Not a word to them!" replied Bonaparte; "the knowledge of one plot but engenders a second. Let Josephine remain ignorant of the danger she has escaped. Hortense, Joseph, Cambaceres—tell none of them; and let the government journals say not a word about my fall."

The First Consul was then silent for some time. "Duroc," said he at length, "you will come to-morrow to mass in the chapel, and examine with attention a young girl whom I shall point out to you. She will occupy the fourth window in the gallery on the right; follow her home, or cause her to be followed, and bring

Digitized by Google

me intelligence of her name, her abode, and her circumstances. It will be better to do this yourself; I would not have the police to interfere. Have you taken care of the bomb, and removed it?" "I have, citizen-consul." "Come, then, let us again drive in the park," said Bonaparte. The drive was resumed, but, on this occasion, the coachman was allowed to fulfil his own duties.

On the morrow, the eyes of more than one person were turned to the window in the gallery. But the jealous Josephine sought in vain for the elegant figure of the young girl. She was not there. The impatient First Consul, with his confidant Duroc, were greatly annoyed at her nonappearance, and small was the attention paid by them to the service that day. Their anxiety was fruitless. The girl was seen at mass no more.

The summers of Napoleon were chiefly spent at Malmaison, the winters at St Cloud and the Tuileries. Winter had come on, and the First Consul had been holding court in the great apartments of the last of these palaces. It was the third of the month, which the republicans well called *nivose*, and, in the evening, Bonaparte entered his carriage to go to the opera, accompanied by his aide-de-camp Lauriston, and Generals Lannes and Berthier. The vehicle was about to start, when a female, wrapt in a black mantle, rushed out upon the Place Carrousel, made her way into the middle of the guards about to accompany Napoleon, and held forth a paper to the latter, crying, "Citizen-consul! citizen-consul! read—read!" Bonaparte, with that smile which Bourrienne describes as so irresistible, saluted the petitioner, and stretched out his hand for the missive. "A petition, madam?" said he inquiringly; and then continued, "Fear nothing; I shall peruse it, and see justice done." "Citizen-consul!" cried the woman, imploringly joining her hands. What she would have further said was lost. The coachman, who, it was afterwards said, was intoxicated, gave the lash to his horses, and they sprung off with the speed of lightning. The First Consul, throwing into his hat the paper he had received, remarked to his companions, "I could not well see her figure, but I think the poor woman is young."

The carriage dashed rapidly along. It was just issuing from the street of Saint Nicholas, when a frightful detonation was heard, mingling with and followed by the crash of broken windows, and the cries of the injured passers-by. The *infernal machine* had exploded! Uninjured, the carriage of the consul and its inmates were whirled with undiminished rapidity to the opera. Bonaparte entered his box with serene brow and unruffled deportment. He saluted, as usual, the assembled spectators, to whom the news of the explosion came with all the speed which rumour exercises upon such occasions. All were stunned and stupified; Bonaparte only was perfectly calm. He stood with crossed arms, listening attentively to the oratorio of Haydn, which was executed on that evening. Suddenly, however, he remembered the paper put into his hands. He took it out, and read these lines:—"In the name of heaven, citizen-consul, do not go to the opera to-night, or, if you do go, pass not through the street Saint-Nicholas!" The warning came in some respects too late.

On reading these words, the consul chanced to raise his eyes. Exactly opposite to him, in a box on the third tier, sat the young girl of the chapel of Saint-Cloud, who, with joined hands, seemed to utter prayers of gratitude for the escape which had taken place. Her head had no covering but her flowing and beautiful chestnut hair, and her person was wrapt in a dark mantle, which the consul recognised as identical with that worn by the woman who had delivered the paper to him at the carriage door. "Go," said Bonaparte quietly but quickly to Lannes; "go to the box exactly opposite to us, on the third tier. You will find a young girl in a black mantle. Bring her to the Tuileries; I *must* see her, and without delay." Bonaparte spoke thus without raising his eyes, but, to make Lannes certain of the person, he took the general's arm, and said, pointing upwards, "See there—look!"

Bonaparte stopped suddenly. The girl was gone; no black mantle was to be seen. Annoyed at this beyond measure, he hurriedly sent off Lannes to intercept her. It was in vain. The box-keeper had seen such an individual, but knew nothing about her. Bonaparte applied to Fouché and Dubois; but all the zeal of these functionaries failed in discovering her.

Years ran on after the explosion of the infernal machine, and the strange accompanying circumstances which tended to make the occurrence more remarkable in the eyes of Bonaparte. To the consulate succeeded the empire, and victory after victory marked the career of the great Corsican. At length the hour of change came. Allied Europe poured its troops into France, and compelled the emperor to lay down the sceptre which had been so long shaken in terror over half the civilised earth. The isle of Elba became for a day the most remarkable spot on the globe; and, finally, the resuscitated empire fell to pieces anew on the field of Waterloo.

Bonaparte was about to quit France. The moment had come for him to set foot in the bark which was to convey him to the English vessel. Friends, who had followed the fallen chief to the very last, were standing by to give him a final adieu. He waved his hand to those around, and a smile was on the lip which had lately given the farewell kiss to the imperial eagle. At this instant a woman broke through the band that stood before Napoleon. She was in the prime of woman's life; not a girl, but yet young enough to retain unimpaired that beauty for which she would at all times have been remarkable among a crowd of beauties. Her features were full of anxiety and sadness, adding interest even to her appearance at that moment. "Sire! sire!" said she, presenting a paper hurriedly; "read! read!"

The emperor took the paper presented to him, but kept his eye upon the presenter. He seemed, it may be, to feel at that instant the perfumed breeze in the park of Saint-Cloud, or to hear the choristers chanting melodiously in the chapel, as he had heard them in other days. Josephine, Duroc, and all his friends, came haply before him, and among them the face which he was wont to see at the fourth window in the gallery. His eye was now on that countenance in reality, altered, yet the same. These illusory recollections were of brief duration. Napoleon shook his head, and held the paper up to his eye. After perusing its contents, he took it between his hands, and tore it to pieces, scattering the fragments in the air.

"Stop, sire!" cried the woman, "follow the advice! Be warned; it is yet time!"

"No," replied he; and taking from his finger a beautiful oriental ruby, a valuable souvenir of his Egyptian campaigns, he held it out to the woman. She took it, kneeling and kissing the hand which presented it. Turning his head, Napoleon then stepped into the boat, which waited to take him to the vessel. Not long afterwards, he was pining on the rock of St Helena.

Thus, of *three warnings*, two were useless because neglected until the danger had occurred, and the third —which prognosticated the fate of Napoleon if once in the power of his adversaries—the third was rejected.

"But who was this woman, Duke of Otranto?"

"Oh," replied Fouché, "I know not with certainty. The emperor, if he knew ultimately, seems to have kept the secret."

All that is known respecting the matter is, that a female, related to Saint Regent, one of the authors of the explosion of the street Saint Nicholas, died at the hospital of Hotel-Dieu in 1837, and that around her neck was found suspended, by a silk riband, the exquisite oriental ruby of Napoleon.

[This little story is abridged from a recent French feuilleton, by Maria Aycard, one of the most fertile authors of such nouvellettes now figuring in the Parisian world. There was so much of the marvellous in Napoleon's whole career, that it would be hard to say when or where the anecdotes told respecting him diverge into fiction. Certainly he was an object of unbounded admiration, almost of idolatry, to thousands of whom he himself knew nothing, yet who would have preserved him from danger at the cost of their own lives.]

THE NEW VACCINATION ACT.

We do not know any species of discovery, invention, or improvement, which has been more unworthily treated than vaccination. For half a century it has had to struggle against the indolent prejudices entertained by the bulk of society, and, notwithstanding its marked power of preventing small-pox, and thereby arresting one of the greatest scourges of the human race, it is still regarded by a pretty large section of the community either with indifference or hostility. With the hope that what we write may in some manner reach this numerous class, we beg to say a few words for their special benefit.

In the first place, let us explain (for this is necessary with many) what vaccination is. It is well known that there is a disease called small-pox, peculiarly apt to affect children. It is a hideous disease, which, if it do not kill the infants, leaves them much disfigured, and also, in some cases, deprived of sight. With the view of modifying this dreadful disorder, it was formerly customary to communicate it from one child to another by the insertion of a little matter, which is called *inoculation*. This, in some cases, has the desired effect of giving the small-pox in a less violent degree than if taken naturally; but disfigurement, and even death, often ensue from the practice—thus showing that it is no perfect safeguard—while the child who is affected forms a source of contagion to the whole neighbourhood around. Let this be clearly understood. We say, that a child who is smitten with small-pox by inoculation is as capable of communicating the disease in a natural form as if the child had taken the disease naturally itself. Hence the parents who allow their child to be inoculated, endanger the lives of old and young in the same house, and probably in the adjacent dwellings, or all who visit them. What, then, is to be done to prevent these calamities? We shall explain. There is a process called *vaccination*, which consists in inserting a small portion of matter taken from pustules which rise on the udder of a cow; the insertion in the arm of the infant being done in the same manner as inoculation. This matter raises a pustule at the spot where it is inserted, and this is called having the cow-pox. Where the vaccination has been properly performed, the child is at once relieved from all liability to take the small-pox. How such should be the case cannot be well explained, but the fact is indisputable. The constitution is affected by vaccination in such a way, that those who have undergone it, and really had cow-pox, never catch the infection of small-pox. Besides, children enduring cow-pox or vaccination, do not communicate any contagion to others. Such being the case, is it not wonderful that mothers should persist in keeping their children from being vaccinated? We say distinctly to parents, if you do not have your children vaccinated, you are clearly guilty of incurring the risk of killing them with small-pox, and perhaps endangering the lives of hundreds of unvaccinated persons about you. Think a little on the disgracefulness of incurring such a serious charge as this.

We shall now show what havoc small-pox has been lately committing in England, all through the prejudices of parents against vaccination, or from pure negligence. From the valuable information recently obtained by the registration of the causes of death, it appears that in 1837, there were in England only four diseases by which more people were killed than by small-pox. The number of deaths registered as caused by small-pox, during the two years and a half ended December 31, 1839, was 30,000, which gives about 12,000 deaths annually in England and Wales. It appears that the extremes of mortality at the Small-Pox Hospital in London, amongst those attacked by the disease, have been 15 per cent. and 42 per cent. In some districts the mortality from small-pox is stated to be one in six of those attacked. But if, according to other statements, the average mortality be taken at one in four, or 25 per cent. of those attacked, the number of persons attacked in England and Wales must amount, on an average, to nearly 50,000 persons; thus, besides 12,000 killed, there are probably nearly 40,000, who, although they recover, have at least been subjected to a painful and loathsome disease, with all the disadvantages which attend and follow it.

It appears that the practice of inoculating with the small-pox has been long abandoned by the whole of the respectable part of the medical profession, on the grounds, first, as respects the individual inoculated, that it is much more dangerous than the cow-pox; secondly, as respects others, that it makes the person inoculated a source of contagion, thus multiplying the chances of its spreading, and without absolutely protecting the life of the one person inoculated, exposes to imminent risk the lives of others, who are the more entitled to protection as they have the less warning to protect themselves. The practice of inoculation with small-pox is mostly pursued by ignorant and unqualified persons, old women, and itinerant quacks. Excessive mortality from small-pox is frequently traceable to the proceedings of such persons. Instances are authenticated of persons having caught small-pox after vaccination, and having died, as there are also instances of persons having small-pox a second time and dying from it; but instances even of the former kind are extremely rare; and allowing that the sufferers had been properly vaccinated, a fact which is still more rarely proved, the proportion of such fatal cases is so small as scarcely to affect the value of vaccination as a measure of prevention.

With respect to the value of vaccination as a preventive of small-pox, the following evidence is given in a report to the Poor-Law Commissioners:—"In the year 1827, the small-pox appeared in one of the largest institutions in Dublin, the average number of inmates being between 2000 and 3000. The disease attacked 106 individuals, and was confined chiefly to the nursery, in which were 141 children, together with their mothers or nurses, many of the latter having been vaccinated during their infancy or childhood, and they all escaped the small-pox, though placed under circumstances most favourable for the reception of the infection. Up to the 28th of March of the present year, thirty-eight cases of small-pox have occurred, and notwithstanding the close and constant intercourse which arises from the crowded state of the establishment, no instance of small-pox after vaccination was observed, excepting in one child, who was said to have been vaccinated two years ago in Liverpool, but on whose arm there was no trace of cow-pox."

It is important to note, that vaccination should be carefully performed. If done carelessly, there is no certainty of the right effect being produced. In all cases, it should be performed by properly educated and practising medical men—not by midwives, or ordinary women, who cannot be expected to possess the pure vaccinating matter.

In consequence of the great number of deaths annually occurring from inoculation with small-pox, an act of parliament has lately been passed,* and which has already come into operation throughout England, Wales, and Ireland, having for its object the extension of the practice of vaccination, and the entire prohibition of the inoculation of children with small-pox, by constituting the latter a misdemeanour, punishable with one month's imprisonment. In adopting this course, the legislature has followed the example of several of the continental states.

We conceive that we shall be performing an acceptable service to our readers, and promoting, in some degree, the benevolent intention of the legislature, by giving increased circulation to the provisions of the

* The 3d and 4th Vict. cap. 29.

Digitized by Google

act, and the measures which are to be immediately taken to carry out the execution of those provisions.

This act is entitled "An Act to extend the Practice of Vaccination," and enacts—

1. That from and after the passing of this act, it shall be lawful for the guardians of every parish or union, and for the overseers of every parish in which relief to the poor shall not be administered by guardians, in England and Wales; and they are thereby directed to contract with the medical officers of their several unions or parishes respectively, or with any legally qualified medical practitioner or practitioners, for the vaccination of all persons resident in such unions or parishes respectively: provided always, that it shall be a condition of every such contract, that the amount of the remuneration to be received under the same shall depend on the number of persons, who, not having been previously successfully vaccinated, shall be successfully vaccinated by such medical officers or practitioners respectively so contracting.

2. That in making such arrangements as may be required for the execution of this act, such guardians and overseers, and all other officers engaged in the administration of the laws for the relief of the poor, shall conform to the regulations which may from time to time be issued by the Poor-Law Commissioners in that behalf, which regulations the said commissioners are thereby authorised and required to make and issue.

3. Medical officers to report from time to time the number of persons vaccinated to the guardians or overseers.

Sections 4, 5, 6, and 7, refer to the arrangements of the medical officers in the various districts.

8. It is enacted, That any person who shall, from and after the passing of this act, produce, or attempt to produce, in any person, by inoculation with variolous matter, or by wilful exposure to variolous matter, or to any matter, article, or thing impregnated with variolous matter, or wilfully, by any other means whatsoever, produce the disease of small-pox in any person in England, Wales, or Ireland, shall be liable to be proceeded against and convicted summarily before any two or more justices of the peace in petty sessions assembled, and for every such offence shall, upon conviction, be imprisoned in the common jail or house of correction, for any term not exceeding one month.

The Poor-Law Commissioners, under whose direction this act is generally to be carried into effect, have, as a preparatory step, issued a circular letter to the boards of poor-law guardians in England, calling their attention to the several provisions of the act, with a view to the understanding of their object, and the steps to be taken for its accomplishment.

The act of parliament does not extend to Scotland, none of the Scottish members of the legislature, as we have been told, having thought proper to desire that it should do so, although precisely the same evils require to be remedied in the one country as in the other.

EXHIBITION OF MODELS AND MANUFACTURES AT GLASGOW.

An exhibition of Models and Manufactures was prepared, in connexion with the British Association, in the Monteith Rooms in Buchanan Street. This is a kind of exhibition of which, as far as we are aware, the Adelaide Gallery in London afforded the first example. There was one in Edinburgh last winter, of which an account appeared in the present work. Another and flourishing one was open to the public at Newcastle in spring, and about the same time there was one of immense extent and variety of objects, in connexion with the Mechanics' Institution of Liverpool. The results of the one last mentioned were such as to show how well calculated such exhibitions are, in the present day, to attract public attention. During the six weeks it was open, it drew (at a shilling a-head of admission-money) upwards of three thousand four hundred pounds, of which all, except a few hundreds for expenses, went to the funds of the institution. A confectionery table, opened in it for the refreshment of the visiters, drew above four hundred pounds, and from the half of its profits afforded a little dowry to the shop-girl who kept it. The show held forth in Glasgow was not of such vast extent, but a very good exhibition nevertheless. After doing service during the week of the association, it was opened to the public at a small rate, and was well attended.

In the entrance hall, we observed some models by the ingenious Mr Thom of Rothesay, the engineer of the extraordinary water-works at Greenock. Amongst them was one of a self-acting filter, which was stated to have been established at the Paisley water-works two years since, and to have completely accomplished its object. In the same hall was suspended a locomotive carriage-wheel, of wrought iron, "forged at a blow." Touched with a hammer, this large mass sounded like a bell, thereby denoting its perfect soundness. The catalogue states it to have been "from Mr Jeremiah Grime, Lancashire."

On entering the *lower room*, we found five tables, covered with various objects; besides which there were many things placed upon the ground or suspended from the walls. Immediately opposite the door stood a large model of Glasgow Cathedral, by Mr G. M. Kemp, the self-taught Gothic architect, whom we formerly introduced to our readers as the successful competitor for the furnishing of a plan for the Scott Monument in Edinburgh. This model is executed with the greatest neatness and accuracy, on a scale of four inches to ten feet, and it comprehends the restorations or re-edifications proposed upon the existing building by Mr Kemp. Glasgow, it occurred to us, ought to possess this very interesting model. Near by, in a corner, we found a model of a different but not less interesting kind—the subject represented being the district of the Western Pyrenees, and the object being to illustrate the campaign of 1813. This is done in *papier machée*, by Major Sir T. L. Mitchell. Every hill, every path winding over and amongst them—every town, village, and castle, every river and every streamlet—is here clearly, and, we should presume, accurately represented. We have been informed that this model was exhibited last winter in London, when the Duke of Wellington visited it, studied it for several hours, and went away declaring his complete satisfaction with it.

In such an assemblage of objects, the oddest associations sometimes occur. Very near to this beautiful high-relief map, as it might be called, lay, upon the same table, a *patent gridiron frying-pan*, made by a Mr Rettie, a brassfounder, a most ingenious piece of apparatus certainly. The design evidently is to broil steaks or chops, and at the same time save the greater part of the juice and fat, which, when ordinary gridirons are used, falls, as all the world knows and laments, into the fire. To effect this end, Mr Rettie's gridiron is made primarily as a frying-pan, but with a pretty high convexity in the centre, and this convexity is composed of bars in radiating fashion, each having a channel running down the middle of it, all of these channels meeting in one larger channel, forming the rim of the vessel. Thus, steaks put upon the convexity receive the fire through the bars; the juice runs down the channels in the bars, and collects in the hollow rim; and, while the process is essentially a *broil*, the results also involve the benefits of a *fry*. Dr Kitchener would have beheld Mr Rettie's contrivance with transport.

But a truce with whim—an object is before us which calls for something not much short of awe. We behold the identical model steam-engine with which James Watt experimented in his youth, within the walls of Glasgow College; also, suspended over it, the original portrait of the venerable mechanician, by Partridge. The model is a frame about three feet high, two broad, and one in thickness, comprehending a furnace scarcely large enough to boil an old woman's tea-kettle; over that, a small barrel-shaped boiler of copper, supplying a cylinder about the size of a half pint measure; from this rises the stalk of a piston, attached at the top to the extremity of a beam like a balance, the other end of which works upon a miniature pump below. Between the pump and the boiler lies a small trough, into which the water, when pumped, was discharged. Altogether, the apparatus strikes one as simple and homely, and has something affecting in it from that very cause. The portrait is a bust, very lively and beautiful; it made us aware for the first time of the philosopher having possessed a pair of uncommonly fine blue eyes, adding greatly to the mildness of his aspect. It may be added, that the model belongs to the College of Glasgow, and the portrait to John Smith, Esq. of Crutherland. Close beside these objects, we found another of great interest, as connected with the history of steam power, namely, the actual engine employed by Henry Bell in his first vessel—the first working steam-vessel, as is well known, out of America. This vessel, named the Comet, began to ply upon the Clyde in 1812; and afterwards, being transferred to the West Highland station, it was wrecked about 1819 in the *Doors of Dorrismore*. Many years after, Messrs Girdwood and Company, machine-makers in Glasgow, desiring to have the engine as a curiosity, caused it to be raised from the wreck and erected in their works, at an expense of L.120. It now belongs, we believe, to Messrs Craig and Company, Tradeston (a suburb of Glasgow). The cylinder is surprisingly small, not above a foot in diameter; and the whole works, like Mr Watt's model, are of rude construction. To see these two objects so near each other struck the mind forcibly. If there had also been present the small engine used in the experimental vessel which Mr Miller set a-going on Dalswinton lake in 1788 (not long ago placed by Mr Miller's son in the British Museum), it would have been one of the most remarkable groups of objects which the world could produce. It is to be lamented that they are separate; but certainly we could not wish to see the Watt model or the Bell engine sent out of Glasgow, even to be united with Mr Miller's engine in the British Museum. There is an additional interest in seeing such objects on the same ground which their authors trod in life, where they encountered all their difficulties, and finally made good their admirable designs.

Pass we on amongst objects of various kinds—a model of a drain-tile work, a model of Chester Bridge, a printing roller engraved by galvanism, and many others— until we come to one which arrested our attention for a little while, namely, the model of a *self-acting gate*. This is an invention by a Mr Paterson, architect in Dundee, for saving all the trouble which is encountered, while driving in a carriage through a gentleman's parks, in every minute alighting to open the gates. By a peculiar mechanism, this gate is no sooner approached by a carriage, from either side, than it flies open, the leaves receding from the side on which it is approached. The carriage, again, is no sooner through, than the leaves fall together, and are fastened by a central catch, "which remains down out of the way of the horses' feet, and rises in time to secure the gate." Of the mechanism for causing the gate to open, we see nothing besides two plates of iron on the wheel track, resembling those connected with weighing-machines for carts, and which are made to operate upon the central catch and the hinges of the gate by means of the weight of the carriage when it passes over them. Thus it would appear that a carriage might pass through a series of gates without one moment's interruption, every one flying open, like those encountered by John Gilpin, at the approach of the vehicle, and as readily closing behind it when it has passed.

Again we pass on through a crowd of ingenious machines, many of them of recent invention—as, a patent self-acting mill for spinning wool, by Mr Smith of Deanston, a pneumatic grate, models of steam-engines of various kinds, dissected models of chemical manufactories, by Mr Griffin of Glasgow, and many others, the enumeration of which would convey few definite ideas to the mind—until we are arrested by what may be called a *curiosity*, in the shape of certain hanks of cotton yarn, spun at New Lanark between the years 1790 and 1800, the early days of cotton-spinning in Scotland. They are labelled with their prices, which range from 5s. to 6s. 4d., while beside them lie specimens from the same mill done in 1840, and the prices of which are from 10d. to 1s., thus showing the great cheapening which has been effected in cotton goods through the improvement of machinery and the general advance of the trade. Again, a crowd of indescribable engines, including one which we understand to be of considerable importance, *a self-acting feeding machine*—that is, a machine in which the rolls of wool are made to supply themselves to the machine in which they are spun, the invention of Mr H. Brown, woollen manufacturer, Selkirk; also a patent *self-acting reel*, "which stops when the thread breaks or bobbin empties, or when a given quantity is reeled, without straining the thread," the invention of Mr William Nairne, flax-spinner, Perth—engines these which almost give human intelligence to inanimate matter, and renew, but for a good instead of a vain end, the offence of Prometheus. We have now passed up one side of the room and are coming down the other; and here we have presented to us, hanging like great and gorgeous palls upon the walls, specimens of carpets, of the kind bearing the name of Axminster, manufactured in Glasgow. This kind of carpets, it is generally known, are distinguished as being made all in one piece, with a very deep pile on one side, the other side being, like the back of a picture, not designed for show. For some time they have been made in other places besides Axminster, for example, at Lasswade, near Edinburgh, in the factory of Messrs Whytock; but, in these instances, the pile is formed by a range of boys, who insert it thread by thread, each attending to his own little portion of the pattern. We find to our surprise that in Glasgow this process has been transferred from human labour to machinery, these specimens being described as "woven entirely in the loom," by the patentees, Messrs James Templeton and Company. Richer stuffs Luxury could not wish to set his proud foot upon.

The first room being now surveyed, we ascend to the second, at the door of which we find an unexpected sentinel, in the shape of a stuffed and glass-cased specimen of the *Alpaca*, a hitherto little-known example of the sheep tribe, inhabiting the higher regions of Peru. The alpaca is as large as a tolerable Shetland pony, with a long neck and long erect ears. Unlike its congener the lama, it has long silky wool, of a perfectly black hue, and containing no grease, the animal not being a perspiring one. Some peculiar interest attaches to the creature at the present moment, as a considerable importation of its wool has lately taken place for manufacturing purposes, and it has even been proposed to introduce the live animal to our pastures. Some specimens of cloth made from the wool are shown upon a neighbouring table, and seem to justify the saying of the manufacturer, that alpaca wool rather interferes with the silk than the wool trade. But we have our doubts as to the naturalisation of the animal. The high climates of Peru are certainly as cold as our Highlands, but one of the elements of our condition is wanting there, namely, the humidity. Our rains have been found to rot the feet of foreign sheep, to which the cold alone would have done no harm. We remember Sir John Sinclair getting home a flock of some such creatures, and sending them out to winter on the Pentland hills, with greatcoats on their backs. He quite forgot to supply them with shoes and leggins also, and hence, if we recollect rightly, they were all dead mutton before the end of the season.

Immediately within the door of this second room, there is a water tank, designed to exhibit in an appropriate manner models of steam and sailing vessels, including a peculiarly interesting set of models, "constructed by a committee of the British Association appointed for ascertaining the best forms of vessels." We pass this, and come to a table presenting a variety of cutlery and other instruments, including "a six-barrelled self-acting revolving pistol;" a huge razor,

Digitized by Google

"with a view of Chatsworth House beautifully etched on the blade;" a piece of mechanism composed chiefly of two gems, "for correcting the edges of surgeons' cutting instruments;" and "an improved pivot castor for heavy furniture, constructed so as to have a constant supply of oil;"—the two last being the invention of Sir John Robison. Here also is an old Tyrolese matchlock, a similar weapon formerly belonging to Tippoo Saib, and a horn of great length, brought from Abyssinia by Bruce. Vain were it to detail the multitude of similar articles which immediately follow; but we must advert to what struck us as a good, because a useful and instructive idea, namely, trays containing articles of hardware, in all their various stages of manufacture, from the rudest to the most polished. Pins, buttons, files, gun-locks, German silver articles, &c., were thus illustrated. Some exquisite specimens of turning, from the private lathe of Sir John Graham Dalyell, were also here exhibited.

At the head of the room, "a Paisley shawl loom, with draw-boy," was seen in full operation. Here also stood a large case, containing Mr Alexander's electric telegraph, a model of Mr Ponton's being exhibited at the other, under the care of Mr Dunn, optician. Having lately treated of electric telegraphs in general, we shall not enter further into the description of these, than to say that Mr Alexander's produces 42 signals by means of as many wires, while Mr Ponton's, by some short-hand sleight, gives as many signals by means of three wires—a circumstance which we only mean to state as a matter of fact, and not as any proof of the superiority of the one telegraph to the other, on which point we have not had an opportunity of forming a judgment. We may, however, take this opportunity of adverting to the fact that, for some months past, the telegraph patented by Messrs Cooke and Wheatstone has been in operation between Paddington and West Drayton, on the line of the Great Western Railway, the communication being in that case effected by "metallic wires made to operate on fine magnetic needles, which point to twenty letters of the alphabet marked upon the dial, being acted upon by electric currents passing through coils of wire placed immediately behind them." This telegraph requires five wires throughout the length of the intervening space; but Mr Wheatstone has invented a new plan, by which only two wires will be required, and "so extremely simple, that any person, without any previous acquaintance with it, can send a communication, and read the answer." It appears that the expense of laying down such an electric telegraph along a line of railway will be about L.300 per mile. There may also be placed in the same tube different sets of wires, for the use of different companies or individuals: for instance, one might be for the use of the railway company, another for the service of government, and a third for general commercial purposes. If any party entertained a fear of their correspondence being tampered with, they might correspond by cipher, "of which an extremely safe and simple mode had been devised, enabling a person to communicate with a thousand correspondents so as that it should be impossible for any one of them to read what was intended for another." Mr Wheatstone proposes, in the case of a railway telegraph, to have, at every distance of a quarter of a mile, posts through which the magnetic wires can be carried up, and with an apparatus at the top. The guard, with a portable instrument, might at any of these stations communicate a message in either direction, so as to give warning of the approach of the carriages under his charge. Thus the risk of collisions would be considerably diminished.

The remainder of the tables in the second room are covered with a profusion of objects of art, and models of mechanism, which our space will scarcely allow us to touch upon. One small carved group in ivory, "Death sparing neither age nor sex," by Fiamingo, attracted general attention by its extreme beauty. A series of specimens of papier machée articles, by Messrs Jennens and Bettridge, of Birmingham, and a series of ornamental boxes and other articles, by Messrs Smith of Mauchline, showed to what a pitch of elegance, in form and pictorial design, some of even our manufactures of little or humble pretension have now attained. Another object generally admired was a "Warwick vase," done in terra cotta at the Garnkirk Works, near Glasgow. The only other object we have room to notice, is a *chimney-sweeping* machine, the invention of Mr Malcolm Muir, of Glasgow. This was exhibited at work upon a wooden chimney reared for the purpose at the end of the room. The mechanism for sweeping consists of a series of rods, connected by joints, which, like those of a clasp-knife, allow of a bending only in one direction. By means of these joints, the series of rods can be wound up upon a reel, so as to be readily carried about from house to house. The reel containing the wound-up rods being brought close in front of the supposed fire-place, a man fastens a brush on the extremity of the first rod, inserts this into the chimney, and then, beginning to turn the reel, causes the series to unwind, open, and proceed, like one long connected rod, up the chimney, driving, of course, the brush before them. To keep the united rod right in the centre of the vent, and to enable it to make lateral turnings in conformity with the turnings of a chimney along a wall, each individual rod is furnished with a wheel of about nine inches diameter, revolving upon an axis fastened in it, and there are other joints permitting of flexure to either side, but not forward or backward. The unwinding goes on, joint after joint proceeds up the chimney, which, the better to exemplify the principle, is bent almost at a right angle; and finally, after a few minutes have elapsed, the spectator sees the brush appear above the top of the vent, near the ceiling of the room. The importance of this machine, as a means of doing away with "climbing-boys," is so obvious, that we heartily wish it may come into general use.*

NOTICES OF EDUCATIONAL INSTITUTIONS.

THE SCOTTISH INSTITUTION (EDINBURGH), FOR THE EDUCATION OF YOUNG LADIES.

This institution was noticed in the Journal some years ago, while as yet it was in its infancy. Some may recollect its being described as an attempt to combine all the useful and ornamental branches of a young lady's education under one roof, at a comparatively moderate fee. To be more particular, a certain number of teachers—all of them men standing in the first rank of their profession in a city which acknowledgedly takes a lead in education—associated themselves for the purpose of establishing a school apart from their ordinary classes, where young ladies, for one slump fee (twenty guineas per annum), might acquire all those accomplishments which, taken under separate masters of the same reputation, usually cost a much larger sum. We learn with pleasure that this plan has been completely successful. The average attendance at the Scottish Institution for the last three years has been eighty; the season just commenced has brought even a larger number of pupils, many of them from distant parts of the world. At the same time, other establishments following the same plan have met, we believe, with a fair share of success; and private teaching in the same branches has been in no degree injured. The Scottish Institution is now conducted in a large house in the most elegant part of the city. The branches taught in the establishment, each under a first-rate master, are twelve—namely, junior English department; writing, arithmetic, and book-keeping; elocution and composition, history and geography; piano-forte, singing, theory of music and elements of composition; drawing and perspective; mathematics, with its more interesting applications; French language and literature; Italian language and literature; German language and literature; dancing and calisthenics. There are also lectures, by gentlemen of equal attainments, on chemistry, including electricity and galvanism; natural philosophy, including astronomy; geology and mineralogy; botany, zoology; and ancient and modern history. It is obvious that no young lady could learn all these things at the same time, at least with the same rapidity as when a few things only engage her attention; but a choice may be made, and it is a principle in the institution to afford a long and deliberate course of instruction at the same rate at which a short and hurried one is usually obtained. At the head of the establishment there is a lady exercising all the functions of the superior of a boarding-school; four governesses are retained to assist in the musical department, and one in the French; while the junior school has also an assistant. Such an amount of teaching power, at so moderate a rate of cost to individual pupils, is perhaps unexampled: indeed, nowhere but in such a city as Edinburgh, where education may be said to be a staple production, could any thing exactly like this institution be expected to exist. One of its most important effects is to make the ornamental branches of education more accessible than formerly to the middle classes of society. Another is to introduce physical science into the education of the upper classes. At the beginning of the present season, a new and important feature was added, namely, a normal school for governesses, for which the existing elements of the institution certainly furnish great advantages.

THE LIVERPOOL MECHANICS' INSTITUTION.

We have before us the Report for 1839–40 of the Liverpool Mechanics' Institution, one of the greatest establishments of the kind in Great Britain, or perhaps in the world. Many points in the conduct of this institution are worthy the special attention of those who have the management of others of the same kind throughout the kingdom. It was established in June of the year 1825, under the patronage and presidency of the late Mr Huskisson, then member for the city. It continued for some subsequent years to flourish in a manner worthy of so great a seat of commerce and enterprise, and, in 1835, the foundation-stone of a handsome and massive building, for the purposes of the establishment, was laid by Lord Brougham, a fund being provided for the erection by subscriptions. All subscribers of ten guineas were appointed members for life. The ordinary members of the institution consist of individuals above the age of fourteen, who subscribe one guinea annually. The main privileges of membership consist in the use of the library, and admittance to the schools and lectures connected with the establishment. Life members, and those paying 21s. per annum, have a right to the admittance of such of their sons as are under twenty-one years of age, to the lectures, the evening schools, and the library, on paying 5s. for each per annum. Members who have no sons present, may send apprentices, aged from fourteen to twenty-one, on the same terms. Wives and daughters of members to be admitted to the lectures and library, on paying each 10s. 6d. annually. The election of officers, and all ordinary business, is managed by ballot-voting at general meetings.

The number of members belonging to the institution, in March 1840, is thus stated in the report:—"512 life members; 1595 annual members; 43 quarterly members; 655 sons of members; 266 apprentices of members; and 389 ladies." The recent income of the institution is described as unprecedentedly great. The following is an abstract of the accounts:—The available funds for 1839–40 (from March to March) amounted to L.9273, 17s. 4d.; the subscriptions of members, and receipts from lectures and evening classes, for the year, being L.3229, and the rest, exclusive of balances on hand from the preceding year, being chiefly derived from receipts on account of day-schools, open to ordinary payment. The large sum of L.7130 was expended on teachers' salaries and other expenses of the establishment; and the institution, after all other demands for the year were settled, could spare L.1490 to the building fund, for the completion of a sculpture gallery, which was in the course of being added to the establishment.

The institution, it will therefore be seen, is in a most flourishing condition as regards the indispensable article, money. Respecting the schools in connexion with the institution, and in which lies its great and peculiar utility, the report must be allowed to speak partly for itself. It is proper, however, to remark, in the first place, that the schools of the institution are of two kinds, the evening ones being intended, generally speaking, for young men who are already engaged in the pursuit of some trade, and whose early education has been more or less imperfect; while the high and preparatory day-schools have the character of ordinary academical seminaries, for the bestowal of a perfect course of instruction on the young. "The evening schools (says the report) consist at present of eighteen departments, conducted by twenty-six masters, and containing, in all, about 650 pupils, to whom instruction is afforded in English grammar, composition, geography, history, writing, arithmetic, mathematics, navigation, chemistry, natural philosophy; the French, German, Latin, and Greek languages; landscape drawing; practical, perspective, architectural, mechanical, and naval architectural drawing; ornamental and figure drawing; painting, modelling, vocal music, and rhetorical delivery." Detailed accounts of the condition of each of the classes for these branches are then given, and the results of the various courses are equally creditable to teachers and taught. Great, indeed, must be the benefit to the mechanical arts of the country from such instructions as are derived by young tradesmen at the following class. "The number on the list of the mechanical drawing class, under Mr Thomas Baker, is 48. The average attendance is about 30. This class is chiefly composed of apprentices—engineers, millwrights, pattern-makers, smiths, moulders, and coach-makers—with a considerable number of young students." Nor can we omit noticing particularly the class for vocal music, in which "there are about 70 pupils, who are now divided into two sections, a senior and a junior. To each of these, in consequence of the great numbers, it has been found necessary to devote a separate evening. Without a single exception, the pupils are deeply interested in their pursuits; their progress has been proportionably rapid; and when the directors consider the influence of music in refining and elevating the character, they confidently expect that this class will be found to be not merely attractive, but useful in the highest sense." Thirty years ago, this combining of the agreeable with the useful would have been called a wild waste of time. But the human mind, with all its wants and powers, is now better understood.

The library of the institution, and its museum, are thus noticed. "During the past year, upwards of L.200 have been expended on the purchase of suitable works, and nearly 3000 books have been added, by purchase or donations, to the library, which now contains in all upwards of 6000 volumes. This great increase in the number of books has induced the directors to allow members three volumes of a single work at a time, instead of one volume as formerly. Twelve of the most esteemed monthly and quarterly periodicals have been introduced into the library, the numbers being received as soon as published. As might have been expected, the increase of readers has been so great as to justify the increased expense which has been incurred, and to demand a still further expenditure in the purchase of useful works, whenever the funds shall be able to meet the outlay. At present the number of readers on the list is 1210; and the average daily number of books distributed is 200.

The Museum has been recently fitted up with shelves, and lighted. A curator has been appointed, by whose exertions the numerous specimens, chiefly of ornithology, which have been either purchased or presented, have been arranged. At present, the museum is open to members every Saturday, from twelve to five; and it is intended that, whenever the collection increases so greatly as to induce a more crowded attendance of visiters, greater facilities shall be given to members for its inspection. To the pupils

* Since the above was written, steps have been taken for the laudable object of establishing a permanent exhibition of models and manufactures in Glasgow.

Digitized by Google

of the various schools, it is expected that this department of the institution will be of the utmost service."

Not the least valuable feature in the conduct of this establishment is the delivery of lectures in connexion with it, upon all manner of important subjects. "Since March 1839, twelve courses of lectures, or in all, eighty lectures, have been delivered to audiences varying in numbers from 800 to 1400. The subjects have been diversified as much as possible, that all classes of members might find something suited to their various tastes and pursuits in life." Organic chemistry, animal mechanics, electro-magnetism, astronomy, vegetable physiology, landscape painting, steam power, &c., are but a few of the subjects lectured upon—the lecturers being among the first men of the day in their respective departments.

The institution is preparing to open an exhibition of objects illustrative of science, arts, and manufactures, such as that noticed in our present number. "No exertion will be spared to render it worthy of the institution and of the town, and the co-operation of all the members is earnestly requested, in order that the institution may not only be assisted by the proceeds, but that the collection of articles may be such as to instruct as well as amuse and gratify the public."

The report, after noticing the preceding points, concludes with an account of the state of the day-schools of the institution, where a complete education is given to boys. "Your committee have peculiar pleasure in stating that the Lower School has not been left behind in the general progress of the institution. In March 1838, it contained 221 pupils, and 3 masters. In March 1839, it contained 429 pupils, and 10 masters. It now contains 470 pupils, who are under the care of 12 masters, and are divided into eight classes, including the two which belong to the preparatory department. Experience only could demonstrate the possibility of teaching and keeping in order, without the fear of corporal punishment, so large a number of boys, of so various ranks, in all classes of advancement, many of whom have been sadly neglected, and almost all of whom have been imperfectly taught. The only two serious evils still prevalent in the schools, though both are much diminished, are the practice of irregular attendance at school on the part of many, and the rudeness and unseemliness of behaviour, which are the natural results of early improper education, and of want of intercourse with refined society. The preparatory department now contains 80 boys, most of whom are between 7 and 9 years of age. An additional master has been appointed, and the directors, in November last, reduced the fees of this department from 15s. to 10s., and for members' sons, from 12s. 6d. to 7s. 6d. per quarter, in order that a still more numerous class of society might avail themselves of its advantages. This department derives peculiar interest from the consideration that the intellectual, and still more the moral, welfare of the whole school, depends greatly on the age at which the pupils are subjected to its mild yet firm discipline. The earlier a child enters the school, the more likely is he to improve in knowledge, and to escape the contagion of evil habits." The branches taught in the Lower School are numerous—arithmetic, mathematics, geography and history, grammar, the French language, natural history, natural philosophy, &c., being amongst the most prominent objects of study. The "High and Preparatory Schools" are attended by 356 pupils. Here instructions are given in almost every department of useful knowledge, six years being the term of a complete course. The classics form a branch of the teaching in these schools, and we are pleased to see classes also for dancing. "A Juvenile Library and Museum have likewise been established, the first containing volumes of a kind most attractive and useful to boys." We ought not to omit notice of the prizes given to the pupils, both of the day and evening schools. These are bestowed, in some cases, for general scholarly excellence, in others for models of engines, drawings, &c.; and, in the latter instances particularly, cannot but have a great effect in stimulating the ingenuity of the pupils.

Upon the whole, this establishment combines such a vast number of objects, and works them out upon a scale of such magnitude and liberality, that we feel the sketch now given of it to be very imperfect. It combines the purposes at once of a reading-room and a library, of a school and a lecture-room, of a museum and an exhibition-gallery; and, in short, possesses in itself every requisite for the entertainment alike and instruction of the young and old, rich and poor, of a great community. Smaller towns cannot possibly imitate the scale on which matters are conducted in the Liverpool institution, nor is it necessary that they should; but the wise and generous combination of amusement with utility is what may be widely copied. The musical courses, the exhibition of arts, and the museum, are what we chiefly refer to. If it be imagined by any one that the instruction given in the Liverpool institution is too comprehensive, and that a tradesman, whether master or man, can derive no benefit from his initiation into the mysteries of so many different arts and sciences, we would beg to answer this doubt in the concluding words of the report:—"What is the use to ME of this or that branch of knowledge? is a question more frequently than wisely asked. If the obvious and direct bearing of any branch of knowledge on a peculiar profession, be the test of its utility or desirableness, the labours of education may be greatly diminished. But not to mention that, in these days of rapid and startling improvement in all mechanical, commercial, and scientific matters, every profession, nay, the humblest trade, will yet require for its successful conduct a much wider intellectual range than was ever before imagined—mental cultivation in itself, and for its own sake, is our highest, our ultimate aim, and to try its value by any inferior or extrinsic standard, is to display our own ignorance of its nature and importance. Your committee trust that it will ever be the object of those to whom the management of this institution may in after years be confided, to send forth, as far as possible, its pupils imbued not merely with technical and practical science, but with general knowledge; and not merely with knowledge, but with wisdom, sound feeling, clear views, and the power of appreciating excellence and beauty wherever they may be found. The truly educated man is he who combines the learning and reverent spirit of the past, with the inquiring and improving tendencies of the present, and the brilliant expectations of the future; whose mind, in the words of an eloquent writer, 'resembles an eastern palace, in itself magnificent, and its wide spaciousness adorned and filled with diversified treasures; its lofty turrets commanding an ample horizon, circling field, flood, and mountain, art's stately gardens and nature's wild loveliness; and its hundred gates ever open for the welcoming of each worthy guest, from all earth's regions, far or near.'"

RECOLLECTIONS OF CEYLON SPORT.

MY FIRST ELEPHANT HUNT.

COLD, wet, and hungry, after a ten hours' ride over the bleak, rugged mountains in the interior of Ceylon, we at last hailed with satisfaction our long-wished-for bungalow—the place we had fixed on as being most appropriate for our scene of action with the birds, beasts, and fishes of the creation. No sooner did the white walls of our future domicile attract the major's eye (than whom a finer specimen of a well-fed Scot never broached a whisky-tub), than the jungles around re-echoed with his jolly shout, and digging his brawny heels into the ribs of the Tattoo pony that carried him, and which really was, I believe, the lightest weight of the two, away we went, with a total disregard and indifference of all mortal accidents. Brandy-pawnee, pale ale, cheroots, and a hot dinner, in perspective, it required more than the power of man to stop him, so making a Chifney rush of it, five minutes brought us all (five in number) to a commodious jungle habitation, that had been built some time before by a sportsman of Ceylon, both for his own amusement, and also for the benefit of such of his brethren in the craft as might at times feel inclined to risk their life and limbs in warfare with the elephants, with which the place abounds. The country in which the said abode is situated resembled an English park somewhat out of repair; clumps of large forest trees being interspersed at intervals, and the ground carpeted with smooth elastic turf, while the countless herds of spotted deer that lay scattered over it, the wild gaudy peacock, and the jungle fowl that we put up in all directions, gave promise to the sportsman of glorious sport. "The major," under whose fatherly protection we had placed ourselves, in addition to his other good qualities, was a most excellent cook. His stews were unexceptionable; a bottle of Madeira in them generally prevented any body, except himself, knowing what they were made of; and should they be overdone, underdone, or the ingredients rather tough, in went another half bottle, which, in the major's estimation, was a specific remedy for all culinary irregularities. Moreover, our friend evinced none of those affectations (which I know some of my sporting friends do) of not eating the game they shoot. The old soul was never half so happy and pleased as when masticating a tough old pea-fowl that he had shot, cooked, and served up himself. But we are digressing. Having put our nags into the best place we could find for them (and, luckily, jungle ponies are not over fastidious in their ideas of local habitation), we commenced tapping and overhauling the commissariat, a supply of provisions enough to have lasted us for a six months' siege. We all agreed that it was no advantage working on empty stomachs, and we were too old soldiers to rely on our guns for subsistence. Having satisfied our inner man for the present, we proceeded to business, getting ready the guns and ammunition for the morrow's slaughter, while "the major" was sent off to cook the dinner. This was served up in due time, and as gladly welcomed by a party of hungry subs as a brevet company would have been, the portly old major bringing in the last dish himself, with an expression of cannibalism on his features that would have petrified a rhinoceros. Oh! ye gods, that dinner! It was all the same to our worthy cook, which had come to hand first—whisky, Madeira, or water. The soup was a compound of all three, with a half-boiled hare in the middle of it; while a goodly piece of boiled beef tasted far more of "Old Tom" than anything else. But who would grumble? Here we were thirty miles from any habitation, except those of the denizens of the forest—modern Robinson Crusoes out elephant-shooting—so pass the bottle and keep up the song was our motto, till the small hours warned us that steady hands and clear heads would be a requisition for the morning's work; so into bed we turned, considerately helping, in the first instance, those whom the potency of the major's cookery had rendered incompetent to turn into theirs. The morning came, and with it a pretty considerable quantity of headaches, while numberless anathemas were bestowed on the major's soup and cooking propensities. In this case it certainly was not the wine—"It was all the beef," as some one said. The major was the only one on whom his cookery had not visible effect, and he actually gloated over the sufferings of what he called a parcel of unseasoned hogsheads. However, we gained our point, and the major was turned out of the kitchen, except in the stewing department, for which we gave him an allowance of a half bottle of whisky and one of Madeira daily, and he supplied any deficiency he thought might exist with Cayenne pepper. Having dressed, we lighted our cheroots, and started on our ponies for the jungle, in which we had received intimation that a herd of elephants was feeding; each of us being armed with three or four double-barrelled guns, carried by natives, as in case of the first fire missing the mortal spot, there is generally time to take the second gun, and if not kill, at least turn the animal from you. The natives that carry the supernumerary guns are, for the most part, staunch, steady hands, and will not run unless in very imminent danger.

The old elephant-finder having guided us to the jungle, lost no time in finding the position the brutes had taken up; there were five females, with as many young ones. To get within shooting distance of an elephant (and we never fire at them with any certainty of killing at above ten paces), it requires nearly as much caution as to get near a hare in her seat, going against the wind, &c. However, they scented us long before we could get at them in this instance, but, unluckily for themselves, made a rush in the direction we were standing. They came down in line. At the first shot from the major, we poured in our broadside (none of us except him had been out elephant-shooting before) and on the smoke clearing off, we found two of the beasts stretched dead on the ground. The major had killed one, but who killed the other, out of so many who fired with the same sized ball, would be no easy matter to find out. While reloading, I observed something, about a dozen yards off, in the bushes, and sincerely hoped it might prove to be a cheetah (much nobler game in Ceylon than the elephant), but I was disappointed; for on approaching, I found it to be the calf of one of the dead elephants, about two feet in height. I immediately secured him, and walked him off prisoner of war. I kept this same youngster for nine months afterwards, but he grew up such a thief and dissipated character, clearing at times the whole of the bazaar, and rifling all the fruit shops, &c., that I was obliged to have him destroyed.

We now agreed to separate, and make two parties, or we should never be able to identify the elephants each of us might kill. This we were not long in arranging. H. and myself, taking "a line of our own," were eventually the most fortunate of the party. We had scrambled on for about five miles in the midst of herds of deer, at which we dared not fire, for fear of alarming the elephants, when we espied an elephant not twenty yards off, standing in the jungle. He evidently saw us, and was in hopes that, by remaining stationary, he might escape our observation, but his stars had fated otherwise, and on our coming to closer quarters, off he bolted at a long trot. H. fired—his right-hand barrel did its duty, and the brute fell on its knees wounded. We ran up, put a ball through its head, and finished him. I must own, if ever I felt envious, it was at the moment I saw the tail (the trophy we preserve of our game) find its way into his shooting-coat pocket. Elated by our success, we went forward with *sanguine* and *sanguinary* expectations of sport; nor were we disappointed. On emerging from the jungle, we discerned a herd of fifty elephants feeding about a quarter of a mile before us. To get up to them, we used every possible means in our power, now creeping like snakes on our bellies, and now lying perfectly still for minutes together, until our exertions were crowned with success, and we rose at last within about eight yards of the whole herd. I fired at the head of the nearest animal, but he merely shook it, stared at me, and walked away, evidently disgusted at my daring impertinence, while I felt mortified above every thing. My left barrel was still loaded, and the brutes were now in the most admired state of confusion, some retreating, others charging, until a noble fellow thought me worthy of his notice, and picking me out for single combat, came at me. Steadying my back against a tree, with my gun at my shoulder, I let him come within six paces, when a slight pull of the forefinger sent an ounce ball into his brain, and he dropped dead at my feet. Never do I remember to have experienced such a moment of intense excitement as at the fall of that noble brute to my gun. It was a matter of life and death, as I could not retreat had I wished it, and had my gun missed fire, I should never have lived to record this day's adventures. The others immediately took to the jungle, and the crash of fifty elephants rushing through a forest jungle beggars all description. We were now far from the bungalow, and the sun was beginning to get unpleasantly warm, so we turned our steps homewards, in hopes of falling in with our *compagnons de chasse*. They had been nearly as fortunate as ourselves, and

Digitized by Google

on emptying our pockets we mustered eight tails—fair sport for griffs at the work—and pale ale and cheroots was the first order of the day. Of that jolly party one has since fallen a victim to his zeal. My companion of the morning went out elephant-shooting some months after, his gun missed fire in front of an elephant, and the brute transfixed him with his tusks. Poor boy, he deserved a better fate!—*Sunday Times newspaper.*

CAUSES OF DEPRESSION IN THE LABOURING CLASSES.

First, how much of this depression is to be traced to intemperance! What a great amount of time, and strength, and money, might multitudes gain for self-improvement by a strict sobriety! That cheap remedy, pure water, would cure the chief evils in very many families of the ignorant and poor. Were the sums which are still lavished on ardent spirits, appropriated wisely to the elevation of the people, what a new world we should live in! Intemperance not only wastes the earnings, but the health and the minds of men. How many, were they to exchange what they call moderate drinking for water, would be surprised to learn, that they had been living under a cloud, in half stupefaction, and would become conscious of an intellectual energy of which they had not before dreamed! Their labours would exhaust them less, and less labour would be needed for their support; and thus their inability to cultivate their high nature would in a great measure be removed. The working class, above all men, have an interest in the cause of temperance, and they ought to look on the individual who lives by scattering the means and excitements of drunkenness, not only as the general enemy of his race but as their own worst foe. In the next place, how much of the depression of labourers may be traced to the want of a strict economy! But how many waste their earnings on indulgences which may be spared, and thus have no resource for a dark day, and are always trembling on the brink of pauperism! Needless expenses keep many too poor for self-improvement. And here let me say, that expensive habits among the more prosperous labourers often interfere with the mental culture of themselves and their families. How many among them sacrifice improvement to appetite! How many sacrifice it to the love of show, to the desire of outstripping others, and to habits of expense which grow out of this insatiable passion. A labourer having secured a neat home, and a wholesome table, should ask nothing more for the senses; but should consecrate his leisure, and what may be spared of his earnings, to the culture of himself and his family, to the best books, to the best teaching, to pleasant and profitable intercourse, to sympathy and the offices of humanity, and to the enjoyment of the beautiful in nature and art. Another cause of the depressed condition of not a few labourers, as I believe, is their ignorance on the subject of health. Health is the working man's fortune; and he ought to watch over it more than the capitalist over his largest investments. Health lightens the efforts of body and mind. It enables a man to crowd much work into a narrow compass. Without it little can be earned, and that little by slow exhausting toil. For these reasons, I cannot but look on it as a good omen that the press is circulating among us cheap works, in which much useful knowledge is given of the structure, and functions, and laws of the human body. It is in no small measure through our own imprudence that disease and debility are incurred, and one remedy is to be found in knowledge. Once let the mass of the people be instructed in their own frames—let them understand clearly that disease is not an accident, but has fixed causes, many of which they can avert—and a great amount of suffering, want, and consequent intellectual depression, will be removed. I will mention one more cause of the depressed condition of many labourers, and that is sloth, "the sin which doth most easily beset us." How many are there, who working languidly and reluctantly, bring little to pass, spread the work of one hour over many, shrink from difficulties which ought to excite them, keep themselves poor, and thus doom their families to ignorance as well as to want! In these remarks, I have endeavoured to show that the great obstacles to the improvement of the labouring classes are in themselves, and may therefore be overcome. They want nothing but the will.—*Channing's Lectures on the Elevation of the Working Classes.*

TREATMENT OF THE AMERICAN INDIANS.

The employment of the savages by the French and British, and of bloodhounds by the Spaniards, to destroy their enemies, are among the most atrocious acts which Christendom has been called to witness. * * The records of history cannot furnish a more cold-blooded, heartless document, than the official report of Sir Jeffrey Amherst, the British commander-in-chief, dated Albany, 13th August 1763, and communicating the result of Colonel Grant's expedition against the Cherokees. He states, that Colonel Grant had burnt fifteen towns, and all the plantations of the country; destroyed fourteen hundred acres of corn; and driven about five thousand men, women, and children, into the woods and mountains, where, having nothing to subsist upon, they must either starve or sue for peace. * * Not a vestige remains of any permanent advantage derived by the Indians from the cessions [of land] and sacrifices they made. Their actual relations with the British may be emphatically stated in few words. *They were useful, and were used, in war to fight, and in peace to trade.* Queen Anne, indeed, presented sacramental vessels to the Mohawks, and other furniture for a chapel; and this is about the extent, as far as we have been able to discover, of the direct interference of the British in any plan to improve the moral condition of the Indians.—*North American Review.*

[The above, we believe, is all true. The British cannot be sufficiently blamed for their inhumane treatment of the aborigines, not only in America, but in Australia and South Africa; in fairness, however, the reviewer should extend his indignation to those cruelties now practising by his own countrymen in Florida, where the natives are in the course of being hunted down and exterminated by blood-hounds from Cuba.]

LINES ADDRESSED TO A FRIEND FROM THE VICINITY OF ABBOTSFORD.

Here, upon the waveful Tweed,
Haunt of love and song decreed,
Prone beneath a willow tree,
Shall I chant a stave to thee.

Would that thou wert with me here,
Now when July warms the year,
And the Tweed careers below,
Bright and breakless in its flow,
Save where trouts leap here and there,
Bathing in the sunny air;
While, upon the adverse bank,
May be viewed, in stately rank,
All the trees which he, the lord,
Ever-famed of Abbotsford,
Planted with his wondrous hands,
Pleasure-givers to the lands.
Peeping o'er the leafy screen
May the turrets, too, be seen,
Of the bright "romance of stone,"
Builded by the Mighty Known.
Towers, and crystal streams, and trees,
Ever may the gazer please;
How much more should such as lie
Now before my charmed eye,
Steep'd in twilight, dewy, cool,
Like the landscapes of a pool!

Oft on such an eve have I
Wander'd through these woods hereby,
Musing on the mightiest mind
Kernell'd e'er in earthly rind;
While from every shrub and tree
Issued floods of melody.
There the mavis pour'd its song,
Like old wine, mellow and strong,
Calling answers, pleased and loud,
Even from those echoes proud,
Which were wonted to rejoice
At the master-minstrel's voice;
There the blackbird's stirring note
Through the woods was heard to float;
And the finch's whining plain
Mingled with the linnet's strain;
And an hundred other lays
Made an evening hymn of praise,
Such as caused that vast arcade,
Bedded by the dark green glade,
Once and oft to nod with glee
To the pleasing minstrelsy.
On the hilly slopes in view,
Propp'd against the arc of blue,
Mark'd I then the heather bell,
Grasping close the mountain swell;
And the broom's bright flowers were seen,
Stars of gold in skies of green;
And the fox-glove's purple cup
Seem'd to drink the breezes up;
While, upon some brown scaur-side,
Waved old Caledonia's pride—
Emblem fit, in form and deed,
Of her bold and hardy breed,
Who, upon their island rocks,
Laugh to scorn a foeman's shocks.
As the breeze with deeper plain,
Seems to start away again,
When its rash, assailing wing
Meets the thistle's wardful sting,
So, e'en so do Scotland's foes
Still repent their hostile blows.
Well the Minstrel might declare,
"Breathed I not my native air—
Saw I not the heather bloom—
Heard I not the wild bee's boom—
Once as every year ran by,
Surely, surely I should die!"
Such a scene, and such a land,
Well may poet's love command!

Die he did! and, well-a-day,
Short thereafter was the stay
Of the daughters of his race,
Who drew life but from his face!
Brief thereafter was the span
Of the sweet and gentle Anne,
Who for her great father bore
Such a love as child before
Never felt, nor may feel more.
When the complete progeny
Of bright works that cannot die,
From that wondrous brain were born,
And the earthly case was worn
By the inward fire away,
And the debt was paid of clay,
Thou, the poet's gentlest child,
Felt a woe so deep and wild,
That, if this should e'er be said,
Thine was grief beyond all aid.
Soon did that absorbing pain
Burst the bonds of life in twain;
In the tomb wert thou laid low,
Victim of that filial wo.

Who can wander through these woods,
Or behold these pleasant floods,
Nor thus dwell on thee and thine,
Poet of the living line?
Many a flower is scatter'd there,
Nursling of the sunless air;
But the most I prize by far,
One that, like an earth-born star,
Seems to shrine the name of Scott,
Saying still, "Forget-me-not."
Yes! sweet flower, so brightly blue,
Eye which Flora may look through
When she scans man's acts below,
Scott shall ne'er oblivion know!
While old Scotland lasts, his name,
Fitly form'd for mutual fame,
Shall with her's still co-exist,
First in honour's lofty list.
Till his land and race are not,
Glory be to Walter Scott!

T. S.

SINGULAR PRISONERS.

James Swan, an American merchant, was committed to the prison of St Pélagie [in Paris], on the 28th of July 1808, for a sum of 625,640 francs (upwards of L.25,000), and re-passed the gates, for the first time, on their opening to the Revolution, on the 28th of July 1830, twenty-two years afterwards, to a day. This man, possessed of a fortune amounting to nearly four millions of francs, denied the justness of the claim beyond the sum of six or seven thousand francs, and determined to pass his life in prison, rather than obey a judical sentence which he considered unjust. Having, first, caused it to be intimated to his wife and children that he would disinherit them to the last farthing of his property if they paid the debt, he furnished his prison apartment in a style of princely magnificence, and hired, in the Rue de la Celé, opposite the gates of St Pélagie, a spacious dwelling, with coach-house and stables, for his friends, cooks, &c. For the former class, he kept two carriages; and they were commissioned to appear for him, and spend his money, in the Bois-de-Boulogne, public streets and promenades, balls and theatres. "A curious original was James Swan. He strutted and attitudinised in his prison, like Chodruc-Duclos in his rags: it was his method of flinging a defiance in the face of society. Consistent in his determination, he was preparing to return to his prison, after the events of the 'three days,' when, on the 31st of July, he was seized with apoplexy at his temporary lodging," and consigned to the closer and longer imprisonment of the grave. The motives of the well-known M. Ouvrard are less honourable, though the consequences to himself were less severe. Not disputing the debt for which he was detained, he yet refused to pay it, and determined, like Mr Swan, to undergo his imprisonment, which, as a Frenchman, could not, in his case, exceed five years. He, too, led a life of princely expenditure in his prison; and, amongst other instances of his extravagance, it is told of him that, for the purpose of adding a neighbouring room to his establishment, he paid the debt of the prisoner who occupied it. "One day, when M. de Villèle, the Finance Minister, was dining with him, the latter urged him to settle matters with Séguin, representing the scandal which his conduct reflected on the government, which had so long retained him as contractor-general. '*Parbleu*, Monseigneur!' replied Ouvrard; 'you speak very much at your ease. I am here for five years, for five millions of money: I gain, therefore, by my imprisonment, one million a year; and if you know of any speculation at once more lucrative and sure, I am not obstinately wedded to *this*, observe! In that case, I will pay to-morrow.'" For the sake of its honourable contrast, we may add to these the case of Dante, the Conde de Foscolo, patriarch of Jerusalem, who was incarcerated for 100,000 francs, at the suit of a curé of Paris, and liberated by an accidental omission in the deposit of the *aliment* money required by law on the part of the detaining creditor, after an imprisonment of upwards of six years. "But the patriarch was an honest man. When he had recovered his liberty, and was under no further compulsion to do so, he paid every farthing of his original debt; and the curé eventually lost nothing but those costs which a more evangelical spirit would have prevented his incurring."—*Athenæum reviewing Maurice's History of Prisons, a new Parisian work.*

CHOICE OF PAPERS FOR ROOMS.

Many elegant patterns are displayed on coloured grounds: the effect may please in one room, which in another will be displeasing; yet the cause will be inexplicable: light, more or less, will account for the difference. Coloured grounds, however pale, will always be too gloomy in rooms which have not much light. In London, this is an essential matter of consideration; even in the country, the aspect and number of windows will produce a surprising difference in the general effect. Nor ought any erroneous idea to be entertained, that a paper with much white in it will quickly soil, and therefore must be more extravagant; for if white soils, colours fade. A room, then, scantily supplied with windows, ought never to be papered with a coloured ground; for the same reason, the doors and other wood-work should invariably be white. Apartments well supplied with light may rejoice in a less confined range of colours. Another failure in effect—little suspected in the choice of colours, even where light can be commanded to an unlimited extent—is the want of consideration of the hue that will best "light up." Exquisite as is pale blue in itself, it is heavy in a mass; and even where sparingly introduced, ay, even in small portions, among gilding and pure white (as in large concert rooms), it dulls the whole. A blue dress by candle-light is unsatisfactory; and a room with blue grounded paper and blue paint to correspond, will never light well at night; an apartment similarly decorated with buff or "flesh" colour would require but six wax candles to produce a cheerful and sufficient illumination, if blue would swallow up the light of eighteen candles, and *then* not produce an agreeable impression. Pale flesh, or pink and buff, are very charming hues, but are ill for the complexion; few persons look in health with much of these colours around them; and blue is trying; white, with a *hint* of blush, or tint of stone, is good. The most perfect—or rather the nearest approach to perfection—is a paper with a pure white ground, and running pattern of shaded slates, and white paint, "picked in" with pale slate to correspond. Rooms hung with or painted scarlet are rich, but very dismal, and invariably look less than if adorned with a light tint. They require also to be illuminated more, and much earlier in an evening, than those with pale colours. Towards dusk, scarlet appears black: let any person doubting this try the fact, by wearing a scarlet cloak or shawl, and look at it as the shades of twilight advance. Yellow, and buff, and pink, can be scarcely better discriminated by candle-light than can blue and green.—*Correspondent of Magazine of Domestic Economy.*

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 459. SATURDAY, NOVEMBER 14, 1840. PRICE THREE HALFPENCE.

MALINGERING*—NOT MILITARY.

"And now remains
That we find out the cause of this effect;
Or rather say the cause of this defect;
For this effect defective comes by cause."
Hamlet.

THAT old fox upon two legs, Charles Maurice Talleyrand Prince de Benevento, was one day told that an experienced French courtier and statesman of his own stamp had been seized with a fit of the gout. Immediately on receiving this piece of intelligence, Talleyrand fell into a fit of musing, or seemed to do so. He was asked what was the tenor of his thoughts. "I am just reflecting what peculiar interest old —— (naming the courtier in question) can have in being gouty at present."

This anecdote shows in a remarkable manner the difference between ordinary men's ideas and those of great conductors of affairs. The common mind would have seen nothing in the illness but something to be lamented for the sake of the man afflicted; but the politician knew that his friend had a reason for every thing, not even excepting his gout, and he accordingly thought of nothing but to divine what object the old gentleman had in view on the present occasion. Talleyrand's acuteness brings us in mind of a circumstance in the life of Pope Sextus V., a contemporary of our Queen Elizabeth. While a simple cardinal, he was a man comparatively without influence, and had, to appearance, very little chance of attaining to be head of the church. But he surmounted all obstacles. His predecessor, a very old man, grew ill, and evidently was not long for this world. A mighty contention arose between the two parties who entertained the strongest hopes of filling the chair of St Peter. The college of cardinals was divided into two factions, so nicely balanced in strength that neither side could be confident about the issue. Meanwhile, the hero of our anecdote took no part with any of the candidates. "For his part, he was an infirm man; all the ailments that flesh is heir to had settled in his poor frame; he wished all parties well, but with the toils and struggles of the busy world he had no longer any concern." The candidates for the popedom beheld and pitied their poor colleague, and, each of them being afraid at that particular moment of the issue of a contest, they adopted the idea, probably upon a hint given, that it would be the safest plan for both to push the infirm cardinal for the time into the chair. He was, they thought, too much debilitated to perform its duties without aid; they would govern for him, and he would not be long in their way. Accordingly, when the popedom became vacant, the cardinal was made Sextus V. But what was the surprise and dismay of the two candidates, when they beheld the new pope arise from his couch, cast away all signs of debility, and stride to his coronation with a vigorous and stately step, that spoke of years to come of health and strength! They had been outwitted, and had nothing for it but to succumb to the sway which they had brought upon themselves, and which proved of the firmest order, and far more durable than they had been led to anticipate.†

The reader will now, we apprehend, be fully aware of the value and importance of a little timely infirmity. One can easily suppose that, if a minister were beginning to decline in the favour of his sovereign, a few days' confinement with some severe malady might give him such a claim upon the sympathy of his master as would tend to stay his downward course. If he were accused of some great mal-administration, an illness, described in the bulletins as likely to prove fatal, might save him from an impeachment, for who could think of taking stern measures with a poor helpless old man already at the point of death? It would obviously be for the interest of such a man not to get well until the minds of his enemies and of the public had been in a great measure turned to some new subject of engrossing interest. Much may of course depend on the way in which a statesman manages his illnesses. It would never do if he were to turn too suddenly ill immediately after his falling into danger. He should foresee a coming storm, and take to his chamber in time. Perhaps it might even be advisable for a minister in critical times never to be *too well*, so that, let danger come ever so suddenly, he could clap on his nightcap in an instant, and appear quite as sick as there was any occasion for.

In the walks of ordinary life, a few well-managed appearances of infirmity prove, in their own limited way, of not less consequence. We would fain take a lenient view of the foibles of humanity, but believe it may be safely averred, that one-third of the young gentlemen, and (truth compels us to add) young ladies, who complain without ceasing of defective vision, and, on that plea, keep eye-glasses dangling over their necks, can see quite as far into a millstone as the most sharp-sighted of their neighbours. Perhaps a great part of the mystery lies in the fact that two eyes are common to all of mortal mould. They are vulgar things, which every plebeian can boast of possessing, and of possessing, for the most part, in a very acute and exercisable state. There lies the rub. The eyes cannot be taken out, to distinguish the high-bred from the low-bred, but they may be deprived, at least in seeming, of that healthiness which characterises the vision of the vulgar. Hence, in most instances, the black ribbon and the pendent eye-glass of the young *malingerer* of fashion. Cowper, indeed, suggests another reason, in the case of a senatorial candidate, whom he thus describes:—"He is very young, genteel, and handsome. He has a pair of very good eyes in his head, which not being sufficient, as it should seem, for the many nice and difficult purposes of a senator, he has a third also, which he wears suspended by a ribbon from his button-hole." But though this may be an explanation of the custom, as true as it is ingenious, in the case of senators, every eye-malingerer is not an M.P., and our first solution of the matter, we imagine, is the more generally correct one. The depreciatory phrase "rude health"—as if in the extremest good health there could be any thing rude!—indicates the feeling which leads some people to despise the vulgar blessing of good eyes, and support the optician.

It is true that there are peculiar advantages in the plea of weak sight, and the use of eye-glasses. What a charming latitude young ladies and gentlemen, with eye-glasses and spectacles, allow themselves, as regards staring and the cutting of acquaintances, either out of doors or at assemblies and parties! If any individual, unspectacled or unglassed, were to fix his eye upon a fair neighbour, in the downright persevering way in which every young gentleman, provided with such appendages, thinks himself entitled to do in the boxes of the theatre, a challenge or a knock-down from the protector of the fair one stared at would be the certain consequence. But the all-excusing glasses protect the malingerer from any such troublesome results. Then, again, look at that young lady with the eye-glass. How coolly she turns her eye upon an almost immediate neighbour of her own sex, and seems as if she were about to send an account of her whole habiliments to the *Belle Assemblée*. Nay, with what superlative nonchalance she turns her glass upon the *gentleman* opposite, so distinguished by moustache and fur collar. If an unglassed lady were to attempt this latter feat, she would assuredly be set down as void of all delicacy—totally wanting in that modesty which is the best ornament of her sex.

The ears, not less than the eyes, may be the seat of a simulated infirmity, either through affectation, or for purposes useful to the simulator. Sir Mungo Malagrowther was a magnificent example of the comforts and advantages derivable from a convenient deafness. That renowned knight, it will be remembered, heard nothing but what it suited him to hear. A dun was a personage who might have roared into his ear for a month, and all in vain; while any word that related to the advantage of Sir Mungo, never fell in vain on Sir Mungo's organs, though whispered ever so lightly. There be Malagrowthers yet stirring in the world. Some, too, are deaf because good ears are vulgar possessions, and because, as in the more familiar case of eye-malingering, it is deemed a base thing to participate even in the blessing of good hearing with the common mass of humanity.

Has it been generally noticed that medical men are a class who become amazingly soon old and infirm? A young man passes surgeon, or is capped physician, and settles down in some town to practise. He may retain his youthful aspect for a short time; but by and bye, particularly if he be a man of sense, he begins to present the appearance of incipient age. He walks with slow steps, and perhaps stoops a good deal. His eyes seem to fail him, for he assumes a pair of spectacles of a staid and venerable kind. His lately flowing locks appear to get rapidly thin, and he perhaps mounts a goodly middle-aged wig. His dress is in accordance with this change. White neckcloths, and a sombre, gravely-cut suit of black, take the place of the smart Belcher neckerchiefs and round green hunting-coats, in which he once used to shine; while a cane is ever in his hand, to support his steps from place to place. The alteration is great and surprising. You know him to be considerably under thirty, and you would declare his looks to be those of a man of five-and-forty. "Hard work," you may be disposed to say, "must that of a surgeon be." But you are on a wrong scent entirely. The young doctor is as vigorous as ever, and, if you saw him sit down to a book, after entering his own snug apartment, you would see him toss his venerable spectacles aside, being able to see a vast deal better without than with them. If you possessed his confidence, you would hear him laugh heartily as he detailed his various manœuvres for simulating age and infirmities. The cause of all this is plain. Nobody, he found, would believe that so young-looking a man had acquired any medical knowledge, or would intrust the care of their bodies to him. The ladies, above all, he found difficult to satisfy on this point. Age, then, being the only qualification he wanted, he thought it a pity if so many others, acquired with vast labour and expense, should go for nothing, and resolved that, since they would have him old, why, he would just be old, to the best of his ability, accordingly.

No one who has had the pleasure of being unwell in early life—when mammas and aunts were incessantly haunting his bed-room with coddlements and delicacies of all kinds—can be at a loss to divine why people at a maturer period of life like so much to be a little indisposed, or even a little lame. We have known a young gentleman walk about with his arm in a sling for weeks after all the genuine consequences of his

* "Malingering—a term applied to the simulation of diseases by soldiers, with a view to avoiding duty, or obtaining their discharge."—*Dictionary of Modern Terms.*

† Sextus V. reigned five years, namely from 1585 to 1590.

accident had vanished, and only part with the dear ensign of infirmity with the greatest reluctance. We have known young ladies "keep their sofas" for months, in a style of languor and paleness no doubt most effective upon their beaux, all through that severe cold which—lasted, in a genuine state, only about eight days. We reverence age; but yet it is to be feared that the pleasure of being attended to by grand-children, of having great chairs wheeled about for one, and footstools placed conveniently in front of said chairs, and neat spindle-shanked tables put down by their side for tea or book, beside the evening fire, is too tempting for elderly flesh and blood, and keeps many a worthy old gentleman far longer ill than he has any need to be.

Malingering, indeed, is obviously too ready a means of securing a dawdling sort of sympathy and attention, as well as of staving off the consequences of error, not to have been extensively made use of by mankind. The very child of three years, when conscious of having done something calling for reproof, will drawl out, "Mamma, I'm not well—I've a sore stomach," calculating that mamma can never be so cruel as speak severely to a babe in his alleged circumstances. Just the other day, we observed in an American newspaper that the feelings of the people of Baltimore had recently been moved by seeing a mercer's shop suddenly closed, and a piece of crape kept for days upon the knob of the door. At length some who knew and had extended credit to the party, called at his residence, and found that he had gone no one knew whither. The door was then opened, and the shop found to have been stripped of every article of "dry goods" except that magical piece of crape, which had sentinelled the door to such good purpose. Here was the same principle at work. Most creditors will acknowledge that they have found nothing so apt to baffle them in their endeavours to obtain payment of debt in difficult cases, as an appearance, real or pretended, of illness on the part of the debtor. The course of law is effectually obstructed by the course of medicine, and the justest claim is hushed to silence beside a sick-bed. Hence it is that in novels debtors are scarcely ever taken to jail except in the last stage of severe, though rarely well-defined illness, and striking tableaux are formed from the entering of the undertaker's men and the sheriff's officers at the same moment. In any kind of contested case between man and man, *he* is sure to have a great advantage over his opponent, who can contrive first to be seized with some alarming malady. It comes to nearly the same thing if he only have some dear member of his family in the alarming state, for that equally entitles him to sympathy, and will probably be not less fatal to his adversary. Even to be able to make it appear that one is much older than his opponent, may give one some advantage. "I am now an old man" somehow tells very affectingly, however ridiculous the postulate which it prefaces, or bad the conduct which it is designed to excuse.

These speculations serve to illustrate a truth of some importance, namely, that there is much more benevolence in the world than there is conscientiousness. An appeal to the feelings of mankind tells in a moment; an appeal to their sense of justice comes poorly off in comparison. One may have reason and right both upon his side in the clearest manner, and yet, if the opposite party can only work a little on the public pity, his pleadings will be all in vain.

MEETING OF THE BRITISH ASSOCIATION AT GLASGOW.

SECTION OF GEOLOGY AND PHYSICAL GEOLOGY.

THE Geological Section, as formerly remarked, was attended on this occasion by almost all the first-rate men connected with the science—Buckland, Lyell, De la Beche, Agassiz, Murchison, Philips, &c.—besides many of less elevated standing, but who have already proved themselves skilful investigators. It was the section which attracted uniformly the largest audience, and was attended, we were somewhat surprised to remark, by the largest proportion of ladies. Some papers of very great interest were read before the section; and to the best of these we now propose devoting some attention.

BACKWARD CASCADES OF THE RIVER ST JOHN.

Some remarkable features of the river St John in New Brunswick were explained by Dr James Robb.* The St John is of the size of the first-class European rivers. Draining a large region, it discharges a prodigious quantity of water into the Bay of Fundy, especially during the spring floods, when the tides rise to the height of 35, 50, and even sometimes 60 feet above the ordinary level. The river being ten miles in breadth, but in several places contracted into narrow channels, at one place into a strait of 300 feet, a strange phenomenon arises, namely, that on the coming back of the tide, it pours through these channels into the wide spaces beyond, in the form of magnificent cascades. Thus, the St John may be said to have waterfalls going backwards, or against the direction of the river.

IDENTITY OF THE COMPOSITION OF COAL WITH THAT OF VEGETABLE MATTER.

The Association had committed to Mr Johnston, the clever young professor of chemistry in the Durham University, the duty of drawing up a report on the application of that science to geology. Mr Johnston now brought forward the result of his investigations respecting coal. He finds that all kinds of coal are *composed of precisely the same elementary substances as wood*, only combined in different proportions. These elements are carbon, oxygen, and hydrogen. In lignite, the nearest approach to the original wood, to 160 parts carbon, there are 78 hydrogen and 48 oxygen. In the Newcastle caking coal, there are, to 160 parts carbon, 56 hydrogen and 8 oxygen. In the Welsh anthracite, again, in which all external appearances of the vegetable origin are lost, and which is only a dry hard black mass, to 160 parts carbon, there are 33 hydrogen and 3 oxygen. The kinds of coal in which there are greatest proportions of hydrogen, the element which gives flame—as, for instance, the cannel coal—are always found uppermost, the longer chemical action and pressure having apparently caused the lower beds to lose more of their hydrogen. Anthracite, which has least hydrogen, is always lowest. Mr Johnston, at the end of his report, announced his opinion that the matter of coal had in most instances been produced on the spot, and not drifted, as some geologists have supposed—an opinion for which, notwithstanding Professor Philips's objections, we think the evidence greatly preponderates. Dr Buckland paid Mr Johnston the just compliment of saying that his report formed an epoch in the investigation of the formation of coal.

RAISED BEACHES.

Dr Robb, in his paper on the river St John, stated that, along the course of that river, there were terraces one above another on the sides of the vale, and all of them parallel. They are composed of sedimentary matter, in which fragments of rock are found. [He was asked if shells were found, and answered, only a few, and these of marine kinds; but the country, from having no limestone, and from the great length of the winters, was, he conceived, unfavourable for the formation of shells.] The terraces, he said, are distinctly marked, and he exhibited sections of them. Similar terraces were found on other North American rivers, and he was inclined to consider them, as Dr Darwin had done the Glenroy terraces, as beaches raised into their present situation by successive upheavals of the land.

This interesting subject was further illustrated by a paper read by Mr Smith of Jordanhill; but, as we lately gave a short account of Mr Smith's speculations on this subject,* we shall here notice his statements very briefly. Of the superficial beds in the neighbourhood of Glasgow, the uppermost is a sand; next is a brick clay, interlaminated with sand, containing marine shells; then, the hard blue clay called in Scotland the till. There were evidences of all of these being formed after the tertiary period, or period of the highest rocks. Between these and the sandstone, there were three other beds of sand. In some of these beds, forty feet above the present sea-level, great quantities of sea-shells were found, containing about 15 per cent. of shells not now existing. What was most remarkable, the shells in some of these beds resembled those of shell-fish which now inhabit arctic regions, *seemingly showing that a much colder climate had at one time existed in our island.* The president, Mr Lyell, expressed his belief that, both in North America and here, there had been a change to a warmer or at least more uniform climate. He adverted to the possible connexion of Mr Smith's discovery with the theory of erratic blocks. [This theory is, that the large detached stones now found far from their native beds of rock, have been transported in seas to their present situation, attached to *icebergs*, from which they had been dropped, the bottom of the sea on which they fell being afterwards raised so as to become dry land.] Mr De la Beche said he had been struck by Mr Smith's statement that the beds in which the shells were found, were forty feet above the present level of the sea; and he asked if this was about the maximum height. Mr Smith answered that it was nearly so; when Mr De la Beche remarked that forty feet was also the maximum of the elevation of a raised beach in Cornwall, Devonshire, &c., as ascertained by the gentlemen of the Ordnance Survey. It was, he said, a remarkable coincidence, and would seem to show that a change in the level of the sea and land had taken place over a large area. [We believe, Mr De la Beche might have said the whole island of Great Britain, as a raised beach of about the same height is found in the north of Scotland, as well as in the Firths of Forth and Clyde, and in the southernmost extremity of England.]

* See a paper on Changes of Level in the Earth's Surface, in No. 427, published on the 4th of April 1840.

PROFESSOR AGASSIZ'S ACCOUNT OF THE GLACIERS AND MORAINS OF SWITZERLAND.

No communication to the Geological Section attracted greater attention than an address which Professor Agassiz of Neufchatel delivered,* respecting the glaciers of Switzerland. He particularly drew attention to facts relative to the manner in which the glaciers move. He attributes their movement to the continual introduction of water into all their minutest fissures, which water, in freezing, continually expands the mass. What follows is an account of his communication drawn up under his own eye:—"The bases of the glaciers, and the sides of the valleys which contain them, are always polished and scratched. The fragments of the rocks that fall upon the glaciers are accumulated in longitudinal ridges on the sides of the ice, by the effects of the unequal movement of its middle and lateral masses. The result is longitudinal deposits of stony detritus, which are called *morains;* but as the glaciers are continually pressed forwards, and often in hot summers melted back at their lower extremity, it results that the polished surfaces, occasioned by friction on the bottom and sides, are left uncovered, and that the *morains*, or curvilinear ridges of gravel, remain upon the rocks formerly covered by the ice, so that we can discover, by the polished surfaces and the *morains*, the extent to which the glaciers have heretofore existed, much beyond the limits they now occupy in the Alpine valleys. It even appears to result from the facts mentioned by Professor Agassiz, that enormous masses of ice have, at a former period, covered the great valley of Switzerland, together with the whole chain of the Jura, the sides of which, facing the Alps, are also polished, and interspersed with angular erratic rocks, resembling the boulders in the *morains*, but so far different, that the masses of ice, not being there confined between two sides of a valley, their movements were in some respects different—the boulders not being connected in continuous ridges, but dispersed singly over the Jura at different levels. Professor Agassiz conceives that at a certain epoch all the north of Europe, and also the north of Asia and America, were covered with a mass of ice, in which the elephants and other mammalia found in the frozen mud and gravel of the arctic regions, were imbedded at the time of their destruction. The author thinks that when this immense mass of ice began quickly to melt, the currents of water that resulted have transported and deposited the masses of irregularly rounded boulders and gravel that fill the bottoms of the valleys; innumerable boulders having at the same time been transported, together with mud and gravel, upon the masses of the glaciers then set afloat. Professor Agassiz announced that these facts are explained at length in the work which he has just published, '*Etudes sur les Glaciers de la Suisse*,' illustrated by many beautiful plates, which were laid before the Geological Section. Professor Agassiz is also inclined to suppose that glaciers have been spread over Scotland, and have every where produced similar results." He concluded by saying that he meant to follow up his researches in the Highlands of Scotland, where he confidently expected to find evidence of such glaciers having existed, particularly around Ben Nevis.

[It may here be remarked that Professor Jameson, some years ago, published an account of moraines which he had discovered in Norway, in districts where no glaciers are now to be seen. Mr Darwin more lately found glaciers reaching down to the level of the sea on the coast of Chili, in latitude 46°, that is, eleven degrees nearer the equator than Ben Nevis. These particulars will form a suitable preface to the following letter which Professor Agassiz addressed to Professor Jameson, from Fort Augustus, on the 3d of October, after he had visited Glenroy and Ben Nevis. It was designed for publication in the *Edinburgh New Philosophical Journal;* but being too late for the current number of that work, it was communicated to the public through the medium of the *Scotsman* newspaper. The discovery of morains on Ben Nevis is certainly a most interesting circumstance; but we must, with all humility, confess that we dread some rashness in the learned professor's conclusion respecting the terraces of Glenroy, the perfect levelness and parallelism of which seem to us irreconcilable with the idea of their having been laid by any thing but quiescent water:—"After having obtained in Switzerland the most conclusive proofs that at a former period the glaciers were of much greater extent than at present, nay, that they had covered the whole country, and had transported the erratic blocks to the places where these are now found, it was my wish to examine a country where glaciers are no longer met with, but in which they might formerly have existed. I therefore directed my attention to Scotland, and had scarcely arrived in Glasgow, when I found remote traces of the action of glaciers; and the nearer I approached the high mountain chains, these became more distinct, until, at the foot of Ben Nevis, and in the principal valleys, I discovered the most distinct *morains* and polished rocky surfaces, just as in the valleys of the Swiss Alps, in the region of existing glaciers; so that the existence of glaciers in Scotland at early periods can no longer be doubted. The parallel roads of Glenroy are intimately connected with this former

occurrence of glaciers, and have been caused by a glacier from Ben Nevis. The phenomenon must have been precisely analogous to the glacier-lakes of the Tyrol, and to the event that took place in the valley of Bagne. It appeared to me that you would be glad to be able to announce, for the first time, in your extensively-read journal, the intelligence of the discovery of so important a geological fact."]

THE SKIPPER'S STORY.*

It's about four years ago, I was strolling one evening down the side of the harbour at Cove, with my hands in my pockets, having nothing to do, nor no prospect of it, for my last ship had been wrecked off the Bermudas, and nearly all the crew lost; and somehow, when a man is in misfortune, the underwriters won't have him at no price. Well, there I was looking about me, at the craft that lay on every side waiting for a fair wind to run down Channel. All was active and busy; every one getting his vessel ship-shape and tidy, tarring, painting, mending sails, stretching new bunting, and getting in sea-store; boats were plying on every side, signals flying, guns firing from the men-of-war, and every thing was lively as might be—all but me. There I was, like an old water-logged timber-ship, never moving a spar, but looking for all the world as though I were a-settling fast to go down stern-foremost; maybe as how I had no objection to that same; but that's neither here nor there. Well, I sat down on the fluke of an anchor, and began a-thinking if it wasn't better to go before the mast than to live on that way. Just before me, where I sat down, there was an old schooner that lay moored in the same place, for as long as I could remember; she was there when I was a boy, and never looked a bit the fresher nor newer as long as I recollected; her old bluff bows, her high poop, her round stern, her flush deck, all Dutch like, I knew them well, and many a time I delighted to think what queer kind of a chap he was that first set her on the stocks, and pondered in what trade she ever could have been. All the sailors about the port used to call her Noah's Ark, and swear she was the identical craft that he stowed away all the wild beasts in during the rainy season. Be that as it might, since I fell into misfortune I got to feel a liking for the old schooner. She was like an old friend; she never changed to me, fair weather or foul; there she was, just the same as thirty years before, when all the world were forgetting and steering wide away from me. Every morning I used to go down to the harbour and have a look at her, just to see that all was right, and nothing stirred; and if it blew very hard at night, I'd get up and go down to look how she weathered it, just as if I was at sea in her. Now and then I'd get some of the watermen to row me aboard of her, and leave me there for a few hours, when I used to be quite happy walking the deck, holding the old worm-eaten wheel, looking out ahead, and going down below, just as though I was in command of her. Day after day, this habit grew on me, and at last my whole life was spent in watching her and looking after her: there was something so much alike in our fortunes, that I always thought of her. Like myself, she had had her day of life and activity; we had both braved the storm and the breeze; her shattered bulwarks and worn cut-water attested that she had, like myself, not escaped her calamities. We both had survived our dangers to be neglected and forgotten, and to lie rotting on the stream of life till the crumbling hand of time should break us up timber by timber. Is it any wonder if I loved the old craft; or if, by any chance, the idle boys would venture aboard of her to play and amuse themselves, that I hallooed them away; or, when a newly-arrived ship, not caring for the old boat, would run foul of her, and carry away some spar or piece of running rigging, I would suddenly call out to them to sheer off, and not damage us. By degrees, they came all to notice this; and I found that they thought me out of my senses, and many a trick was played off upon Old Noah, for that was the name the sailors gave me.

Well, this evening, as I was saying, I sat upon the fluke of the anchor, waiting for a chance boat to put me aboard. It was past sunset, the tide was ebbing, and the old craft was surging to the fast current that ran by with a short impatient jerk, as though she were well weary, and wished to be at rest: her loose back-stays creaked mournfully, and, as she yawed over, the sea ran from many a breach in her worn sides, like blood trickling from a wound. Ay, ay, thought I, the hour is not far off; another stiff gale, and all that remains of you will be found high and dry upon the shore. My heart was very heavy as I thought of this, for, in my loneliness, the Old Ark was all the companion I had. I've heard of a poor prisoner who, for many and many years, watched a spider that wove his web within his window, and never lost sight of him from morning till night; and, somehow, I can believe it well; the heart will cling to something, and, if it has no living object to press to, it will find a lifeless one: it can no more stand alone than the shrouds can without the mast. The evening wore on, as I was thinking thus; the moon shone out, but no boat came; and I was just determining to go home again for the night, when I saw two men standing on the steps of the wharf below me, and looking straight at the Ark. Now, I must tell you I always felt uneasy when any one came to look at her, for I began to fear that some ship-owner or other would buy her to break up, though, except the copper fastenings, there was little of any value about her. Now, the moment I saw the two figures stop short and point to her, I said to myself, Ah! my old girl, so they won't even let the blue water finish you, but they must set their carpenters and dock-yard people to work upon you. This thought grieved me more and more. Had a stiff sea-wester laid her over, I should have felt it was natural, for her sand was run out: but just as this passed through my mind, I heard a voice from one of the persons that I at once knew to be the port admiral's.

"Well, Dawkins," said he to the other, "if you think she'll hold together, I'm sure I've no objection: I don't like the job, I confess, but still the admiralty must be obeyed."

"Oh, my lord," said the other, "she's the very thing; she's a rakish-looking craft, and will do admirably; any repair we want, a few days will effect: secrecy is the great thing."

"Yes," said the admiral, after a pause, "as you observed, secrecy is the great thing."

Ho! ho! thought I, there's something in the wind here; so I layed myself out upon the anchor stock to listen better unobserved. "We must find a crew for her, give her a few carronades, make her as ship-shape as we can, and if the skipper—ay, but there is the real difficulty," said the admiral hastily, "where are we to find the fellow that will suit us? we can't every day find a man willing to jeopardy himself in such a case as this, even though the reward be a great one."

"Very true, my lord; but I don't think there is any necessity for our explaining to him the exact nature of the service."

"Come, come, Dawkins, you can't mean that you'll lead a poor fellow into such a scrape blind-folded?"

"Oh, as to that," said the other, "there are plenty of scoundrels in the fleet here fit for nothing else. Any fellow who has been thrice up for punishment in six months, we'll draft on board of her; the fellows who have only been once to the gangway, we'll make the officers."

A pleasant ship's company, though I, if the devil would only take the command. Ho, ho! thought I, I've found you out at last; so this is a secret expedition; I see it all; they're fitting her out as a fire-ship, and going to send her slap in among the French fleet at Brest. Well, thought I, even that's better; that, at least, is a glorious end, though the poor fellows have no chance of escape.

"Now, then," said the admiral, "to-morrow you'll look out for the fellow to take the command; he must be a smart seaman, a bold fellow, too, otherwise the ruffianly crew will be too much for him; he may bid high, we'll come to his price."

So you may, thought I, when you are buying his life.

"I hope sincerely," continued the admiral, "that we may light upon some one without wife or child; I could never forgive myself"——

"Never fear, my lord," said the other; "my care shall be to pitch upon one whose loss no one would feel; some one without friend or home, who, setting his life for nought, cares less for the gain than the very recklessness of the adventure."

"That's me," said I, springing up from the anchor-stock, and leaping between them; "I'm that man."

Had the very devil himself appeared at the moment, I doubt if they would have been more scared. The admiral started a pace or two backwards, while Dawkins, the first surprise over, seized me by the collar, and held me fast.

"Who are you, scoundrel, and what brings you here?" said he, his voice hoarse with passion.

"I'm Old Noah," said I; for, somehow, I had been called by no other name for so long, I never thought of my real one.

"Noah!" said the admiral; "Noah! Well, but Noah, what were you doing down here at this time of night?"

"I was a-watching the Ark, my lord," said I, bowing, as I took off my hat.

"I've heard of this fellow before, my lord," said Dawkins; "he's a poor lunatic that is always wandering about the harbour, and, I believe, has no harm in him."

"My lord," said I, boldly, "I am not mad. Misfortune and calamity I have had enough of to make me so; but, thank God, my brain has been tougher than my poor heart. I was once the part owner and commander of a goodly craft, that swept the sea, if not with a broad pennon at her mast-head, with as light a spirit as ever lived beneath one. I was rich; I had a home and a child: I am now poor, houseless, childless, friendless, and outcast. If, in my solitary wretchedness, I have loved to look upon that old bark, it is because its fortune seemed like my own. It had outlived all that needed or cared for it; for this reason have they thought me mad, though there are those, and not few either, who can well bear testimony if stain or reproach lie at my door, and if I can be reproached with aught save bad luck. I have heard, by chance, what you have said this night; I know you are fitting out a secret expedition; I know its dangers, its inevitable dangers; and I here offer myself to lead it; I ask no reward; I look for no price. Alas! who is left to me for whom I could labour now? Give me but the opportunity to end my days with honour on board the old craft where my heart still clings: give me but that. Well, if you will not do so much, let me serve among the crew; put me before the mast. My lord, you'll not refuse this; it is an old man asks, one whose grey hairs have floated many a year before the breeze."

"My poor fellow, you know not what you ask; this is no common case of danger."

"I know it all, my lord; I have heard it all."

"We," said the admiral, "must speak together again. Be here to-morrow night at this hour; keep your own counsel of what has passed; and, now, good night." So saying, the admiral took Dawkins by the arm, and returned slowly towards the town, leaving me, where I stood, meditating on this singular meeting and its possible consequences.

The whole of the following day was passed by me in a state of feverish excitement which I cannot describe; this strange adventure breaking in so suddenly upon the dull monotony of my daily existence, had so aroused and stimulated me, that I could neither rest nor eat. How I longed for night to come!—for sometimes, as the day wore later, I began to fear that the whole scene of my meeting with the admiral had been merely some excited dream of a tortured and fretted mind; and as I stood examining the ground where I believed the interview to have occurred, I endeavoured to recall the position of different objects as they stood around, to corroborate my own failing remembrance.

At last the evening closed in; but, unlike the preceding one, the sky was covered with masses of dark and watery cloud, that drifted hurriedly across; the air felt heavy and thick, and unnaturally still and calm; the water of the harbour looked of a dull leaden hue, and all the vessels seemed larger than they were, and stood out from the landscape more clearly than usual; now and then a low rumbling noise was heard, somewhat alike in sound, but far too faint, for distant thunder; while, occasionally, the boats and smaller craft rocked to and fro, as though some ground swell stirred them without breaking the languid surface of the sea above.

A few drops of thick heavy rain fell just as the darkness came on, and then all felt still and calm as before. I sat upon the anchor-stock, my eyes fixed upon the Old Ark, until gradually her outline grew fainter and fainter against the dark sky, and her black hull could scarcely be distinguished from the water beneath. I felt that I was looking towards her; for long after I had lost sight of the tall mast and high-pitched bowsprit, I feared to turn away my head, lest I should lose the place where she lay.

The time went slowly on, and although in reality I had not been long there, I felt as if years themselves had passed over my head. Since I had come there, my mind brooded over all the misfortunes of my life; as I contrasted its outset, bright with hope and rich in promise, with the sad reality, my heart grew heavy, and my chest heaved painfully; so sunk was I in my reflection, so lost in thought, that I never knew that the storm had broken loose, and that the heavy rain was falling in torrents. The very ground, parched with long drought, smoked as it pattered upon it, while the low wailing cry of the sea-gull, mingled with the deep growl of far-off thunder, told that the night was a fearful one for those at sea. Wet through and shivering, I sat still, now listening, amid the noise of the hurricane and the creaking of the cordage, for any footstep to approach; and now, relapsing back into a half-despairing dread that my heated brain alone had conjured up the scene of the day before. Such were my dreary reflections, when a loud crash aboard the schooner told me that some old spar had given way. I strained my eyes through the dark to see what had happened, but in vain; the black vapour, thick with falling rain, obscured everything, and all was hid from view. I could hear that she worked violently as the waves beat against her worn sides, and that her iron cable creaked as she pitched to the breaking sea. The wind was momentarily increasing, and I began to fear lest I should have taken my last look at the old craft, when my attention was called off by hearing a loud voice cry out, "Halloo there! Where are you?"

"Ay, ay, sir, I'm here." In a moment the admiral and his friend were beside me.

"What a night!" exclaimed the admiral, as he shook the rain from the heavy boat cloak, and cowered in beneath some tall block of granite near. "I began half to hope that might not have been my poor fellow," said the admiral; "it's a dreadful time for one so poorly clad for a storm; I say, Dawkins, let him have a pull at your flask." The brandy rallied me a little, and I felt that it cheered my drooping courage.

"This is not a time, nor is it a place, for much parley," said the admiral; "so that we must even make short work of it. Since we met here last night, I have satisfied myself that you are to be trusted, that your character and reputation have nothing heavier against them than misfortune, which certainly, if I have been rightly informed, has been largely dealt out to you. Now, then, I am willing to accept of your offer of service, if you are still of the same mind as when you made it; and if you are willing to undertake what we have to do, without any question and inquiry as to points on which we must not and dare not inform you. This is the plan: as soon as that old craft can be got ready for sea, or some other, if she be not worth it, you will sail from this port with a strong crew, well armed and supplied with ammunition. Your destination is Malta; your object to deliver to the admiral stationed there the dispatches with which you will be intrusted; they contain information of immense importance, which, for certain reasons, cannot be sent through a ship of war, but must be forwarded by a vessel that may not attract particular notice. If you be attacked, your orders are to resist; if you be taken, on no account destroy the papers, for the French vessel can scarcely escape re-capture from our frigates, and it is of great consequence these papers should remain. Such is a brief sketch of our plan; the details can be made known to you hereafter."

"I am quite ready, my lord: I ask for no terms; I make no stipulations. If the result be favourable, it will be time enough to speak of that. When am I to sail?"

* * * *

I do not shorten sail here to tell you what reports were circulated about Cove, as to my extraordinary change in circumstances, nor how I bore my altered fortunes. It is enough that I say, that in less than three weeks I weighed anchor, and stood out to sea one beautiful morning in autumn, and set out upon my expedition.

I have already told you something of the craft. Let me complete the picture by informing you that, before twenty-four hours passed over, I discovered that so ungainly, so awkward, so unmanageable a vessel, never was put to sea: in light winds she scarcely stirred, or moved

* This portion of a very clever and amusing book, "Charles O'Malley," is reprinted here, with the permission of the publishers, Messrs W. Curry, Jun. and Co., of Dublin.

as if she were water-logged; if it came to blow upon the quarter, she fell off from her helm at a fearful rate; in wearing, she endangered every spar she had; and when you put her in stays, when half round she would fall back, and nearly carry away every stitch of canvass with the shock. If the ship was bad, the crew were ten times worse. What Dawkins said turned out to be literally true: every ill-conducted, disorderly fellow, who had been up the gangway once a week or so—every unreclaimed landsman, of bad character and no seamanship—was sent on board of us; and, in fact, except that there was scarcely any discipline and no restraint, we appeared like a floating penitentiary of convicted felons.

So long as we ran down the Channel, with a slack sea and fair wind, so long all went on tolerably well; to be sure, they only kept watch when they tired below, and reeled about the deck, went down below, and all just as they pleased, and treated me with no manner of respect. After some vain efforts to repress their excesses—vain, for I had no one to second me—I appeared to take no notice of their misconduct, and contented myself with waiting for the time when, my dreary voyage over, I should quit the command, and part company with such associates for ever. At last, however, it came on to blow, and the night we passed the Lizzard was indeed a fearful one. As morning broke, a sea running mountains high—a wind, strong from the north-west—was hurrying the old craft along at a rate I believed impossible. I shall not stop to recount the frightful scenes of anarchy, confusion, drunkenness, and insubordination, which our crew exhibited; the recollection is too bad already, and I would spare you and myself the recital; but, on the fourth day from the setting in of the gale, as we entered the Bay of Biscay, some one aloft descried a strange sail to windward, bearing down as if in pursuit of us. Scarcely did the news reach the deck, when, bad as it was before, matters became now ten times worse, some resolving to give themselves up, if the chase happened to be French, and vowing that, before surrendering, the spirit-room should be forced, and every man let drink as he pleased. Others proposed, if there were any thing like equality in the force, to attack and convert the captured vessel, if they succeeded, into a slaver, and sail at once for Africa. Some were for blowing up the old schooner with all on board; and, in fact, every counsel that drunkenness, insanity, and crime combined, could suggest, was offered and descanted on. Meanwhile, the chase gained rapidly upon us, and before noon we discovered her to be a French letter of marque, with four guns, and a long brass swivel upon the poop-deck. As for us, every sheet of canvass we could crowd was crammed on, but in vain; and, as we laboured through the heavy sea, our riotous crew grew every moment worse, and sitting down sulkily in groups upon the deck, declared that, come what might, they would neither work the ship nor fight her; that they had been sent to sea in a rotten craft, merely to effect their destruction; and that they cared little for the disgrace of a flag they detested. Half furious with the taunting sarcasm I heard on every side, and nearly mad from passion, and bewildered, my first impulse was to rush amongst them with my drawn cutlass, and, ere I fell their victim, take heavy vengeance upon the ringleaders, when suddenly a sharp booming noise came thundering along, and a round shot went flying over our heads.

"Down with the ensign!—strike at once!" cried eight or ten voices together, as the ball whizzed through the rigging. Anticipating this, and resolving, whatever might happen, to fight her to the last, I had ordered the mate, a stanch-hearted resolute fellow, to make fast the signal sailyard aloft, so that it was impossible for any one on deck to lower the bunting. Bang went another gun, and, before the smoke cleared away, a third, which, truer in its aim than the rest, went clean through the lower part of our mainsail.

"Steady, then, boys, and clear for action," said the mate. "She's a French smuggling craft, that will sheer off when we show fight, so that we must not fire a shot till she comes alongside."

"And harkee, lads," said I, taking up the tone of encouragement he spoke with, "if we take her, I promise to claim nothing of the prize. Whatever we capture, you shall divide amongst yourselves."

"It's very easy to divide whatever we never had," said one. "Nearly as easy as to give it," cried another. "I'll never light match or draw cutlass in the cause," said a third.

"Surrender!"—"Strike the flag!"—"Down with the colours," roared several voices together.

By this time the Frenchman was close up, and ranging his long gun to sweep our decks; his crew were quite perceptible, about twenty bronzed stout-looking fellows, stripped to the waist, and carrying pistols in broad flat belts slung over the shoulder.

"Come, my lads," said I, raising my voice, as I drew a pistol from my side and cocked it, "our time is short now; I may as well tell you that the first shot that strikes us amidship blows up the whole craft, and every man on board. We are nothing less than a fireship, destined for Brest harbour to blow up the French fleet. If you are willing to make an effort for your lives, follow me."

The men looked aghast. Whatever recklessness crime and drunkenness had given them, the awful feeling of inevitable death at once repelled. Short as was the time for reflection, they felt that there were many circumstances to encourage the assertion; the nature of the vessel, her riotous, disorderly crew, the secret nature of the service, all confirmed it, and they answered, with a shout of despairing vengeance, "We'll board her; lead us on." As the cry rose up, the long swivel from the chase rung sharply in our ears, and a tremendous discharge of grape flew through our rigging; none of our men, however, fell; and, animated now with the desire for battle, they sprang to the binnacle and seized their arms.

In an instant the whole deck became a scene of excited bustle; and scarcely was the ammunition dealt out, and the boarding party drawn up, when the Frenchman broached to and lashed his bowsprit to our own.

One terrific yell rose from our fellows as they sprang from the rigging and the poop upon the astonished Frenchmen, who thought the victory was already their own; with death and ruin behind, their only hope before, they dashed forward like madmen to the fray.

The conflict was a bloody and terrific, though not a long one; nearly equal in number, but far superior in personal strength, and stimulated by their sense of danger, our fellows rushed onward, carrying all before them, to the quarter-deck. Here the Frenchmen rallied, and, for some minutes had rather the advantage, until the mate, turning one of their guns against them, prepared to sweep them down in a mass. Then it was that they ceased their fire, and cried out for quarter. All, save their captain, a short thick-set fellow, with a grisly beard and moustache, who, seeing his men fall back, turned on them one glance of scowling indignation, and rushing forward, clove our boatswain to the deck with one blow. Before the example could have been followed, he lay a bloody corpse upon the deck, while our people, roused to madness by the loss of a favourite among the men, dashed impetuously forward, and, dealing death on every side, left not one man living among their unresisting enemies. My story is soon told now. We brought our prize safe into Malta, which we reached in five days. In less than a week our men were drafted into different men-of-war on the station. I was appointed a warrant-officer in the Sheerwater, forty-four guns; and as the admiral opened the dispatch, the only words he spoke puzzled me for many a day after.

"You have accomplished your orders too well," said he; "that French privateer is but a poor compensation for the whole French navy."

Many years afterwards I found that our dispatches were false ones; intended to have fallen into the hands of the French, and mislead them as to Lord Nelson's fleet, which at that time was cruising to the southward to catch them. This, of course, explained what fate was destined for us; a French prison, if not death; and, after all, either was fully good enough for the crew that sailed in the old schooner.

POETRY OF FRANCE.

EIGHTH ARTICLE.

ALPHONSE DE LAMARTINE is a poet of a very different stamp from Pierre Jean de Beranger, and of a genius much less decidedly national, or at least less akin to that which characterises the past poetical literature of France. Perhaps it would be more correct to say that the genius of Lamartine is truly national, but that his poetical tendencies and powers have been modified by, and moulded upon, models very unlike any afforded by his own country either in old or recent times. The poetical luminaries of modern England, and more especially Wordsworth and Byron, are the high exemplars which Lamartine has set before himself, and the result has been a marked commingling of the spirit and tone of these two bards in his compositions. The latter are as pure as the writings of Wordsworth as regards moral and religious sentiments; but the temperament of the French poet was ardent and impassioned as that of Byron, and hence the calm and philosophic gravity of the great Lake poet will be looked for in vain in the productions of the continental bard. In a word, Lamartine is something of a *religious Byron*. But, though we rank the French poet highly, we would by no means place him beside either of his English contemporaries in point of real poetical merit. His writings are beautiful and highly imaginative, but their excellence is marred by diffuseness—by a want of condensed power both in thought and language.

These observations will introduce to our readers a brief specimen of Lamartine, being the opening of a long poem addressed to Byron, who was then in life. It will be seen how deeply the strangely-mingled qualities of the English poet had impressed the mind of the French writer:

Thou, whose true name not yet mankind have glean'd,
Mysterious spirit, angel, man, or fiend!
Be thou a genius or of good or ill,
Byron, I love thy wild strange music still—
More than the roar of winds, or thunder's voice,
Mingling in tempest with the torrent's noise!
Night is thy sojourn, horror thy domain.
Like thee, the eagle scorns the lowly plain;
King of the wilds, he seeks the rugged rocks,
By winter blanch'd, and scarr'd by lightning-shocks;
Shores strewn with shipwrecks by the angry flood,
Or fields by war all blacken'd o'er with blood;
And, whilst the gentler bird that sings and grieves,
Builds upon flowery banks its nest of leaves,
He of Mount Athos spurns the awful crown,
And hangs his eyrie where abysses frown;
And there, alone, engirt by quivering limbs,
Whence o'er the rocks black gore for ever swims,
Joying in cries from many victims sent,
Rock'd by the storm, he sleeps in fierce content!
Thou, Byron, like this brigand of the air, &c.

This terrible comparison refers, it will be understood, to the wild and mocking way in which, in his later days, Byron allowed himself to speak of the virtues and failings of man, and, indeed, of all that involved his best interests. Lamartine, in the sequel, endeavours to reason Byron into submissive resignation to the decrees of Heaven—an attempt which at least shows the earnest nature of Lamartine's own mind. The object of the address, as we find from his letters, only smiled at the other's simplicity. The French poet further showed his admiration of the English bard by adding a canto to Childe Harold, describing the close of the real Childe's pilgrimage on earth. Enough of this subject, however. Our readers will doubtless prefer another specimen of Lamartine's poetry to our prose. The following little piece is from one of his books of "Harmonies, Poetical and Religious:"—

TO THE NIGHTINGALE.

What time thy heavenly voice preludes
Unto the fair and silent night,
Wing'd minstrel of my solitudes,
Unknown to thee I trace its flight.

Thou knowest not that one remains
Beneath the trees hour after hour,
Whose ear drinks in thy wondrous strains,
Intoxicated by their power;

Nor that the while a breath of air
Escapes but from my lips with grief;
And that my foot avoids with care
The rustling of a single leaf;

Thou deemest not that one, whose art
Is like thine own, but known to day,
Repeats and envies in his heart
Thy forest-born nocturnal Lay!

If but the star of night reclines
Upon the hills thy song to hear,
Amid the branches of the pines
Thou couchest from the ray in fear.

Or if the rivulet, which chides
The stone that in its way doth come,
Should speak from 'neath its mossy sides,
The sound affrights and strikes thee dumb!

Thy voice, so touching and sublime,
Is far too pure for this gross earth:
Surely we well may deem the chime
An instinct which with God has birth!

Thy warblings and thy murmurs sweet
Into melodious union bring
All fair sounds that in nature meet,
Or float from heaven on wandering wing.

Thy voice, though thou may'st know it not,
Is but the voice of the blue sky—
Of forest glade, and sounding grot,
And vale where sleeping shadows lie;

It blends the tones which it receives
From prattlings of the summer rills,
From trembling rustlings of the leaves,
From echoes dying on the hills;

From waters filtering drop by drop
Down naked crag to basin cool,
And sounding ever, without stop,
While wrinkling all the rock-arch'd pool;

From the rich breeze-born plaints that flow
From out the branchy night of trees;
From whispering reeds, and waves that go
To die upon the shores of seas;

Of these sweet voices, which contain
The instinct that instructeth thee,
God made, oh nightingale, the strain
Thou givest unto night and me!

Ah! these so soft nocturnal scenes,
These pious mysteries of the eve,
And these fair flowers, of which each leans
Above its urn, and seems to grieve;

These leaves on which the dew-tears lie,
These freshest breathings of the trees—
All things, oh Nature, loudly cry,
"A voice must be for sweets like these!"

And that mysterious voice—that sound,
Which angels listen to with me,
That sigh of pious night—is found
In thee, melodious bird, in thee!

This piece forms a very fair specimen of the poetry of Lamartine. There may be a want of the tangible and substantial about it, but, in place of these qualities, there is a fine dreamy beauty, both of sentiment and imagery, and much eloquence of language. At some future time we shall return to Lamartine. In the mean time, one or two pieces by other French authors lie before us, which may perhaps please our readers. Alfred de Vigny is one of the cleverest novel writers of modern France, and he has also composed some most beautiful poetry. The subjoined lyric, which we select merely because it is at hand, being quoted in a very able notice of the writer in the Westminster Review, seems to us very spirited, though we mean not to record any approval of the ultramarine tendencies displayed in it. These are perhaps allowable, however, in the case of a sea-rover addressing the lady of his love.

SERENADE.

Come and fear not, gentle one,
Come o'er the sea;
Portionless and all alone,
Come thou with me.
See! how gaily in the sun
My pennons fly
Over mast, and sail, and gun!
'Tis a shell—yet, peer'd by none,
King there am I.

Land was made but for the slave,
Fair love of mine!
But the free, the bright, the brave,
Theirs is the brine.
Mystic stores its waters have
Of joy and glee;
Every murmur from its wave
Speaks of love, and chants a stave
Of liberty!

Our old friend Beranger treats a similar subject in a strain more to our taste. With his usual skill in effecting such infusions, he makes the following verses to Adèle the vehicle, as the reader will see, of sentiments, not very original, perhaps, but manly, cheerful, and free-spirited. In one sense, Beranger never wastes a line. Be the subject what it may, he treats it so as to inculcate some practical truth.

BEAUCOUP D'AMOUR.

Despite what wisdom's voice may say,
I fain would gather heaps of ore,
And at my true-love's feet would lay,
With pleased haste, the golden store.

Digitized by Google

Then daily would I satisfy
Each lightest wish, Adèle, of thine:
No jot of avarice have I,
But boundless is this love of mine.

To make immortal my Adèle,
Were I with powers of song inspired,
My verse, which still on her should dwell,
Would be from age to age admired.
Thus may the future's memory
Our graven names one day entwine:
I have no wish for fame—not I,
But boundless is this love of mine.

If Providence should deign to place
My steps upon a kingly throne,
Adèle that splendid dream should grace,
And all my rights be hers alone.
To please her more, I willingly
Would see a court around me shine:
Ambition!—none of it have I,
But boundless is this love of mine.

But why these vexing vain desires,
Since every wish Adèle doth crown!
More happiness true love inspires,
Than grandeur, riches, or renown.
Then, let me on that bliss rely,
Which fate can never make me tyne;
Nor wealth, nor fame, nor rank have I,
But boundless, boundless love is mine!

These various specimens from the poetical stores of modern France, may be closed with another piece, the production of one who filled a high place in that country in days not long past, Hortense Beauharnois, daughter of the Empress Josephine, and wife of Louis Bonaparte. For a time, it will be remembered, Hortense sat on the throne of Holland. She was a woman of extraordinary beauty and accomplishments, and deeply attached to her native France. The subjoined lines, entitled "The Charms of Fatherland," were written by her when about to return to that land after a long exile. Happy for the poor lady that she did not live to see her eldest son sent to a dungeon there, a captive for life!

I go to see my own dear land once more;
I go to die where first I saw the light!
How much your loss, ye cold ones, I deplore,
In whom the thoughts of home no thrill excite!

Ye fields, of childhood's joys the teeming scene,
With hosts of tender recollections sown,
The twofold charm ye offer us, I ween,
Of recent joys mix'd up with those long gone.

All here below feel more or less the tie
That draws us where our infant cradles lay;
Sweet sympathy, which makes life lightly fly,
And from the grave takes ev'n its gloom away!

Wearied with absence, lengthen'd out too long,
Of former pleasures I delight to dream;
My heart revives, and Hope inspires my song,
And still is home, dear home, the cheering theme.

OCCASIONAL NOTES.

NEW VESICATORY.

WHILE nothing can be more dangerous to society than the nostrum-vending of incompetent persons, and the latitude given to it by our existing laws, on the other hand it is clear that any real advance in remedial science ought to be warmly hailed as conferring a blessing of the most direct possible kind upon humanity. In Edinburgh, within these few months, a discovery of this order has been made, which, in our opinion, merits being universally known. Counter-irritation, in the case of internal disease, has been too long approved of by the medical world for any doubt to be entertained of its utility; and, of all the counter-irritants that have been tried, cantharides, or Spanish flies, have been found the most convenient and efficacious. In fact, with the exception of mustard cataplasms in mild cases, no other blisters are now in use. These blisters, however, have their disadvantages. In the first place, they are apt to produce the very painful affection called strangury, and in many instances cannot be used, in consequence of that accompanying mischief. Again, the pain of the cantharides blister is very considerable, and this not only while the skin is being broken, but also afterwards, from portions of the flies adhering to the spot, and keeping up the irritation unnecessarily. A third point to be remarked is, that the blister very seldom rises so equally as is desirable. From unequal spreading of the plaster, or unequal mixing of the flies, a vesicle is produced in one spot and not in another, and, in short, many small irregular vesicles are caused, instead of a single perfect one. Other defects in the operation of the cantharides blisters might be noticed, but these will suffice for the present purpose.

Two ingenious young chemists, Messrs Smith of Duke Street, Edinburgh, have discovered a new vesicatory, or blister, liable to none of these objections; or rather they have discovered a new mode of using the cantharides, by which all its advantages are obtained without any of its disadvantages. This new blistering article is very elegant in form, being manufactured in sheets resembling those of common white adhesive plaster. It is, in fact, a *paper impregnated with the effective essence of cantharides*. A slip of this, cut of the proper form, is applied in the usual way, and, under ordinary circumstances, raises a complete vesicle in from six to twelve hours upon the skin of an adult—in a lesser time, in short, by an hour or two, than the old blister would take. The application is peculiarly cleanly. No whisky or other stimulant need be applied to the skin beforehand, as formerly done; and, when the new vesicatory is removed, no vestige of the cantharides remains behind, to excite strangury or cause a continuance of pain. The difference between the two processes, we repeat, is great as regards efficacy, neatness, cleanliness, and ease of management; and the perfect unity, also, of the vesicle produced, is a point of superiority not less remarkable.

It was from accidentally seeing its operation in private, some time since, that our attention was called to this new vesicatory. But we have subsequently learned that it has been already put to proof by a large portion of the medical public, and found to possess such superior efficacy, as renders it desirable that the discovery should be widely known. In addition to numbers of private physicians and surgeons, the Royal or Public Infirmaries of Edinburgh, Dundee, Aberdeen, and other places, have used this substance largely for a number of months, and it has gradually superseded the use of the old blisters in their practice. After employing it in several hundred cases, the medical people of the Edinburgh Infirmary have found it in no one case to produce strangury, an affection formerly most troublesome to themselves and their patients. The desired effects have been produced, on the other hand, with almost unfailing certainty, whatever part of the frame the vesicatory was applied to, and whatever the degree of toughness (no unimportant point) characterising the patient's skin. The apothecary of the Aberdeen Infirmary has certified to his use of it in between one and two hundred cases, within a few past weeks, and it has only failed to produce the full effect in about six instances. [The old blister, in a third of the cases, might perhaps have produced at least very imperfect vesication.] No strangury has followed the use of the new blister, and its cleanliness and convenience are highly commended.

We have noticed this subject, in the belief that the improvement now made in the materials of vesication will render the practice of counter-irritation, so common now-a-days in cases of disease, far less painful to the sufferer, as well as more convenient, safe, and effective. To keep silence, while aware that the means for attaining an end so desirable exist, would be nothing less than inhumane.

PHYSICAL DEFORMITIES.

An improvement in the surgical branch of the medical art is something even more important than a beneficial discovery in the department of the Materia Medica. The cure of squinting, by division of the muscles that move the eye-ball, was formerly adverted to. The same principle of cure has been extended to other deformities. A contracted arm or leg, a bent body, or a twisted neck, depends in most cases upon the very same fundamental cause to which squinting is attributable—namely, a shortening or contraction of the muscles, or of their tendonous endings. Hence the remedy is the same—the division of the muscular or tendonous fibres in fault. Dr Stromeyer of Hanover, at present Professor of Surgery in the University of Erlangen, was the surgeon who first effected a cure of bodily deformity, by operating in the manner described. This took place in the year 1831. The same gentleman proposed the extension of his discovery to the cure of squinting, but was not himself the first who successfully carried it into practice. Dr Duffenbach, a distinguished surgeon of Berlin, having witnessed the consequences of one of Dr Stromeyer's operations, in the person of a medical man now residing and practising in London, immediately took up the invention, and by him was it first successfully applied to the cure of obliquity of vision.

Drs Stromeyer and Duffenbach operated in their respective districts, with signal success, in hundreds of cases of deformity in the arms and legs. The invention found its way, a year or two afterwards, to Paris, and many remarkable cures have been effected there. In one late instance, a distinguished Parisian surgeon divided not less than forty muscles (we write from memory) in the body of a deformed person. The British surgeons have been long in taking up this operation as a regular part of their professional practice, but we have no doubt that it must soon gain ground and favour among them. An intelligent medical man, resident near our Scottish metropolis, has sent us some remarks upon this subject, with a particular account of Dr Stromeyer's mode of operation, to which we have much pleasure in giving a place in our columns. It is painful, "in walking along the streets (says our correspondent), to see both old and young people, of both sexes, and sometimes of great personal attractions, walking upon very high-heeled boots, or supporting themselves upon stilts, from deformities in their feet and limbs. If of the fair sex, they very naturally do their utmost to conceal any thing of the kind, but their awkward gait betrays the existence of some defect. If such persons knew that there is a mode of curing the majority of these affections, and that hundreds of cases have already been cured, they would surely hasten to inquire of their respective medical men if their own individual cases were similarly remediable."

The deformity consists, it has been said, in a shortening of the muscles, or contractions of the tendons. These are cut, and then the part is stretched to its natural shape, and kept in that position for weeks or months. For instance, "we often see people with one of their feet pointing straight downwards to the ground, and the heel five or six inches above it, and who walk with a boot having a heel of corresponding height. Now, this affection is caused by extreme shortness of the thick tendon running for some inches above the heel (called *tendo Achillis*); and if this tendon be cut through, two or three inches above the heel, just as we would a piece of rope, and if we apply any apparatus so as to bring the foot to a right angle with the leg, and lengthen the interval between the cut ends, a cure is effected. The tendon is cut with a small scythe-shaped knife, with or without a button at the end of it; but the skin is left quite uncut, except to the extent of a quarter of an inch, where the knife is introduced. The operation is completed in fifteen or twenty *seconds*; the pain is very trifling, and only a few drops of blood come away. At other times we see feet twisted inwards or outwards, and the persons walking upon the side of the foot next the ground, the other side being one, two, or more inches above it. These affections generally depend upon contractions of the muscles acting upon the inner or outer side of the foot; and the tendons of these muscles must be cut through, along with that tendon already spoken of (the *tendo Achillis*), which in these cases also exercises great influence. Contractions often exist in the muscles whose tendons form the hamstrings, and then the patient has a knee projecting several inches before the body. To cure him, he must literally be hamstrung, and a suitable apparatus then employed to straighten the leg. The hands often have their fingers turned into the palms, from burns, &c., and they can only be put to rights by cutting through the tendons, or tendonous bindings at fault, and then stretching out the fingers upon splints, or pieces of pasteboard or wood. Such contractions are common in the elbow and neck; and the principle of cure in these cases is precisely the same as in the others." Whether or not the divided tendons or muscles be perfectly united by tendonous or muscular fibres, the junction formed is at least so far complete that power of motion is restored to the part operated upon.

"As these deformities are often hereditary, it is really a matter of conscience to get rid of them as fast as possible, inasmuch as no individual, if curable, is justified in running the risk of propagating such to his or her children. It is much to be desired, then, that these affections, at once distressing to their possessors, and an eyesore to the community at large, may be extirpated from amongst us."

OLD BURGHAL REGULATIONS.

THE Maitland Club, an association of gentlemen who print old manuscripts for their own private use, have just completed a second volume of what they call their *Miscellany*, in which, amongst other curious matters, we find certain acts and statutes of the magistrates of Edinburgh, extending from the year 1529 to 1531. These acts throw some light on the age to which they refer.

The town-council seem to have at that time thought themselves not more seriously called upon to interfere for the maintenance of just weights and measures amongst tradesmen, than for the fixing of prices, and the prevention of retailing. They ordain, for instance, "that na brouster na dry tapster tak apone hand to sell ony derrar aill fra Monunday furth at nixt cummys na xvi d. the gallonne, and at it be guid and sufficient aill of the price forsaid;" [that is, that no brewer or dry tapster take upon hand to sell any dearer ale, from Monday next forward, than 1s. 4d. per gallon, and that it be good and sufficient ale of the price aforesaid.] The penalty is to be 8s. for the first fault; for the second, the ale is to be distributed gratis; to punish the third, the public officers are to bring "thar caldrone or kettellis to the crose, and ding thame throw with ane puncione, and spane thame fra the operation for zer and day;" [to bring their caldron or kettles to the cross, and drive a puncion through them, and debar the proprietor from his trade for a year and a day.]

"Baxtarris," that is bakers, are, in like manner, ordained to bake their bread of good and sufficient stuff at twopence the eighteen-ounce loaf—the honest bailies never once reflecting, to all appearance, how the baker was to be sure of purchasing his flour at such a rate as to afford the bread at that price. He was to have "bot ane buth" [only one shop] in which to sell his bread; and no huxter was to retail his bread: all this under pain of banishment from the town. Candlemakers are to sell their candles at sixpence a pound where rag wick was used, and fivepence where the wick was of *hards* or lint. The same penalties which enforce these regulations are imposed upon all who shall melt their tallow "on the fore gait," that is, the front street—in itself a curious trait of our early city customs.

"Stabillaris" are enjoined under severe penalties to have their stables well "furnest with hek and mangear, and with sufficient lokis for the durris, for sure keiping of the horsis." Prices are fixed for corn and hay; and where these articles are bought from them, they are to charge no stable fee. On the other hand, no other class of persons are to sell or "regrait" oats and hay, under severe penalties.

People dealing in poultry and wild fowl are or-

Digitized by Google

dained to come openly with them to the cross, "and nocht to be halden in covert under clokis or gounis, nor yit in thair houses." They are to hold their market in this open manner during certain hours. Severe penalties are threatened to all who shall buy such articles from strangers to sell again in the town, otherwise than at the market cross. The same strong measures are taken "that na maner of persone, man nor woman, regrait nor by eny fische, to tap nor sell agane to the nychtbouris of the toune," till twelve o'clook noon, or from ane till six in the afternoon; "item, that na maner of persone, man ner woman, regratouris of fische, eggis, butter, cheise, frute, or uther syk stuff, hald ony maner of burdis or cramis to sell syklike stuff upon the hie gait, nor under staris, bot in thair awin house, under pane of bannasing of the toune;" [that no manner of persons, men or women, regrettors of fish, eggs, cheese, fruit, or other such stuff, hold any kind of boards or stalls to sell such stuff, upon the High Street, nor under stairs, but in their own houses, under pain of banishment from the town.]

The penalties were not imposed in the spirit of empty menace. Not long after the act respecting stablers, we find five women banished all at once, because they had "contempnandlie brokin the said statutis, and coft [bought] corn and aittis in greit to regrait agane." The pain of banishment is visited upon many others for the like offences. It is to be observed, however, that, in some instances, the defaulters are in a short time allowed to return, on their friends giving surety for their paying obedience to the town's statutes in future. Thus "Gilbert Skeillis" gives surety for his wife, that she would never again buy hay or oats to sell again; whereupon "the said Gilbertis wyf was relaxit agane to the fredom of the toune as scho was obefor [as she was of before] or [ere] scho was bannist the samyn."

There is reason to conclude that the motive of all these proceedings was a good though mistaken one. There are various statutes respecting hucksters, or retailers, showing that the profit made by these parties on their goods was regarded as an oppression of the lieges; an idea which is still found to exist amongst the working classes in some of our manufacturing districts, but which, we need scarcely say, is totally unsound. In the statutes under notice, every means are taken to compel those who raise country produce to appear in the market and sell it themselves, as if it had been possible thus to obtain the articles at the mere cost of production, the worthy provost and baillies not observing that the producer required in that case to be remunerated for the time he spent as a merchant, and that probably a huckster, combining the goods of many producers, could have afforded to sell the articles at a cheaper rate. An amusing example of the anxiety of the magistracy to keep down prices, is given in a statute "anent seruandis," as follows:—"Item, that because thar is na seruand woman, or nurys [nurse], that gettis in ane gude mannis hous throw hir seruice v or vj merkis, bot scho will tak ane hous of hir awin [take a house of her own], and be ane browstar or huckstar, quharthro the nychtbouris of the toune ar hevelie hurt, *and the meit and drink rasit darer throw the bying of the samyn at the second or thrid hand*, that tharfor na seruand woman pas fra hir seruice and tak ane hous, without scho be mariit or pas to the bordall, except scho haif the licence of the provest for gud rationabill causis, under the pane of banasing." For a broker or forestaller of wool and hides to be even seen speaking to the persons who brought those articles to market, on a market day, was an offence visited with punishment. The statute on that subject shows in a peculiar manner how strongly, under the impulse of convenience, private parties were inclined to that division of labour which is really most for their advantage, notwithstanding every effort of erroneous legislation to make them take a different course.

Some familiar traits of the time are communicated in these statutes. We find, for instance, David Cristeson banished "because he is ane young stark fallow [a young stout fellow], and beggis, and will nocht wirk for his leving." For the same reason, banishment is inflicted on "Richman that singis with the lass and beggis." John Anderson, keeper of the tolbooth or jail, obliges himself to keep the statutes of the town in time coming, "under the pane of the daling of ane barell of ale, till gif utheris exempill till brek the said statutis in tyme coming." Leper folk are forbidden to appear in any market, under pain of being burnt in the cheek and banished the town. The provost and baillies order that Jonet Anderson "say na displesour nor injuriouse language till Thomas Wauchope nor his spouse, nother oppinlie nor priuatlie, under the bane of bannesing of the toune." Margaret Smith of her own free will comes before the council, and obliges herself, "that fra this tyme furth scho sall nocht use na injurious wordis, blasfeme, nor schame, Dene Alexander Creichtane, vicar of Sanct Cuthbertis Kirk, nother in word nor deid, under the pament of x li [ten pounds] til be gevin till Sanct Gelis werk." The council seem to have thought themselves entitled to interfere in every thing. They statute and ordain that no person give any wool to card or spin out of their own houses, except "till honest wedowis or honest falit [disabled] personis houshalderis, under the pane of xl s." This would be from an anxiety to benefit the poor, for whom there was then no public provision of any kind.

A striking proof of the frequent acts of violence then taking place in the open streets, is found in a statute, referring to the slaughters and murders committed in "tymes bypast," on account of the officers and neighbours not rising to resist and punish the same; and ordering that "every merchand and craftisman haiffand foir buthis [having front shops], that thay haif in thair said buthies ane ax, or twa, or thre, as thay have servandis, and to cum incontinent to the provest and ballies reddy to fortefy and manteine thar our men and justice." It also appears that the children then exercised their combativeness as actively as their seniors, for we find an act against "Bikkyrringis betwix Barnis," providing that, "forasmekle as thar has bene gret bikkyrringis betwix barnis and followis in tymes past, and diverse tharthrow hurt in perrell of thar lyffes, and, gif sik thingis be usit, thar mann diverse barnis and innocentis be slane and divisione ryse amangis nychtbouris tharthrow, theirfor we charge straitlie and commandis, that na sik bikkyrringis be usit in tymes to cum, certifing that and [if] ony persone be fund bikkyrrand, that thar faderis and masteries sall answer and be accusit for thar deidis, and gif thai be vagabondis, thai to be scurgit and bannist the toune." It is but justice to the sixteenth century to state, that these *bikkyrringis betwix barnis* continued to be frequent upon the streets of Edinburgh down to about the year 1810.

The statutes include a period during which the plague visited Edinburgh, and we are presented with many curious notices of the regulations which were thought necessary to be enforced on such an occasion. In October 1529, the disease is spoken of as raging at St Andrews and other places beyond the Forth. People are therefore forbidden, under great penalties, to approach Edinburgh from those districts, or to receive merchandize from the same quarter. On the 23d of November, learning that the disease had spread in St Andrews mainly from a mistake which prevailed at first, namely, that it was "the het seiknes," the council ordain that all sick persons in Edinburgh keep by themselves, and that notice of them be given to the town officers, under pain of banishment. At the same time, none are allowed to pass to the north of the Forth, without the provost's licence. Sick persons appear to have been obliged by formerly existing statutes to go and take up their quarters on the common muir without the town; for Thomas Mereleys, at his own desire, is allowed to come back from the muir to his house in town, "with his self, wyf, barnis, and guddis, unclengeit," he becoming obliged, upon his life, goods, and heritage, that no infection shall come within his house through the "unelenging" of his goods. In February 1530, finding that the danger deepens as the spring advances, still stricter statutes are made on all these points. On the 18th, Margaret Cok is condemned by an assise for coming from St Andrews with infected clothes, and sentenced to be burnt in both cheeks and banished. On the 20th, the inhabitants of Edinburgh and Leith are forbidden to attend the fair at St Monanes, a village in Fife, to which it might be supposed that persons with infected goods would be likely to come. The existence of infected persons in the town is first spoken of on the 25th of May, and all the statutes are again renewed; people are also forbidden to buy or sell old clothes; persons keeping swine are commanded to restrain them from appearing on the street; and then follows the most sensible ordinance of all—"Forasmekle as ther is gret fylth within this toune, baith on the hie gait and in closis [both in the High Street and the alleys leading from it], and ale the guttaris of the toune ar full of filith, quharthrow infectionne may spreid and ryse, That tharfore euery man and woman dicht and mak clene befor ther durris and closis, and clenge away the filith tharfra, under the pane of punising of thar personis and gudis at the prouest will." People having houses to let are at the same time forbidden to let them to vagabonds or trampers. Individuals who have been "in Gladois hous the smyth, or oney other houses that are now suspect of this contagius seiknes," are commanded to reveal the circumstance to the town's officers. Servant women who have hitherto been in the habit, while conveying their master's clothes to the water to wash, of taking "this womanis coller and that womanis curche," to wash along with their master's clothes, are forbidden to do so any more, as "it is unpossable to keep the toune clene gif sik thingis be usit."

On the same day, a woman who had been in the houses of infected persons, and was now infected herself, without revealing either circumstance, is sentenced to be burnt on the cheek and banished the town for life, and to remain on the muir till she be recovered, under pain of death. On the 4th of June, a woman who had a daughter sick without giving information, is sentenced to the like punishment, "all her barnis" being at the same time adjudged to perpetual banishment. Several cases of the same kind occur throughout June and July; but at length, in August, when probably the danger had become greater, concealment of sick friends is punished with death! An unfortunate tailor, David Duly by name, had a wife sick; he kept her concealed in his house, and even, while she was ill, went to attend mass in St Giles's kirk, thereby "doeand at was in him till haif infekkit all the toune." For this he was adjudged to be hanged on a gibbet before his own door. The sentence seems to have immediately been carried into execution, for, in the afternoon of the same day, we find an entry stating that Duly had been hung up, but that the "raip" had broken, and he escaped at the will of God, for which reason, and because "he is ane pure [poor] man with small barnis, and for pete of him," the council banish him instead. A few months afterwards, we find that several women were actually put to death ["drounit in the Quarrell holis at the Grey-frier port"] for concealing their sickness. Throughout August, the business of "clenging," that is, we presume, of completing quarantine, proceeds under the regulation of various statutes. But even after suspected or sick persons had given full satisfaction of their purity from the disease, and had been allowed to come back to their homes with their goods, they were still forbidden to attend mass amongst the other clean people.

Such were a few of the doings and sufferings of our citizens in "the good old times!"

KENNEDY'S NARRATIVE.

THE late campaign of the British army upon the Indus has been attended with the effect, now so common in such cases, of adding one or two entertaining and not uninstructive works to the current literature of the day. The "Court and Camp of Runjeet Sing" was one of the earliest of these productions, and it has lately been followed by a "Narrative of the Campaign of the Army of the Indus in Sind and Kaubool in 1838–9," by Dr Hartley Kennedy, one of the principal medical officers present on the occasion.* Dr Kennedy's narrative comprises a pretty regular view of the whole movements of the campaign, but, to civilians like us, the sketches of personal adventure embodied in such publications, seem always of greater interest than the semi-official parts of the narrative; and the majority of our readers will probably agree in this preference. In the succeeding notice, therefore, we shall only trace the operations of the army in so far as may be necessary to tack together such interesting extracts as chance to fall under our eye.

In the first place, a word may be premised on the objects of the war. The rich and populous districts on the line of the Indus and its springs, comprising Sind, Kandahar, Herat, Peshawar, and others, had long been tributary provinces of the powerful Afghan kingdom of Kaubool, but had been latterly split into separate and independent principalities. Runjeet Sing, an ally of Britain, had become raja of the Punjaub and of Peshawar. Among other changes arising from the disturbed state of the country, Shah-Shooja, legitimate sovereign of Kaubool, and properly also of Sind, had been expelled from his throne by Dost Mohammed, a soldier of fortune, whose brothers had likewise become masters of Kandahar. When the Persians advanced to besiege the Indo-Persian city of Herat in 1837, the British became suspicious of their ulterior designs, and the more so as Dost Mohammed went openly into their interests, and began to menace the native allies of Britain. The result was, that the governor-general found it necessary to suppress the usurper of Kaubool, and, by restoring Shah-Shooja to his throne, to settle the provinces of the Indus on a new, secure, and peaceful footing.

With this object in view, the British forces under Sir John (now Lord) Keane left Bombay in November 1838, and were transported by sea to the mouths of the Indus. Marching inwards, the army sustained considerable hardships from various causes, the cholera appearing in the ranks before Christmas. On the 29th of January, at which time alarms were beginning to be raised regarding the approach of the enemy, the following strange and fatal personal adventure took place. A hunting-forest, called a *shikargah*, in the neighbourhood of the encamped troops, was observed to be in flames, and "many of our officers (says Dr Kennedy) rode out to witness it. Among others, Doctor Hibbert of the 2d or Queen's Royals, and Lieutenants Spark and Nixon of the same regiment, proceeded thither on foot with fowling-pieces and rifles, expecting exercise on the wild animals driven by the fire out of the burning forest. Lieutenant Halkett of the same regiment accompanied them on horseback; and when they plunged into the thickest parts of the wood, and he found it impossible to accompany them, returned to camp, little dreaming of the melancholy fate awaiting them. No servant, and only one dog, was with them; and the poor beast the same evening returned to camp. On their not returning in the evening, some alarm was felt; and as we had supped full of rumours of war for some days before, it was conjectured that they might have been made prisoners by the Beloochies.

On the following morning two parties of cavalry and irregular horse were sent in search of them; and, sad to say, a villager who had been cutting wood in the forest, and probably found it convenient to follow the course of the fire, had discovered and led the way to where their bodies were found, half buried in the smouldering and still hot ashes of the long grass and brushwood by which their clothes had been destroyed.

More pitiable objects were never seen than the three bodies as brought into camp: not a vestige of their clothes remained; the extremities were partially consumed; and the blackened skin, and the limbs

* In two volumes. London: R. Bentley.

Digitized by Google

stiffened into the most frightful distortions, with the features almost entirely defaced, exhibited to their friends the most distressing spectacle that can be imagined.

An inquest was immediately assembled, and a verdict of 'Accidental death' recorded. No sign of sword-cut or gun-shot wound appeared on their bodies; nor could it have been supposed that three energetic young men, well armed, could have met a violent death from the enemy without having given some account of their assailants. The relics of their clothes, such as metal buttons, were found on the spot. The barrels of their guns were a valuable booty when found, and were easily carried off: it was not wonderful that they were not found; but parts of the stocks remained, showing that they had been burnt. The bodies had evidently not been rifled; Dr Hibbert's gold rings were left on his fingers; and all three showed, by the injury received, where their powder-flasks had exploded on their sides; and one of the party being left-handed, the side on which the injury appeared indicated the character of the occurrence which occasioned it. This further proves another most satisfactory circumstance, that their sufferings must have been short; since no three men could possibly have been long surrounded by fire with their senses about them, without ridding themselves of their gunpowder.

A close examination of the spot where the bodies were found, which was not very far from where Lieutenant Halkett had last seen them, seemed to show that they had ascended a tree from which to shoot such animals as might fly from the forest: some sudden change of wind appears to have brought the fire on them. One of them seemed to have dislocated his wrist, and to have broken the bones of his arm, in leaping, no doubt, wildly from the tree: his comrades may have perished through a vain attempt to rescue him." They were buried in one grave.

On the Indus, near Kurachy, the first town taken by the army, our author witnessed a most primitive mode of fishing for an oily fish called the *pulla*. "At these places we first saw the pulla fishery on the Indus; a piscatory pursuit which more nearly reduces the human form divine into an aquatic beast of prey than Izaak Walton, or any disciple of the 'gentle craft,' could have contemplated by the silver Thames. A large, light, and thin earthen vessel of the strong and unequalled pottery of the Indus' clay, and thoroughly baked, forms the fisherman's float: it is fully four feet in diameter, and about thirty inches high; of a very flattened form, and exceedingly buoyant. On this the fisherman balances himself on his stomach: covering the short neck and small aperture at top, and launching himself forth on the current, paddles with his legs behind to steer his course, drifting with the stream, and holding his pouch-net open to receive the prey, which, when caught, he deposits in his reservoir, the vessel he floats on."

The army reached Kandahar, without encountering any other enemy than bands of flying plunderers, who were so dexterous as to steal camels, as well as baggage, almost from under the noses of the owners. The usurping chiefs of Kandahar had fled, and here Shah-Shooja was formally nominated to the sovereignty of the Affghan or *Douranee* empire. Resuming the march towards Kaubool on the 30th of June, the army again began to suffer, not from regular enemies but roving robbers. Many murders were committed on stragglers. For example, two officers chancing to see two natives "standing knee-deep in water, in a somewhat unusual manner, approached them to satisfy their curiosity: their movement not suiting the parties alluded to, they fled precipitately; and, on their moving, the body of one of our followers, whom they had murdered, and on which they were standing to keep it out of sight until the gentlemen should have passed, rose to the surface, and was rolled over by the stream. The murderers, I believe, escaped." In the beginning of July, the army arrived before Ghizni, a strong fortress held by the troops of Dost Mohammed, and which was taken on the 22d of July, by blowing up the gate and scaling the place. Dr Kennedy mentions some curious wounds and escapes which took place in the contest. "Captain Raitt of the Queen's Royals, when wounded in the hand, was cut down, and felled to the ground by a sabre-blow, which happily inflicted only a moderate cut, being parried by the steel plate of his grenadier wing on his right shoulder; when down, another blow, which must otherwise have proved mortal, was fenced off by the metal lid of his drinking horn slung to his side. Lieutenant Simmonds, Adjutant of the Queen's Royals, afterwards again severely wounded at Khelaut, owed his life to his having one of his official memorandum-books and his silk handkerchief in his cap: a heavy ball, apparently from a jingal, severely wounded him in the head, notwithstanding the protection of the book, and, passing downwards, was again parried by the plate of his shoulder-strap."

Dost Mohammed, alarmed by the capture of Ghizni, fled from Kaubool, and the British entered that city without opposition. Kaubool is a place of considerable extent, and remarkable for the beauty of its vineyards and fruit-gardens. The people, like half the natives of India, thieve unremittingly. Our author describes the quartermaster-general of the forces as having one morning appeared before his military companions in a most ludicrous garb. He wore a red nightcap, and had a cloak wrapped about him, which was all too short to conceal the owner's entire want, at the moment, of any other vestment whatever. The truth was, having ridden before the army to fix on a spot for the camp, he had gone to sleep for the night in his little tent, and had been robbed before morning of every stitch of clothes but those on his recumbent person—the cap, namely, and cloak. "Let the reader imagine one of the best-looking and best-dressed staff officers of the army," appearing before his comrades, when the troops came up, in such a plight! At Kaubool, Shah-Shooja was in reality made a king, and, by British influence, presented with a capital and a people. The war was now ended. Dost Mohammed's flight left the seat of authority vacant, and it was only afterwards necessary to send detachments to reduce Khelaut and a few fortresses yet occupied by enemies. The 26th of September 1839, saw the army begin its march homewards, with the satisfaction of having fully accomplished the objects in view.

We shall close our notice with an isolated anecdote or two. In coming down the Indus in Sind boats, our author and his friends were almost devoured by rats. "When we compared notes in the morning, after our night's adventure, it was evident that Scott had been most familiarised in rat experience: 'I did not care,' said he, 'at their scampering in couples over my bed, and coming down bump upon me from the ceiling; but when one hungry villain clapped his cold paws upon my cheek, and sniffed about with his cold nose over my eyes and up my nostrils, I could stand it no longer!' I certainly should have jumped about vehemently had I been pawed and nosed after the same fashion; but let Colonel Scott's experience warn all future voyagers on the Indus to embark with a cat in their company." The following anecdote shows much penetration on the part of the officer concerned:—"Sir David Ochterlony was once able to make a most advantageous move on the Nepaul frontier by attending to a native tradition, that, some fifty years before, an elephant had been sent from some rajah of the low country to some rajah of the Nepaul hills. The legend was inquired into, and found to be true; the road the elephant had travelled was sought for, traced; and a British column, following the route thus discovered, not by accident, but by judicious and sensible inquiry, was enabled to turn the enemy's position, and penetrate into a district that had been considered inaccessible."

In conclusion, we feel called upon to express our regret that Dr Kennedy should have been led to introduce so many deprecatory remarks regarding the general conduct of the campaign. His position, surely, did not render such observations imperative, yet they are frequent, and greatly mar the otherwise agreeable tone of his book.

A WHALE-CHASE IN AUSTRALIA.

The South Australian Record gives the following description of a whale-chase, from the journal of a gentleman just returned from South Australia. The characters are Fell and Frank, two whalers at Encounter Bay; Solomon Sanguine (fictitious name), the guest of Fell and Frank, and, though a novice, a devoted sportsman; and Bob and Dick, two natives.

"In the midst of breakfast Bob entered, bawling out, 'There she clouts (spouts)! there she clouts!' Fell started up, and told his guest that it was a whale, and that he would now have an opportunity of gratifying his longing desire. The boat was instantly manned, and Mr Sanguine, by Fell's instructions, took the midship oar, one of the men being left out, as such boats are only fitted to contain the crew and no more. The whale was close in-shore, and a few strokes brought them alongside. Mr Sanguine laid out lustily at his oar, and was excited to the highest pitch, but ever and anon kept peeping over his shoulder for a sight of the object of pursuit, whose spoutings he could only hear. 'Come, come, Mr Sanguine,' says Fell, 'a good whaler minds only his oar, trusting to the headsman for the rest; but never mind. Stand up, Frank.' Frank was instantly on his feet, and the whale rose under the bows of the boat. 'Give it her, my lad,' says Fell; and in a moment the iron was buried in her side. 'Peak your oar, Mr Sanguine,' said Fell. Although the former did not understand the phrase, yet he was sharp enough to do as the rest did, and that correctly. The line was by this time flying out, and the fish sounding; in a trice she commenced running, and a turn being taken with the line round the lugger-head, the boat was soon skimming the water with great velocity. Solomon, rubbing his hands, hitching his shoulders, and seeming ready to jump overboard, in the height of ecstacy, exclaimed, 'This is glorious! Talk of the Manchester and Birmingham railways! they are nothing.' But here his speech was interrupted, and his frenzy cooled, when he cast his eyes at each side of the boat, and observed the water rising high above the gunnels. It may be necessary here to state, that it is only the rapidity of the motion that prevents the water from rushing in and filling the boat on these occasions. Solomon had no time to philosophise; but seeing the water several inches above the gunnel of the boat, he did not know how soon it might be as many feet; so he inhaled a prodigious quantity of air, and invoked the whole host of Neptune to aid him in his journey to the shore, as he was no great hand at swimming. His fears were, for the present, groundless; the whale began to rise, and his attention was now engaged by the rowers hauling in the line, with their faces turned inwards. Solomon did as he saw the rest doing, and his gigantic strength was perceptible enough on the boat, for, by the time that the whale reached the surface, the bowman had hold of the harpoon shaft. The headsman, Fell, from his proximity, was enabled to have 'a set on' the fish with the lance, which had such an effect, that it sickened and sounded, so that they were obliged to slack line again.

The calf which belonged to this female, in the hurry and fright having lost its mother, mistook the boat for her, as often happens, and coming alongside rubbed the boat with its noddle, and endeavoured to clasp it with its fins, to the great detriment of the boat's equilibrium. Solomon, not much liking this visiter, called out to Fell, 'The little creature is more plague than its mother; for any sake give it a poke and send it adrift, or it will turn us topsy-turvy.' Fell only laughed; but, to ease him of his terrors, struck it gently on the head, and down it went. The respite was but short, for the mother, which rose head first, close alongside the boat, almost touched Solomon, who viewed it with a mixture of astonishment and awe, as, like a huge black rock, covered with barnacles, it emerged from the deep. His taste for the marvellous was further gratified by observing her carrying her sick cub on her fin. His feelings were fast rising to a climax, when the whale spouted blood to a terrific height, the gurgling sound of which drew Solomon's attention that way; but he only turned his head in time to discern the falling column, which descended with great violence on his unfortunate pate, half choking him and half filling the boat. 'Sampson slaying the Philistines, or Whitechapel on a Friday, is mere shakings to this!' shouted Mr Sanguine. But, alas! his troubles were only beginning; for the irritated creature passing under the boat, with one blow of its enormous tail sent the boat into the air, and the crew into the water. For a moment every one was immersed; but when Fell rose to the surface, he beheld Solomon, who had alighted on the whale's back, lying at full length there, puffing, striking out, and struggling, with all the appearance of a drowning man contending strongly for life. 'Keep up a good heart, my boy,' cried Fell, to whom such scenes were every-day work; 'and make for the bottom of the boat!' Solomon, who, from the first, seemed recalled to a state of consciousness by Fell's friendly voice, looked wildly round, and replied, 'That's all very good, but a swimmer of my capabilities had better remain where he is.' Fell, pushing a pair of oars before him, towards Solomon, answered, 'Yes, yes; but your foundation is about as unstable as the house that was built on sand.' 'By Jupiter, that's true,' said Solomon, 'so here's for it;' and casting himself from the whale, with one or two ungainly strokes seized the blade of an oar, and was thus towed to the boat, on the keel of which he mounted, and shook his fiery locks much after the fashion of a Newfoundland dog. His first inquiry was if they were all safe; and being answered in the affirmative, asked for a quid of tobacco, as he observed all his companions busy chewing, and which he considered must be necessary under such circumstances.

A relief boat, manned with black fellows (Bob Headsman and Dick Steersman), came up, and Fell and his crew jumping into it, left the black fellows, who were only in their element, to right the boat, while they followed after the whale, which had gone but a short distance, and having picked up the line, soon terminated his existence. Solomon, in the height of his excitement, strongly besought Fell to kill the calf also, as he considered that it had been the cause of all their troubles. But on Fell saying that nature's law hardly allowed us wantonly to destroy that which was of no utility to us, and might hereafter be of great benefit, he at once coincided with him, and asked how he behaved under the trying circumstances. Fell briefly replied, 'Like a man,' which seemed to soothe the last billow of his wrath.

The whale was towed home, and the newly-elected member ceased not for a moment on the way to expatiate with rapturous enthusiasm on the splendid sport of the day, at the same time venting his spleen on the pap-eaters at home, and picturing the benefit they had that day conferred on mankind, as well as holding forth learnedly on the happy prospects that this new world presented to generations yet unborn. Let them clear the surface of the earth of game, still the deep would annually yield its myriads of whales to gratify the hunting propensity of man, and supply him with many of the requisites of life.

The boats were hauled up, and the different members proceeded to their respective huts. Fell was detained on the way, but Frank and Solomon found a blazing fire awaiting them—no trifling comfort under present circumstances. They were horrid-looking creatures, particularly the latter, from the quantity of blood clotted all over them. Mr Sanguine was, however, quite unconscious of his odd plight, and was with difficulty prevailed on to strip, scrub, and put on dry clothing. It was dark when Fell entered; the dinner was just set, and Mr Sanguine was looking himself round, and extolling his whaler's dress to the skies. 'How easy it sits, how comfortable it feels, how handsome it looks,' said he; 'and all for the price of a pair of fancy slippers. What silly folks are they in England, and the higher in life the more foolish; as poor as church mice and as proud as Lucifer—as helpless as calves, ay, ten times more so than whalers'—but here he was interrupted by Fell, who was standing beside him, highly delighted at the happiness of his guest, as well as amused at his ideas of utility and contempt of foppery. 'Yes, Mr Sanguine,' said Fell, 'how often do we see the whale's calf, newly ushered into the world, show considerable instinct at self-preservation. You saw one to-day sink beyond the reach of our stroke to avoid harm; how often do we see them cling to their mothers' paps, or take shelter under her fins, as she bounds with them through the deep, flying from her foes. Nor does the mother ever forsake them. This day, Mr Sanguine, while you triumphantly rode on the whale's back, you owed your life to the mother's mistake—she thought you were her calf. It is, indeed, nothing uncommon for a whale to remain on the spot, and be lanced to death, afraid of moving her tail, with which at one stroke she could scatter her enemies, lest she should injure her young, preferring present death to flying for her life and mourning her lost offspring.' Mr Sanguine here interrupted Fell by observing, that 'It is very fortunate, in-

Digitized by Google

deed, that they take care of their young for the sake of preserving the breed.' Fell resumed: 'How many mothers do we see of the human species, who, in point of natural affection, would bear but a miserable comparison with the whale! How many mothers are there in the polite circles who bring forth and send their children abroad to be watched by the alien and the stranger, regretting only the pains they endure, the time they are shut out of society, the inroads made on their beauty, and only looking anxiously forward to the moment when they will again be able to rush into new scenes of dissipation; but the whale's greatest delight appears to be in nourishing its young, and shielding it from danger, until her tender trust is able to shift for itself, ofttimes eighteen months and upwards.'

By this time they were unconsciously seated round the dinner-table; the cook had shown great justice to the dishes—the flavour of the soup, made of the kangaroo's tail, was beyond anything that Solomon had before tasted. The kangaroo steaks were, in his opinion, only surpassed by the fried smell, a part of the whale near the tail which is very delicate eating, to which Mr Sanguine did ample justice, and praised it as much. In the middle of his enjoyment he did not forget to deplore the degeneracy of the age, and their apathy for any great or noble enterprise, and calculated how many families could live comfortably for many days on the delicate parts of the whale they had killed. Afterwards, the tale and song went merrily round, to which Mr Sanguine contributed abundantly, and in the midst of his joy he was heard repeatedly to declare that he never knew what happiness was before."

"MAXIMS, MORALS, AND GOLDEN RULES."

[Selected from a neat little work, bearing the above title, published by J. Madden & Co. London: 1839.]

Forbear to *sport an opinion* on a subject of which you are ignorant, especially in the presence of those to whom it is familiar. If it be not always in your power to speak to the purpose, it certainly is to hold your tongue; and though thousands have remembered with pain their garrulity, few, as an ancient remarked, have had reason to repent their silence.

The sure way to be deceived is to believe ourselves more cunning than others.—Rochefoucault.

It is no merit to accomplish an object by difficult instruments, when easy ones are at hand, or to reach an end by a circuitous road, when there is a straight course. Michael Angelo being told of an artist who painted with his fingers, exclaimed, "Why does not the blockhead make use of his pencils?"

Trust him little who praises all, him less who censures all, and him least who is indifferent about all.—Lavater.

The excesses of our youth are drafts upon our old age, payable, with interest, about thirty years after date.—Colton.

One ungrateful man does an injury to all who are wretched.—Pub. Syrus.

I am sent to the ant to learn industry; to the dove to learn innocence; to the serpent to learn wisdom; and why not to the robin-redbreast, who chants as delightfully in winter as in summer, to learn equanimity and patience?

He who gives for the sake of thanks, knows not the pleasure of giving.

Most men abuse courtiers, and affect to despise courts; yet most men are proud of the acquaintance of the one, and would be glad to live in the other.—Colton.

A companion that is cheerful, and free from swearing and scurrilous discourse, is worth gold. I love such mirth as does not make friends ashamed to look upon one another next morning; nor men, that cannot well bear it, to repent the money they spend when they be warmed with drink. And take this for a rule: you may pick out such times and such companions, that you may make yourselves merrier for a little than a great deal of money; "'Tis the company, and not the charge, that makes the feast."—Izaak Walton.

A Persian philosopher, being asked by what method he had acquired so much knowledge, answered, "By not being prevented by shame from asking questions when I was ignorant."

Truth will ever be unpalatable to those who are determined not to relinquish error, but can never give offence to the honest and well-meaning; for the plain-dealing remonstrances of a friend differ as widely from the rancour of an enemy, as the friendly probe of a physician from the dagger of an assassin.—E. W. Montague.

If you would be known, and not know, *vegetate* in a village; if you would know, and not be known, *live* in a city.—Colton.

In wonder all philosophy began; in wonder it ends; and admiration fills up the interspace. But the first wonder is the offspring of ignorance; the last is the parent of adoration.—Coleridge.

Children should be inured as early as possible to acts of charity and mercy. Constantine, as soon as his son could write, employed *his* hand in signing pardons, and delighted in conveying, through *his* mouth, all the favours he granted. A noble introduction to sovereignty, which is instituted for the happiness of mankind.—Jortin.

If a man had no person whom he loved or esteemed, no person who loved or esteemed him, how wretched must his condition be! Surely a man capable of reflection would choose to pass out of existence rather than to live in such a state.—Reid's Essays.

The two most precious things on this side the grave are our reputation and our life. But it is to be lamented that the most contemptible whisper may deprive us of the one, and the weakest weapon of the other. A wise man, therefore, will be more anxious to deserve a fair name than to possess it, and this will teach him so to live as not to be afraid to die.—Colton.

A kind refusal is sometimes as gratifying as a bestowal: he who can alleviate the pain of an ungracious act is unpardonable unless he do so.

Moderation is the silken string running through the pearl-chain of all virtues.—Bishop Hall.

Be not ashamed to confess that you have been in the wrong. It is but owning what you need not be ashamed of, that you now have more sense than you had before, to see your error; more humility to acknowledge it; and more grace to correct it.—Seed.

A great means of happiness is, a constant employment for a desirable end, and a consciousness of advancement towards that end.

He who saith there is no such thing as an honest man, you may be sure is himself a knave.—Bishop Berkeley.

Of all sights which can soften and humanise the heart of man, there is none that ought so surely to reach it as that of innocent children, enjoying the happiness which is their proper and natural portion.—Southey.

When we feel a strong desire to thrust our advice upon others, it is usually because we suspect their weakness; but we ought rather to suspect our own.—Colton.

Persons who are always innocently cheerful and good-humoured, are very useful in the world; they maintain peace and happiness, and spread a thankful temper amongst all who live around them.—Miss Talbot.

Seek not proud riches, but such as thou mayest get justly, use soberly, distribute cheerfully, and leave contentedly.—Bacon.

We are often infinitely mistaken, and take the falsest measures, when we envy the happiness of rich and great men: we know not the inward canker that eats out all their joy and delight, and makes them really much more miserable than ourselves.—Bishop Hall.

If 'tis a happiness to be nobly descended, 'tis no less to have so much merit that nobody inquires whether you are so or no.—La Bruyere.

When any calamity has been suffered, the first thing to be remembered is, how much has been escaped.—Dr Johnson.

Receive no satisfaction for premeditated impertinence: forget it, forgive it, but keep him inexorably at a distance who offered it.—Lavater.

The race of mankind would perish, did they cease to aid each other. From the time that the mother binds the child's head, till the moment that some kind assistant wipes the death-damp from the brow of the dying, we cannot exist without mutual help. All, therefore, that need aid, have a right to ask it of their fellow-mortals: no one who holds the power of granting can refuse it without guilt.—Sir Walter Scott.

Those beings only are fit for solitude who like nobody, are like nobody, and are liked by nobody.—Zimmerman.

He that does not know those things which are of use and necessity for him to know, is but an ignorant man, whatever he may know beside.—Tillotson.

It is an old saying, *that charity begins at home;* but this is no reason that it should not go abroad: a man should live with the world as a citizen of the world; he may have a preference for the particular quarter or square, or even alley, in which he lives, but he should have a generous feeling for the welfare of the whole.—Cumberland.

We ought, in humanity, no more to despise a man for the misfortunes of the mind than for those of the body, when they are such as he cannot help; were this thoroughly considered, we should no more laugh at a man for having his brains cracked than for having his head broke.—Pope.

ERROR OF GIVING MEDICINE TO INFANTS.

Many mothers are continually administering medicines of one kind or another, and thereby deranging instead of promoting the healthy operation of the infant system. Instead of looking upon the animal economy as a mechanism constituted to work well under certain conditions, and having, in virtue of that constitution, a natural tendency to rectify any temporary aberrations under which it may suffer, provided the requisite conditions of action be fulfilled, they seem to regard it as a machine acting upon no fixed principles, and requiring now and then to be driven by some foreign impulse in the shape of medicine. Under this impression, they are ever on the watch to see what *they can do* to keep it moving; and, altogether distrustful of the sufficiency of the Creator's arrangements, they no sooner observe a symptom than they are ready with a remedy. Such persons never stop to inquire what the *cause* is—whether it has been, or can be, removed—or whether its removal will not of itself be sufficient to restore health. They jump at once to the fact that disease is there, and to a remedy for that fact. If the child is convulsed, they do not inquire whether the convulsions proceed from teething, indigestion, or worms, but forthwith administer a remedy *to check the convulsions;* and very probably the one used is inapplicable to the individual case; and both the disease and the cause being in consequence left in full operation, instead of being removed, the danger is increased. * * I have no hesitation in expressing my conviction that a child can encounter few greater dangers than that of being subjected to the vigorous discipline of a medicine-giving mother or nurse; and wherever a mother of a family is observed to be ready with the use of calomel, cordials, anodynes, and other active drugs, the chances are that one-half of her children will be found to have passed to another world.

Even when the child is under the care of a professional adviser, it is by no means safe from the risk arising from the exhibition of heterogeneous medicines. Whenever a child is seriously ill, there is not only great anxiety on the part of the mother, but much sympathy on the part of friends and neighbours, every one of whom has her own story of what was done with such another child in the same situation, and the great good obtained from such and such medicines. In vain the mother may urge that the physician has seen the patient, and already prescribed a different course. Entreaties are poured in with an earnestness proportioned to the danger, just *to try* the vaunted remedy *without telling the doctor* or interrupting the use of his medicines. Anxious for the relief of her child, the mother often yields before her better judgment can come into play to prevent her, and in a short time the child perhaps suffers from this abuse of incompatible or dangerous remedies, which aggravate the original disease. Those who are accustomed to reflect before they act, would be amazed if they were to witness the perilous follies sometimes perpetrated in this way, and the perfect self-complacency with which the anticipated results are looked for from the individual doses, no matter how much they may counteract each other. * * * *

The system of concealment from the family physician, into which the adoption of "every body's" advice is so apt to lead, is itself an evil of the first magnitude. By inducing him to ascribe effects to wrong causes, it necessarily tends to mislead his judgment, and may thus render him also unwittingly an instrument of mischief. The maternal anxiety which lies at the root of the error is highly natural, and every sensible practitioner will make allowance for its impulses, even where they are ill-directed and annoying to himself. But the fair and proper way for the mother is, not to act upon the suggestions of others without the knowledge of the medical attendant, but to state simply, and in an honest spirit, that certain suggestions have been made, and inquire whether they meet with his approbation or not. If they do, they will then be adapted by him to the necessities and peculiarities of the individual case, and the different parts of the treatment be carried on consistently and safely. If, on the contrary, they do not, the physician will have an opportunity of assigning a reason for his disapproval, and of pointing out the greater fitness of the means already employed; and if the parent shall not be satisfied with this explanation, but still insist on the suggestion being tried, he can then either decline farther responsibility, or take care that the trial be made with as much safety and prospect of advantage as possible.—*Dr Combe on the Management of Infancy.*

RARE DOINGS OF A TAILOR.

The bridge over the Teith at Doune is well worth a passing notice. It is a strong, sturdy erection, though upwards of three hundred years old, and the work of a tailor. In the parapet is the following inscription, still distinctly legible: we shall modernise the spelling. "In God is all my trust, said Spittel. The tenth day of September, in the year of God, 1535 years, founded was this bridge, by Robert Spittel, Tailor to the Most Noble Princess Margaret, Queen to James the Fourth." Mr Spittel was not ashamed of his profession, for, in addition to the designation in the inscription, he has ornamented the parapet with the characteristic emblem of a large pair of scissors! There is a tradition in the district concerning this worthy knight of the *shears*. There was a ford and ferry about half way between the present bridge and Doune Castle, and Spittel had frequently to pass the ford. The fare was a doit, but Spittel had no smaller coin than a bodle (equal to two doits), and having been at former times ill pleased with the inattention of the ferryman, he very coolly took out his shears, clipped the bodle in two, and gave one-half to the ferryman! The careful tailor grew rich and prosperous, and was a public benefactor. He built two other bridges; one at Bannock, and another at Tullibody; and he founded an hospital in Stirling, from which widows and orphans are still relieved and supported. Queen Margaret's tailor was, therefore, no ordinary man. He placed a motto on his hospital at Stirling, "The liberal man deviseth liberal things," and he surmounted it again with a representation of his *shears*—the source of all his liberality. Is Queen Victoria's tailor as proud of his shears, or as well disposed to devise liberal things?—*Inverness Courier.*

CURIOUS CALCULATION.

The following interesting account was taken on the 12th of August, by a gentleman from Yorkshire, at the soap-manufactory of a relative situate in King William Street, London Bridge, of the number of carriages, of various descriptions, which passed from eight in the morning till eight in the evening:—

From 8 o'clock till		9	903	From 3 o'clock till		4	975
9	...	10	997	4	...	5	1053
10	...	11	895	5	...	6	712
11	...	12	1015	6	...	7	771
12	...	1	984	7	...	8	894
1	...	2	806				
2	...	3	905	Total			11010

This averages 970 an hour, or 15 in every minute; and it is fair to presume that there is no street in the world where so many carriages pass and repass in one day. On the 1st of September last this gentleman engaged several persons, in order to ascertain the number of foot passengers which passed the factory from eight in the morning till eight in the evening, and the result was as follows:

From 8 o'clock till		9	3600	From 3 o'clock till		4	4480
9	...	10	4460	4	...	5	5280
10	...	11	4380	5	...	6	4480
11	...	12	4620	6	...	7	3945
12	...	1	3900	7	...	8	6720
1	...	2	3840				
2	...	3	4200	Total			53503

This statement will be found equal in number to 4455½ per hour, or 74 in every minute. The number of persons supposed to pass in and with carriages (averaging two to each) amounts to 22,020, which, added to the above, makes a total of 75,505 passengers in 12 hours.—*Sunday Times.*

London: Published, with permission of the proprietors, by W. S. Orr, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 460. SATURDAY, NOVEMBER 21, 1840. PRICE THREE HALFPENCE.

GLORY.

THE love of fame is, in the main, a generous passion. It does not form the highest of motives, but it is very much superior to many. In its more elevated moods, it approaches even the highest, for then we overlook the earthy present, and contemplate only the praise of posterity—of those we can never know, nor hear, nor see, nor in any way profit by. Apart from this, it will be found that the motives of laudable deeds are mostly material; pains to be avoided, or pleasures to be enjoyed. This alone is an ideal, an intellectual breathing. It is the unbought grace, and will often influence those in whom a sense of religion is dead, or moral ties disregarded. Such being the social importance of a desire of renown, it is of consequence that the passion should be rightly directed, and ignominy or honour justly awarded.

In the early ages, glory was founded on beneficence. Acts useful to man alone raised a mortal to the skies. This was the beginning of hero-worship. All the more celebrated characters who fill the Pantheon of the ancients, earned divine honours by meritorious services, by encountering trials and dangers, by ridding the earth of monsters, of nuisances and oppressors, or by useful arts, discoveries, and inventions. Bacchus taught the use of the vine, and of honey; Æsculapius the art of curing diseases. Ceres instructed men in agriculture; Apollo and Orpheus were the inventors of music. Theseus is renowned as the determined foe of robbers and wild beasts; Castor and Pollux of pirates, by which they encouraged navigation: and amongst the labours of Hercules, we have no doubt that one for which he earned as much praise as for any other, was that cleansing of the Augean stable, which has been the prototype of so many reforms of later days. From such characteristic attributes, and in spite of fabulous mystification, it seems clear that the early Pantheon of the ancients was strictly an aristocracy of *talent and desert*. Its basis was of the Benthamite order, utilitarian; and no one could scale the Olympian heights, and win the glorious apotheosis of a sidereal mansion, save through deeds of valour, philanthropy, or patriotism.

Illusions less profitable to mankind succeeded these dazzling chimeras of a poetical age. The chief was the love of conquest. Heroic toils cease to consist in the abatement of public grievances, in slaying the ravaging lion of Nemæa, in cutting off the heads of the Lernean hydra, or in rescuing a suffering community from an oppressive tribute by the destruction of the devouring Minotaur. In lieu of such patriotic services, heroes occupied themselves in destroying each other, and in subduing and laying waste their respective territories. This was the pride of imperial Rome, her thirst being for universal sway; and the same passion for domination had previously animated the monarchies of Persia, Babylon, Assyria, and Macedon, and the petty and belligerent republics of Greece. It was the corruption of true heroism, whose primitive application consisted in the godlike vocation of doing good to mankind; for which laudable devotion the benefactors were translated to heaven.

A similar perversion of what was meritorious in origin continued through subsequent ages. The hyperborean glories of Odin and his hall of skulls, or of the heroes of Ossian, are too remote to be dwelt upon; but the reign of Charlemagne offers a better defined era. The exploits of this illustrious warrior were mainly directed against the Saracenic invaders, and to the conversion of the Saxons and other German nations to Christianity. The triumphs of the Cross continued for centuries, in western Europe, to be the guiding star of heroic enterprise. Glory consisted in the diffusion of the Gospel; and Jupiter and Mars were supplanted by the renown of St George of Cappadocia and Montjoye St Denis, whose names became respectively the rallying battle-cries of England and France. This pious fervour attained its meridian heat during the Crusades. In these famous expeditions, the energies of Europe were concentrated; all were roused, from prince to serf; and history offers no other example in which so universal, generous, and ardent an enthusiasm was elicited. The Trojan war, a similar enterprise of associated princes, was for an object which sinks into insignificance in comparison. In the mediæval conflicts of Palestine, the single disinterested object sought was to rescue the holy sepulchre from infidel profanation. The struggle was bravely maintained for upwards of a century, under great disadvantages from climate and distance. The flower of European chivalry perished by the sword or disease; and the multitudes and treasure sacrificed in this romantic undertaking are quite incalculable, showing the vast extent of disinterestedness of which men are capable, when once their sympathies are thoroughly excited.

Passing over the religious wars of the Protestant Reformation, we come to the illusions of the seventeenth and eighteenth centuries. Among the votaries of a vain-glorious ambition, of this period, stands prominently forward Louis XIV. of France. His history is a lesson to princes, and even to private persons. In him we have a striking example how natural abilities and good dispositions may be perverted by vicious education. Accustomed from earliest infancy to hear only what flattered his pride and depraved tastes, he never learnt what was truly just and elevated in conduct. He was perpetually reminded of the vast power he was born to, never of its correlative duties; of his surpassing greatness, but never how that greatness could be most beneficently illustrated. His long reign, in consequence, was a grand mistake, which he discovered when too late to repair its errors. France never recovered under the elder branch of the Bourbons from the evils entailed by his mistaken policy. She was enfeebled and impoverished by his profitless wars; the choice of her population were slain in battle; the finances were disordered; the industrious orders were weighed down by burdensome imposts, and the seeds of those calamities were sown which ripened into destructive maturity under his successors. The king himself in old age exhibited the usual conclusion of a weak and misspent life—becoming the victim of an intolerant superstition, of self-reproach and disappointed schemes. The people rejoiced at his death, having discovered the emptiness of those objects in which he had wasted the national resources, and by which they had been dazzled in the earlier part of his career.

Contemporary with the latter period of this king's reign, flourished Charles XII. of Sweden. He had drunk heroic inspiration from the pages of Quintus Curtius, and sought to rival the exploits of the Macedonian hero. Without refinement, or sympathy with aught save toil and danger, Charles was formed by nature for the conqueror's vocation. War was enjoyment to him, which he followed as disinterestedly as some individuals do the chase; only, in lieu of a pack of hounds he had a nation in leash, and his game did not consist in partridges and hares, but his brother potentates, whom he deposed or hunted out of their territories, apparently more for sportive occupation than any just cause or settled purpose of extending his dominion. His career was of short duration. For a moment Europe was astonished at the dashing attempt of the adventurous Swede to revive the ancient drama of universal conquest; but the visionary aspiration was dissolved by the decisive victory of Pultowa, won by Peter the Great—a more prosaic but useful prince, whose leading aim was the civilisation of his own subjects, not the disturbance of his neighbours.

The philosopher-king of Prussia, Frederick II., cannot be reckoned among ordinary conquerors. Much of his reign was certainly spent in desperate warfare, but his wars mostly originated in politic ambition. His paternal kingdom was small, and he sought, by availing himself of circumstances, and of pretexts for aggression not always defensible, to enlarge its boundaries. Louis XIV., indeed, was the last among the old monarchs of Europe who sought to embody Asiatic ideas of empire and regal magnificence. The miserable results of his ostentatious efforts, their enfeebling effects on France and neighbouring states, afforded lessons of instruction that tended greatly to abate the pride and pomp of soldiering. Diplomacy, in place of physical force, began to be more frequently resorted to in the settlement of national differences. The wars that did occur, and in which England participated, mostly originated in commercial jealousy, in disputes about the possession or boundaries of colonies, or grew out of the electoral dominions of the Brunswick family, or were expressly undertaken for the maintenance of a balance of power in Europe, as the best guarantee of general peace and security.

This system continued without essential derangement till the burst of the French Revolution. By this great commotion former ideas and relations among states were disturbed. France became, in the European family, a sort of outlaw, carried away by energies and principles that had no previous type or existence. After undergoing rapid and extraordinary mutations, alternately the dread and astonishment of Europe, she found a temporary resting-place from internal conflicts under the sway of a chief who owed his elevation to her divisions, and his strength to her necessities. Napoleon Bonaparte was formed exclusively on the antique model of Pagan grandeur. He had the ambition of Julius Cæsar, with the craftiness of the Carthaginian Hannibal; and to the end of his public life, Plutarch's heroes formed his standard of excellence. His career is a brilliant episode in modern history, but, like that of the Swedish Charles, Alexander, Tamerlane, and Zinghis Khan, has left few traces proportioned to the vast physical power he called into action. Thrones were overturned, and nations overrun, but it was the lofty flight of the eagle, or the ravages of a hurricane that touched only the high places, leaving the solid structure and heart of European society not materially altered. France owed to his restlessness her greatest humiliation, and the illusions of military glory with which she was transported under his guidance, were as irrelevant to public happiness as those of an impracticable liberty, with which she had been previously intoxicated.

The honours paid to the memory of Napoleon, by the removal of his remains from St Helena, are not a flattering exponent of the spirit of the times. By the apotheosis of his ashes, the god of war is invoked; for in war consisted his chief eminence. It shows, notwithstanding the spread of science, that the objects of idolatry in the modern are not greatly remote from those of the ancient world. Popular rites continue sanguinary; victims still smoke on bloody altars, and the incense of carnage is not unsavoury to the nostrils. This is to be lamented, for, though military force is as yet necessary for defence from both external and internal aggression, it is, in its offensive character, the most detestable of all things. War in itself was

not glory at the beginning, for the first heroes were the benefactors of mankind; and it never has been, and never will be, true glory. For ourselves, we are for the revival of the primitive worship, divested of its corruptions. Ceres and Apollo are the deities who should enjoy our votive offerings, and not Mars and Bellona. We should wish to see honour and glory given to the men who, by useful suggestions and acts, by pleasing accomplishments, and the furnishing of innocent enjoyments, should ensure greater happiness to greater numbers; still more to those who, by improving the moral nature of their fellow-creatures, made them better for both time and eternity.

STORY OF JOSEPH RIDGE.

Master Joseph Ridge was a very worthy individual, but such a one as seldom has played the part of hero in tale or history. The county of Surrey had the honour of giving him birth, and there he passed his early days. His parentage could by no means be called distinguished; his father, Gaffer Ridge, being but a plain hedger, and his mother, Goody Ridge, being a personage who had not married below her station—a roundabout way of saying that Joseph's immediate progenitors were both of the humblest class of society. Young Master Ridge was the only son of his parents, and was born to them in their mature years. He would have been called by most people a regular bumpkin; and certainly he had been nurtured in a way suitable to that appellation, and had every prospect of passing through life in such a state of Arcadian simplicity as to render the term enduringly appropriate. But, though Joseph Ridge might be a bumpkin, he was one "with capabilities," and so time proved.

In his boyish days, Joe wrought, as boys usually work, about a farm adjoining his natal cot; and, as he grew stronger and older, he began to help his father, who had a considerable amount of employment, and was beginning to feel the weight of years. Our young hero had a good heart, and usually assisted his father in a dutiful and manful way; but at times he showed a soul above hedging, and diverged from its sober engagements into pursuits which most folk called idle, and which the neighbouring manorial lords were apt to regard as high misdemeanours, worse than treason against the state. In general, however, Joe behaved himself like a good boy, and Goody and Gaffer Ridge were very proud of him.

One day Joe was returning alone from his regular toils, with his bill over his arm. He was wearied, but went on whistling cheerily, and ruminating at intervals on the comforts attending the consumption of fried bacon, and other little restoratives for a tired frame. A carriage came up behind him, and on reaching his side drew up. A respectable-looking servant out of livery, who was seated on the coach-box, looked hard at Joe, and then leapt down. "Stop a moment, if you please," said he civilly to our young labourer. Joe did come to a pause, but looked a little surprised. The man stared at him for a few moments longer, and then said, "I think I can't be in a mistake. Yes, you are the man. I have a note for you." As he spoke, he tendered a little unsealed and undirected billet to our hero.

"A letter for me!" returned Joe; "bless you, sir, you must be mistaken. Nobody writes to *me!*" "That may be," replied the other, "but this note *is* for you; I am sure it is," and he held out the paper again to Master Ridge. The latter took it into his hand, looked at it all ways, and then scratched his elbow. "I be'nt very good at reading hand of write," said he; "perhaps you would be good enough to do it for me?" The servant took back the letter, saying quietly, "It is from Lord S——." At this name, which was that of one of the greatest men of the district, and a minister of state, Joe's face turned suddenly to all colours of the rainbow. The memory of various little peccadilloes flashed rapidly across his brain, and he thought to himself—"Well, hang it, Joe, you *are* in for it at last!" The billet, however, gave no countenance to his fears, but on the contrary bore an opposite tenor. It merely desired the party "to whom the letter should be delivered, to accompany the bearer, without a *moment's delay*, to the house of Lord S—— in London, where something might perhaps be disclosed of advantage to his future interests."

"Oh, ho!" cried Joe, a little relieved, "it can't be me he wants. You have come to the wrong hand. My name's Joe Ridge. I am a poor hedger-lad, and have come, you see, from my work—up there by the canal side." This disclosure, which he expected to be perfectly decisive, had no effect whatever. The man-servant only smiled, and said, "I don't at all wonder at your surprise, young man. All will be explained to you. I know your name, and I am sure of the letter being for you, and you alone; and I advise you to come immediately with me, as it will perhaps be for your own good."

Joseph Ridge was perfectly confounded. To be sent for by a lord was something altogether out of the line of his wildest conjectures. While he stood in mute amaze, the servant said, "Time presses. The more quickly you come, the better pleased will his lordship be." "But I must go and tell father and mother," replied Joe; "and I must put on my Sunday's jacket." "Pooh, pooh!" said the servant, "come away just as you are." As he spoke, he led the half-reluctant Joe to the carriage, and was about to pull down the steps. "Come," cried Joe, bursting into laughter in spite of his confusion of mind, "that is a bit over much! *me* go into a carriage! No, heaven love you, I'll go on the dicky, if I must go at all." "That won't do," said the man; "you must go inside, and I shall pull down the blinds." He then half forced our hero into the carriage, bill and all, let down the blinds, shut the door, and in a few minutes the vehicle was off for London, which was not above eight or nine miles distant.

Master Joseph Ridge had some humour about him, and, notwithstanding the almost alarming oddity of his situation, he could not at first help laughing heartily, though not loudly, to find himself so suddenly become the inmate of a nobleman's carriage. "Polly Woodward thinks herself a cut above me—and so she is, 'cause her father's a farmer; but if she could see me now," thought Joe, "how she would stare!—and mother! Talking about mother, I must let her know, directly I can do it, where I am. I won't vex the old soul for ever a lord in the land!" After making this commendable reflection, our hero fell into a profound fit of musing on the possible cause of his lordship's summons. "It can't be the girn I set on Monday was a week," thought Joe; "no, no—the constable would have been the gentleman picked out to visit me had it been that." Another term of meditation succeeded, and then, on a sudden, our young rustic started up, and clapped his hands. "I have it!" cried he joyfully; "his lordship has seen me handling the bill, and wants to make me head hedger upon his grounds hereabouts. Oh, my eye! what news for father!" And poor Joe, overcome with the anticipation of his parent's joy, lay back in his seat, and wept. An honester or more honourable tear was never shed in noble's carriage!

The end of the journey arrived, and the carriage was driven to the door of Lord S——'s splendid mansion in —— Square. The dusk had fallen in, and Joe was delivered from his place of confinement without observation. He was ushered into a private room, and the unliveried servant went to inform his lordship of the arrival of the visiter. In a few seconds the man returned to bring him to the presence of Lord S——. Having never been in London before, Joe's confusion and tremors had returned on being whirled through the crowded streets, and were strengthened at sight of the magnificence around him in Lord S——'s house. Looking at his clumsy hob-nailed shoes, he said hurriedly to the servant, "Shouldn't I take them off?" "No, no," returned the other; "but you need not bring your hedge-bill with you," continued he with a smile, seeing that our confused hero had lifted that weapon, so formidable to hawthorn boughs and green leaves. Joe laid down the bill, and followed his guide to a small but handsome apartment, where sat Lord S—— alone.

Lord S—— was a pale, weakly looking man of middle age. His countenance was fine, but wore a sensitive, nervous expression, indicating more than even the usual languor of luxurious life. The moment that Joe entered, the peer looked fixedly at him, and turning to the man-servant, who had remained in the room after carefully closing the door, he said, "You are right, William; this is he—the very person." His lordship then turned away, and seemed embarrassed—as much so as poor Joe. But the great man recovered himself apparently by an effort, and looking directly at our hero, said, "You know me, young man!—you recognise me!" Joe had seen his lordship several times in the country, and he said, with tolerable composure, "Yes, my lord." The peer again turned his head away for a moment, and then resumed—"It is needless to waste words. I will do much for you, if you will be *prudent*. Can I depend upon your discretion, young man!" Our rustic understood so far what was meant as to know it was fitting to reply, "Yes, my lord." "Then we understand each other—*fully?*" said Lord S——, with emphasis. "Yes, my lord," poor Joe *said*, but what he *thought* was something very different. "Then, let this subject never be adverted to again. William," addressing the servant, "I know your attachment to me. You hear my wishes. Never let the subject of this evening's meeting be mentioned between us again!—do not even think of it to yourselves!" An expression of pain and confusion passed from his lordship's face as he said to Joe, after a pause, "I will do much for you, young man. I think you have the appearance of good natural abilities, and you shall have wherewithal to cultivate them—you shall have education. You are not yet too old for it. Afterwards, I will take care of your fortunes. Remember only my wishes."

Joseph Ridge was re-conveyed to his parents on the morning succeeding this memorable evening. What were his reflections on the subject of it, it is scarcely possible to describe, the issue of the interview having been so extraordinary—so different from all that he had anticipated. His natural shrewdness led him sometimes to conjecture that there was a huge mistake under the whole affair; but against this conclusion stood out the fact, that the man-servant, and through him Lord S—— also, assuredly knew his name, and who and what he was. A strange notion as to his parentage came across his mind; he might have been a son of Lord S——, placed in infancy under the charge of Goody Ridge; but then he and his reputed father Gaffer Ridge were as like each other as two peas. All was mystery, in short; but Joe had sense enough to resolve upon holding his tongue at all events, and letting the tide of fortune carry him whither it chose. He told his parents that Lord S—— had seen him working, thought him an amazingly clever fellow, and was going to make a man of him. But he also said to them that the whole affair would be blown up if they talked about it. The old people were quite ready to believe Joe a genius; but their questions were troublesome to him. From these he was delivered two days after, being then carried to London, and put to school, while Lord S—— promised to make up privately for his loss to the old people, a promise which he amply fulfilled.

If a bumpkin, Joseph Ridge was certainly rather a clever bumpkin. He profited rapidly by the advantages afforded him, and in the course of no great time became a fair scholar. He was now well clad, well lodged, and well fed; and had sense to see that by strictly following up his lordship's wishes, he had a chance of rising in the world, but none otherwise. He therefore attended to his lessons diligently. In due time he was called, for the *second* time, before Lord S——. "I have the best accounts of you, Joseph," said his lordship; "and am told you are now fitted for a respectable situation. I have got a clerkship for you." Poor Joe was now able to put his gratitude into decent though embarrassed language. "Gratitude!" said the nobleman, interrupting him, "you owe me no gratitude. You have been prudent, and merit every thing I can do for you. Allude no more to this subject. It is painful to me."

Joseph Ridge went away pleased, but more surprised than ever. Again he teased himself with thinking whether or not he could bear some secret relationship, if not that of a son, to Lord S——; but there was no satisfaction to be got in this quarter. He could not doubt his being the son of Gaffer and Goody Ridge, and *their* lines of descent were known to the whole parish. "Never mind," thought Joe, "up the ladder I go, push me what may." And up the ladder of fortune he did go. Lord S—— raised him step by step, and at last fixed him, while still very young, as junior partner in a thriving commercial house. In his course of luck our hero forgot neither his poor old father and mother, nor any other old friends. They shared in his prosperity.

Mr Joseph Ridge had been in his new situation for several years, when William, the confidential servant of Lord S——, came one day with a hurried summons for him to appear at the bedside of that nobleman, who was declared to be dying. Joseph went without delay. "I have sent for you," said his lordship, speaking in a faint voice, "to thank you for having preserved my secret so well." "Secret! my lord," said Joseph. "Yes, I can now talk of it—I could not bear to do so before. It is little that a dying man cares what is said of him, yet you must promise to preserve silence still"— His lordship grew exhausted. He pressed the hand of Joseph, and the latter returned the pressure, and this seemed to satisfy the dying peer. Friends and physicians came round him, but he never spoke again.

After all was over, Joseph, more confounded than ever, was retiring from the house, when William, the servant, stopt him and took him into a private apartment. The man was sorrowful, but he composed himself, and said to Joseph, "I have sometimes thought, Mr Ridge, that a mistake was made in your case. Do you, or did you ever know the secret cause of my lord's notice of you?" "To be candid," said Joseph, "I never did." "You have been made a man of, then, by a fortunate accident," replied the other. A pause now took place, and William seemed thoughtful. "You must feel curious to know the truth," said he at length, "and I believe you are too grateful to my lord to disclose it to the injury of his memory. I will tell you the whole. My lord was, you know, an able statesman, and altogether a man of great talents; but he was constitutionally nervous and sensitive in the extreme. One day, some years ago, a circumstance connected with public business drove him into a state of temporary derangement. He rushed down to his seat in Surrey, accompanied only by myself. When there, he went out alone, about mid-day, and precipitated himself into the canal. Fortunately, I had watched him, and I managed to get him out. A young countryman stood on the opposite bank at the time. He had seen the deliberate attempt of my lord, and rushing up, though he could not help us, saw my lord recover—in short, saw the whole affair. The cold bath effectually restored the reason of Lord S——, but then came upon him a feeling of dreadful alarm lest his suicidal attempt should get wind. The idea of being despised as a lunatic, and the prospect of losing place, character, and influence, almost hurried his proud and sensitive mind back into its former state, and he gave me instant orders to search for the sole witness of the scene (whom he himself had seen), and to bring him away, in order to secure his silence at any cost. I was left to do this, and his lordship, though ill, rode off for London, to make a public appearance that evening, lest the worst should come out. I found you out, learnt your name, watched you at work near the spot, and was convinced

Digitized by Google

you were the very person, your dress and appearance being the same with that of the individual wanted. You know the rest. I went for the carriage, and you were in London that evening. His lordship's shrinking dislike to enter on the details of the subject caused the mistake to be confirmed, and *I* never spoke of it, because to me his commands were ever law. He thought your look promising, and took the course that he did with you, in the hope of being safer with an educated man than a boor."

"I was not the person," said Joseph. "Well, well," said William, "my poor lord could well afford all he spent on you. The mistake has done no harm to any one, certainly not to you."

It indeed made the fortune of honest Joe Ridge. These matters occurred a good while ago, but we believe there are some of Joe's descendants yet living, who bear the double name of Woodward Ridge.

MEETING OF THE BRITISH ASSOCIATION AT GLASGOW.

SECTION OF MATHEMATICS AND GENERAL PHYSICS.

PERHAPS the most remarkable paper read at this section, both for its scientific character and its popular interest, was one by an American gentleman, named Espy, respecting the laws governing storms. Mr Espy is, we understand, a gentleman of moderate fortune, who, instead of giving himself up, as most Americans of his class do, to mercantile pursuits, has devoted himself from an early period of life to investigations in meteorology, and thereby excited no little wonder amongst his more practical compatriots. A brief notice of some part of his speculations formerly appeared in the Journal, but not in so conspicuous a manner as to preclude our here giving a summary of his entire theory.

Mr Espy, whose address to the section occupied two hours, commenced by stating that he had found, by examining simultaneous observations made in the middle of storms, and all round their borders, that the wind blows inwards from all sides of a storm to its central parts. If the space overspread by the storm be circular, the wind blows to a central point; if oval, it blows towards a line extending through the longest diameter. He stated that he had been able, within the last five years, to investigate seventeen storms, not one of which formed any exception to the general rule. As an illustration, he presented a map of Great Britain and part of Ireland, exhibiting the direction of the wind in twenty-two different places on the night between the 6th and 7th of January 1839, when so much damage was done to the shipping around our coasts, and particularly at Liverpool. It appeared that at all the points where observations were made in Scotland, beyond the Forth and Clyde, the wind came from the north-west. In all the places throughout the east and central districts of England, it was from the contrary direction, south-east. On the west coast, again, from the Mersey to the coast of Ayrshire, the wind was, after 10 o'clock at night of the 6th, from the south-west. It appeared, indeed, that the wind on this occasion blew from all around towards a point somewhere in the south of Scotland, or the German ocean immediately to the east of that district.

In all the other cases, precisely similar phenomena had been observed. With the aid of the Franklin Institute, Mr Espy had got a correspondence established with individuals in various parts of North America, extending from Canada to Georgia, a space of a thousand miles. These individuals were requested to record the precise period when storms occurred in their neighbourhood, their duration, the direction of the wind, and the state of the barometer and thermometer, when the parties had such instruments. The history of nine storms was obtained in this way, and they were all wonderfully similar. In the centre of the storm there was a calm, and the barometer was there low. The storm had, besides, a progressive motion eastward. In one case, for instance, the centre would be in the western states, and the eastern states would have an east wind; next day, the storm had travelled eastward, a calm prevailed in the eastern states, and an east wind on the coast; on the third day, the wind blew from the west in the eastern states. Thus the centre appeared to travel from the western states to the coast, and from thence into the Atlantic Ocean. Mr Espy had also examined the accounts collected by Mr Redfield and Colonel Reid, of various storms and hurricanes in the West Indies. The form of these seemed to be more nearly circular, and their progressive motion, as Messrs Redfield and Reid showed, was north-westward. It is this progressive motion which has given birth to the idea that the currents of air in these storms form vortices revolving horizontally. Mr Espy says that he has examined the data collected from the log-books of ships, by the gentlemen mentioned, and when those which are strictly *simultaneous* are compared, they agree completely with his theory, and show that the winds did not revolve horizontally, but blew inwards to a common centre.

This blowing inwards to a centre, Mr Espy conceives to be the consequence of the sudden and powerful ascent of a column of air at that centre, from the atmosphere being there more heated than elsewhere. The column, as it ascends, expands, in consequence of being always less and less under pressure. In its ascent, it takes up with it the aqueous vapour with which it has chanced to be charged. It is here necessary to advert to what scientific men call the *dew point*. Many must be familiar with the phenomenon of a bottle of iced wine, or any other bottle containing very cold liquor, being introduced into a room which has been warmed by a large company, when immediately dew begins to be formed on the outside of the bottle, the coldness having condensed the aqueous vapour of the surrounding air. The highest temperature at which the bottle would condense the surrounding vapour, is called the dew point: that degree of temperature depends on the quantity of vapour in the air, and is therefore variable. As a column of air ascends, it loses, in consequence of expansion, 1¼ degrees of temperature of Fahrenheit for every hundred yards of ascent; in other words, it rapidly becomes cool, and acquires the power of condensing the aqueous vapour with which it is charged, or which may be immediately around it. Thus cloud is formed, and ultimately rain. If that vapour, in its ascent, continued in the same state in which it was below, the changed temperature would affect it in this manner to a far greater extent than we see in nature: the effect is moderated to a considerable extent in consequence of the expansion which at the same time takes place in the vapour. The vapour, in short, becomes thinner as well as the air, but not in the same ratio. It is affected in this way only to the extent of ¼ of a degree of Fahrenheit for every hundred yards of ascent, being a full degree less than the extent to which the air is affected by expansion. It follows that, as soon as the column rises as many hundred yards as there are degrees of Fahrenheit between the temperature of the atmosphere and the dew point, cloud will begin to form. When the vapour condenses, it will give out the latent caloric into the air, which will prevent the ascending air from cooling more than half as much as it would otherwise have done on its further ascent. Thus, the higher the column of air rises, the warmer it will be when compared with the air on the outside of the cloud at the same height. For every degree that the cloud is warmer, it will be a certain amount lighter than air at zero; and thus under the cloud the barometer will fall, and the air will run in under the cloud and upwards, with a velocity of upwards of 240 feet per second. Mr Espy first inferred the existence of these ascending currents over the space where a calm prevailed on the surface of the earth, but was afterwards able to prove it, and to prove, too, that they always attend the formation of clouds. For this purpose he sent up large kites, and he invariably found that, long before they reached the under surface of the cloud, they were strongly dragged upwards, and often carried violently out of his hands. In explaining the formation of clouds, he has an instrument of his own contrivance, which shews how vapour is condensed and rendered visible, by the cold produced by the dilatation of the air. Water-spouts are another of the effects of these upward currents, which are, in Mr Espy's theory, the key to the principal phenomena of meteorology.

This may be taken as an outline of the theory, and of the observations on which it is founded. Mr Espy deduces from it several observations bearing on the practical concerns of life; and these we take from an excellent report of his paper in the Athenæum:—

"As air cannot move upwards without coming under diminished pressure, and as it must thus expand and grow cooler, and consequently form cloud, any cause which produces an up-moving column of air, whether that cause be natural or artificial, will produce rain, when the complement of the dew point is small, and the air calm below and above, and the upper part of the atmosphere of its ordinary temperature.

Volcanoes, therefore, under favourable circumstances, will produce rain—sea-breezes, which blow inwards every day towards the centre of islands, especially if these islands have in them high mountains, which will prevent any upper current of air from bending the up-moving current of air out of the perpendicular, before it rises high enough to form cloud, such as Jamaica, will produce rain every day—great cities where very much fuel is burnt, in countries where the complement of the dew point is small, such as Manchester and Liverpool, will frequently produce rain—even battles, and accidental fires, if they occur under favourable circumstances, may sometimes be followed by rain. Let all these favourable circumstances be watched for in time of drought (and they can only occur then), and let the experiment be tried; if it should be successful, the result would be highly beneficial to mankind. It might probably prevent the occurrence of those destructive tornadoes which produce such devastation in the United States; for if rains should be produced at regular intervals, of no great duration, the steam power in the air might thus be prevented from rising high enough to produce any storm of destructive character. Independently of its utility to the farmer, it would be highly useful to the mariner in the following way:—As the very time and place of the commencement of the rain would be known, it would be easy to find out in what direction from the place of beginning it moved along the surface of the earth, and also its velocity of motion, and the shape that it assumed from time to time in its progress. Now, this knowledge is the principal thing wanting to enable the mariner, who has the power of locomotion, to direct his vessel so, when one of these great storms comes near him, as to use as much wind in the borders of the storm as will suit the purposes of navigation—for Heaven undoubtedly makes the wind blow for his use, and not for his destruction, provided he becomes acquainted with the laws to which it is subject. From the preceding principles, he will be able to know in what direction a great storm is raging when it is yet several hundred miles from him, for the direction of the wind alone points it out. If, however, the storm should be of such great length, moving side-foremost, as to preclude the possibility of avoiding it, he will at least be enabled to know in what direction to steer his ship, so as to get out of the storm as soon as possible. For example, if it shall be found that storms between the United States and Europe always move towards the east, then it will manifestly be improper to scud with the wind in the latter part of the gale, when the wind is blowing from the westward, because this would be to keep in the storm as long as possible. The sailor also will be able to know when he is out of danger; for when a great storm has passed off to the east in middle and high latitudes, and to the north in low latitudes, on the north of the equator, he will know that it never returns; and therefore he will not be afraid to spread his sails to the wind, before the calm of the annulus comes upon him. The mariner will finally be able, by observing storm-clouds on their approach, to ascertain the direction in which storms move; for these storm-clouds frequently exhibit themselves above the horizon in the form of an arch; and if the highest part of the arch approaches towards the zenith, then is the storm coming from the point where the arch first appeared.

When a storm has a much greater diameter from north to south than from east to west, the wind will not blow towards a central *point*, but towards a central *line*, which may be called the major axis of the storm.

On the northern end of the storm, if it moves towards the east, the wind will change round *without* a lull, by north towards the west—and on the southern end of the storm, the wind will change round *without* a lull, by south towards the west; but in the middle of the storm the wind will change *with* a lull from easterly to westerly.

When the storm is of great length north and south, the lull in the central parts may be experienced simultaneously, at considerable distances apart, north and south, which could not be the case if the storm was round; and as this occurs frequently on the coast of the United States, it is certain, from that circumstance alone, that the centre of storms is frequently a line of great length; and, moreover, as the wind in the first part of the storm is frequently south-east, and in the last part of the storm north-west; and as the barometer falls successively from north of west to south of east, it seems highly probable that these storms of oblong form move towards the south of east.

In the West Indies, from Barbadoes to Jamaica, it is known, by the invaluable labours of Redfield and Reid, that the hurricanes there move from the south-east to north-west; therefore, if the wind springs up violent from north-west in those parts, the mariner may be sure that a hurricane is coming upon him if he remains stationary; and if it springs up in any other direction, he will know in what direction to sail to avoid its violence."

ABBOTSFORD.

SECOND AND CONCLUDING NOTICE.

WE take up the description at the point where it was broken off, having still the armoury, drawing-room, and library, to notice. All of these look out upon the Tweed, and are places of interest, from the contents they display. The mere enumeration of the remarkable objects in the armoury, though the room be a very small, or rather very narrow one, would make a goodly catalogue; and it is in reference to these objects principally, that the world has cause to regret Sir Walter's non-completion of his "*Reliquiæ Trottcosiance*," a catalogue of his rarities, which he had projected and even commenced, and which would certainly have been rendered by him a very entertaining work. Arms, as is fitting, predominate in the armoury; and, among the articles of that nature, not the least interesting to a Scotsman is the gun of Rob Roy, an immensely long weapon, of Spanish manufacture. It is marked with the initials of the freebooter, R. M. C., Robert Macgregor Campbell. The purse of the same renowned individual hangs on the walls of the armoury, but not that immortal purse shown by him to Nicol Jarvie, which is described as having been curiously guarded with a small pistol, the contents of which were likely to be lodged in the body of any one opening it without a knowledge of the secret. The present purse is merely a leather spleuchan, of a very plain kind, and likely to have been used by "Rab" in his honest drover days. Its authenticity is unquestionable, Mr Train having procured it from an immediate descendant of the original possessor.

The armoury contains the gun of another famous mountaineer—famous, we must say, in despite of national prepossessions, for much better things than our own Highlander. The weapon in question belonged to Andrew Hofer, the Tyrolese patriot, from whose lieutenant it was obtained by Sir Humphry Davy, in reward for having cured him of a fever. It forms an almost ridiculous contrast to the musket of Rob Roy, being even stuntedly short, and having two barrels. If these arms are interesting, still more so, in the opinion of most visiters, will be a pair of pistols

Digitized by Google

that hang over the mantel-piece of the armoury. They are about a foot long, and very plain articles, though they were once the property of an emperor, and that emperor Napoleon Bonaparte. They were found in his carriage at Waterloo, and presented to Scott by the Duke of Wellington. A single pistol, of a much more ornamental character, is to be seen opposite to them. This is a relic of Claverhouse, and has a handle finely inlaid with ivory. Whether or not it be the weapon which he used at Drumclog, and which is specially alluded to in Old Mortality, Sir Walter alone, it is probable, could have told us. Among other guns or fire-arms in the armoury, some Persian weapons may be mentioned, as beautiful specimens of workmanship, their stocks and butts being of wrought silver and ivory. There are also many specimens of antique fire-arms, such as the original matchlocks, which were discharged like modern cannon, by match or lintstock. Many of these may have histories attached to them, but their antiquity now forms their only interest.

Swords and other edge-weapons are abundant in the armoury. One sword has a deep interest, both from its beauty of make and the associations connected with it. It is the sword of the gallant Montrose, and was presented to him by Charles I.; though, from the arms of Prince Henry being wrought on the hilt, it would appear originally to have been the property of the elder brother of Charles. The weapon is of elegant shape, and has a magnificent appearance, from the sheath being covered with crimson stuff, crossed by strong bands of silver. A more costly sword in the armoury is that presented to Sir Walter himself, by the Celtic Society. We can only describe this as a gorgeous article, with a sheath of elaborately chased silver; but it is, on the whole, inferior in chaste and tasteful beauty to the sword of the great marquis. Scimitars, claymores, axes, tomahawks, arrows, javelins, darts, &c., from all quarters of the world, and of all ages, are also to be seen in this apartment. Scarcely a nation upon earth, savage or civilised, has not contributed something, in the shape of a warlike weapon, to the stores of Scott's armoury.

Miscellaneous rarities are numerous. We have Prince Charles Stuart's spurs, very massive ones, and seemingly of solid gold. We have still more massive spurs here, relics of the moss-trooping days; and hard-skinned indeed must the steed have been, which could resist a hint from spikes one to two inches in length, and proportionably thick. Spurs almost as large are to be seen, said to be from the "Spanish main," or rather from the Spanish colonies, for the Buccaneers of that region would certainly have their hands more often upon "the ocean's mane," than on that of the horse. The identical pair of thumbikins which crushed the hands of Professor Carstares, hang above the mantel-piece. This instrument consists simply of two small parallel bars of iron, made approachable by a screw, and between which the victim's unlucky thumb was squeezed. These very thumbikins have before now pressed royal fingers, King William having submitted to be operated on with them, but only in a gentle and experimental way. An old hunting flask, made of leather, belonging once to "bonnie King Jamie;" an iron box found in the chapel of Mary of Guise, in the Castlehill of Edinburgh; a *mazer*, or drinking-horn, one of a set which Robert the Bruce provided for the use of lepers frequenting the hospital called King's Case, founded by the Bruce himself, near Ayr, in consequence of receiving personal benefit from a medicinal spring there; a Canadian horn of large size, with a map of Upper Canada and its lakes, most ingeniously and not incorrectly carved upon it by a native Indian; the identical slippers of Tippoo Saib; an old hat—a very old hat, indeed—which was worn for ages at the installation of the burgesses of Stow, a village of great antiquity on the Gala; and, lastly, a necklace of human bones—may be specified as worthy of notice among the remaining articles of interest which the armoury contains. Out of many hundreds of rarities, we have not, we hope, trespassed on the patience of the reader by mentioning these few.

Passing eastwards from the armoury, the visiter enters the drawing-room, a large and lofty apartment, rich in its furniture and walls, and not without curious contents of a different kind. As to the walls, they are covered with "splendid Chinese paper" (to use Scott's own words), a present to him from his cousin, Hugh Scott, of the Raeburn family, who had it made purposely for his great relative in the land of tea and pagodas. The windows, doors, and other wood-work, are of Jamaica cedar, and, being well varnished, have a rich and beautiful appearance. The common chairs, again, are an ebony set, presented to the poet by George IV., and really worthy of the rank of the donor. There are two finer chairs, however, in the room, large elbow ones, brought from the Borghese palace at Rome, and presented by Constable to Scott. They are in boxwood, with figures and foliage elaborately carved upon them, and are truly exquisite specimens of this kind of manufacture. The magnificent bibliopole was in nothing more magnificent, in his palmy days, than in his donations, and this the rooms of Abbotsford show, in the case of many other articles besides these chairs. But enough of mere furniture. The paintings of the drawing-room form a more intellectual object of attention. Among them we have Raeburn's well-known and admirable portrait of Scott himself, sitting in the open air, with a book in his hand. We find also a fine original of "glorious John" (Dryden), with his "grey hairs floating about (to use Mr Lake's words) in a most picturesque style, eyes full of wildness, presenting the old bard in one of those tremulous moods in which he appeared, as we are told, when interrupted in the midst of his Alexander's Feast." A portrait of Lady Scott exhibits to us a *petite* figure, with dark eyes and complexion, and foreign-looking, on the whole. We see here, also, the comely Scottish countenance of Anne Scott, and, beside her, a decent old-world-like lady, who stands for Miss Rutherford, the poet's near relative. These are nearly all the paintings in the room.

On an antique table of mosaic marbles, between two of the drawing-room windows, stands a large porcelain vase, of most beautiful workmanship, being that presented to Sir Walter by Lord Byron, along with a silver urn filled with bones from the Piræus. The urn had upon it the inscription, "Given by George Gordon, Lord Byron, to Sir Walter Scott, Bart.," but it is not now shown to visiters. It has not, however, we believe, gone the way of the letter originally accompanying the donation, which some one carried off—a piece of rascality most unserviceable to the author of it, as the letter never could or can be shown, the knowledge of the theft having long been universal. The only other object of interest in the drawing-room which we shall notice, is a curious and valuable clock, given to Scott by the Duke of York, who was a great clock-fancier. It is a gilded, foreign-looking article. With its silk damask hangings, fine paper, mirrors, and other ornaments, the drawing-room of Abbotsford altogether would do honour to any palace.

For general grandeur as an apartment, however, the library exceeds all the other rooms of the house, being of oblong form, and about fifty feet by thirty in dimensions. The wood-work, including the book-shelves, is of Jamaica cedar, "finely pencilled (says Sir Walter) and most beautiful, something like the colour of gingerbread." The hangings are of "superfine crimson cloth (he says) from Galashiels, made of *mine own* wool." The roof is also of carved wood, either oak or cedar, probably the latter, and the chairs are of old oak. All these things, forming the staple furniture of the apartment, give it a very rich appearance, and the presence of some fifteen or twenty thousand volumes, all in fine order, tend in no degree to detract from the general effect. The cases are wired in and locked. One painting only has a place in the library, and it is a full length of the present Sir Walter Scott, in the uniform of the fifteenth hussars, and with his horse by his side. The picture is by William Allan, and is placed over the mantel-piece. Opposite to it, and prominently placed in a large recess terminating in a bow-window, is a fine cast of the bust of Shakspeare, taken from the Stratford monument; and in a central niche in the east wall of the room, upon an elegant stand of porphyry, is a marble bust of him, who alone of all whom the isle of Britain has produced, has a fair claim to be named along with the great dramatist—namely, Sir Walter Scott. This is the bust, so well known from the numberless casts of it, which Chantrey executed for the poet himself, and, being of the purest white marble, is not less admirable as a work of art than as a likeness. The expression of the countenance is at once perfectly natural and noble. It was after his death that the bust of Scott was placed here. At the west end of the library there is another bust (a cast). It is the likeness of William Wordsworth, and exhibits a head of beautiful and Miltonic formation.

Among the objects occupying the centre of the library floor, there are but two which appear worthy of special notice. One is a large writing-cabinet of ebony, richly figured, which was once used by George III., and was presented by his heir to Sir Walter, being a match to the ebony chairs. The other is a desk of peculiar construction, having four slopes, which can be moved round at the will of the writer, thus enabling him to consult a number of works at one time. Scott used this desk in the composition of the Life of Napoleon, a production which rendered it necessary for him to have hosts of authorities under his eye at one and the same moment.

A catalogue of the books in the Abbotsford library has been recently published by Mr Cadell. In antiquarian lore particularly, the collection is rich beyond measure. The books are arranged according to their subjects, British history and antiquities, for example, occupying one range of shelves, and foreign literature another. It would be vain to particularise individual works. Many of them are presentation-copies, and gifts from friends. Constable contributed, among other things, a splendid set of the Variorum Classics, and George IV. a ten-volume folio copy of Montfaucon's Antiquities, bound in scarlet, and stamped with the royal arms. We have now only a few concluding remarks to make upon Abbotsford. It is entirely a place of show, every one must admit; and nothing establishes this fact more satisfactorily, than a glance at the second floor of the house. The huddled and uncomfortable character of the bedrooms on the second floor, and, in short, of all parts of the house excepting the exhibition rooms that have been described, can escape no one's notice. There is here and there a piece of rich furniture on the second floor, but there is no order or judgment shown in the construction and arrangement of the parts. The comfort of the family-occupants has formed no part, apparently, of the projector's views. The provision of sleeping-room to the greatest possible number of persons, seems to have been the main object in his thoughts, and that object he has certainly attained. Passing from this point, we may observe that there is but one article of a curious nature on the second floor, which we shall advert to. This is a large chest which was sent from Italy to Sir Walter, as the identical chest in which the beautiful young bride (Ginevra) hid herself on her marriage-day, out of a frolicsome wish to baffle the search of her newly-wedded lord; and out of which chest she never came, until the lapse of many years had converted her beautiful frame into a mouldering skeleton. A spring-lock had shut her in, and all search for her proved vain. Mr Rogers tells this story finely in his "Italy," and the English song of the "Mistletoe Bough" does the same thing also very effectively. It is proper to state, however, that Sir Walter was ultimately led to entertain strong doubts of the authenticity of the chest sent to him, from the annoying fact that Italy has a box with similar claims in two or three of her principal cities. Besides, the chest at Abbotsford has not the spring-lock. However, Sir Walter's may be the right one—the real Socia—and if visiters are romantic enough to get over the difficulties mentioned, let them shed a tear over the deathbed of Ginevra. We have told the truth.

Such as it is, with all its faults and all its beauties, Abbotsford will certainly be a place of pilgrimage to the nations in the times to come. At this hour, the throng of visiters to the spot is something altogether surprising, and among them are strangers from all quarters of the globe. We may expect the shrine to be still more fondly reverenced in after days, for, if the present dare prognosticate respecting the tastes of the future, the productions of Scott may be expected to charm the leisure hours of civilised man in all ages.

OCCASIONAL NOTES.

MAKING A PRINCIPLE OF THINGS INDIFFERENT.

It is right to watch the first approaches to real error, which often take a very indifferent and unalarming appearance; but there is no need for making a principle of matters which, from their absolute nature, never can be any thing but indifferent. The possession of a steady, well-balanced mind, to distinguish between what is important and what is indifferent, is a great blessing, for the opposite subjects its possessor to much ridicule, and on many occasions to no small inconvenience. It is generally against the lesser customs of society, the little formalities and ways which human beings fall into when massed in communities, that those liable to this error lift up their testimony. They become conspicuous, accordingly, as odd or disagreeable persons, and lose much of the credit to which for other reasons they would be entitled. They never do this; they can't endure that; they avoid another thing: all of these being matters which an angel might submit to without tinging the tip of one of his snow-white feathers. We have known a literary man of this order, who made a principle of spelling *music* and *public* with a final *k*, because it was more Saxon; yet at the same time subtracted a *t* from *Scottish*, because so it was done in Latin. We have known an artist make a world's wonder of himself by dismissing a neckcloth, alleging that neckcloths are antagonistic to the natural grace of the human figure. He was perhaps right in his opinion; but a man nevertheless looks foolish in this country without a neckcloth, or something serving the same end. The line of defence usually taken up by an odd person is, "I have a right to do in this matter as I please: no one has any right to interfere." No doubt of both propositions; but then is it worth while to assert or act upon a right of so worthless a nature? And, again, though no one has a right to interfere, every one has a right to laugh, and every one does laugh accordingly: is it worth while, we would ask, to subject one's self to so much ridicule for so small an object? It is the disproportion between a trivial oddity, and the ridicule encountered for its sake, that makes the practice so absurd. As much good martyrdom is thrown away, perhaps, in affecting a different length of hair from the bulk of mankind, as, if bottled up and kept over, might prove the means of overthrowing some great national evil. The fault lies partly in a kind of moral *elephantiasis*, which makes little things appear huge; but there is also a morbid self-esteem at the bottom of it—a self-esteem which makes it seem better that we should be singled out for *something*, however ridiculous, than be swamped amidst the common herd. The true philosophy is to do as others do in all trivial matters, amongst which is to be included the whole range of external manners, dress, eating (within moderation), speaking, and so forth, and only to stand up against things which really portend or do evil, it being quite enough for any man to incur odium as a dissenter from the serious delusions and vices of his fellow-creatures, without also causing them to laugh at him for affecting to consider that as a matter of principle which their common sense has set down as a thing of not the slightest consequence.

THE NEWSPAPER PRESS OF FRANCE.

A calculation lately made by a French journal, places in a striking light the importance attached to the profession of a journalist in France. In July 1830, *forty-four* journalists, including the editors, conductors, and publishers of the principal news-sheets of Paris, signalised themselves by protesting against the ordinances of Charles X. The extraordinary influence acquired since that era by the press, and the extent to which public situations were thrown open to talent by the Revolution, is made remarkably apparent by the position in which a considerable portion of these forty-four individuals have for some time stood. The following list exhibits the state of the case :—

M. Thiers, chief editor in 1830 of the newspaper called the *National*, has been for a considerable period *Prime Minister* of France.

Mignet, co-editor or permanent writer in the same paper, is now Keeper of the Archives to the Minister of Foreign Affairs, Counsellor of State, and an Academician.

Carrel, another co-editor, was killed in a duel, otherwise he would certainly have now been in very high office, supposing him willing to accept of any thing of the kind.

Chambolle, also co-editor, is a Deputy of the Chamber, and is now intrusted with the conduct of the official or ministerial paper, the *Siècle*.

Peysse, also co-editor, is Director of the Academy of Fine Arts.

Rocke, also co-editor, is Keeper of the Public Library of Paris.

Gauja, manager of the same paper, is at this time Prefect of the Pas-de-Calais.

M. Dejean, one of the editors of the *Globe*, is now a Counsellor of State, and was recently Director of the Police of the kingdom.

De Remusat, co-editor of the same, is now *Minister for Home Affairs*.

De Guizard, also co-editor, is a Counsellor of State, and Prefect of the Aveyron.

M. de Jussieu, editor of the *Courrier des Electeurs*, is Prefect of the Ain.

M. Cauchois-Lemaire, editor of the *Constitutionnel*, is Principal Keeper of the Archives.

Année, co-editor of the same, is a Counsellor of State.

M. J. Coste, editor of the *Temps*, is a Pensioner of the State, and a Chevalier of the Legion of Honour.

Baude, co-editor of the same, is a Counsellor of State.

Hausmann, also co-editor, is Sub-Prefect of a department.

Barbaroux, also co-editor, is Solicitor-General of the Isle of Bourbon.

Chalas, also co-editor, is Under-Secretary to the Ministry of the Interior.

Billard, also co-editor, is an Ex-Prefect.

M. Larrèguy, editor of the *Commerce*, is now a Counsellor of State, and Prefect of the Charente.

M. Bohain, editor of the *Figaro*, is an Ex-Prefect, and a Chevalier of the Legion of Honour.

Roqueplan, co-editor of the same, is a Chevalier of the Legion of Honour.

M. Leon Pillet, editor of the *Journal de Paris*, is a Master of Requests, and Acting Director of the Opera.

In all, out of the forty-four protesting journalists of 1830, *three* are dead ; *six* are now no one knows what or where ; and *fourteen* have remained independent, in the same position as formerly. At least *twenty-one* have been loaded with employments, wealth, and honours, during the ten years intervening since the Revolution.

Why, it may be asked, and asked with some indignation, is not literary talent equally advanced and honoured in our own country ! Before feeling indignant on this point, it would be well to make sure that the advancement of literary men in France is an indication of a sound and desirable state of things. Public writing, we are told, is now adopted in that country by young persons of talent as one of the paths to eminence, just as the law, the church, and the army, used to be. Most of the ambitious and turbulent spirits take this course, and the public press of Paris is accordingly rather marked by earnest endeavours on their part to acquire importance, than by any conscientious regard for what is for the public interest. Every means are taken to raise and keep up a flame about all kinds of things, that papers may be purchased, and the editors made great men. The interests of these gentlemen and of the public are therefore, we would say, not one, and the public peace and welfare is just so far endangered. Right and safe elements of power must, we fear, be considered as wanting in a country, where merely to inflame the human passions by extravagant writing is a ready means of attaining to high station and influence.

It would also be well to ask if our literary class, as a whole, are of a character to make it desirable that they should be advanced to places of high trust. There is certainly an immense display of literary talent and industry in the country. According to Mr Bent, the number of books published in 1838 was 1550 (by the way, the number in 1828 was only 842, though there were then no cheap publications to ruin the trade). There are above 30 quarterly, between 200 and 300 monthly, and an infinitude of weekly periodicals, besides nearly 500 newspapers, daily, weekly, and twice and thrice a-week. But of all this display of literary exertion, how much is devoted to mere amusement, how much to trivialities of all kinds, how much to the objects in which not truth but party is concerned, how much to the great object of making the worse appear the better reason, obfuscating the common sense of the plain-sailing public, and misleading into all kinds of error and delusion ! If all this were subtracted, we fear that the account would look pretty much as a certain celebrated tavern-bill would have done, supposing the deduction of the sack. Admirable things there are no doubt in our literature, and some men of virtue belong to it ; but, take it as we will, it cannot be said to be pervaded by any defined philosophic or moral spirit tending to the permanent benefit of our race, or to be in the main any thing but a vain show of intellect. We must confess that we should like to see its men animated more generally by some lofty and abiding principle, before we could wish them as a class to be advanced to state situations of any considerable degree of responsibility.

MR J. S. BELL'S WORK ON CIRCASSIA.

HUMAN nature being ever the same, it is not surprising that past history should be often reproduced in action, scene and characters alone being changed. At this hour, the struggles of the Swiss with Gessler, and of the Scotch with Edward I., are in the course of being renewed on the shores of the Black Sea, the parties in the present case being, the Circassians on the one hand, a handful of semi-civilised, but vigorous-natured people, and on the other the colossal government of Russia. This contest has been carried on since 1828, without the least mark of languor or shrinking on the part of the Circassians ; and now, from some late triumphs, they seem to be more thoroughly exempt from Russian bondage than at any time since the commencement of the war. Of the general features of the contest within the last year or two, and of the character and peculiarities of the Circassian people, we have a striking and attractive account before us, in a new work by Mr J. S. Bell, who resided for a considerable time on the very scene of action.*

The territory of the Circassian people is well defined in its limits, being confined, or nearly so, to the space between the north-eastern shore of the Black Sea, and the large river Kûban. The nation, which is chiefly of Tatar descent, was of the Christian faith four or five centuries ago ; but the influence of Turkey, at one time predominant in the country, caused the establishment of Islamism as the national religion. Properly speaking, as Mr Bell shows, the Circassians were always an independent race, governed by their native chiefs ; but a pretence of suzerainship, put forth by the Porte, led to the insertion of a clause of cession in a treaty between the Turks and Russians, on which the latter ground their claim of authority. What was the exact nature of Mr Bell's mission to Circassia, does not appear very clearly, but he was certainly received by the whole nation as an agent accredited, to a greater or less extent, by England. They bestowed on him the sounding appellation of the "greatly honoured, the ever-constant, the nobly-descended Lord Misr Bell ;" though, as it might have been inconvenient at times to repeat all this, they also assigned to him the every-day title of "Yakûb Bey." In point of hospitality and politeness, the Circassians are described by our author, from experience as well as observation, to be superior perhaps to any other nation in the world. When residing in one part of the country, he used to be presented by messengers from other quarters with the "respects of hundreds of men, women, and children," all unknown to him ; and was often told that, wherever he might choose to go, "not one, but a hundred thousand doors," were open to receive him. He further observes—"From all I have seen, I feel inclined to pronounce the Circassians, in the aggregate, the most genuinely polite people I have ever known or read of." Their politeness, moreover, seems not to be superficial, or of that kind which displays itself only to strangers. It is universally practised among themselves, and goes beyond forms or mannerism. "A matron on a visit here frequently pays the girls a visit ; and I observe when she approaches, whether they be seated before the cottage or inside of it, they invariably rise (intimates and relatives as they are) and remain standing till she seats herself. The same respect is shown to the male visiters when they enter the cottage, and to me when I pass even at some distance from its window. One or other of these girls invariably, and sometimes all our females, accompany such female visiters as they have to the confines of the territory of the hamlet, and a young one, married or unmarried, is never allowed to go home alone." To old men, of whatever rank, the Circassians pay the same Spartan-like respect. This may be partly form, but not so in the following case. Mr Bell speaks of often seeing "some happy band of neighbours, old and young, males and females, busily engaged in weeding their crops with the hoe or hand, and singing together some lively air to lighten the labour, which they sometimes intermit to come around me, offering some of the refreshments they generally have with them ; a light for my pipe, or to joke a little. Thus they aid each other alternately, and their crops in general have the cleanly appearance of one of our nursery-grounds. If a traveller pass while this or any other agricultural occupation is going forward, he almost invariably cries out 'Rabestûakho' (May it be productive !) ; and the rules of good-breeding equally require that, when he encounters a flock of sheep or goats, he should not press on, but wait until the shepherd has gathered them to one side or other of the pathway, when he exclaims to him 'Bowhapshi' (May you have increase !)"

One of the most charming forms in which our author saw the good feeling, or politeness, if you will, of the Circassians exemplified towards one another, consisted in the care and attention bestowed on the wounded and the sick. "The custom of females visiting the wounded men is universal, and shows, at all events, a kindliness of feeling among the people. The visit of the bright-eyed maidens to the young wounded warriors, must contribute greatly to the diffusion of courage. I have repeatedly seen two of these maidens, one of them the sister of Hassan Bey, sitting by the couch of my patient, fanning and paying him other delicate attentions, among others that of combing the tuft of hair on the apex of the head, generally worn by young men." The freedom permitted to young unmarried females, in walking abroad and uncovered, is strikingly at variance with the rules to which married females are subjected. "The house and society of the married female are inaccessible, as in Turkey, to all males except those of her own family, the ataliks of her children, and the members of her husband's fraternity, who have free admission at all times. When she goes out to visit her female friends, her head and face are closely veiled, and her whole figure enveloped in a cloak ; she must avoid meeting males, or, unless they be serfs, stand respectfully aside till they pass. But the maid—whose tight corslet covered in front with clasping plates of silver, and skull-cap ornamented with knobs and lace of silver, give her somewhat of a martial appearance, as if the panoply of her innocence were proof against all assaults ; while her pendant tresses, flowing skirts, and gentle gait, preserve the feminine character of her figure, and, if she be tall, give it much of dignity and grace—sallies forth unveiled, and upon occasions she fearlessly, but never with effrontery, enters amid groups of men. The tall handsome girl I have repeatedly seen entering the guest-house here when filled with men, to visit the wounded warrior, has made me think more than once of the 'Maid of Orleans' performing this military duty to her companions in arms." Bright colours—red, yellow, and blue—are the favourite hues in the dresses of the Circassian maidens, but the long veils of the matrons are white as driven snow. We cannot help quoting, for the benefit of the followers of fashion here, the remarks of our author on the Circassian dresses generally. "How superlatively ridiculous do some of the follies of what is called civilised life become when one's mind has got a little 'unsophisticated' by living among an artless people ; when one contrasts the ceaseless dance of fashion in Europe, and all the monstrosities in turn produced—the hats, petersham, tally-ho, and clerical—the small and large-collared, broad and swallow-tailed coats—the apoplexy-inducing neckcloths and stocks of our men—and the bonnets and sleeves, of all possible forms and sizes, of our women—with the simply elegant and unvarying attire of these Asiatics, whom we reckon among barbarians !"

One practice which the Circassian mothers have long followed, of girding the waists of their girls with leather bands, when they are very young, and leaving these for many years, is still prevalent, Mr Bell says ; but of late years they have wisely "abated the tightness" of these cinctures to a great extent, and diminished their hardness.

The Circassian men, in a state of peace, occupy their time chiefly with pastoral and agricultural concerns, and are governed by their chiefs and elders, who assemble in congress on great national occasions. Excepting in one point to be noticed, there is much practical freedom in their communities, and, doubtless, it is their acquaintance with this blessing that has made them enter with such gallantry into their unequal contest. Some instances of patriotic devotedness and personal bravery are recorded in the work before us, which would have done honour to the days of Leonidas and Cœur de Lion. In a skirmish with the Russians, "they observed a tokav of the neighbourhood who was in advance of them, and at one side of the advancing body of Russians, draw his sabre and rush alone into the midst of it. He was atalik of my host's second daughter, and a person of singular intrepidity. He had been wounded on the head by a ball only an hour before, and was no sooner bandaged than he engaged ten or twelve others to perform with him this feat of devotion, saying, 'Better to effect something and perish, than be subdued like women.' At the subsequent exchange of dead, the Russians said that, unless they had witnessed his prowess and hardihood, they could not have believed in them." Wounds are despised by the young *braves* of Circassia. Mr Bell once had for a patient "Osmond, a former ac-

quaintance, a remarkably brave young warrior from Adughûm, who only ten days before had received a concussion of the brain and other injuries by a fall with his horse. On the second day of his visit, when the roar of the firing was almost incessant, he became perfectly miserable; chatteringly bewailing, in the corner where he lay, his hard fate, that he had not died to prevent his being left to be degraded to a woman. His impatience at length became so great, that he had himself dressed to set forth, notwithstanding that his right arm is almost powerless, his right eye entirely so (from the falling of the eyelid), and the vision of the left greatly impaired, and all my arguments about the imprudence of such an attempt; but on coming to the examination of his *kasirs* (the cartouche-tubes on the breast), he found that some kind friend, during his late insensibility, had wisely relieved them of the powder." Osman, however, went off immediately; but whether he found means to go to the field or otherwise, our author did not learn. Nor are the old men one whit behind their juniors in chivalrous gallantry. Mr Bell met an aged chief who had left his home for the field, and was told the following anecdote of him. "I have just heard from *Kûsht* Vardan, who says that a few days since Haseah and he having found themselves in presence of a considerable body of Russian horse, the former, whose beard is already all blanched, turned to him gaily (for he is full of gaiety and spirit), and merely saying, 'Follow me,' dashed in among the enemy with his sabre, and cut his way through without receiving any injury. Vardan, who enjoys a high character for bravery, candidly owns he had not courage to follow such an example."

The female slaves who are sent from Circassia, are principally, if not entirely, derived from an inferior caste, who stand in the relation of serfs to the landed proprietors of the country, as is the case in Russia. Serf-girls are still sold by the Circassian proprietors, though the disgraceful trade is much less extensive than formerly. Yet, when their fate is at the worst, these poor girls have hopes, which soothe their distress. "Two serf-girls of this establishment—about twelve or thirteen years of age—have just been sold to a merchant going to Constantinople. Twelve horse-loads of merchandise have arrived in payment of them—a sight that sickens my British stomach, however it may operate on a Turk's. The girls have been here to kiss my host's hand at parting, on which occasion the hearts of both of them seemed greatly convulsed; and one with reddish hair (and therefore keener feelings) shed floods of tears, which went nigh to set mine a-flowing. Parting, however, is always painful; and I trust these two girls may be sustained by the ambition I believe common here among the youth of their sex—of becoming wives to nabobs of Stambûl."

One of the most remarkable features in the social policy of the Circassians, consists in the existence of numerous septs or fraternities, the members of each of which hold themselves to be of one stock, and do not intermarry. The young people of each fraternity look upon one another in the light of brothers and sisters. A union of this kind may contain from two or three hundred to two or three thousand families. The members are bound to protect each other in danger and distress, and to assist in paying those fines which constitute the chief legal punishments of the country. If a member is condemned to capital punishment, his fraternity inflict it. Altogether, these fraternities of Circassia bring one forcibly in mind of the Scottish clans. Mr Bell mentions the following case illustrative of the criminal procedures of Circassia. "As we passed the temporary court of justice—a thatched shed—we had further proof of proceedings having terminated, by its being set fire to, as is invariably done. The delinquent in this case *appears* to have been insane, as he had killed a boy, and wounded two other persons of a family he had conceived himself aggrieved by, and had entered a house for the purpose of killing one of my countrymen whom he expected to find there. His fraternity had consequently put him to death in the usual manner, by throwing him into the sea with his arms tied; yet his family and fraternity are bound by the Circassian ideas of justice to pay the legal fines for his offences. It may easily be conceived that such institutions, though at variance with our notions of justice in the west, are yet highly conducive to good order, each family and fraternity being deeply interested in watching the conduct of each individual connected with them, lest they should be amerced for his misdemeanour.

The fines payable in this instance were two hundred oxen for a boy killed, and thirty for a young man and two for a woman wounded, the latter having been less severely injured. Of these only the former has yet been exacted; the parents of the boy having received the value of sixty oxen, and their fraternity the remainder. The payment of the other two is fixed for next summer, and will be proportionably divided among the sufferers and their fraternities. The cause for such division is, that the family and fraternity of the delinquent are amenable in similar proportions.

So far as I can learn, insanity is almost unknown in this country. It appears to be a curse attendant on the complications of civilisation and commerce."

We have now quoted pretty freely from Mr Bell's volumes, endeavouring to choose such passages as would at once illustrate the character of the Circassians, and exhibit the very interesting nature of the work, which has the additional attraction of numerous engravings.

The principal drawback in the character of the people under our notice, is their recklessness in shedding human blood. They are certainly not blood-thirsty, but seem to know no other arbiter in disputes than cold steel or the bullet. Much must be allowed, however, for position and training, and, taking such things into account, we would say that, upon the whole, the Circassians seem to have in them the materials of a noble race of people. Let us hope, that in the event of a new arrangement of eastern affairs, our statesmen will at the same time discover some mode of restoring peace to the north-eastern shores of the Black Sea.

The following closing anecdote will show the honesty of the Circassians. "During almost the whole four months I have been in this valley, I have slept alone out of doors; first under a great pear-tree, on a green within the enclosure of this hamlet, and latterly on a stage, which Hassan Bey, of his own accord, ordered to be erected for me in an orchard, slightly enclosed, and which overhangs a deeply-wooded glen. This glen communicates with the valley, in which there are no houses all the way to the sea. On my couch, on this stage (which in fine weather, such as we generally have, is my house), sundry articles of high value here, such as my watch, silver snuff-box, silver-mounted dagger, knives, &c., lie throughout the day frequently (during my walks for exercise) quite unprotected; and at night, the four plum-trees which form my leafy shelter are hung with my clothes and other appurtenances; yet have I never missed a single article, although my retreat is well known to all the neighbours round; groups of whom, and of strangers, almost daily seat themselves on the grass around me. Nor must it be forgotten that my person also is of no little value, on account of the price set upon it by the munificent offer of the Russian general in the neighbourhood." The reward was 2000 silver roubles.

SHAKSPEARE'S JEST-BOOK.

In *Much ado about Nothing*, Benedick alleges of Beatrice that she had her good wit out of the *Hundred Merry Tales*. Overlooking an erroneous surmise of Mr Steevens, this book seems to have been a small black-letter volume published in the reign of Henry VIII., under the title of "*Tales and Quick Answeres, very mery, and pleasant to rede*," and which, consisting of a centenary of anecdotes, had probably come to bear the familiar appellation of the Hundred Merry Tales. A copy of this volume was in the Duke of Roxburghe's celebrated collection (now in that of the Duke of Marlborough), and from it a new edition was produced a few years ago,* with the additional title of "The Hundred Merry Tales, or Shakspeare's Jest-Book."

The contents of this volume are extremely curious. The anecdotes strongly illustrate the simplicity and rudeness of the middle ages, and also, we fear, speak of a time when men were more easily amused than they are at present. The language is extremely quaint, the construction faulty, the words variously and venerably ill-spelt, and the stops almost invariably misplaced. The moral reflections which are made to accompany many of the stories is an amusing feature in the collection; for their *naïveté* frequently excites a smile, even when the "mery tale" itself would fail to do so. The following selections from the volume will, we think, make good these remarks:—

Of hym that folle in to the fyre.

A felowe that was frowarde to his wyfe, vsed to be oute drynkynge many tymes verye late. So on a nyghte he taryed so longe oute, that his wyfe wente to bedde, and badde her mayde make a good fyre, and tarye vp for hym. About xij. of the clocke home he came, and as he stode warmynge him by the fyre his hede was so tottye, that he felle in to the fyre. The maydo seing him fall ranne vp cryenge to her maistres, and sayd: Alas my maister is fallen and lyeth longe straughte in the fyre. No force mayde, said her maistres, let him lye and take his pleasure in his owne house, where so euer him listeth.

Of Papirius pretextatus.

Aulus Gellius reherseth, how the Senatours of Rome on a tyme helde a great counsaile. Before which tyme the senatours chyldren, called of their garmentes *Pueri pretextati*, vsed to come in to the parlement house with theyre fathers. So at this tyme a chylde called Papyrius, cam in with his father and herde the great counsayl the which was straytely commaunded to be kept secrete tyll hit was decreed. Whan this chylde came home, his mother asked him what the counsaile was. The chylde answered, hit oughte nat to be tolde. Now was his mother more desyrous to knowe hit than she was before: wherfore she enquered more straitly and more violentlye. The chylde beinge sore constrayned of his mother, shortelye deuysed a propre merye leasynge. It is reasoned in the parlemente (quod he) whether of both shulde be more profytable for the comon welth, a man to haue ii. wiues or els a woman ii. husbandes. Whan she harde him say so, her mynde was pacified: and forth with she wente and tolde hit to the other matrones.

On the morowe a great company of the moste notable wyues of Rome came to the parlemente house weping, and humbly prayen: that rather one woman shuld be maryed vnto ii. men than ii. wemen to one man. The Senatours entringe in to the court, what with the sodayn assembling of the wyues and of their request, were right sore astenied, than the childe Papyrius stode forth, and enformed the senatours, how his mother wold haue compelled him to vtter the secrete counsayle: and howe he to content her mynde, feyned that leasynge. For which dede the Senatours right hyghly commended the childes fydelite and wytte. And forth with they made a law, that no child after that (saue only Papirius) shuld come in to the parlement house with his father. And for his great prudence in that tender age he had gyuen to hym, to his great honour, this surname *Pretextatus*.

Wherby ye may se, that the hygh treasure of man, and greattest grace, resteth in well ordrynge of the tonge. The moste prudent poete Hesiodus sayth: The tonge shulde not ronne at large, but be hydde as a precious treasure. For of all the membres of man, the tonge yll ordered is the worste. The tonge blaspemeth God: The tonge sklaundereth thy neyghbour. The tonge breaketh peace, and stereth vp cruell warre, of all thynges to mankynde moste mischefull, the tonge is a brcker of baudrye: the tonge setteth frendes at debate: The tonge with flatterynge, detraction, and wanton tales enfecteth pure and clene myndes: the tonge without sworde or venome strangleth thy brother and frende: and brefely to speake, the tonge teacheth cursed heresyes, and of good Christiens maketh Antichristes.

Of kynge Lowes of France and the husbande man.

What tyme kynge Lowes of Fraunce, the xi. of that name, bycause of the trouble that was in the realme, kepte hym selfe in Burgoyne, he chaunced by occasion of huntinge to come acqueynted with one Conon a homely husbande man, and a plaine meanynge felowe. In whiche maner of men the hygh princes greatly delyte them. To this mans house the kynge ofte resorted from huntynge. And with great pleasure he wolde eate radysshes rotes with hym. Within a whyle after whan Lowes was restored home, and had the gouernaunce of France in his hande, this husbande man was counsailed by his wyfe, to take a goodly sorte of radysshe rotes and to go and gyue them to the kyng, and put him in mynd of the good chere, that he had made hym at his house. Conon wolde nat assent therto, what folysshe woman qued he, the great princes remembre nat suche smalle pleasures. But for all that she wolde not reste tyll Conon chose out a great syght of the fayrest rootes, and toke his iourney towarde the courte. But as he went by the way, he yete vp all the radysshes saue one of the greattest.

Conon peaked in to the courte, and stode where the kynge shulde passe by: By and by the kynge knewe hym, and called hym to hym. Conon stepte to the kynge and presented his rote with a gladde chere. And the kynge toke it more gladly, and bad one, that was nerest to hym, to laye it vp amonge those iewels that he best loued: And than commaunded Conon to dyne with hym. Whan dyner was done he thanked Conon: and whan the kyng sawe that he wolde departe home, he commaunded to guye him a thousande crownes of golde for his radisshe rote. Whan this was knowen in the kinges house, one of the court gaue the kyng a propre mynion horse. The kyng perceiuing, that he dyd it, bicause of the liberalite shewed vnto Conon, with very glad chere he toke the gyft, and counsailed with his lordes, how and with what gyft he myght recompence the horse, that was so goodly and faire. This meane while the picke thank had a merualous great hope, and thought in his mynde thus: If he so wel recompensed the radysshe roto, that was gyuen of a rusticall man: howe moche more largely wyl he recompence suche an horse, that is gyuen of me that am of the courte: whan euery man had sayde his mynde, as though the kynge had counsayled aboute a great weyghty matter, and that they hadde longe fedde the pycke thanke with vayne hope, at last the kyng sayd. I remembre nowe, what we shal gyue hym: and so he called one of his lordes, and badde hym in his eare, go fetche hym that that he founde in his chambre (and told hym the place where) featly folded vp in sylke. Anone he came and brought the radysshe roote, and euen as it was folded vp, the kyng with his owne hande gaue it to the courtier, sayenge: we suppose your horse is well recompensed with this iewell, for it hath cost vs a thousande crownes. The courtier went his way neuer so glad, and whan he had vnfolded it, he feund none other treasure, but the radysshe rote almoste wethered.

Of the plough man that sayde his pater noster.

A rude vplandishe plough man, whiche on a tyme reprouynge a good holy father sayd, that he coude say all his prayers with a hole mynde and stedfaste intention, without thinkyng on any other thynge. To whome the good holy man sayde: Go to, saye one *Pater noster* to the ende, and thynke on none other thynge, and I wyll gyue the myn horse. That shall I do, quod the plough man, and so began to saye, *Pater noster qui es in celis*, tyll he came to *Sanctificetur nomen tuum*, and than his thought moued him to aske this question: yea but shal I haue the sadil and bridel withal? And so he lost his bargain.

Of the fryer that brayde in his sermon.

A fryer that preached to the people on a tyme, wolde otherwhyle crie out a loude (as the manner of

some fooles is) whiche brayenge dyd so meue a woman that stode herynge his sermone, that she wepte. He parceyuyng that, thought in his mynde her conscience being prycked with his wordes, had caused her to wepe. wherfore whan his sermon was done, he called the woman to hym, and asked what was the cause of her wepynge, and whether his wordes moued her to wepe or nat. Forsoth mayster (sayde she) I am a poure wydowe: and whan myne husbande dyed, he lefte me but one asse, whiche gotte parte of my lyuynge, the which asse the wolues haue slayne: and nowe when I hard your hyghe voyce, I remembred my selve asse, for so he was wonte to braye bothe nyghte and daye. And this good mayster caused me to wepe. Thus the lewde brayer, rather than preacher, confuted with his folysshenes, wente his waye: whiich thinkynge for his brayenge lyke an asse to be reputed for the beste preacher, deserued well to here hym selfe to be compared to an asse.

For truely one to suppose hym selfe wyse
Is vnto folysshenes the very fyxste gryce.

Of the wyse man Piso, and his seruaunt.

A certayn wise man called Piso, to auoyde greuous ianglynge, commaunded, that his seruauntes shulde saye nothinge, but answere to that that thei were demaunded, and no more. Vpon a daye the sayde Piso made a dyner, and sent a seruaunt to desire Clodius the Consull to come and dyne with him. Aboute the houre of diner al the guestes came saue Clodius, for whom they taryed tyll hit was almoste nyght, and euer sente to loke if he came. At laste Piso sayde to his seruaunt: Diddest thou byd the Consull come to dyner? yes truely sayde he. Why cometh he nat than? quod Piso. Mary, quod the seruaunt, he sayde he wolde nat. Wherfore toldest me nat so incontinent? quod Piso. Bycause, quod the seruaunt, ye dyd nat aske me.

By this tale seruauntes may lerne to kepe theyr maisters biddyng: but yet I aduise maysters therby to take hede, howe they make an iniunction.

HAMMERSLEY'S BANK.

THE following account of Messrs Hammersley and their bank (Pall Mall, London), which lately stopped payment, is given in the *Circular to Bankers*. The manner in which Mr T. Hammersley is described to have been led on from one speculation to another—the new scheme always to redeem the loss from that which preceded it, but always making matters worse—gives a startling insight into the higher walks of business in this commercial country.

"Some fifty or sixty years ago, the old and eminent banking-house of Herries and Co. was the only firm in England which had adopted the practice of issuing notes payable on presentation, or at a few days' sight, at various large towns throughout the continent of Europe: it was a circulation of the greatest possible convenience, safety, and utility to travellers and temporary residents in foreign countries, and it was very properly, and with much foresight as to the consequences, so arranged by the introducers of the practice as to render the accommodation to the applicants or the public easy and economical to them, so that they always felt obliged for the opportunity of resorting to it. It was also, no doubt, a lucrative kind of business to the issuers of the notes. The amount of this circulation must have been greatly curtailed by the French revolutionary war; but still it was almost an exclusive field, and it had, as may fairly be assumed, rendered a good return to the enterprising firm with whom the practice originated. The war must terminate; and those who were in possession of the field of operation, and were acquainted with all the circumstances, places, persons, and details necessary to the conduct and management of such a business, would have great advantages on the renewal of intercourse with the continent of Europe. Few persons knew any thing about the extent of the profits of this kind of banking business; but among those few would be the confidential clerks of Messrs Herries, and one of them was the late Mr Thomas Hammersley, the father of Mr Hugh Hammersley, just deceased.

Mr Hammersley quitted his position as clerk, and entered into co-partnership with Messrs Morland and Ransom, under the firm of Morland, Ransom, and Hammersley. This firm did not remain united many years, and it was understood on its dissolution that there was a balance of loss to be borne by each of the several parties. It might not be a very large one, at least not amounting to a sum that could materially impede the operations of a great and substantial London banking firm; but supposing it to be not more than L.20,000 for Mr Hammersley's share, it was to that extent a load on that gentleman's shoulders in his subsequent struggles. He then, upwards of thirty years ago, formed a co-partnership under the firm of Hammersleys, Montelieu, Greenwood, Brooksbank, and Drewe—a union which would seem to promise great results in profit, seeing that Mr Greenwood was in the high tide of prosperity as the leading army-agent and the confidential friend of the Horse Guards, and that other members of the firm were capable by their connexions of introducing valuable business to the new banking-office.

It happened, however, that the new firm was under the principal direction of a mind deeply imbued with the bold and confident spirit of the times—a spirit which is in perfect contrast to that which governs the conduct of almost all experienced bankers of the present day. They pushed their accommodation for the purpose of acquiring business, or they granted such accommodation on the representations of parties, too readily. Among these was a bank at Honiton, in Devonshire, which failed many years since. It is said that the accommodation granted to this bank at its highest point considerably exceeded L.230,000. It was given principally in the shape of bills, accepted by Messrs Hammersley and Co.; and it was an understood arrangement between the parties, that the sum of this kind of circulation to be constantly kept afloat should be about L.200,000. Bills of this description, drawn on purpose to obtain bank-notes by discounting them, could not at this day be made to work at all; they even then moved heavily in certain quarters, and we believe, if it had not been for the friendly aid and co-operation of a director of the Bank of England, now deceased, the whole scheme of raising money by this kind of circulation would have broken down much sooner than it did.

Before the failure of this Devonshire Bank, Messrs Hammersley and Co. reduced the balance from its highest point, which is variously stated at sums between L.280,000 and L.300,000, as well as they could, by getting available securities and otherwise. For the final balance, which, after all practicable reduction had been effected, amounted, we believe, to L.180,000, they accepted, we were many years since informed, 1s. or 1s. 6d. in the pound; consequently, the real loss upon this account would not be less than from L.160,000 to L.170,000. It would be instructive if we could toll by what means and gradations borrowers contrived to involve Messrs Hammersley and Co. in this large and ruinous liability. The bankers at Honiton made a great show of possessions in land, upon which securities for the advances would be given; but, according to our information, these were no further available for the payment of the great debt than we have above stated. Whether the then existing partners of the firm of Hammersley and Co. took each his share of this enormous amount of loss, or it was left as an incubus on the bank to be liquidated by the accruing profits of that establishment, we do not know. The latter seems the more probable, seeing that the firm was gradually stripped of every one of its members, except the lamented Mr Hugh Hammersley.

Whilst the firm was subject to the aforesaid influence—viz., was under the direction principally of its founder, Mr Thomas Hammersley—other losses of considerable magnitude were incurred, either by that gentleman individually, or by the house over which he presided. There was one with an office-bearer in his Majesty's Treasury, amounting to a sum approaching to L.46,000. What portion of this sum may have been subsequently liquidated by the connexions of the party on whom the obligation rested, we do not know. Then there was a much larger sum which Mr Thomas Hammersley advanced to a firm for the manufacture of soap carried on in the borough of Southwark. The loss here, we believe, was little, if any thing, short of L.80,000. The history of this soap manufacture would be interesting and instructive if related circumstantially in detail; we must episodically advert to some of the leading facts, for they are pregnant with warning to men of property and such as have the command of large sums of money.

An ingenious person of the name of Phelps, professed the art of making soap of a better quality than any other manufacturer of the article could produce. The profession was not a vain one, no regard being had to the cost, as the product exhibited bore evidence. On this showing, he induced men of great property to join him with capital, without careful examination; costly works were raised, and the best plant was formed that labour, materials, and money could furnish. They soon found, however, that profit did not ensue from this large outlay, and Mr Phelps then suggested that the great profit lay in the making of alkali, and the firm consequently undertook the manufacture of that article; still there was no profit, and the adventure had at this stage absorbed too much money to admit of the consideration of retreat from the enterprise. 'Go ahead' was then the signal-flag of the times; so the firm turned merchants, and would fetch their tallow in their own ships from St Petersburg. It was during the war; the tallow-laden ships were seized, and carried into one of the Danish islands. This was a great blow to the firm; and to recover their property they mustered a sufficient force to go and attempt to cut out and retake the ship or ships, and in this they succeeded. One large ship was on its passage home from the Danish port, with a cargo insured for more than L.40,000, when the captain and crew descried a smaller vessel, to which they gave chase, with the intention of capturing it; but which, when they came near to it, they found to be an American, with whose country we were at peace, and they dared not touch it. They then steered for London, but the ship and cargo were burnt before they reached port, the crew alone escaping; and the underwriters refused to pay one shilling, because the ship had been out of the prescribed course in chase of the Americans. In this, and such other ways as great manufactures on novel plans are incident to, several hundred thousand pounds were lost by Messrs Phelps and Co.

We continue the recital. Mr Phelps succeeded in getting for his co-partner Mr Bracebridge, proprietor of Aston Hall, near Birmingham, the park and fine old mansion of which estate is now in the occupation of Mr Watt, the son of the celebrated James Watt. Mr Bracebridge set up a bank at Warwick, but he was soon driven out of that field from want of confidence to conduct so responsible an office; he paid all the creditors of the bank, and gave it up. The means, however, from his mercantile adventures had restored him to such straits, that he was constrained to sell his reversionary interest in those two valuable estates of Aston Hall in Staffordshire, and Bostock Hall in Cheshire. And we believe it to be not extravagant to say that, if this gentleman had been content to live within his income, and had not turned banker and soap-boiler, he would at this moment be in possession of landed property worth very little short of a million sterling, which is for ever alienated from his family. Nothing could more forcibly illustrate the different consequences flowing from providence and improvidence, than the fact that a part of that same estate of Aston Hall was purchased by Mr Whitehead, banker of Warwick; and from its proximity to Birmingham, it is likely to become a property of great value.

Why do we refer to these circumstances? Because they are, even in this naked sketch, pregnant with instruction. A great London bank has stopped payment, holding deposits which are stated to amount to L.650,000, and having promissory-notes circulating in all parts of the continent of Europe, amounting to a very considerable sum; and, as we believe, it is brought to this state, not from any misconduct on the part of the late possessor and director of the office, as far as the management of the funds intrusted to him is concerned, but from the misconduct of those who preceded him. Mr Hugh Hammersley inherited a lucrative business encumbered with dreadful losses. A long course of years might have brought about solvency, and laid a solid foundation of wealth. We are bound to explain these things, and to trace the evil to its sources. These sources are mainly—

1. A loss on Mr T. Hammersley leaving the firm of Morland, say - -	L.20,000
2. A loss with the Honiton bank, which we put down, - - - - -	160,000
3. A loss in the soap factory, - - -	80,000
	L.260,000

We believe that, under the management of the late Mr Hugh Hammersley, this large sum was in the course of gradual liquidation from regularly accruing profits. There is no doubt that a very valuable description of business had been attracted to the office, and we believe if the disaster had occurred a few years sooner, the creditors would have received a smaller dividend—the assets being now stated to be equal to the payment of about 15s. in the pound. The rapid sliding away of property from opening the sluice of improvident confidence, and the slow recovery of it by care and circumspection—for a quarter of a century has elapsed since any of the losses here stated were incurred—are notable facts, worthy of the consideration of all bankers and merchants."

MILITARY SYSTEM OF FRANCE.

[The following condensed and accurate account of the military system of France is extracted from the second part of Messrs Adam and Charles Black's new System of Geography, abridged from the works of Malte Brun and Balbi; a work evidently prepared with extraordinary care and with the benefit of an unusually extensive command of information, and which, when completed, as designed, in one volume, must be the most economical book of the kind which we possess.]

THE French have always been fond of military glory, and have invariably placed the most unhesitating confidence in their prowess in war. Their arms have, indeed, at various times been crowned with the most splendid success, and yet no nation has ever experienced greater reverses or more signal defeats. At present, the French government maintains a large standing army, rated, even on the peace establishment, at 311,412 men, and 62,142 horses. This force is composed of infantry, cavalry, artillery, and engineers. The infantry consist of 67 regiments of infantry of the line, of three battalions each; 21 regiments of light infantry, also of three battalions each; 3 battalions of light infantry of Africa; 8 companies *de discipline*; 4 companies of pioneers; 3 battalions of zouaves; and a foreign legion of three battalions. The cavalry consist of 2 regiments of carabineers; 10 regiments of cuirassiers; 12 regiments of dragoons; 8 of lancers; 12 of chasseurs; 6 of hussars; 3 of chasseurs d'Afrique; 1 regiment of regular spahis of Algiers; 1 regiment of Bonah; 1 regiment of Oran. The artillery consist of 14 regiments of twelve batteries each; 1 battalion of pontoniers; 12 companies of artillery workmen; and 6 squadrons of train of the parks of artillery, each including six companies. The engineers consist of 3 regiments of sixteen companies each, and various other bodies. The total number of infantry, in 1839, was 205,100; of cavalry, 49,000; of artillery, 22,700; of engineers, &c., 28,500; besides 28,500 gendarmes, or armed police, dispersed in small bodies throughout the kingdom. The war establishment is rated at 420,265 men, and 121,892 horses. The army is recruited partly by voluntary enlistment, and partly by conscription; but the latter is greatly modified since the time of the Emperor Napoleon; the numbers required being now limited to 40,000 annually, and the period of service to six years, while great latitude is allowed in the procuring of substitutes.

The gradations of military rank are, sub-lieutenant, lieutenant, captain, chef d'escadron, colonel, marechal

Digitized by Google

de camp, lieutenant-general, and marechal of France. Promotion is never obtained by purchase, and not often by special order; more than half the appointments take place by seniority. The number of marechals of France is at present ten; but by the new regulations it is to be fixed at eight in time of peace, and may be increased to twelve in time of war.

Not content with military glory by land, the French have been equally ambitious to become a great naval power, but have not hitherto succeeded in rendering themselves formidable by sea. After a century and a half of continual effort and frequent conflict, their fleet was almost annihilated by the battle of Trafalgar, and subsequent minor engagements during the late war. Since the peace, the government have paid the utmost attention to the navy, and are now prepared, in the event of war, to send a powerful fleet to sea. According to the budget of 1839, there were in active service, 8 ships of the line, 12 frigates, 16 corvettes or sloops, 24 brigs, and numerous other vessels; and the amount of their crews was 20,317 men. The number in commission at 1st January 1840, was—Ships of the line, 13, from 80 to 120 guns; frigates, 13; corvettes, 19; brigs, 33; gunbrigs, 9; schooners, cutters, advice-boats, transports, &c., 578; steam vessels, 25. By royal ordonnance of 1st January 1837, the navy in time of peace is fixed at 40 ships of the line, 50 frigates, 40 steamers, and 190 smaller vessels. The smaller vessels are to be kept afloat; but only half of the ships of the line and frigates are intended to be launched, the other half to be kept on the stocks in different stages of building.

As soon as a young man has been apprenticed in the coasting trade, or has made two voyages at sea, or has been employed two years in the fisheries, he is registered in the lists of the district to which he belongs. Besides this class of mariners, all other persons, be their ages what they may, who enter merchant vessels, or engage in the fisheries, are inscribed in the registers as soon as they have seen service; nor is any exception made in their favour, though they may have previously stood their chance of the ballot for the army, or have served their time in its ranks. The record of their names in the register of mariners is all that is necessary to fix that liability upon them; and in their case, as well as in that of every regularly bred seaman, this liability continues till the age of fifty. They all become as much the property of the state as the Russian serf is of the landowner at the moment of his birth. Whenever sailors are required for the naval service, the naval prefect announces to the local supervisor or commissary the quota of men to be supplied from each district. The latter thereupon directs the syndic of the navy to send him twice or thrice the number of men required, and he makes such selections from them as he thinks proper. No exemption whatever is admitted; and there is no appeal from the will or caprice of the commissary. The total number of individuals, of all descriptions, employed in the sea service, as at 1st January 1838, was 110,589, among whom there were 10,836 captains, shipmasters and pilots; and of that number 272 belonged to the public, and 6946 to the mercantile service.

As connected principally, though not exclusively, with the army and navy, we may mention the Order of the Legion of Honour, which was instituted by Napoleon. The usual title to admission is the discharge of important duties, either civil or military; and in time of war, the performance of some action of great bravery. The gradations are—1. Chevaliers, of whom the number is unlimited; 2. Officers, limited by the laws of the order to 2000; 3. Commanders, limited to 400; Grand-Officers, to 160; and Grand-Crosses, to 80; but on 1st January 1840, the actual number of the members was —Grand-Crosses, 96; Grand-Officers, 206; Commanders, 829; Officers, 4491; Chevaliers, 44,393; in all, 50,015.

PUBLIC HEALTH AND MORTALITY.

Paradoxical as it may appear, it is certain that a man's health, nay life, is nearly as much in the keeping of those of whom he knows nothing as in his own. Of the three influences mainly acting on it—himself, society, and external nature—the first bears on it most intensely, the second most covertly, the last most constantly. Moral culture may teach the individual so to curb his passions and appetites, as to develop all the forces of his organisation in their most healthful scope; or its neglect may set them loose as the deadliest instruments of self-destruction. The social system acts upon us not only through its fashions and customs, but by the power of government; and an ill-considered impost, indirectly affecting the food, the habitation, or the clothing of the community, shall send more to their graves than ever fell by sword or spear. Climate is always so ameliorated by civilisation, that we may safely say that it forms no exception to the general fact, that all the sources enumerated as influencing life are greatly modifiable; so that, although we may not believe, with M. Quetelet, in the perfectibility of our race, we may yet be sure that all its numerous ills may be immeasurably lessened. Nothing is truer than that the mortality of a kingdom is the best gauge of its happiness and prosperity. Show us a community wallowing in vice, whether from the pamperings of luxury or the recklessness of poverty, and we will show you that there truly the wages of sin are death. Point out the government legislating only for a financial return, regardless or ignorant of the indirect effects of their enactments, and we shall see that the pieces of silver have been the price of blood.—*Quarterly Review.*

ADVISERS.

The following specimen of the shrewd humour of James Smith was intended to have been included in a notice of his "Memoirs and Comic Miscellanies," which lately appeared in the Journal, but was postponed for want of room:—

There is a family named Partington, that has lately commenced its residence in Upper Harley Street. It consists of a father, a mother, two sons, and two daughters. The father is a sturdy, red-faced, good sort of man, and the mother is a slender, sallow, good sort of woman. John, the elder son, is with his father in the wine and spirit line, in America Square; Charles, the younger son, is in the law; the two girls expect to be married. There is at present a great deal of *advice* stirring about London, and the Partingtons have given and received more than their due proportion of it. It has often astonished me why so much of that commodity has been, and continues to be, given: nobody thanks you for it; indeed, nine people out of ten tell you, in pretty plain terms, to keep your advice to yourself—yet still we continue to give it. Never was benevolence more gratuitous than ours!

Hardly was old Partington well settled in Upper Harley Street, in a most commodious situation, inasmuch as it commanded a corner view of the outside of the Diorama, with a peep at the little statue of the late Duke of Kent at the top of Portland Place—when he received a visit from his crony, Mr Chapman, of Devonshire Square, Bishopsgate Street, who called to give him some advice as to his recent proceedings.

Mr Chapman commenced his harangue in one of the accustomed forms: "Now, Mr Partington, I am sure you have too much good sense to be offended at what I am about to say." Mr Partington assured him, in answer, that he had a great deal too much good sense; whereupon the adviser, in reply, began to descant upon the extreme folly of Mr Partington in quitting his city residence to sojourn in Upper Harley Street. The adviser reminded the advisee of those happy days when, Bedlam being then standing upon London Wall, they used to walk up and down Moorfields in front of the iron gates of that edifice, for half an hour before dinner, to get an appetite; a needless ceremony, but persisted in notwithstanding. Mr Partington owned, with downcast eyes, that such had been their practice; but alleged in his defence, that nobody lived in the city at present—"even Bedlam has deserted it," exclaimed he, with a sigh. "True," answered the adviser, "and if you had removed your quarters to St George's Fields, I should not have so much wondered; but what the deuce could draw you to Upper Harley Street? Let me now advise you as a friend: if you have not yet signed and sealed, declare off, and come back again. We have dined with you once, in the way of friendship; but, my dear Jonathan, when you could have us all to dinner in a ring-fence, within one hundred yards of the Royal Exchange, what could put it into your head to drag us four miles off, to cut your mutton in Marybone parish?" Mr Chapman now retired, and Mr Partington took his advice as children take physic, by canting it out of the window the moment the apothecary's back is turned. The lease was executed that very morning, and Mr Partington, notwithstanding a strong internal aversion to the hot chalky dusty corner of the Portland-road, became tenant of the house in Upper Harley Street for twenty-one years, from Christmas-day then last past. Men in the spirit line are not to be advised with impunity.

While this affair was transacting in the small back apartment behind the dining-room (the only one in the whole house which a married man can call his own, and even this is apt to be invaded by hats, canes, and umbrellas, out of number), advice was going on at a great rate in the front drawing-room up stairs. Mrs Chambers was full tilt at Mrs Partington, advising her how to manage her family. "My dear Mem (for to this diminutive is our French Madame humbled since the Revolution)—my dear Mem," said this matronly Mentor, "only conceive that you should never have heard of Doctor Level. I've got three of my girls down under his hands, and I hope to get Julia down the moment she comes from school." "Down! Mrs Chambers, I don't quite understand you." "No!—only conceive how odd! By down, I mean down flat upon their backs upon three sofas. Doctor Level says it's the only way to bring up girls straight. All depends upon the spine: nerves, bile, toothache, asthma, and every thing of that kind—all springs from the spine." "Well!—but, Mrs Chambers, is not horse exercise a better thing? My girls ride in St James's Park now and then, with their brother Charles as a make-weight. I can assure you, several young men of very considerable property ride there; and, according to my calculation, men are more apt to fall in love on horseback than on foot." "Horseback!—only conceive how dreadful! Doctor Level won't hear of it: he says girls should be kept quiet—quite quiet. Now, you know Anna is short and rather thick in her figure: the poor girl burst into tears on reading that Lord Byron hated a dumpy woman. I was quite in despair about her: only conceive!—no more figure than my thumb! I spoke to Dr Level about it, and he said, 'It's no matter, she must have the *long gaiters*.'" "Long gaiters, Mrs Chambers!—a very pretty appurtenance to a grenadier, but surely for a diminutive young lady"—— "Oh, Mem, I beg your pardon: it's the best thing in the world; let me advise you, as a friend, to try the long gaiters.* I'll venture to say, that in six years he would make little Crachami as long as the Queen of the Sandwich Islands. How he manages it I don't know; but there are two long straps that keep down the shoulders and flatten the ankles; then he turns a sort of screw, under the sofa, which sets the straps in motion, and pulls out the body just for all the world as if he were rolling out paste for a gooseberry pie-crust. Well, my dear Mem, would you believe it? we have already gained two inches; and Doctor Level promises me, if I keep Anna quite quiet for three years and seven months, she may get up quite a genteel figure. Jemima and Lucy are rather better figures: I hope to have them up and about in a twelvemonth." "Poor girls, don't they find it very dull?" "Oh no; I left them this morning with 'Irving's Four Orations,' and 'Southey's History of the Brazils.' Plenty of amusement, that's my maxim. Let me advise you, as a friend, to follow my example."

Mrs Chambers was qualified to give all this advice from living in Lower Grosvenor Street, which gave her much more knowledge of the world (especially on a fine Sunday) than could be possessed by an inhabitant of Upper Harley Street. Mrs Partington, for the same reason, was bound to take it in seeming thankfulness. Most fortunate was it for the two Misses Partington, that their mamma was "advised as a friend." But for those soul-revolting expressions, Mrs Partington might have been induced to call in Doctor Level to bind her daughters' back-bones over to their good behaviour; and the two Misses Partington, in lieu of cantering under the back-wall of Marlborough House, and kicking up as much dust as a couple of countesses, might, at this present writing, have been flat on their backs, in the back drawing-room in Upper Harley Street, like a couple of Patiences on a monument, smiling at a whitewashed ceiling!

* Qu. Elongators?

LINES TO MURPHY.

[The following lines, which first appeared some months since in a periodical work of limited circulation, are obligingly placed at our disposal by the author—the same individual who composed "Tonis ad reste Mare."]

Oh, Murphy, Murphy, I am sure afraid
You're but a poor and sorry common-tator;
A very tyro in the weather trade,
And all unfit for Jack Frost's legislator.

Your foggy days, alas! are clear and fine,
Your cold and rainy all are warm and sunny;
Each following day belies your every line,
And proves your want of science and of money.

What ails your hail that it will not come down?
Why does your Phœbus fib us, too, like this?
Why does your thunder disappoint the town,
In your ephemeral Ephemeris?

Your meteorologic logis pray revise,
Your problems too, so very problematic;
And if, moon-struck, you still must theorise,
Let not your comet course be so erratic.

Your reign will end before the rain begins,
And down to Zero sink your reputation;
Fog, Meteor, Vapour, all will kick your shins,
And change your altitude to declination.

The powers above—Aries, *et cetera*,
Libra, Aquarius, Sagittarius—all
Will be indignant at thy exposé,
And stop, methinks, thy Comic Annual.

The planets, too, will doubtless join the wars,
Stop thy diurnal, annual rotation;
And, thy Urania mania marred by Mars,
Thou wilt not well escape a good gyration.

But fare you well, my weather-beaten boy;
I'll bid good-bye, with every wish that's kind:
May all your future days be fine and dry,
And you still make a breeze and raise the wind.

S. W. P.

RECOVERY OF PROPERTY.

The following circumstance is as true as it is singular. A few years ago two gentlemen, who had been left executors to the will of a friend, on examining the property, found a scrap of paper on which was written, "Seven Hundred Pounds in Till." This they took in the literal sense, and examined all his apartments carefully, but in vain. They sold his collection of books to a bookseller, and paid the legacies in proportion. The singularity of the circumstance occasioned them frequently to converse about it, and they recollected among the books sold (which had taken place upwards of seven weeks before), there was a folio edition of Tillotson's Sermons. The probability of this being what was alluded to by the word "Till" on the piece of paper, made one of them immediately wait upon the bookseller who had purchased the books, and ask him if he had the edition of Tillotson, which had been among the books sold to him. On his replying in the affirmative, and the volumes being handed down, the gentleman immediately purchased them, and on carefully examining the leaves, found bank notes, singly dispersed in various places of the volumes, to the amount of seven hundred pounds! But what is perhaps no less remarkable than the preceding, the bookseller informed him that a gentleman at Cambridge, reading in his catalogue of this edition to be sold, had written to him, and desired it might be sent to Cambridge, which was accordingly done; but the books not answering the gentleman's expectations, they had been returned, and had been in the bookseller's shop till the period of this very singular discovery.—*Odd Fellow.*

FLUENCY OF SPEECH.

Dean Swift says, the common fluency of speech, in most men and most women, is owing to a scarcity of matter and scarcity of words; for whoever is a master of language, and hath a mind full of ideas, will be apt, in speaking, to hesitate upon the choice of both; whereas common speakers have only one set of ideas, and one set of words to clothe them in, and these are always ready at the mouth; so people come faster out of church when it is almost empty, than when a crowd is at the door.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 461. SATURDAY, NOVEMBER 28, 1840. PRICE THREE HALFPENCE.

A FEW WEEKS FROM HOME.

THE NORE AND THEREABOUTS.

To continue these rambling sketches of home travel—the reader may be reminded that we stopped in our journey through Hampshire, to spend a quiet Sunday amidst the interesting antiquities of Winchester and St Cross. Departing from this scene of William of Wykeham's glories, and now one of the least altered of Old England's oldest cities—leaving the green and soft luxuriance of the vale of the Itchin, we proceed on our way by rail to London, and in little more than two hours we are turned out from the mixed train to be mixed among the busy crowds of the metropolis.

Some writers—my Lady Morgan for one, if we recollect rightly—have a very convenient knack of vaulting at a bound over an interval of time in their narratives, by giving a dashing line of stars—the said stars being all that the reader gets for some darkly mysterious part of the story which it would puzzle the author to explain. On the present occasion it would be remarkably easy to follow this excellent example, but as plain dealing is more to our taste, we shall just say, in a few words, that we pass over an interval of three months, and are again, during the fortnight or three weeks of "farewell summer," once more upon our rambles from home. In short, we are again in London, ready for all sorts of inquiries and excursions.

I had gone, I do not know how often, up and down the Thames. Sheerness, and Tilbury Fort, and Purfleet, and Gravesend, and the old cocked hats and wooden legs which daily air themselves on the terrace at Greenwich, were all perfectly familiar to me. But somehow or other I had never got round the Nore, in the direction of Margate; and so now I resolved to pay a brief visit to a few places in this quarter of the Kentish coast.

The opportunities for making such an excursion are now exceedingly plentiful. In the days of old, the only means of transit consisted of the Margate hoys, a class of small sloops which carried you in a couple of days, wind and weather permitting, to the place of your destination; but now, what a change!—smart steamers dash off daily from London Bridge, and in five or six hours disload their hundreds of gaily-dressed passengers on the jetties of Herne Bay and Margate. In one of the most active of these well-managed boats, the Red Rover, we one morning placed ourselves; and in due time were brought abreast of the Isle of Sheppy and adjacent parts in the mainland of Kent. This part of the coast, it is necessary to explain, forms the great airing ground of the good folk of the metropolis. During "the season" as many as two or three thousand persons are daily landed and carried back to town. But Saturday, in particular, forms the great day for these excursions; the toiled and stupefied tradesman, who has been stewed up for a week amidst the streets and lanes of the city, on that day gets off to pay his accustomed visit to his wife and family—to enjoy a few hours' fresh air on the beach on Sunday—and to return again on Monday to his desk and dingy counting-house.

From all I could learn, there are two kinds of summer recreation in these places of resort—one consisting of actual rustication and airing at Herne Bay or Ramsgate, and another of imaginary rustication and airing among the fashionable lounges and tea-gardens of Margate. Another thing may be mentioned; the resort to either of these places is almost exclusively of persons east of Charing Cross—that is to say, citizens with their wives and families, or young ladies and gentlemen of the same class, who wish to spend money any way, but "genteely," if possible; and what half so genteel as spending it for a few weeks on the amusements of Margate!

With these preliminary explanations, we now land, in the first place, on that part of the coast where the real and more sober-minded rusticators resort. Herne Bay, as this place has been called, is quite of modern date; and its name, as may be inferred, is derived from the ancient village of Herne, which is situated about a mile inland, on the high road to Canterbury.* The coast at this spot is eminently suited for a watering-place. Unlike the greater part of the adjacent district, the shore has a fine slope, in the form of a sandy and pebbly beach, to the water, and may at all times be reached from steamers with perfect comfort, by means of a beautiful and substantial jetty of three quarters of a mile in length. The country, backwards, all the way to Canterbury, is of a soft undulating character, well plenished with woods and copses, and dotted over with old-fashioned hamlets and trimly thatched farm-buildings and cottages. The walks, therefore, whether along the grassy downs which overhang the sea, or into the rural scenery beyond, seem well adapted for the summer solacement of the overworn inhabitants of the city. Some ten or twelve years ago, Herne Bay, by the activity of a few rash speculators, became "all the rage," and buildings and streets, on a superlatively grand scale, sprung up in all directions. From one cause or other, however, the tide of popularity did not last a sufficient length of time, and the building lots being retained at enormous prices, the projected town stuck after it had been begun, and in the present day we find it composed of many partially finished edifices, and rows of streets standing like so many loop-holed and ragged ruins. Nevertheless, the place, as Brown would have said, has capabilities calculated to carry it over this great initiatory misfortune, and these are leading gradually to its settlement and improvement.

Along the shore there is a remarkably neat terrace-like walk for promenaders. Adjacent are bathing-houses, numerous dwellings for visiters, and two hotels of large dimensions in full operation; during my short stay, a very handsome church was consecrated by the archbishop for the use of the inhabitants, regular and transient. It would be very inexcusable to pass over in this notice, however slight it be, the good deeds done to the town by a benevolent and wealthy patroness, Mrs Thwaites, relict of an opulent merchant in the city, and who devotes no small share of her property to charitable and public purposes. Unlike the generality of mankind, who only leave wealth to their fellow-creatures when they can no longer make use of it themselves, this well-disposed lady, having taken a fancy to Herne Bay, has largely assisted in the support of free schools for the place, and lent her charitable aid to the poor of the neighbourhood. She likewise, a few years ago, erected, at a considerable expense, a tall and handsome clock-tower on the sea-promenade, which may be seen at a great distance. Although totally unacquainted with this lady, there seems such a degree of rationality in the disposal of her superabundant wealth, that I feel much pleasure in holding up her conduct to imitation.

Herne Bay forms a good starting-point for those who wish to explore the antiquities and geological character of the coast. About three miles to the eastward, on the verge of the sea, stand those remarkable objects of antiquity, and land-marks, the towers of the church of Reculver. To this spot I hastened to pay a visit. In front is the wide expanse of the German Ocean, studded here and there with vessels making for the mouth of the Thames from the Downs or continental ports; on our left is the Isle of Sheppy, darkly pictured on the horizon, and on the right that flat expanse of prairie or meadow land, which occupies the filled-up channel between the mainland and Thanet, whose higher grounds close up the scene. Nowhere, on the coast of Great Britain, have such extensive changes been effected by the sea and other causes, on the dimensions and configuration of the land. On a prominent knoll, now carried completely away by the waves of the ocean, once stood the castle of Raculf-cester, an early station of the Romans, and, latterly, a seat of the Anglo-Saxon king, Ethelbert. During this latter period, a church of great extent was built adjoining the castle; and it is the towers of this edifice, popularly called the Reculvers, which now stand as the most prominent objects on the whole line of coast. On attaining the spot, we find that the sea has washed away at least a mile of the land, leaving for several miles a precipitous cliff, which is daily lessening in bulk. In dread of these rapid encroachments, the church has been many years abandoned, and is now an open desolated ruin—the only complete portion remaining being the two towers, which are preserved as land-marks for mariners: The sea has not, as is generally reported, reached the building, but it has carried away a half of the burying-ground around it, and numerous remains of mortality project from the face of the cliff, and are scattered along the beach. To prevent, if possible, farther inroads, the Trinity House has caused the erection of a paved bulwark for a considerable distance along the shore; and it is evident, that unless some precautionary measures of this kind be speedily adopted elsewhere, a very considerable loss of land must ensue. The extraordinary carelessness hitherto shown on this point, is far from creditable. At present, as we are told by Mr Lyell, the loss of land, by the washing away of the clayey and chalky cliffs, is at least two feet per annum; and it is calculated that the whole island of Sheppy, now measuring six miles in length by four in breadth, will be annihilated in half a century.

It is interesting, in a geological point of view, to remark, that while the precipitous and some other parts of the coast have been diminishing annually, land has in one spot been accumulating with equal rapidity. Casting our eye south-eastwards from the Reculvers, as I have said, we observe a flat tract of rich meadow land, as like the polders of Holland as any thing in this country. This tract, which is embellished with trees, fences, and farm-offices, was once an arm of the sea, which stretched from Sandwich to near the Reculvers, and through this navigable channel the Roman fleets used to sail on their way to and from the Thames. About the time of the Norman Conquest, the Channel became impassable, from the accumulation of earthy matter; and in the fifteenth century it was crossed by a bridge. Since that period, all vestige of water course has disappeared, if we except the wet ditches which here and there intersect the enclosed fields. It will be understood, therefore, that Thanet is no longer an island, but a portion of the mainland of Kent, and forms a bold piece of country, with the North Foreland, Margate, and Ramsgate, on its exterior and sea-washed extremity.

Having sufficiently explored the environs of Herne

* Herne was the first cure of the pious Ridley, afterwards bishop of Rochester and London; and here he resided for several years, discharging the duties of his pastoral office with great zeal.—*Beauties of England and Wales*, vol. viii. Herne church, to which I paid a visit, contains a number of objects as old as the fifteenth century; among others, is a monumental brass figure over the tomb of Lady Philip, wife of Matthew Philip, sometime Lord Mayor of London; she died in 1470, and is represented in the dress of the times.

Digitized by Google

Bay and the Reculvers, the place to which we next proceeded was Margate, a steamer carrying us thither in rather less than an hour. I am sorry to say that I was disappointed with Margate. Let the reader conceive the idea of a bold chalky line of cliffs, closely overhanging the sea, and in a notch, at a part lower than the rest, a cluster of red brick houses, spreading in irregular or plain lines into the country, with two or three church spires, and tall barrack-looking buildings, and he has a tolerable idea of the town. There is no beach for walking upon, and the accommodation for bathing in the sea is very limited. The town is approached by a long wooden jetty; but it is so low, that the sea at high tides washes over it. Adjoining is a well-built harbour, which, however, is left dry at low water. A more unfavourable spot for a sea-port or watering-place cannot well be imagined. The streets, straggling upward from the harbour, are as narrow as the lanes of the city; and how families should come hither for fresh air, is beyond my comprehension, because they must be obliged to live in houses nearly as confined as those they have left. Margate, however, as already hinted, derives its chief support from being a favourite scene of fashionable racket and amusement during the dull autumnal season in town. In walking through the narrow streets, you observe bazaars, which form lounging places for the idle; and in each is seen a gambling or raffling table for those who wish to try their luck. There are likewise several houses which offer the choice of hot bathing and music; and besides these means of killing time, there are public concerts and dances, at which the height of city splendour is exhibited. The best point in the Margate arrangements are the numerous respectable boarding-houses, where, on moderate terms, you may reside for a short time in a very agreeable manner. At these houses, parties of pleasure are made up for the day, the expense for cars and refreshments during the excursion being defrayed by general contribution. It is a recognised point of etiquette among the persons who thus become acquainted for the time being, that they are not in any respect supposed to know each other when they return to town; a watering-place acquaintance being like that contracted in a stage-coach, which terminates at the end of the journey.

From Margate, a variety of short trips may be made to places of local importance. Within a short distance, in an easterly direction, is the retired watering-place called Broadstairs (a corruption, by the way, of Bradstow), which is resorted to much more for tranquillity and sea air than Margate. Taking a short cut by the main road, across the high cultivated grounds of Thanet, we reach Ramsgate, at a distance of four miles from Margate, and find that, with the same foolish crowding together of streets, it is far superior as a place of healthful resort. Ramsgate occupies an exceedingly striking situation, partly in a hollow leading up from the shore, but more particularly on the top of the cliffs which bound this hollow on each side, and fronting the clear expanse of sea. The cliffs here are from sixty to seventy feet in height, and being of pure white chalk, have a light dazzling appearance. By flights of well-constructed steps, the lofty terraces on which the straight lines and crescents of houses are placed, are connected with the wide stretch of fine sands beneath. These sands are among the finest I have any where seen, and are only inferior to those at Portobello, near Edinburgh, which, I have no hesitation in saying, are unmatched for extent and beauty. At the time of my visit to the Ramsgate sands, the weather was clear and beautiful, and they were crowded with promenaders, as well as lady invalids on neatly saddled donkeys, pacing easily along the margin of the rippling tide. Opposite the central and lower part of the town is the harbour, which is of modern erection, and upon a most extensive and substantial scale. On account of the want of natural harbourage for shipping along this bold line of coast, there is no place of refuge, in the case of storms, between the Downs and the Thames; and to obviate this serious deficiency, the harbour of Ramsgate has been erected at an enormous outlay, which is met by a tax on all vessels passing, whether they use the harbour or not. The harbour is of a circular form, nearly enclosed with broad stone piers, and contains a superficies of about forty-six acres. It is never left dry by the tides, and by means of reserved masses of water and sluices, it is scoured of the sand-banks which have a tendency to accumulate within its bounds. On the occasion of extremely heavy gales from the east and north-east, hundreds of vessels of all nations may be seen fleeing to this famed harbour for succour, which is afforded to all with an equal degree of liberality. In fine weather, the piers, which are smoothly paved with granite, offer a most agreeable marine parade to the numerous transient residents. The character of Ramsgate, as I learned on inquiry, differs very materially from that of Margate. Along with Broadstairs, it is resorted to by a higher and more expressly health-seeking class of visitants, and its very aspect conveys the notion of something more refined and tasteful.

In the course of the day which I spent in Ramsgate and its vicinity, I did not omit to visit the favourite excursion terminus at Pegwell Bay, at a mile and a half's distance to the south. Here, on the edge of the mouldering cliff, stand a few houses in an apparently perilous situation, for the sea has, in the course of time, formed a bay, and is now within a few feet of the walls of the dwellings. At this extreme south-eastern corner of Thanet, we are presented with a most extensive prospect seawards. The eye in a clear day commands the outline of the sand-hills and cliffs on the French coast from about Calais to Dunkirk, a distance of at least thirty miles, the sparkling interval of ocean being dotted over with white sails, and streaked with lazy currents of blue smoke issuing from the steamers which are almost always seen plying in the Downs. More immediately at hand, on the right, we have a full view of the low silted-up shore on which are situated the ancient cinque-ports of Sandwich and Deal, also the groves amidst which Walmar, the seat of the Duke of Wellington, reposes, and beyond them the cliffy knolls which overhang the town and port of Dover. We have here, indeed, a prospect of the spot on which, fifty-five years before the Christian era, Julius Cæsar arrived with his war galleys and conquered the aboriginal inhabitants of our island; and here, also, in subsequent times, was the landing place of Saxons and Danes who came to the country on a similar errand. It was likewise somewhere within this territory, which may well be defined as the portal of England, that St Augustine arrived about thirteen hundred years since, and spread a knowledge of that Christianity which now illuminates the whole of Britain.

But I must stop, for the present, this narrative of past events and modern appearances, and conclude with an agreeable piece of information to all future tourists to the spot, that Pegwell Bay has the happiness to possess an inn on the very brink of the precipice, where you may at once study the progress of disintegration from the eternal washing of the waves beneath, and enjoy the comforts of a lunch on shrimps and bread and butter—such being the repast for which Pegwell Bay has for ages been highly, and, I have every reason to believe, justly celebrated.

THE ANTI-HEBREW EPIDEMIC.

Among the moral epidemics of Christian society—at least of Christian society in a low state of civilisation—may be ranked a violent and suspicious dislike of the Jews. This feeling has broken out at various times, and in many different countries, since the commencement of our era, and has raged destructively for a season, like the plague, cholera, or any other physical disorder to which mankind are liable. The source of the affection is in some measure obvious. The tenacity with which the Jews cling to the faith and customs of their forefathers, and the comparative mystery attending their various ritual observances, have led to the belief that they also preserve in secret the same sentiments of aversion and hate, which caused the martyrdom of the founder of Christianity. In Great Britain, certainly, and other countries advanced in knowledge, these illiberal views do not now prevail; but they are far from being extinct among the less educated Christian communities. The recent persecution of the Jews of Damascus will be remembered by every one; and in Poland, but a few weeks ago, a similar case occurred, though it excited less attention, from the comparative harmlessness of its consequences. Even in England, however, but a few centuries ago, the most extraordinary notions were entertained respecting the practices of the Jews. The prioress's story, in Chaucer's Canterbury Tales, contains abundance of passages which show that the poet believed the Jews to be capable of any cruelty. The prioress relates that "in Asie, in a great citee," where there was "among Christen folk a Jewerie," a child was slain by the Hebrews, because, "as he came to and fro, full merrily would he sing and cry, 'Oh alma Redemptoris! (mother of the Redeemer) ever mo!'" A miracle is described as having followed, the little boy continuing to sing "Oh alma Redemptoris!" from the pit into which his mangled body was cast. Then—

> "With torment and with shameful death, each one,
> The provost doth these Jews for to starve
> That of this murder wist. * * *
> Therefore with wild horse he did them draw,
> And, after that, he hung them by the law."

At the close of the poem, Chaucer refers to another case, exclaiming,

> "Oh young Hew of Lincoln! slain also
> By cursed Jews, as it is notable,
> For it was but a little while ago."

The boy of the Asiatic city and young Hugh of Lincoln were but examples of a dreadful criminality ascribed in the middle ages to the Jews. This unhappy race were generally believed to make a practice of stealing away and murdering Christian children, in order to use their blood to leaven some of the substances to be eaten in the course of their rites. The superstition is not yet extinguished in some parts of the world. In the late case which occurred in Poland, a young woman came forward and gave evidence that she had been seized by her master, a Hebrew, and had been confined to a room in his house, where she had been bled several times against her will, to yield the leaven alluded to. The story was readily believed by the credulous public, with whose prepossessions it tallied only too strongly; and several Jews were imprisoned and misused for the imputed crime. But the young woman, seised with remorse, soon afterwards retracted her accusation, and admitted that she had been prevailed upon to make the statement by her lover, a young man at enmity with some of the Jews, and who had invented the story for her. The only foundation for the charge lay in circumstances most honourable to her master. The girl had been ill, and had been bled in the usual way by the family surgeon, whom the master had called in from the most humane motives, besides lavishing other kindly attentions upon his ungrateful servant. The case could not stand against such disclosures, and the Jews were acquitted.

So lately as the end of the sixteenth century, the popular idea of a Jew in England included every imaginable criminality. Shakspeare, in his Shylock, has in some measure pandered to this prejudice; but his Jew is spotless innocence compared to the Barabas, or Jew of Malta, depicted by his immediate predecessor Marlow:—

> "As for myself, I walk abroad a-nights,
> And kill sick people groaning under walls:
> Sometimes I go about and poison wells;
> And now and then, to cherish Christian thieves,
> I am content to lose some of my crowns,
> That I may, walking in my gallery,
> See 'm go pinioned along by my door.
> Being young, I studied physic, and began
> To practise first upon the Italian:
> There I enriched the patents with my train,
> And always kept the sexton's arms in use
> With digging graves, and wringing dead men's teeth.
> And, after that, was I an engineer,
> And in the wars 'twixt France and Germany,
> Under pretence of serving Charles V.,
> Slew friend and enemy with my stratagems.
> Then, after that, was I an usurer,
> And with extorting, cozening, forfeiting,
> And tricks belonging unto brokery,
> I filled the jail with bankrupts in a year,
> And with young orphans planted hospitals,
> And every moon made some or other mad—
> And now and then one hang himself for grief,
> Pinning upon his breast a long great scroll,
> How I with interest had tormented him."

This horrible autographical picture must not be disregarded, as if it were merely the fruit of a poet's imagination. The character of Barabas was but an embodiment of the vulgar fancies entertained respecting the Jews; and while terming them vulgar, it is fitting also that we should call them absurdly and extravagantly erroneous. As far as the point can now be determined by the cool-judging eye of posterity, they seem to have been utterly without foundation. They prevailed widely, however, and led to epidemical outbreaks of persecution, most destructive in their results to the scattered children of Israel.

Both before and after the destruction of Jerusalem by Titus, the Jews were subjected to repeated massacrings by the Romans, in Rome, Egypt, and elsewhere; but although the peculiar religious faith of the Jews was in part the cause of these misfortunes, political motives had a still greater share in producing them. It was after Christianity had expelled Paganism from the various countries of Europe, that the Jews began to suffer those particular persecutions which fall within the scope of our present notice. In the twelfth century, a band of two hundred thousand men assembled in Europe for a crusade against the Saracens. At this period the Jews were numerous in France, Germany, and other regions of the Continent, and prejudices ran high against them. By way, therefore, of losing no time, the vast band alluded to commenced their labours for the cross by massacring the Jews in every city which they passed through. At Cologne, Worms, Treves, and other places, great numbers perished in this way. Conversion or death were the alternatives placed before them, and they almost uniformly preferred the latter of the two. Some of the Jews of Treves, warned of the approach of the crusaders, gathered together their children and killed them, to "prevent their being subjected to the insult of Christian baptism." A band of Jewish women belonging to the same place went to the side of the Moselle, and, having loaded their clothes with stones, threw themselves into the river, where they perished. Many similar scenes took place on this occasion. While the crusading mania lasted in Europe, the Jews were kept, altogether, in a most miserable condition. The pretence for misusing them was usually some imaginary crime of the kind already described. In the year 1171, for example, many of the Jews of Blois were burned, on a charge of having crucified a Christian child, in mockery of the Passion of Jesus. In England, in the year 1144, while the throne was occupied by Stephen, the Jews of Norwich were persecuted on a charge of murdering in like manner a boy named William; and in the sixth year of Henry II. (1160), the Jews of Gloucester were maltreated on the faith of a similar accusation.

In the reign of Dagobert, about the year 640, the Jews had been banished from France. They were permitted to return, however, and remained without further molestation till the twelfth century, a period

Digitized by Google

so fatal to their race in Europe. At that period Philip Augustus resolved again to expel them, ostensibly on account of their crimes, but in reality because of their great wealth. In his reign they possessed, it is said, one-half of the whole property of the city of Paris. Philip Augustus first gave a statutory quittance to all the Christians of his kingdom of the debts they owed to the Jews, only causing a fifth part to be paid to himself for the good act; and he then gave the Hebrews their choice of baptism or banishment. With all the moveables left in their possession, the majority of the poor Jews consequently left France in July of the year 1182. Seven years afterwards, the Jews of England, also, were treated in a most barbarous way. Richard Cœur de Lion, then upon the throne, had given orders that none of that race should approach his palace during the holding of a solemn birth-day festival. Ignorant of these orders, some of the leading men of the Jews went to the palace with presents for the king, suitable to the occasion. They were repelled with insults, and the people, observing this circumstance, attacked the little band, and killed several of them. A rumour immediately spread through London that the king had commanded the extermination of the whole of the Jews, and the imaginary order was fulfilled in that city to the letter, with great accompanying cruelty. Other cities caught up a like impression, and assassinated the majority of the Jews within their respective bounds. The most deplorable scene of all took place at York. There the Jews were very wealthy and numerous, five hundred being the amount of the men among them, exclusive of women and children. The whole of these people shut themselves up in a tower, and were there besieged by the populace. Finding no mode of escape open to them, the Jews resolved to fall by their own hands, rather than expose themselves to the tender mercies of their enemies. Each head of a family took a razor, with which he slew first his wife and children, then his domestics, and finally himself. Either in this awful manner, or by the hands of the populace, every Jew of York perished!

During the thirteenth century, the continued excitement relative to the Crusades left the Hebrew people no rest or safety. In the year 1240, Duke John of Britanny banished them from his dominions, and, in 1936, they were vilely misused in Spain. Elsewhere, similar scenes took place at the same period. The compiler of the Causes Célèbres, while detailing these and other persecutions which they suffered, gives instances of the crimes laid to the charge of the Israelite tribes. In 1220 (says he) a boy, named Henry, was killed by them in Alsatia; in 1225, a boy at Norwich; in 1236, several children at Fulda; in 1255, a child of nine years at Lincoln (Chaucer's "Young Hew of Lincoln"); in 1261, a girl of seven years in the Marquisate of Bade; in 1287, a child at Berne, and another in the same year at Munich; in 1289, another in Suabia; and so on. In truth, however, wherever the Jews were peculiarly wealthy, there such accusations are found to have sprung up against them in plenty. The history of their various banishments from France gives us clear and unimpeachable proof of the true source of such charges. Having once fairly stripped them of their property, for example, Philip Augustus showed what his original motives had been, and that he had no sincere fear of their practices, by allowing them to return, and they afterwards remained unmolested in France until they had accumulated sufficient wealth to tempt cupidity anew. Then again were charges brought against them, and they were robbed once more of a great part of their means by banishment. For the sixth or seventh time, they were thus treated by Louis XIII., so late as the year 1615, being expelled from France by statute. In other countries, similar alternations of repose and persecution, and from similar motives, characterised the history of the Jews.

Our readers may now have had nearly enough of this subject, and we shall only refer to another case in which the Jews sustained persecution, at a comparatively recent era. In the year 1669, the wife of a peasant, living within a short distance of the city of Mentz, left her dwelling to water some linen by the side of a neighbouring stream. She was followed by her son, a child of three years old, whom she soon after missed from the spot where she had left him, and which was but twenty or thirty yards from the stream. She looked around for him, but in vain; and equally fruitless was the subsequent search of the father of the child and other friends. At last, the father was informed by a man whom he met on the highway near Mentz, that a Jew had passed shortly before on horseback, with a child before him. This clue was followed up, and a Jew named Raphael Levi was finally charged with stealing and murdering the child. The ancient prejudices of the people, dormant for a time, broke out with the fury of an epidemical fever, and the whole of the Hebrews of Mentz fell under the ban of popular distrust. In a wood adjoining the spot where he disappeared, was found the body of the missing child, so much lacerated and mangled, that, but for violent prepossessions, men would certainly have at once ascribed the mishap to a wolf. But this natural solution of the mystery found no favour with the people, and Raphael Levi was executed. He remained firm to the last, even under the torture, in his denial of all share in the death of the child; and the same constancy was shown by various others who were put to the question on the same account. As might be expected, other accusations were brought at the same time against the Jews of Mentz, and a due amount of fines and confiscations followed—as might also be expected.

It is lamentable to see such scenes revived at the present day, in the face of all reason and justice. By the interposition of the more civilised portions of the Christian world, they have been put a stop to, however—let us hope not soon to be renewed. If occasion does require it, the British public may be encouraged to the same generous interference by having the folly and destructiveness of such prejudices in past times laid before them, as has been briefly done in the present sketch.

BENEVOLA; A TALE.*

THIS pleasant and instructive little volume opens with an account of Benevola, the last of the fairies, a being of supernatural character, but not exempt from human error. She is represented as stopping one evening in an English village, near a cottage occupied by one Martin, a labouring man. A sister of Mrs Martin, who had formerly made an imprudent marriage with a player named Collins, comes up the street, in great distress, with two children, and is kindly received by Mrs Martin and their common mother, who lives in the cottage, and is blind.

A storm takes place, and an alarm is communicated that John Martin, coming along the village street, had been struck by lightning. The feelings of the various parties need not be related. In a few minutes, Martin is borne into his cottage insensible, and laid on a bed, where for some time he gives no sign of life except a faint low breathing. At length "an exclamation from Mrs Martin brought her sister and farmer Mitchell to the bedside. Martin appeared to be restored in some measure to consciousness; he raised his hand, and passed it several times before his eyes, as if to remove something which obstructed his sight.

'All is dark,' he muttered to himself. 'If I could but see the light once again!—no night could be so black as this.' Mrs Martin leant fearfully over him. 'John,' she said, 'my own dearest husband, speak to me—but one word only—tell me how you feel.'

'Is that you, Ann? Bring a light; let me see you. Why do you keep me in the dark?' 'It is not dark, dear John; there are two candles burning in the room, beside the fire-light.' The wretched man sat up, and, stretching out his arms, said, in a hoarse and faltering voice, 'Bring the candles close to me—closer, closer still.'

His wife held them to his eyes.

'Ann, I cannot see. Why do you not hold them nearer?'

'Indeed, John, I should burn you if I put them nearer; they almost touch your face.' He sank back with a heavy groan. Many took the candles from her sister's trembling hands; and the farmer, drawing his sleeve across his eyes, said, in a quivering voice, which he in vain attempted to render firm, 'Cheer up, Martin, the doctor will soon be here, and, I warrant, will do something for you.' But Martin made no answer. He said once, 'My poor Ann!' and a little afterwards, 'What will become of my children!' These few words alone showed on what his thoughts were fixed.

The deep stillness which reigned in the cottage was only broken by the low suppressed sobs of Mrs Martin and her sister, or by the hasty tread and cheerful whistle of a returning labourer.

At length the sound of horses' feet was heard. Farmer Mitchell started up, and, after some conversation with the doctor at the door, returned with him into the room.

Dr Nugent sat down by the bed, and attentively examined Martin's eyes.

'Is there any hope?' faltered the old woman. Her daughters could not put the question: they saw the answer in his countenance.

The doctor shook his head, said that he feared the sight was quite gone, but desired that Martin might be kept quiet; and promising to call again the next day, he gently pushed by the farmer, who was standing with a fee ready in his hand, mounted his horse, and rode off.

The fairy was much grieved by the touching scene she had just witnessed; and slowly and thoughtfully resumed her journey, reasoning thus with herself:—'How will this family be supported in future? Their means of subsistence entirely depended on the industry of the father: of the fruits of that industry they are now deprived. They must be reduced to a state of absolute destitution, and this by no crime—by nothing which good conduct could have prevented; not from idleness, which exertion would have overcome; not from negligence, which prudence might have foreseen and guarded against. To the other sister it may be objected, that she caused her own misfortunes by an early and improvident marriage; and bitterly has she paid the penalty of her imprudence. Not so with this. And from whom will the now wretched family obtain relief? Not from the higher classes, I fear; not from the opulent and wealthy—but, if at all, from their immediate neighbours; from that class which, although the most willing, is the least capable of rendering assistance. How many similar cases may not now exist in this apparently flourishing country? Surely such misery is susceptible of alleviation at least, if not prevention; surely it should not be by the poor alone that the poor, in such circumstances, are supported. Yet thus it will be, without some direct and powerful intervention; for among all ranks of people there is greater sympathy expressed for, and more readiness shown, in relieving the misfortunes of each separate class, by the members of that class, than is found to exist in any class which is distinct from, or unconnected with it. This seems universal.'

After long pondering on these things, Benevola exclaimed, 'There ought to be a law providing adequate relief, at the common charge, in all cases of destitution, from whatever cause arising. Where entire support is not needed, occasional assistance might be given. When an industrious man is unable to support a large family, the rent of his cottage might be paid, or an allowance might be made for supporting some of his children; and in dear times, and during periods of scarcity, food and employment might be found for those who really want it. The funds requisite for such a measure of relief might be levied from all proprietors of land, or from all persons renting land, in a ratio corresponding to the interest they severally possess in such land, or to the rent they pay; and I will not rest until a law of this kind is framed, and carried into effect in "merrie England."'"

Benevola then proceeds to London, and, working by some occult means on the feelings of the prime minister of the day, succeeds in bringing about the establishment of a poor-law, based upon the principles above adverted to.

Returning after many years from the sunny south, she once more passed through England; "when curiosity induced her to direct her flight towards the village which she had previously visited, and where her sympathies had been so powerfully excited.

It was no longer in the contented and apparently flourishing condition in which she had first seen it. The windows of most of the cottages were broken, and stuffed with rags; the walls were cracked and stained in many places by the weather, and the thatch was overgrown with long rank grass; the street, likewise, was broken into puddles, and littered with half-eaten turnips and rotten cabbage-leaves. In other respects the village looked much the same, excepting that a large red brick building had started up opposite the apothecary's shop, and several additional alehouses had been established. Mrs Martin's cottage had fared as the rest; the neat garden was destroyed, the flowers were dead, and sturdy thistles and wide-spreading docks and nettles flourished in their room.

A young woman stood at the open door, holding a dirty sickly-looking child in her arms; her gown was torn, and only fastened by a single pin, against which the child had just scratched its hand, and was crying aloud with pain, while its heedless mother stood watching the butcher's boy sweeping the week's accumulated dirt from his master's shop into the street.

The interior of the cottage was as comfortless as the exterior. A fire was burning in the rusty grate, but the hearth appeared never to have been swept. A ricketty table propped against the wall, a broken bench, a kettle, and a few wooden platters, were the only articles of furniture; and the floor was strewed with fragments of potatoes and greasy bread. In the middle of the room, upon a basket turned upside down, sat a man, his head hanging down, his arms folded on his breast, and his eyes fixed on the ground with a look of stupid sottish gravity. He was still young, but frequent intoxication had enfeebled his constitution, and given an appearance of age as well as vacant inanity to his countenance.

At that moment a man turned the corner, and came slowly up the street: his ragged dress and emaciated frame bespoke poverty and want. Whilst still at some distance, the woman called out to him, with a loud laugh, 'Well, Cousin Collins, which d'ye think is best paymaster now, farmer Grogan, or the parish?'

The man attempted to pass her without replying, but she took hold of his arm, and repeated her question. He then raised his eyes, and said, 'Farmer Grogan is not to blame; he would not have turned us off if he could have helped it; but the rates came so heavy upon him, that he could not afford to pay them, and give us full wages; so he was forced to take on the parish men, although he said he knew he should lose by it, for they did little more work than they liked themselves, and that badly, because they did not depend on him for their wages, but on the parish.'

'But I say, Collins,' continued the woman, 'what's the good, I want to know, of being the best workman, and the most industrious and sober man in the parish? What have you got by it? You are half-starved now, and will have to come on the parish at last. Why, here's Sall Mansfield and her husband—they get a shilling a-week for each of their children, and their rent is paid, though you and I know that he earns ten shillings a-week wages. He wasn't half

* London: Charles Knight. 1840.

as well off before he came on the parish, for he was a lazy workman, and none of the farmers would employ him: but now they *must* find him in work, or support him and his family in idleness; so now you see he lives like a prince, with as much to eat as he likes, and plenty to spend in drink into the bargain.'

'He is an idle, drunken fellow,' said Collins, 'and his wife is no better. I wonder that you, Mary, keep company with such people.'

'Why,' said she, 'what's the use of holding one's head so high? You know, Mother Martin always declared it would break her heart to set foot inside a workhouse; and there she is living still, and as merry as possible.'

'You ought to be ashamed of yourself, Mary Simmons, for talking in that way, when you know your mother almost starved herself to give you food, and worked like a slave, that she might send you to school and bring you up decently.'

'That's all very fine talking,' replied the woman, whom the fairy perceived to be Mrs Martin's daughter; 'but what was I to do with her, and two children of my own (which I had then) to support?'

'The parish made you an allowance for them, didn't it?'

'And so it ought,' replied Mary; 'I had as much right to it as the rest. However, I shan't waste my time in talking to obstinate people like you.' And, with a toss of the head, she returned into the cottage."

Collins goes home to a desolate hearth, a sickly wife, and dying child. He is in despair, and resolves to become, what his honest nature had long revolted from, a pauper. He goes to apply for relief, and, in his absence, his child expires through cold and hunger. Denied relief, he returns home half-frantic, finds his child dead, and curses the law which, by encouraging idleness, had deprived the industrious labourer of the reward due to his toil. Benevola, after witnessing these circumstances with grief, proceeds to the ale-house, where she sees men squandering on drink the allowances made to them by the parish to make up for their low wages, and to aid in supporting their children. "She saw that a reliance upon parish relief had destroyed the great principle of self-reliance and independent exertion; that it had blunted the finer feelings of our nature among the labouring population, and severed, or at least weakened, the social ties which unite the son to the father, the daughter to the mother. She became sensible that her mistake had been, not in affording relief to the destitute, but in giving it on too easy terms; in rendering relief too general and indiscriminate; and in not subjecting the asserted destitution of the claimant to some test to prove the reality of its existence.

She saw also that there was one other defect in the law which she had taken such pains to establish. It was therein declared that each parish should be compelled to support its own poor, and that each applicant should be relieved in the place in which he was born, or to which he belonged. Benevola had considered this a fair and equitable provision at the time, but she now perceived the injurious consequences it had produced; for no labourer would leave his own parish to seek for work elsewhere, as, in case of failure, it was there alone that he could obtain relief. The market for labour was thus necessarily contracted, and liable to great fluctuations.

Benevola found likewise, that it had apparently become the interest of the farmer to employ men who were in receipt of relief from the parish, instead of those who were not so favoured, as the former could afford to work for less wages, being in part supported out of the poor-rates, to which they naturally looked to make up all deficiencies. This of necessity disturbed the natural relations between the master and the labourer: the former had no longer an immediate interest in the welfare of his workmen; and the latter, suspicious of the farmer, and rendered in a great measure independent of him, by the portion of their wages which they received from the parish, became rude and surly in their manners, and idle and careless in their work; whilst the certainty of obtaining parish pay, in case of being out of employment, rendered them indifferent about the means of procuring it."

In short, Benevola becomes convinced that her first law was wrong, and she sets about the establishment of a new one, the main feature of which was, that the workhouse should be a test of destitution for the able-bodied. Having accomplished this object, she summers it again for some years in the south, but at length pays England another visit. Coming to the same village, she finds it in a better condition than even at first. The woodbines were growing as thickly as ever round Mrs Martin's cottage. "A labourer was about to unlatch the little garden-gate, when a gentleman on horseback rode up, and stopping opposite the cottage, called out, 'Good evening, Simmons. How have you arranged with farmer Greatrix?' The man touched his hat respectfully, and coming forward, said, 'Oh, thank your honour, pretty well at the last. Mr Greatrix was kind enough to say he would give me a trial; and after the first few months, he told me he was quite satisfied with me, and would take me on for the year.'

'But,' continued the gentleman, 'I want to know what effect the stopping of all parish pay, and the restriction of relief to the workhouse, has had on your condition. When the new law was passed, I was abroad, you know; and I want to learn all about its operation, and how you find that you are affected by it, from beginning to end.'

'Why, you see, sir,' said Simmons, 'settling his neckerchief, and twitching his coat-sleeves, proud of being thus questioned by a gentleman of so much consequence as Mr Hartland, 'when they first told us that no more relief was to be given out of the workhouse, all we who were in the habit of applying to the parish thought ourselves shamefully ill-used. A gentleman, and a member of Parliament, too, I believe, came down among us, and told us that we had as much right to support from the poor-rates as any lord in the land had to his estate. He said that we must take the law into our own hands, and do ourselves justice: that to separate man and wife, as was done in the workhouse, was against the Scriptures; in short, that government had neither the right, nor would it have the power, to carry such a law into execution, if we stood manfully up for our own privileges, as we ought to do. Well, sir, we all thought this very proper, and very fine—for he was a very clever gentleman, and talked away about our natural rights, and the Bible, and said that all men were made equal, and that the riches of a country lay in the labour of the people, and that the people ought to be served first, and have the power in their own hands—for a better than three hours; and his tongue was going all the while as fast as former Croft's mill in a high wind. But, somehow, we found that to break the law brought a punishment along with it; for when, according to his advice, we determined to smash the workhouse, and actually did break in the doors and windows, a party of soldiers was sent against us, and the most active amongst us were taken before the magistrates; and one, Tom Evans, was transported, and several of the rest were sentenced to imprisonment and the tread-wheel.

Well, sir, we didn't like this, you may be sure, and we then determined, one and all, to go into the workhouse when next they offered it to us; for we thought that it would never hold us all, and that then they would be obliged to return to the old custom of giving us parish allowance out of the house. But when the day came—it was on a Monday that relief was first refused—only one-half of us went in; I was among them; the rest got frightened and slunk off, leaving us floored.

However, we didn't remain in long, and were mostly out before the end of the first week; for we found that the old and the new workhouses were very different, and the guardians weren't to be frightened as the old overseer was. The farmers, too, after this offered us fair wages, and we all gradually fell to working again, and have continued so ever since; and we are now, I think, happier and better off than we were before, as we are employed regularly the whole year round; for a farmer can always find something to be done rather than turn his men off in the winter, especially when he knows that he would have to support them in the workhouse till spring comes round again; and that then he might not find them when he wanted them.'

'Well,' said the gentleman, with a smile, 'I am glad that you have thus found out the evils of the old, and the benefit of the new, poor-law. But did the farmers give you higher wages afterwards, on the lowering of the rates?'

'Why, no, sir, not exactly that, I think, although they ought to have done so; but then they have employed us constantly all the year round, which, you know, comes to much the same thing in the end.'

'And what has become of Dick Mansfield? Has he been poaching again?' said the gentleman. 'He has not been before me since my return.'

'Oh, sir, he and his wife shipped themselves off for America, and I'm sure the parish is well rid of them, at any rate.'

'And John Cole, and Sam Evans—what has become of them?'

'Why, Sam Evans died of a fever, brought on by drinking. His wife, you know, sir, was a tidy, industrious young woman. Well, we did not like her to go into the workhouse; so, with the help of some of the neighbouring gentry, we clubbed and bought her a mangle; and she and her family are now doing well. Cole has turned a tee-totaller, and is become very sober and industrious.'

'And where is your wife's mother—is she still in the workhouse?'

'Old Mrs Martin, your honour means. Oh, no, sir; the guardians said we must pay something towards her support, so we thought we might as well have her at home again. Poor old creature! I thought she would have died of joy before she got over the threshold; and my wife and me, we cried like a couple of children. And then she is so useful with us—she knits all the stockings, and better and faster than e'er a one in the village; and teaches the children, who are as fond of her as possible; and when my wife and me want a bit of good advice, we always go to Mother Martin: so now we would as soon go there ourselves, as send her into the workhouse.'

'There is one other family I want to ask you about—the Collinses,' said the gentleman.

Simmons shook his head, as he answered, 'We are all very fond of Collins, poor fellow; and the farmers always give him the lightest jobs to do. But he'll never be the man he was, sir; he has a bad cough at times, and nothing seems to cure him. Mrs Collins, poor thing, does all she can, but she's very sickly herself.'

The gentleman sighed, and after a short pause, said, 'Have you anything in the savings' bank?'

'Oh yes, sir, I've a matter of ten pounds; and I am in the labourer's sick-club, too, and my eldest boy and girl attend the new school.'

'I am glad to hear it. Good evening, Simmons.'

'Good evening, sir. I hope Mrs Hartland and the young ladies are pretty well.'

'Quite well, thank you.' And Mr Hartland rode on.

The fairy followed Simmons to the door of his cottage, and, as he entered, concealed herself in her old hiding-place.

A neatly-dressed good-looking woman was standing by an old-fashioned round oak-table, upon which stood a tea-tray, with some gay-coloured cups and saucers. She was busily occupied in cutting substantial slices of bread and butter, and upon Simmons's entrance she looked up and smiled, saying, as she poured some water into the teapot, 'What has kept you so long, Will, this evening? I fear the "Hen-and-Chickens" was too tempting for you.'

Simmons laughed at this mention of the 'Hen-and-Chickens,' to which, in former times, he had been too apt to resort, and explained the cause of his delay: then, taking the youngest child in his arms, he tossed it almost up to the ceiling, making the little thing laugh and crow with delight.

The elder children were gathered round their grandmother's knee: she was telling them a story; and it must have been a very interesting one, not only from the attentive and breathless eagerness of her little auditors, but even the old woman's knitting lay neglected in her lap, and her black-rimmed spectacles had been taken off, in order to give additional impressiveness to her tale. In the nicely-plaited cap and clean printed handkerchief, Benevola recognised Mrs Martin's tidiness of attire, as well as her mild intelligent expression of features in the old woman's face.

The fairy then passed on to the next cottage.

Close to the window sat a thin delicate-looking woman. She was working, and her needle seemed almost to fly through the cloth, so quickly did her fingers move. A little girl was sweeping up the hearth, and another 'wee todling thing' was trying to climb upon its mother's knee. There was an expression of patient sadness on her countenance, which told of past sufferings: but the smile which lighted up her worn features, as she stooped to kiss the rosy, laughing little urchin, seemed sweeter from its sorrow.

Uncertain, at first, whether it was indeed Mary Collins, the fairy leant forward to obtain a better view of the woman, who had again bent over her work; when hearing a step behind her, she turned, and saw Collins himself coming slowly up the little garden. His cheek was slightly flushed; but the anxious expression of his eye, and his feeble step, betokened ill health. Want, grief, and disappointment, had sown the seeds of a disease which was now fast hurrying him to an early grave.

Benevola sighed; and as soon as Collins had entered his cottage, continued her progress through the village, where everything wore an appearance of peace and comfort.

The kindly feelings between the master and the labourer had once more taken root; the money, before employed, in the shape of poor-rates, in encouraging idleness, now went to increase production. Wages had generally risen, and employment had certainly increased, on the abolition of the old law—the farmer finding it more conducive to his interests to employ a greater number of labourers on his land, and to give them higher wages, than to support them in the workhouse; whilst the labourer, depending on the farmer for his wages, found his advantage in industry and good conduct.

It is true that, in seasons of scarcity, privation must in some degree be experienced by all, and of course most heavily by the poorer classes, in consequence of the raised price of provisions: but an increase of price, if caused by a diminution of the usual supply, is, perhaps, the only means by which extreme distress can be averted; for, unless the quantity of food consumed be early reduced, the stock would be exhausted before the period for the new crop arrived, and the people, in the latter part of the season, would be left wholly without food. No human law can prevent these variations in the supply of the necessaries of life, or guard against the distress which they occasion. This can only be done by individual effort, care, and foresight; and hence the importance of industrious and provident habits in a people.

The sun was just sinking below the horizon, and the grey sombre clouds of evening were gradually encroaching on the glowing west, when Benevola sprung from the earth, and once more directed her flight towards her native skies. The buoyant air seemed to bear her onward without effort; a radiant smile was on her lips, and her clear dark eye shone with more than usual lustre, as she paused to take a last look at the village, where she had at first unintentionally been the means of doing so much harm—and afterwards, when tutored by experience, of effecting so much good."

The object of this tale, as the reader will have perceived, is to delineate, in a fictitious form, the comparative characters of the old and new poor-laws of

Digitized by Google

England. That the task is executed with taste, spirit, and feeling, the reader will have become equally well aware. Another and larger part of the volume is devoted to a similar view of the condition of Ireland before and since the introduction of the poor-law. We heartily recommend "Benevola" to public attention.

OCCASIONAL NOTES.

MISUNDERSTANDINGS.

It has been very striking, on some recent occasions, how completely both the Americans and French misunderstand the British. Any one who reads Thiers's History of the French Revolution—the only book which gives us any idea of the *French* feelings on that subject, at the time and since—will be satisfied that the great war of 1793 took its rise in a similar misunderstanding of British notions and feelings by the French people, and *vice versa*. On all such occasions, Nation A supposes Nation B to be animated by similar feelings to what it feels would animate itself in like circumstances; it supposes Nation B to have views and objects similar to its own; it imagines Nation B to contemplate every thing in that same light which arises from its own idiosyncracy or peculiarity of mental constitution. Now, the fact is, that Nation B has different feelings, objects, and ways of considering things, from Nation A altogether; and Nation A is therefore under a complete mistake. The mistake is usually mutual, and hence the two nations are said, quite truly, to *misunderstand* each other.

It becomes a curious question, if, since nations have each a peculiar mental organisation, it be *possible* that they can ever thoroughly understand each other. It is our belief that nations so different as the French and British, never will fully do so, though serious quarrels may nevertheless be avoided through the influence of the more rational on both sides, and time and increased intercourse may do much to enable them to see some important matters in the same light.

In nations there are parties, such as our Conservatives, Whigs, and Radicals, and sets of people, such as those we call the religious world, the fashionable world, the sporting world, &c.—all of whom are different from each other in mental organisation and acquired habits of thinking and feeling, just as nations are. If any one candidly inquires into the characters of these various parties and sets, he will find them all respectively attributing to each other views, objects, and ways of regarding things, which are respectively disclaimed, and which, in all cases, arise almost solely from peculiarities in the imputing parties themselves: he will find, in short, that they all misunderstand each other, exactly as nations do. Here, also, we do not see how any thing but mutual misunderstanding to a certain extent can be expected, considering that the parties are naturally so different that they never can see any one thing in exactly the same light.

To come down into private life. Some individuals are as diverse from each other as nations or parties. Constituted differently at the beginning, and trained throughout life to different convictions and different habits of feeling, they appear as if they had scarcely any one point of character in common. The simplest case presented to their understandings, is taken up by them quite differently, each considering it under the influence of his own governing sentiments, and each therefore coming to his own particular conclusion. When persons so diversely charactered are by any chance brought together, five minutes will not elapse before they are at loggerheads, unless they be both alike so much under the influence of the conventional rules of society as to put a disguise and a restraint on all they think and feel. It is utterly impossible that such persons, if much in each other's company, can avoid falling into what are called misunderstandings: their nature admits of no other result.

Is there any thing to give uneasiness to a benevolent mind in these speculations? Rightly regarded, we would hope there is not. The diversity in the characters of nations, parties, and individuals, is a natural institution, intended, we may be well assured, for ends upon the whole good. Instead of denying its existence or explaining away its results, let us look it straight in the face, and endeavour to make the best of it. Misunderstandings, it is scarcely necessary to observe, are constantly taking place, whether we think them avoidable or not. In regarding them as unavoidable under certain circumstances, it appears to us that we are just making the first step towards an improved course of conduct respecting misunderstandings. Suppose nations were fully aware how natural it is for them to misjudge each other, each would surely have reason to be more cautious in taking up the proceedings of the opposite party in an offensive light. "Ah, poor nation A," B might say, "that is just its way—always supposing its honour called in question, when no one is so much as thinking of it!" So, instead of whipping out Bilbo also, B keeps quite quiet, and the wrath of A soon going off, all is well again. The acknowledgment of this truth might also serve as a powerful reason for one nation abstaining from interference with the social or political arrangements of another. So little prepared as each must be to comprehend the likings, tendencies, and needs of another, how can it be presumed that any one is fitted to dictate to another in any thing? Did parties see that it is a decree of nature which ranges them under different dogmas, and sends them into different fields of speculation and amusement, they would see less to be offended with in each other. Individuals might in the same way agree to differ, as the Hibernian said, or come to an amicable understanding that they were not made to be friends, instead of persisting in a vain attempt to be harmonious, which only produced the greater discord. In short, by seeing the matter in this philosophical light, there would be far less of real misunderstanding between both large bodies of men and individuals, than what at present exists.

DIFFICULTY OF BECOMING GREAT.

Bacon speaks of one's having children, as giving hostages to fortune that he will never do any thing great. Perhaps the mere burden of a family is less obstructive of great actions, than the force of opinion and remark which every man more or less finds bearing upon him from relations and neighbours. This judging power, which every man sits under, is of great effect in repressing absurdities and preventing errors; but it also operates to an immense extent in chilling generous ambition and frustrating gallant enterprises. Many a man continues little, because of the tremendous battery of ridicule and blame which he knows would be opened all round him if he were to make the least effort to be great. Even the inclination to attain to superior mental cultivation and refinement of manners, is checked by the sneers of those who choose to continue ignorant and rude. It often, indeed, appears hard to say whether this private kind of public opinion which surrounds all men, does most good by maintaining a certain tolerable standard of conduct, or harm by so often repressing the tendencies of individuals to better things.

THE TWO TRAVELLERS.

BY MARTIN DOYLE.

At an early hour in the morning, and before railways were established, a gentleman arrived in a post-chaise and four at Winchester, on the road from Southampton to London. Having obtained fresh horses, he proceeded without a moment's delay; and had scarcely left the inn door when another carriage, from the same direction, with a single individual in it, drove up.

There was something in the countenance of this person, whose complexion indicated long residence in a warmer climate than that of England, which showed anxiety and the contemplation of some important subject; nor did the waiter fail to notice in one of the pockets of his chaise, when it stopped at the inn door, from which the other traveller had just started, either a case of silver-mounted pistols, or some instruments resembling those deadly weapons.

The first traveller, who had obtained a glance at the other, appeared considerably disconcerted, and immediately desired his post-boys to drive as fast as possible. He was obeyed, and reached Papinlane in a very short time; here he changed horses, and proceeded in the same rapid manner; and was congratulating himself on his progress, when, to his surprise, he perceived at a turn of the road, about a mile behind him, a chaise which he conjectured to contain the same person who had so nearly overtaken him at the first stage, and whom he supposed to be at least four miles in his rear.

"This is most vexatious," said he; "after all my efforts, I shall be too late! I must move faster." But he had on this part of his journey to deal with a steady, solemn kind of postilion on the near wheeler, who, having terribly overworked his horses during the preceding month of the Ascot races, and justly considering that ten miles an hour was now a very fast pace for them, was deaf to the traveller's earnest solicitations for increased speed.

The gentleman threatened—that had no effect; coaxed, but in vain. Jem shook his head; grunted out that "The roads never vent no vorser nor 'eavier for 'orses." The passenger showed gold between his forefinger and thumb. The drivers both declared, like honest and humane men, such as are rarely met in similar circumstances, that "they vouldn't hilltreat their cattle."

The traveller inside became agitated, and doubled his offered bribe for a gallop. "I vont kill my 'orses," said Jem, indignantly, "for hany money."

The gentleman threw himself backwards in despair; after a moment or two he leaned forward, put out his head, and then put it in again—seemed to labour with some oppressive secret, which he was about to impart. "Will you," said he, in a voice almost inarticulate from his earnestness—"*will you then drive to save a man's life?*"

The postboys looked back at him for an instant. He was evidently in extreme anxiety; his whole heart and soul were engaged in the object which had occasioned his journey; and now that they were informed of an adequate cause for haste, they became at once alive to its necessity. "Yes," pursued the gentleman, who saw at once the sensations he had happily produced, "if I am not with the high-sheriff of the city of London this day at one o'clock, an innocent man will be hanged."

"A man hanged!" rejoined Jem, tickling the flank of his horse with his only spur; "a man's life against 'orse flesh hany day. I'm blowed but ve'll make the cattle go if hits hin 'em."

And they did go at a frightful rate. Had an axle broken, a wheel come off, or any collision occurred with another vehicle, the results would probably have been most disastrous; and even the breaking of a trace, or the stumbling of a foundered horse, might have rendered all their efforts unavailing to save the life of the poor convict, now poised, as the drivers had been told in such a critical and appalling state of peril. It was altogether a *mad* hour of intense and absorbing interest.

As they entered on a common, Jem's hat was blown off by a gust of wind. He hastily pulled up a little, for he had a regard for the beaver independently of its value, and looked significantly at the traveller, who was counting minutes, as if he would have said—"May I get down and pick it up?" "No, no," quickly and decidedly said the other; "here, take mine."

Jem's head was encased in the new envelope; he was quite satisfied, and drove manfully to Basinstoke, where there was a solitary post-house.

"Turn out four posters instantly," roared the gentleman. "How many pair have you at home?" inquired he, breathlessly, of the head hostler.

"Five pair, sir."

He paused a moment. "Let a chaise and four start this moment before me to Hartley Wintney; turn out another chaise and four for myself; and let the remaining pair go with another chaise instantly to Papinlane, and remain there until evening. Can any other horses be obtained here or near us?" "No, sir!" replied the hostler in astonishment, thinking that the supply was already quite sufficient for any individual traveller.

"All right," said the gentleman; who, having first seen that the chaise and pair was dispatched in a gallop on the Papinlane road, and the two four-horse chaises ready (and all this was effected in five minutes), jumped into one of them, and, preceded by the other, dashed off at a furious rate.

The information had been passed from Jem and his comrade to the fresh postboys, that a man's life depended on their driving, and that the fees were munificent. This stage was run with speed accordingly. "Out with four horses immediately," was the order again issued and obeyed with promptitude at Hartley. The second chaise, however, was allowed to stop—and why that unoccupied carriage had been driven there as a pioneer to that in which the traveller sat alone, was a mystery to every one in the village who had witnessed its entrée, and especially to the postilions, who could not comprehend why the strange gentleman should have ordered it out in such a hurry, and paid them so liberally, for no apparent object—for what had the life of the condemned man to do with the movements of the empty chaise?

The mystery was not solved by the supposition that it had been sent for a physician, surgeon, accoucheur, or eloping lady; nor did it contain even a case of duelling pistols, nor any thing that could have furnished a solution of the cause for which it had been rattled along at such a desperate rate; nay, the puzzle was increased by the information of the postboys, that a third chaise, without a passenger to occupy it, had been dispatched by the same party in all haste back to Papinlane.

The door was again closed, the order to drive on repeated, and the gentleman within, amidst endless speculations, rolled away as before.

The most probable conjecture was, that the poor gentleman was deranged in his intellects, and under some hallucination had engaged the post-carriages, and driven so furiously. Yet, as he paid so very liberally for his unaccountable whim, and had sufficient cunning to detect any imposition practised to keep back any of the horses, no attempt was made to oppose his extraordinary proceedings.

The excitement of the gentleman, from whatever source originated, was rather increased than diminished when he jumped from the chaise into a cab, and approached the city along the Strand. The interposition of obstacles of every kind at Temple Bar and Ludgate Street was, in the state of his mind, intolerable, and he could have cried with vexation as his way was blocked up by rows of waggons and coaches.

Time pressed; he pulled the check string, and before the cabman could look about, was running along the Flagway in old Broad Street. The cabman roared after him—the traveller ran the faster—the hue and cry after the man without the hat increased—the pursued was rather fat and thick-winded, and was soon overtaken and collared by the pursuing police. In vain he expostulated, blustered, and proffered bribes; he threw his purse to the captors, told them to pay the cabman as much as they pleased, and assured them that he was Sir Benjamin Bustle, knight, alderman, and a city magistrate.

The policemen, who were lately nominated to that district of the city, and unacquainted with his person, very naturally disbelieved his assertion; and seeing him without his hat, and hearing the cabman, who had followed in their wake, declare that "the 'gemman' was honly unscrewed in the 'ead," were about to form the same conclusion, and conduct the prisoner to the nearest lunatic asylum, when, by one of those lucky coincidences which are not of frequent occurrence, a passer-by, known in the neighbourhood, recognised and identified the hurried and persecuted traveller as the real Sir Benjamin Bustle, and obtained his liberation.

The two gentlemen walked off arm in arm, and their first movement, through the noisy and laughing crowd,

Digitized by Google

was to a hatter's shop, where Sir Benjamin—talking, however, earnestly the whole way to his friend—provided himself with a new hat, but with so much precipitation that it was unfitted to the head for which it was purchased.

His liberator seemed now as much disposed to rapidity of motion as the other: they both entered a carriage together, gave directions to the driver to stop at one or two houses, and then dismissed him.

The clock of one of the principal public edifices of the city had just struck four, as the friend of the traveller came out of the building with the jaunty step of one who had effected an important purpose. He was immediately met by Sir Benjamin Bustle, who whispered some question in his ear, to which the answer appeared most satisfactory, for the knight instantaneously exchanged his previous air of solicitude and doubt for that of self-satisfaction and quietude: as he walked alertly along with his friend, his brightened eye, rapid enunciation, animated action, and elastic step, as he seemed to detail the circumstances of his hurried journey, showed that he was at that moment a successful and happy man—he seemed at peace with all the world, and on especially good terms with himself.

If any close observer of the human character had marked his entire conduct and demeanour from the preceding evening at Southampton to the conclusion of his journey, and his present deportment, he would have felt certain that Sir Benjamin had been charged with an important mission of very difficult accomplishment, and that he had perfectly succeeded: he would readily have believed that the life of a fellow-creature—as intimated to the postboys—was the stake for which the indefatigable knight had run his rapid and anxious course. And the philanthropist would have honoured him for such exertions of a warm and active benevolence.

The facts, however, were these. Sir Benjamin Bustle had gone down in a stage-coach on the preceding day to Southampton, on some mercantile business: at the inn where he stopped was a gentleman who had just landed from Lisbon, and who was evidently too much debilitated by his voyage to proceed to London without a night's repose.

The travellers supped in the same room, and being both of the mercantile body, entered into conversation on commercial subjects; in the course of which an observation incautiously escaped from the Lisbon individual, which, if known on the Stock Exchange, would instantaneously produce a most influential effect upon the Portuguese funds, in which the London merchant had largely speculated, and in which the other also was deeply interested.

Sir Benjamin, being a very shrewd man, said nothing of his promptly formed resolution of starting at daybreak the next morning for the city, in order to have a new speculation in the Portuguese funds completed before the arrival of the other gentleman in town, or any possible communication from him by which the important intelligence could transpire before his own arrival.

Having at once perceived the bearings of the matter, he assumed an air of indifference, and avoided subsequent allusion to commercial subjects as much as possible; and, for the time, succeeded in satisfying the Portuguese trader that the importance of the disclosure he had unfortunately made had not been appreciated by his temporary companion; and, at all events, that there was no probability of the knight's going immediately to London, whence he had only that evening departed. Aware, however, of the vast importance of being himself in the metropolis, or communicating with his partners at the earliest possible hour next day, our Lisbon friend ordered a chaise to be ready at four o'clock in the morning, and departed at that hour precisely. His amazement, therefore, may be imagined, when he perceived that the carriage in advance of him at the first stage contained the portly and unmistakeable person of the alderman, whose movements now left no doubt of the real state of affairs.

This accounts for the race between the parties, and Sir Benjamin's apparent extravagance in engaging all the horses at Basinstoke in order to have them out of the way on the arrival of the foreigner, who could not in such a case overtake the other, who had fresh horses the whole way onwards, and the start of some minutes besides.

It has appeared that Sir Benjamin arrived critically in time for the attainment of his purpose. His available funds were applied by Mr Bankstock—a stockbroker, and the gentleman whom he so opportunely met in the street when detained by the police—according to the instructions given by Sir Benjamin, who felt assured (and the transactions of the next day proved that he was right) that by this knowledge of the circumstances which had occurred in Portugal at the departure of the merchant in a fast-sailing packet from Lisbon, he must in a few hours realise fifty thousand pounds.

He had unexpectedly derived the information on which the success of his speculation hinged, and taken advantage of it; and so far, perhaps, his conduct was not blameable in a worldly point of view, though his stratagem to prevent the progress of the rival speculator, and his pretence to the postboys of being employed on an errand of mercy, were unquestionably so. This, however, gave him little self-reproach, and he now congratulated himself on his exceeding cleverness in outwitting so many devoted fellow-worshippers at the shrine of Mammon.

Thousands of men, like Sir Benjamin Bustle, would travel far, and exert themselves to the utmost, to make the most of their pecuniary talents, who would not move fifty miles to save the soul or the body of a fellow-creature (supposing them to possess the power in each respect)—whose diligence in such a cause would be sloth, and whose solicitude would be apathy.

BRITISH ASSOCIATION AT GLASGOW.

SECTION OF CHEMISTRY AND MINERALOGY.

At this section, on the Saturday of the meeting, there was read an abstract of a report prepared and published by Professor Liebig, in consequence of a recommendation of the association, on the applications of organic chemistry in agriculture and physiology. The investigations of this foreign professor are of great value, opening up some new views of incalculable importance as to the nurture of plants, and promising to be of immense practical utility in the cultivation of the soil.

NEW CHEMICAL VIEWS RELATIVE TO AGRICULTURE.

The fertility of soils has hitherto been supposed to depend on a certain constituent in them, derived from the decay of former vegetables, and denominated *humus*. It was supposed that the carbon which goes so largely to the composition of plants, was derived from humus; in other words, that the same matter which constituted the carbon in plants of former years entered into the structure of new plants, and was thus used over and over again. The only modification of this view which physiologists admitted of, was, that the humus was first rendered soluble by lime, or the different alkalies found in the ashes of vegetables.

Mr Liebig has found all this to be incorrect and unsound. He has shown, from the known quantity of the alkalies in the ashes of plants, in relation to the carbon they contain, that only an insignificant fraction of the carbon could be derived from humus in this way. He has shown that humus, for its solution, requires no less than 2500 parts of water, an amount which all the rain that falls upon a field in the course of a year could not supply. Finally, he has shown that, even where large crops are annually carried from a field or meadow, the quantity of humus increases. The carbon of plants, he therefore argues, must be derived from other sources; and, as the soil does not yield it, *it can only be extracted from the atmosphere*. That small modicum of carbonic acid which is found in the composition of the common air, furnishes, he contends, the main part of all that vast amount of leguminous and farinaceous substance which is every year brought forth for the use of man and beast!

This opinion is not strictly new, but has never been fully appreciated by natural philosophers, partly in consequence of their imperfect knowledge of chemistry, and partly from certain objectionable experiments which were instituted by them to decide the point. Pure Carrara marble was pounded, seeds were sown in it, and sprinkled with carbonic acid water; but they did not thrive. The result was an inference against this theory. But Mr Liebig shews that several other conditions to the healthy growing of plants were wanting in these cases, particularly the presence of nitrogen and the earthy bodies which all plants contain.

Mr Liebig has inquired into the power which is really exerted on vegetation by humus. This substance, he finds, in its decay, is a continued source of *carbonic acid*, which it takes in from the atmosphere, and emits slowly. Tilling is useful as a means of allowing the atmosphere to get down to the humus, in order to impart to it carbonic acid. The carbonic acid of humus is the support of plants until they acquire leaves, which, becoming organs for extracting the same substance from the air, then supersede the necessity of that element being derived from another quarter. The *hydrogen* which also enters so largely into the composition of plants, is derived by them from water, decomposed, Mr Liebig thinks, under the action of solar light, and from which oxygen (its other element) is set free. He has established the fact that the third of the organic elements—*nitrogen*—is uniformly derived by plants from ammonia. Most unexpectedly, he has demonstrated that ammonia exists in a minute proportion in the atmosphere. It exists in plants themselves, forming the red and blue colours in flowers. It exists largely in manure of various kinds. Mr Liebig believes that manure only acts by the formation of ammonia. There are some other substances which have been observed to produce very favourable effects upon soils. Such is pounded gypsum (the stone from which plaster of Paris is formed). Such also are burned clay and powdered charcoal. It has hitherto been incomprehensible how these substances should have so fertilising an effect. In reality, they only act as a means of extracting ammonia from the atmosphere, ammonia being the medium by which nitrogen is imparted to plants. That nitrogen is thus extracted from the atmosphere, there is an indirect proof in the fact that it is found in lichens which grow upon basaltic rocks; also that our fields produce more of it than we have given them, and it exists in all kinds of soils and minerals which were never in contact with organic substances. It could only in these cases have been obtained from the atmosphere.

Plants contain certain varying, but always small proportions, of other and grosser substances, as demonstrated by their ashes. "Phosphate of magnesia, in combination with ammonia, is an invariable constituent of the seeds of all kinds of grasses. Plants also contain various organic acids, all of which are in combination with bases, such as potash, soda, lime, or magnesia. Of the different alkaline bases found in plants, Liebig finds reason to conclude, that any one may be substituted for another, the action of all being the same. But the number of equivalents of these various bases remains the same. The analysis of Bertherir and Saussure show that the nature of a soil exercises a decided influence on the quantity of different metallic oxides contained in the plants which grow upon it: that magnesia, for example, was contained in the ashes of a pine-tree, grown at Mont Breven, while it was absent from the ashes of a tree of the same species from Mont La Saile, and that even the proportion of lime and potash was very different. But although the composition of the ashes of these pine-trees was so very different, they contained an equal number of equivalents of metallic oxides; or, what is the same thing, the quantity of oxygen contained in all the bases was in both cases the same—being expressed by the number 9.01 in one case, and by 8.95 in another, a coincidence which had escaped the notice of the analyst himself. It is certain that particular acids exist in different vegetables, and are necessary to their life; some alkaline base is also indispensable, in order to enter into combination with the acids, which are always found in the state of salts.

The perfect development of a plant is therefore dependent on the presence of alkalies, or alkaline earths, and its growth is arrested when these substances are totally wanting, and impeded when they are only deficient. Hence it is, that of two kinds of tree, the wood of which contain unequal quantities of alkaline bases, one may grow luxuriantly in several soils upon which the other can scarcely vegetate. Thus 10,000 parts of oak-wood yield 250 parts of ashes, and the same quantity of fir-wood only 83 parts. Hence, firs and pines find a sufficient quantity of alkalies in granitic and barren sandy soils, in which oaks will not grow. Liebig supplies various additional illustrations of the influence of the alkaline metallic oxides on vegetation, amply sufficient to place beyond controversy these conclusions so important to agriculture and to the cultivation of forests. One of these may be quoted: a harvest of grain is obtained every thirty or forty years from the soil of the Luneburg heath, by strewing it with the ashes of the heath plants which grow on it. These plants, during the long period mentioned, collect the potash and soda from the decomposing minerals of the soil, which are conveyed to them by rain water; and it is by means of these alkalies that oats, barley, and rye, to which they are indispensable, are enabled to grow on this sandy heath.

The supposition of alkalies, metallic oxides, or organic matter in general, being produced by plants, is entirely refuted by such well-authenticated facts.

It is thought very remarkable, that those plants of the grass tribe, the seeds of which furnish food for man, follow him like the domestic animals. But none of our corn plants can bear perfect seeds, that is, seeds yielding flour, without a large supply of phosphate of magnesia and ammonia, substances which they require for their maturity. Hence these plants grow only in a soil where these three constituents are found combined, and no soils are richer in them than those where men and animals dwell together."*

We cannot here follow Professor Liebig into the applications which he makes of his discoveries to the purposes of the practical agriculturist; but these, we are assured, are of a most important kind.† In the mean time, the great truth seems now ascertained, that the soil is but an apparatus for elaborating vegetable substances out of the wind and water which fly around our globe. If we might be allowed a playful remark on such a subject, we would say that the old superstition of the chameleon living upon air is true after all, and true of all the other vertebrata, man himself included; only it is not upon air in its direct form that the multitudes of earth are fed, but upon matters drawn from it by a chemistry as subtle as it is sure in its working, and which affords a most striking illustration of the power of the Deity to work out the grandest ends from the most simple means.

A THIEVES' SOOTHSAYER IN MANCHESTER.

The public are not perhaps aware how much it is the custom in Manchester for young delinquents, before committing any offence, to consult some dealer in the "black art" as to the chances of their escape, or detection and punishment. A striking instance of this practice recently occurred in the case of a youth, who being apprehended in the act of committing a felony, declared that it was not his fault, or from any want of dexterity on his part, that he had been apprehended, but that it was his fate; for that Alexander the astrologer had predicted that he (the delinquent) would succeed in three thefts, and be taken in the fourth attempt, and

Digitized by Google

that so it had turned out. Alexander being immediately apprehended by the police, was found with all the symbols of the "occult science" upon him; but he denied having any knowledge of these, and from some defect in the evidence against him, he was acquitted. This man (who is held in great reverence and fear by the young thieves in Manchester) is about sixty years of age, and has been for many years one of the greatest pests in the town.—*Neale's Juvenile Delinquency in Manchester.*

EASTERN SPORTS.

THE dedication of "Scenes and Sports in Foreign Lands," a little work which has just passed through the press, is so extremely characteristic of the spirit which pervades its whole contents, as to be worthy of quotation:—"To his best and earliest friend, to the friend of the British seaman, and the pride of his profession, to 'Old' *Charley* Napier, C.B., Count Cape St Vincent, &c. &c., is dedicated this first production from the pen of his attached and grateful admirer, the author." It is proper to observe that this author, who so familiarly addresses the restorer of the Portuguese monarchy, is his near relative, Major E. Napier.* The style of the inscription would lead the reader to expect something lively and entertaining in the narrative which it prefaces, and in this respect he will not be disappointed. The major is a gallant soldier, fond of adventure, and abundantly stored with animal spirits—so much so, that they ooze from his pen at every page; and the "sports that mimic war," which he seems to have pursued with uncommon zest, afford him an abundance of incidents on which to build a lively and attractive narrative.

India was the chief scene of our soldier's recorded adventures. We shall begin our extracts with a scene from our author's eastern sports, which will probably amuse the reader as much as it has done us. "Whilst on the subject of dogs, I cannot forbear mentioning a pack which we attempted to set on foot, and which, from the variety of curs of which it was composed, went by the name of the *Bauberyt* Hunt. Our ambition did not extend beyond bagged foxes and jackals; however, on one occasion, after circulars had been issued to all the members of the Baubery, stating the time and place of meeting, no fox was to be had for love or money; we were completely *nonplussed*. At last a brilliant idea struck me: I sent my servant to the bazaar, with directions to catch a dog that bore the greatest resemblance to a jackal; he returned with an animal certainly in shape not unlike what we wanted, but not at all tallying in colour, our captive being perfectly white. It was, however, too late to replace him; our only plan was to *disguise* him as best we might. There happened to be some red paint at hand; we set immediately about his toilet, and no lady ever applied rouge with more effect: in five minutes he looked so beautiful that his mother would not have known him. But it was not in the power of paint to change the shape of his tail; therefore, having supplied ourselves with the brush of a defunct jackal, we cunningly fitted this to his spanker-boom with sundry pieces of whipcord; and putting the finishing touch to his dress by anointing him with oil of aniseed, he was carefully deposited in a sack, placed on the shoulders of a horse-keeper, and conveyed to a bit of jungle about a quarter of a mile from the meeting place, and four or five from the cantonment.

We mustered on that day a strong field; it was, moreover, cloudy, and promised good scent. Ten minutes' law was allowed to the 'painter;' the dogs were then put on his track, and went off full cry. Every one swore it was likely to be the best run we had yet had. I—n, an old Yorkshire breakneck, was in ecstacy. 'There he goes,' cried he, as we viewed the brute, 'there he goes! A fine fellow he is, and what a pace he keeps up! But hold hard, gentlemen; don't ride over the dogs.' I—n was the oracle of the hunt, and the *parry* was put down as a jackal of the first water. At first his long legs had the best of our little mongrel terriers, but their bottom soon began to tell. We were now running in view; and as we gained on him, several of the knowing ones began to be sadly puzzled; for although the paint was good paint, and had moreover been laid on thick, it was not entirely proof against bushes and water, and a piece of swampy ground we had just crossed had done a great deal towards softening the tints. To make short of a long story, the poor *parry* died the death amidst shouts of merriment from all who witnessed his *rouge* and false feathers. I said *all* who saw the fun—but no; there was *one*, our oracle, who did not enjoy the joke: he said it was a boyish trick, withdrew his patronage, and never more risked his reputation by joining the 'Baubery Hunt.'"

Those extraordinary creatures called adjutants, birds of great size which serve as scavengers for the barracks at Calcutta, seem to afford infinite amusement to the officers stationed there. Major Napier records the following incident, told by one of his companions, respecting these huge, gluttonous birds:—"Wishing to carry on my experiments with the adjutants, I enticed a favourite little Blenheim lap-dog, belonging to one of the ladies of the family, into the square, in view of the adjutants. The latter appeared at first undecided what course to pursue, a real Blenheim being a delicacy to which they had probably not been accustomed. In the mean time, the poor little dog, nothing abashed at the attention bestowed upon him, was sauntering carelessly and fearlessly along, as he might, under similar circumstances, have done at home, in a barn-yard well stocked with turkeys and fowls. At this moment, a huge adjutant gravely approached, and only moving the muscles of his countenance to yawn destruction on the unhappy little animal, took him quietly up, and the next moment he disappeared down the deep abyss opened to receive him. A piercing shriek warned me, in my place of concealment, that other eyes had beheld the metamorphosis of the dog into a 'swallow.' The next instant, a fair form, with dishevelled locks, was rushing across the square; but 'twas too late. The adjutant majestically soared aloft, and I beheld him alight on the highest pinnacle of a distant building, where, 'like patience on a monument smiling at grief,' he leisurely and complacently appeared to await the progress of digestion."

But we are in a measure wasting time, for we imagine that our gallant soldier's adventures with animals of a more dangerous stamp than dogs and adjutants constitute the cream of his book. First, for a tiger-scene. "We thus (says the major, speaking of an excursion) sauntered carelessly along, until, as we approached the rock, an object attracted our attention which put us on the *qui vive;* it was the carcass of a sheep nearly devoured, and that recently. This smelt rather *tigerish*, particularly as the underwood at the foot of the rock was extremely thick and tangled, affording likely covert for a beast of prey; we therefore proceeded cautiously. Nothing, however, particularly fixed our attention until we had nearly reached the summit: here, on a ledge of granite overlooking a chasm many feet in depth, and in front of an aperture in the rock, we saw a quantity of tiger's hair, as if he had been in the habit of basking there in the sun. We resolved, therefore, to lie in ambush immediately above the fissure, which we supposed to be his den, and patiently await until he should emerge, when we might get a shot at him within a few feet, and before he could be aware of our presence.

But in this world the best concerted plans are liable to be frustrated. We had not been ten minutes in our position, when, instead of coming, as we expected, from under our feet, and allowing us to take him in the rear, a slight rustling in the bushes immediately in front of us was followed by a noble royal tiger, advancing most majestically along the ledge of rock. At first, he did not perceive us, and we allowed him to approach a few paces: he then looked up, viewed us, and made a dead stop. Not a second was to be lost; he was within twelve yards, and a single bound would have sent at least one of the party to eternity. We both fired instantaneously, and both with effect: he reared himself up on his hind legs, as if to make a forward bound, fell back, and rolled headlong into the abyss below. My ball had hit him between the eyes; G——'s had struck him in the loins.

I know not how *he* found himself; but I must confess that, although my hand was steady enough when I fired, after the business was over, and I was again proceeding to load, it felt *unkimmon* tremulous, much as if I had had a glass 'de trop' overnight. As to the poor devil of a black fellow who had accompanied us, he was a perfect chameleon, his polished black phiz being transmogrified into an ashy blue."

On another occasion, the major, when sporting alone, met and shot a large bear. He must have been in great peril, but he speaks of the affair as coolly as if he had been shooting snipes. Having heard of a most destructive bear, he sallied out with an old (and comparatively inefficient) native attendant, "determined, in spite of rocks and briers, to penetrate into the heart of his stronghold, and beard the lion in his very den; but in so doing I had to encounter a thousand difficulties, for, after proceeding some distance up the hill, I was often obliged to creep along on all fours through this intricate mass. I had just emerged from this awkward position, followed by Chennoo, when, at the turn of a rock, a large bear appeared within ten paces. The brute was advancing very slowly, and looking up in my face with the most ludicrous gravity, which I soon put an end to by giving him my left barrel through the head, whereupon the facetious monster rose capering on his hind legs; bang went No. 2 barrel, and over rolled friend Bruin, apparently lifeless. Immediately from the spot whereon he lay extended, arose a din which might have awakened the dead. For an instant I was taken quite aback, but soon recollected it to be a second edition of the music I had heard some days before from the top of the rock; and hastening to ascertain the cause, to my surprise I beheld two young cubs, holding on like sick monkeys by the long and shaggy coat of their prostrate dam, and roaring most lustily. I had no idea of letting the youngsters slip through my fingers; so running up, I laid hold of each by the *scruff* of the neck, and attempted to drag them off their maternal hold. In the mean time, the old lady, who apparently had only been in a trance, feeling something unusual going on, with an effort recovered her legs, and began with one fore-paw to wipe away the blood and brains which were trickling over her eyes and obscuring her visual organs. Luckily Chennoo, who carried my spear and rifle, was at hand, and, applying the muzzle of the latter to her ear, I settled her instanter. The young bears were carried off to our cantonment."

It would be difficult to have a fair conception of the amount of courage requisite to perform such an act as the following, with which Major Napier closes his sporting scenes:—"Before dismissing for ever these raw-skull-and-bloody-bone tales of tigers (a name which an old Indian is now almost ashamed to pronounce), I must relate one of the most daring and successful attempts at *muzzling* a man-eater to be met with in sporting annals.

On the high road between Madras and Hyderabad, and about sixty miles from the latter, is a small place called Nelcondah, situated in a narrow pass between two high hills. In the beginning of 182–, a tiger took up his residence in the abandoned old fort which crowns one of these eminences, and committed almost daily depredations on the numerous travellers passing on that much-frequented road. He at last carried his audacity to such a pitch, as to walk off in broad daylight with an officer's servant from the midst of a party of sepoys. On arriving at Secunderabad, his master, who was much attached to the poor fellow from having had him long in his service, related the circumstance, and Captain W——, of the commissariat, determined on avenging his death.

W—— ..... but why should I attempt any mystery in relating as gallant an action as was ever performed by a stanch votary of Nimrod? And such was Whistler, who will not, I am sure, feel annoyed in seeing his name recorded where it so well deserves a place. Well, then, Whistler, who was no novice at this sort of work, immediately started off to the scene of action with a couple of friends. On arriving at Nelcondah, scouts were placed on the look-out, one of whom shortly announced that he had discovered the retreat of the tiger, and led the party towards the top of the hill. Here, amidst a chaos of large rocks, he pointed to a deep chasm, at the end of which was a recess, where he said the animal had retired. It was, however, impossible to get sight of him without first dropping down a height of sixteen or eighteen feet into the den below, from which there was no retreat. Whistler hesitated not, took the fearful leap, and, fortunately alighting on his feet, saw the monster quietly reposing at the farther end of the den. He gave him no time to rise, but, with the quickness of thought, levelling his rifle, sent a ball through his brain, and extended him lifeless on the spot."

The volumes of Major Napier may be safely recommended to the general reader, as forming one of the very liveliest records of personal adventure lately produced from the press. The writer is of the clay from which our Clives and Nelsons were made; and it is impossible not to admire the spirit which leads such as he, in the absence of opposing foes of their own species, to expend their adventurous energies on contests with grizzly bears and Bengal tigers, the more dangerous adversaries, often, of the two.

* Scenes and Sports, &c., by Major E. Napier, 46th Regiment. In 2 vols. Henry Colburn: London.

† *Baubery* means noise or disturbance of any kind.

AN ACCOUNT OF THE DRUNKEN SEA.

AN amusing and well-written allegory, by Dr James Henry of Dublin, under the above whimsical title, has lately been issued in the form of a small pamphlet, and we doubt not will assist the temperance movement in Ireland. We beg to offer our readers a few extracts from this Swift-like satire on intemperance:—

"Nothing can exceed the beauty of the Drunken Sea from the beach of Soberland, where you take shipping, as far as Point Just-Enough. The clear and smooth water is scarcely so much as rippled by the light breeze which wafts from the shore the fragrance of a thousand flowers. No mist ever broods upon the water, no cloud overcasts the soft blue sky. The glorious image of the sun by day, the silvery face of the moon by night, are nowhere seen to so much advantage as in the mirror of Pleasant Bay, for so this part of the Drunken Sea has been most appropriately named. The current being always towards Point Just-Enough, and the wind, if you can apply that name to the gentle breath which no more than fills your sails, always in the same direction, the passage is so smooth and easy that it not unfrequently happens that the voyager finds himself close upon the Point almost before he is aware that he has left Soberland.

The voyage is usually performed in boats made out of porter hogsheads, or wine pipes, or spirit puncheons. It is astonishing what excellent sailing boats these vessels make, when divided longitudinally, and furnished with sails and oars. Riches having the advantage every where, upon the Drunken Sea as well as upon land, the boats which are used by the rich are much more elegant, easy, and commodious, although perhaps not faster sailers, than those which are used by the poor. Besides the fares, there are certain tolls payable by all persons who sail upon the Drunken Sea. These tolls are so considerable as to form a principal part of the revenues of some of the imperial governments of Soberland. Notwithstanding the expense which is thus necessarily attendant upon sailing on the Drunken Sea, the number of persons, rich and poor, who sail upon it, exceeds all calculation; the rich paying the expense out of their superfluities, the poor out of their necessaries. Some, however, insist that in the end the poor bear the whole expense, and pay out of their necessaries for the rich man's voyage as well as their own.

The voyage to Point Just-Enough becomes more and more agreeable the nearer you approach the Point. The air becomes still more soft and balmy, the blue of the

Digitized by Google

sky and water still more delicious, and even the sombre objects of Soberland, now somewhat in the distance, seem to acquire a certain mellowness and splendour from the new medium through which they are seen. In the mean time, a corresponding change takes place in the passengers themselves; they experience an agreeable sensation of warmth, commencing at the pit of the stomach, and gradually extending from thence over the whole body; their pulse beats quicker and stronger; their breath acquires an agreeable odour, not unlike that of the sea on which they sail; their eyes become brighter and softer, and sometimes even seem to sparkle; their cheeks flush a little; their hands are sensibly warmer to the touch; their looks and gestures become animated; they feel increased strength and courage, and readiness for action; their ideas succeed each other with greater rapidity and vivacity, and are a little less obedient to the will; they regard themselves with more complacence, their neighbours with more charity; gentlemen become less solicitous about the seat of their cravats; ladies, of their caps and collars: all become less serious; less disposed to deliberate; less inclined to prayer, or any other solemn religious duty; less scrupulous about right and wrong; less tight-laced; not so very sober; more gay, good-humoured, frolicsome, frivolous; more inclined to singing, jesting, and light conversation; more voluble, energetic, eloquent; more ready to tell secrets, either of their own or their neighbours; more inclined to quarrel suddenly.

All voyagers to Point Just-Enough agree in the account which they give of their passage across Pleasant Bay, and of the agreeable sensations experienced on approaching the Point; but they disagree very much in their statements respecting the Point itself: some say that it is farther off, others that it is nearer; some that it lies more to the north, others more to the east; many assert that it recedes as you approach it, while some maintain that it moves forward, and comes to meet you before you have more than half crossed Pleasant Bay.

The voyage homewards from Point Just-Enough is much less agreeable than the voyage outwards; the air gradually loses its balminess, and the landscape its brilliant colours; the current and wind, too, although gentle, yet being against you, make it necessary to tack, and thus render the passage tedious. There are few who do not experience, as they return, some diuretic effect, as well as a slight degree of thirst, the latter of which continues after landing, and even until bed-time, unless removed by tea or coffee. The night's sleep is less soft and refreshing, but at the same time heavier than if no visit had been paid to the Point in the day; and on awaking the next morning, a degree of languor is experienced, and sometimes even a little throbbing at the temples, which symptoms, however, disappear either during the making of the toilet, or soon after breakfast, and are succeeded by a strong desire for another voyage to Point Just-Enough. This desire being gratified with as little delay as possible, the same sensations are experienced, and the same consequences ensue; and thus a habit is formed which increases in strength, until at last a daily visit to Point Just-Enough comes to be considered almost as a necessary of life.

Pleasant Bay is therefore covered from early morning until a late hour at night with boats conveying passengers of all ranks and descriptions to Point Just-Enough and back again. The intercourse is, however, by far the greatest from dinner-hour until tea-time, the evening being generally considered the most fashionable as well as the most convenient and agreeable time for the voyage. Some dine before they set out, but the greater number take their dinner on board.

Tipsy Island is always full of visiters. The sensations experienced on this island differ only in degree from those which are felt at Point Just-Enough. The pulse and heart beat a little quicker and stronger, the eyes become brighter, the skin hotter, the face more flushed, the voice louder, the gestures more vehement, the conversation less connected, the ideas rambling and incoherent. Some dance, some sing, some swear, some fight, all stagger about; some become loyal, others patriotic, some poetical, others philosophical; all are veracious, disinterested, magnanimous, chivalrous. It is usual to remain several hours, and even to pass the night upon the island. A few remain upon it for several days together; but as it is considered discreditable to be seen upon it in the morning, those who regard appearances usually leave for Soberland some time before daybreak; many fall asleep on the island, and are carried in that state to their boats. In the morning, all awake unrefreshed, with a parched mouth, hot skin, red eyes, aching head, and no appetite for breakfast, and spend the day drinking soda water at the great fountain on the quay of Soberland, which looks toward Pleasant Bay, and longing for evening in order to return to Tipsy Island, or at least as far as Point Just-Enough.

Tipsy Island is said to have been first discovered by Noah, who planted vines upon it. It was afterwards sacred to Bacchus, whose temple, situated about the middle of the island, is in a high state of preservation. It has been visited by Alexander the Great, and most of the illustrious men both of ancient and modern times, the names of many of whom are to be seen, carved with their own hands, upon the bark of the vines. Its daily visiters sing a song which runs nearly as follows:—

The sea, the sea, the Drunken Sea;
The blue, the fresh, the ever free, the ever free.
Without a mark, without a bound,
It runneth the earth's wide regions round;
It plays with the soul, it mocks the skies,
Or like a cradled monster lies,
Or like a cradled monster lies.
I'm on the sea, the Drunken Sea;
I am where I would ever be,
With heaven above, and hell below,
And ruin wheresoe'er I go.
If a storm should come, and awake the deep,
What matter, what matter, I shall ride and sleep.
What matter, what matter, I shall ride and sleep.
I love, oh, how I love to ride, to ride
On the fierce, the foaming, madd'ning tide!
When every wild wave drowns the moon,
Or whistles aloft its tempest tune;
And tells of Soberland far below,
And how on the horrors the storm doth blow,
And how on the horrors the storm doth blow.
I never was on the Sober shore,
But I loved the Drunk Sea more and more,
And backwards flew to her billowy breast,
Like a bird that seeketh its mother's nest.
And a mother she was and is to me,
For I was born, was born on the Drunken Sea,
For I was born, was born on the Dranken Sea.
The waves were white, and red the morn,
In the noisy hour, in the noisy hour when I was born;
The storm it whistled, the thunder roll'd,
And the lightning seam'd the skies with gold;
And never was heard such an outcry wild,
As welcomed to life the Drunk Sea's child,
As welcomed to life the Drunk Sea's child.
I have lived since then in calm and strife,
Full fifty summers a jovial life,
With wealth to spend and a power to range,
And never have sought or sigh'd for change;
And death, whenever he comes to me,
Shall come, shall come, on the Drunken Sea,
Shall come, shall come, on the Drunken Sea."

We recommend this excellent parody on the favourite song of "The Sea" to be sung at all public temperance meetings.

IMPROVERS OF AGRICULTURE.

It is curious, that many to whom improvements in agriculture are traced, were not professional farmers, but men engaged in other pursuits, who, with cultivated minds, turned their attention also to this subject. Thus, the first English Treatise on Husbandry was written by Sir A. Fitzherbert, Judge of the Common Pleas in 1534, and from this, Harte, Canon of Windsor, in his Essays on Agriculture, dates the revival of agriculture in England. Tusser, the author of "Five Hundred Points of Husbandry," published in 1562, was a scholar of Eton, and afterwards of Trinity Hall, Cambridge, before he applied to farming and literature. Sir R. Weston, who was Ambassador from England to the Elector Palatine and King of Bohemia in 1619, introduced clover into England; his Discourse on the Husbandry of Brabant and Flanders was published in 1645, and is said to mark the dawn of the vast improvements which have since been effected in Britain. Evelyn, who is considered one of the greatest encouragers of improvements that has ever appeared, was, as is well known, a gentleman attached to literature and science, and often employed in the public service. He published, in 1664, his "Sylva, or a Discourse on Forest-trees and the Propagation of Timber in his Majesty's Dominions," with many other works, which had a great influence in the improvement of the country. Jethro Tull, who introduced the drill husbandry, and published his work on Horse-hoeing Husbandry in 1731, was bred a barrister; he first made experiments on his own estate, and then practised farming.—*Royle on the Productive Resources of India*, newly published. [It might have been added, that Mr Cockburn of Ormiston, Mr Home of Kames (Lord Kames), and Sir John Sinclair, the three most eminent improvers of Scottish agriculture, were, the first and last, political characters, and the second a busy lawyer, who had no more interest in the soil and the increase of its productiveness than other gentlemen possessing moderate estates.]

EXTREME DELICACY.

The disposition to be agonisingly delicate, is well ridiculed in the following:—"Is there any thing the matter?" "There is, sir," was the host's reply. "Have I given any offence?" "You have, sir." "Really I am ignorant of it." "Such language won't suit here, sir." "My dear sir, what language?" "We were talking of soup." "We were." "You mentioned *ox-tail!*" "I did." "That's it, that's it, sir; that sent the ladies blushing out of the room—that's highly improper language, which I never heard at any board before, and should not have expected from you." "Why, sir, I but called it by its proper name. You asked a question, and I replied. I am, however, sorry that it has given offence; but I really do not know how I could have avoided it." "Then, sir, I advise you, when you have an occasion another time to speak of that particular soup, do not call it ox-tail." "No! but what shall I call it?" "*Fly disperser.*" "I shall remember the *fly disperser soup*, sir, rest assured."—*New York Paper.*

SUPERSTITION OF MR AND MRS COUTTS.

The most striking evidence of her superstitious prejudice used to cause much wonder among the guests: and this was presented on the steps at Holly Lodge, which are composed of beautiful blocks of white marble, that a statuary might envy; but the highest step is disfigured by two rusty, old, broken horse-shoes fastened to it, which she and Mr Coutts had found in the road, and they had caused these hideous bits of rusty iron to be nailed on the threshold to avert evil, and bring good luck. —*Memoirs of the Duchess of St Albans.*

AMERICAN CUNNING.

Some years ago, during the heat of a coffee speculation in Boston, when every body was holding on, waiting for the article to advance, an old merchant, keen as a razor, whose store was packed from the first to the fourth floor with prime green Rio, concluded, from signs which he well understood, that prices had reached their acme. He was too old a hand at the bellows not to know, that the moment he, with his immense stock, began to sell off, the alarm would be taken, and down would go the prices. Quietly sending off a pretty stiff invoice of the article to auction, and giving the auctioneer a gentle hint to mind his own business, he attended the sale and bade readily at prevailing prices for the coffee. Other holders, who knew that he had about four times as much on hand as they had, concluded that it was safe to do it when he did, and so stood up manfully and bought largely. While old Mr ——'s carmen were tumbling his purchases into the front door of his warehouse, five times as many were carrying coffee away from the back door. One day he failed to appear at a coffee sale, and most of the dealers took the alarm, and prices declined a little. During the afternoon, a pretty large holder, who had always been ready to buy when he saw Mr —— willing, met him in the street, and asked the rate of coffee.

"I don't know what it's going at to-day," replied the old fellow, as cool and pleasant as an ice-cream.

"It declined a little this morning."

"Did it?" responded Mr ——, with what seemed to his fellow-tradesman a strange manifestation of indifference.

"Yes, certainly! Haven't you heard it before?"

"No; but I expected as much."

"Why, we shall be ruined if the prices go down!"

"Not all, I presume," replied Mr ——, with an unmoved countenance.

"Why, you are into it deeper than any of us."

"Me!" exclaimed Mr ——, in well-feigned astonishment; "why, I have not a single bag in my store."

The next day the bubble burst, and a dozen grasping speculators, who had been for a month or two dreaming night and day over their golden gains, were ruined.—*American Paper.*

MILK AS AN ARTICLE OF DIET.

For those who have healthy and *unsophisticated* stomachs, milk appears to be one of the best articles of diet we possess. It is less stimulating than flesh, and more nutritious than vegetables. For persons who are disposed to febrile complaints, and who are not obliged to perform hard and exhausting labour, it is the most appropriate diet. But the stomach is a creature of habit. It can become accustomed to any kind of diet; and sudden changes are liable to derange its healthy action. To those accustomed to what is called high living, such as strong meats, strong drinks, and high-seasoned food of all kinds, the transition to a milk diet, which contains a considerably lowered stimulation, would probably be an imprudent change. When necessary, the change should be so gradual that the stomach should by degrees become accommodated to it.—*Beaumont's Experiments on the Gastric Juice, &c., by Dr Combe.*

THE MOTHER'S HEART.

BY MRS NORTON.

When first thou camest, gentle, shy, and fond,
My eldest born, first hope, and dearest treasure,
My heart received thee with a joy beyond
All that it yet had felt of earthly pleasure;
Nor thought that *any* love again might be
So deep and strong as that I felt for thee.

Faithful and true, with sense beyond thy years,
And natural piety that lean'd to Heaven;
Wrung by a harsh word suddenly to tears,
Yet patient of rebuke when justly given—
Obedient—easy to be reconciled—
And meekly cheerful—such wert thou, my child!

Not willing to be left; still by my side
Haunting my walks, while summer day was dying;—
Nor leaving in thy turn; but pleased to glide
Through the dark room where I was sadly lying,
Or by the couch of pain, a sitter meek,
Watch the dim eye, and kiss the feverish cheek.

Oh boy! of such as thou are oftenest made
Earth's fragile idols; like a tender flower,
No strength in all thy freshness—prone to fade—
And bending weakly to the thunder shower—
Still, round the loved, thy heart found force to bind,
And clung, like woodbine shaken in the wind!

Then THOU, my merry love—bold in thy glee,
Under the bough, or by the firelight dancing,
With thy sweet temper, and thy spirit free—
Didst come, as restless as a bird's wing glancing,
Full of a wild and irrepressible mirth,
Like a young sunbeam to the gladden'd earth!

Thine was the shout, the song, the burst of joy,
Which sweet from childhood's rosy lip resoundeth;
Thine was the eager spirit nought could cloy,
And the glad heart from which all grief reboundeth;
And many a mirthful jest and mock reply,
Lurk'd in the laughter of thy dark blue eye!

And thine was many an art to win and bless,
The cold and stern to joy and fondness warming;
The coaxing smile—the frequent soft caress—
The earnest tearful prayer all wrath disarming;
Again my heart a new affection found,
But thought that love with *thee* had reached its bound.

At length THOU camest—thou, the last and least—
Nicknamed "the Emperor" by thy laughing brothers,
Because a haughty spirit swell'd thy breast,
And thou didst seek to rule and sway the others;
Mingling with every playful infant wile
A mimic majesty that made us smile.

And oh! most like a regal child wert thou!
An eye of resolute and successful scheming!
Fair shoulders—curling lip—and dauntless brow—
Fit for the world's strife, not for poet's dreaming,
And proud the lifting of thy stately head,
And the firm bearing of thy conscious tread.

Different from both! Yet each succeeding claim,
I, that all other love had been forswearing,
Forthwith admitted, equal and the same;
Nor injured either, by this love's comparing,
Nor stole a fraction for the newer call—
But in the Mother's Heart found room for ALL!

NUMBER 462. SATURDAY, DECEMBER 5, 1840. PRICE THREE HALFPENCE.

A PLEADING FOR THE YOUNG.

TAKE a walk out of town with an old and a young dog, and see how different in all respects are their behaviour. While the elder gentleman trudges slowly but steadily along the road, turning little to the right or left, except for particularly odorous hillocks or more than usually interesting friends of his own species, the youngster is over walls in all directions, coursing through fields after sheep, hens, or nothing, barking for joy even when chased by indignant shepherds or old women; at one moment a quarter of a mile to the right; next moment seen descending the wall on that side of the road, and quick as an arrow up the wall on the other side; then presently heard faintly at half a mile's distance to the left; two minutes more, and he is again scrambling down the wall, and dancing after his tail on the road before you. Seeing manifestations so different, one cannot well resist the belief that these are animals under totally different influences. The same thing is to be observed of the respectable old mouser who sits washing her sober face by the cottage fire, not moving for a whole evening, as compared with the pranksome kitten who cannot see a straw move on the floor without rushing to make fun with it, or, if nothing is stirring at all, will caper merrily up into the air, pirouette, and come down again, saying, as plainly as natural language can speak, "I can't help all this folly, for I am young, thoughtless, and happy!" Indeed, the young of most creatures are mirthful and frolicsome, as if there were some ordinance to that effect in Providence, and a good end in view to result from it—as no doubt there is. It must arise from the state of the vital spirits (to use common language) of the animal, and must be designed to promote some process in organisation for which lively movement is requisite. Probably, the fact simply is, that the system of the young animal needs incessant exercise to firm and strengthen it, and, to cause this exercise to be taken, a restless, endless disposition to fun and frolic has been implanted. None but the *too* serious could say that this view is derogatory to the dignity of the lord of nature. God is the author of mirth and of all that can promote it, as certainly as he is the creator of the most solemn affections. We may even here remember that the most inspired of worshippers danced before the ark, and thought it proper to call upon his people to enter the temple "with joy."

Now, I would ask if, in all the range of human experience, an old dog was ever seen to express the least disapprobation of his junior, when the said junior was capering away beside him? Was the sagest old grimalkin ever known to interfere, when she saw her light-hearted son doing his best to entangle the bobbins of her mistress? Is there such a thing as an authenticated case of an elderly goat, with the most reverend of all possible beards, rebuking a kid for saying "Let's have a dance upon the heath?" I never heard of such a thing, and I do not believe that any young animal ever yet was snubbed by its seniors, let it be ever so outrageous in its fun. This is surely a most sensible thing in the grown-up people of the lower animal world, for, were they to do otherwise, they would assuredly be thwarting and impeding one of the processes of nature requisite for the welfare of their respective tribes.

The young of the human family are as sportive as the young of any known animals, and probably for equally good reasons; but how are they treated? Unfortunately, man is a very wise creature. He has a vast deal of rationality about him, a deep sense of propriety, and thanks God that he was not left to nature. He therefore sets himself to keep down the indecorous good spirits of the young, and to make them all as grave as himself as soon as possible. "Less noise there, youngsters, or you shall all be put out of the room." "No nonsense, boys; do you ever see me leaping over chairs in that way?" "Come, now, here are fifteen hexameters to be got by heart, and the first rascal that sniggers shall be whipped." Such are the amiable addresses of the elderly Bimana to *their* young; the consequence of which, if there is any truth in our theory, must certainly be, that the intentions of nature (to use no higher word) are in their case defeated to a certain extent, and the organisation in that degree marred and enfeebled.

Children are, altogether, most unfortunate creatures. The happy puppy is an independent member of the canine world, with every thing but a vote for a member of Parliament, in a few weeks from his birth. But the infant man is in tutelage for twenty-one years—and such tutelage! On many of the most essential points for the prosperity of their offspring, ninety-nine of every hundred fathers and mothers are as ignorant as they are of the quadrature of the circle. The predominating idea of almost all is to make the hapless little wretches intrusted to them as demurely wise as themselves. They have all of them a perfect recollection of their own sufferings under this process; but yet no one dreams that there is any thing wrong about it. It must have been all owing to the waywardness of the young mind that they were themselves restless and uneasy, if not dispirited and wretched, under the severe measures adopted by *their* parents. Or the severity had never been severe enough to accomplish the end. Wo be to the youngsters whose parents think they were not held tightly enough in by the generation antecedent! Children are not managed as children. They are treated as men and women, who, by some strange perversity in their nature, will not behave as men and women ought to do. The rebellious creatures won't sit still a minute, nor think for a moment. With splendid examples of decorum, rationality, and studiousness, constantly before them in their seniors, they *will* persist in every thing that is rantipole. Coaxing, bribing, thrashing—nothing will do. No, my friends, and that simply because the creatures are *not* men and women in a state of rebellion from the standard of propriety, but children, who will only be men and women by and bye, *if you will allow them to grow.*

Ponder well, ye parents dear. Only consider what children are. Receive into your minds, *if possible*, the idea that there is such a thing as nature, producing endless diversities of being, and fixing regulations peculiarly adapted for the welfare of each. Look at the analogous case of the young of the speechless animals, and be convinced that there is something in the restless bounding spirits of your own juveniles, which cannot safely be altogether repressed. Much play, free vent to the spirit of jocundity—that is the proper maxim for the management of young people, because it is what nature dictates. We often recollect with pleasure the qualification which a friend of ours asked for in a teacher for his children—"Can you laugh and make fun?" It was strictly philosophical. The boy is not learning any thing when he is amusing himself, but he is strengthening his brain that it may be better able to learn and to act when the good time comes. Is it not better to begin life with the good sound instrument, fit for the utmost duty its natural reach of power admits of, than with an enfeebled instrument which has only got a smattering of a great number of things it does not comprehend? Old and precise people like to see a quiet, grave child. In sober truth, there is nothing more alarming. It is almost sure to be an indication of some extraordinary quality of not a safe kind. There are varieties, of course; some are quieter than others; but for a young person to want all tendency to romping, and frolic, and gaiety, is, in the eye of a right philosophy, a thing not to be admired, still less to be desired, but, on the contrary, to be regarded with apprehension, and treated with care. A merry schoolmaster, I apprehend, is there particularly wanted.

Children, as a class, are also sadly exposed to the distempered feelings of their seniors. On the one hand, we have extravagant indulgence, vitiating the character almost before it has had time to show the first spring-flowers of its native innocence—on the other, austerity, ill-nature, and gloom, making all the May of life a November, checking the growth of the affections, and introducing distrust and fear where as yet unsuspecting confidence should reign. Of the two evils, I have no hesitation in saying that the first is the least. There is a time between childhood and manhood when the character may be said to go through a process resembling fermentation, and the effects of spoiling and of simply erroneous treatment of various kinds are in a great measure thrown off. But take away from a child all the joyousness proper to his young years, and let him only know his parents, or others that have been around him, as tyrants, and the evil is irreparable. His life has wanted an element. He has not known that morning sunshine of the breast which is the brightest of all moral sunshine. Treated himself without gentleness, affection, and mercy, he has not the call of a recollection of his own experiences to treat others with gentleness, affection, or mercy. He is rather disposed to revenge his own sufferings upon other people, as the genie confined in the barrel and thrown into the sea vowed to destroy whoever let him out. Thus sourness goes down like an estate with a family, and the sins of the fathers are visited upon the children even unto the third and fourth generation. How many a man known in public as a hard-natured person, unforgiving of debtors, inaccessible to petitions from the widow and orphan, rigid as a master and in all the relations of life, unbending even to gratify himself, might point, for the source of all his unfortunate qualities, to a parental home which was to him only a den of misery! If thus bad to those who had no share in blighting his infant happiness, how can he be good to those who did? It is surely most absurd to treat children harshly, and yet expect them to love and reverence us! In the common world, if we constantly rail at any one, call him contumelious names, beat him, and visit him with every kind of injustice, do we find that he loves us the more? Is not rather the slightest departure from civil usage the surest plan to produce aversion in both our equals and inferiors? How strange, when this is so clear, that we should suppose we can wound the self-esteem and sense of justice of a child, besides inflicting actual pain upon his flesh, and that he nevertheless will continue to love us! It is no doubt necessary to take firm measures with children, in order to keep them right in many instances; but a constant exhibition of harshness and oppression is not necessary, any more than it is in our ordinary intercourse with the world. Many men, however, who would not for a great deal use a word out of joint before company or in the transaction of business, allow themselves the latitude of Billingsgate and of a slave-owner in their intercourse with their children. It would be wrong to say that young people remember these insults and injuries as grown people

Digitized by Google

would, for the mind at that time of life has not the same power of retaining impressions which it possesses in its maturity. But can we doubt that a general impression of the treatment received in the parental home is retained? I have heard men in middle life speak with heart-felt indignation of the cruel usage they had received from their parents, and make no scruple to avow any thing but respect for their memories. The long-protracted misery had eaten into their nature, and principle, though it could make them forgive, could not make them forget it. On the other hand, I have heard persons in mature life advert with melting tenderness to little acts of kindness extended to them in their childhood by parents and neighbours. No, no; the years of childhood never can become a blank in the memory. The incidents of those years may not in all instances be reckoned individually, but they tell in the mass. The rationally kind parent is thought of in association with the recollection of that happiness which he promoted or was the occasion of, and may hope to be treated in his own latter pupilage with a return of the courtesy and the humanity which he showed to his children; but for the severe parent what can be expected but that he should be looked back upon as the dismal deity who presided over a period of misery—an object of involuntary horror, loathing, and contempt?

Other sufferings the young experience in many instances, in consequence of the unfortunate circumstances of their parents. The young of the poor, says good Charles Lamb, are not brought up, they are dragged up. But these are evils which it may be presumed no parents would see their little ones exposed to, if they could help it. Here, it may be said, they only undergo their share of the unavoidable hardships of life. And yet it is much more sad, somehow, to think of the children's share, than that of the parents. It may be because the former are so utterly helpless to screen themselves from or to remove out of the way of the evils of poverty—not even able to recognise what it is that produces their sufferings—while the parents have at least some control over their own fate. However the case may be in these respects, it is obvious enough that such sufferings tell as severely as any others upon the young, repressing the natural spirits, introducing sadness where joy should be, and leaving a memory of pain to cast its long shade over all the future years of life. It may be said of such children that they have had no youth. That delightful season, with all its associations, is a blank in the calendar of their lives. Can we doubt that, in their case also, evils flow, and will flow to the end of their days, from a defect so unnatural? Oh, parents, if by any means ye can spare your children any share of your own mishaps, be entreated to make every exertion to do so. Shelter the tender bloom of their minds from the blasts of misfortune. Let *them* sport, unknowing that *you* weep. Give them, if you can, a youth, and so ensure to them not only a positive period of happiness, comprising no slight part of their stated span, but also one of the highest sources of enjoyment for the remainder of their existence.

REPORT ON BIRTHS, DEATHS, AND MARRIAGES IN ENGLAND.

The registrar-general of births, deaths, and marriages, has recently presented to both Houses of Parliament his second annual report, which has been printed and published.

We now proceed to transfer to our columns some portions of the interesting information which is to be found in this report. The period embraced is the year ending June 30, 1839. The numbers registered in that period were, for the whole of England—

Births, - - - - -	489,540
Deaths, - - - - -	331,007
Marriages, - - - -	121,063

"which, compared with the numbers for the preceding year, show, for births, an increase of 80,828; for deaths, a decrease of 4949; for marriages, an increase of 9602." This decrease in the number of deaths, as compared with that of the preceding year, the registrar-general ascribes to a diminished mortality, and not to imperfect registration. "I have found no reason," says he, "to believe that the registration of deaths has been conducted with less care and efficiency than before; but in comparing recent returns of the causes of death with those of the first year of registration, I have found reason to believe that the mortality of that year was above the average, owing to the inclemency of the winter in the beginning of the year 1838, and to some epidemics, the prevalence and severity of which appear to have subsequently declined."

With respect to the proportion of the mortality to the population of England and Wales, it has been found impossible at present to do more than approximate to a solution of that important question, owing to the want of correct data for arriving at an estimate of the population. This difficulty will, however, be shortly obviated, for by an act* recently passed by the legislature, a commission, with the registrar-general of births, deaths, and marriages at its head, is to be formed for taking an account of the population of Great Britain, with power to divide the country into districts, and to appoint persons as enumerators for each district for taking such account. The period named for taking this account of the population, is the 1st of July 1841.

The registrar-general next adverts to the manner in which the records deposited in his office may be rendered useful in illustrating the condition of the people; and this appears to us the most interesting part of the report. The registers of marriages, for instance, are calculated to throw much light upon the state of education, with respect to the ability to write, among the adult population in England and Wales, every marriage almost being duly registered, and every register of marriage signed by the parties married, "those who are able writing their names, and those who are unable, or who write very imperfectly, making their marks." It must be borne in mind, however, that this will only enable us to arrive at the proportion of persons who are able to write *among those married*; and the portion of the whole population exhibited in the yearly returns of marriages is small. In the report before us it is estimated at about seven or eight marriages to one thousand of the population. "If, therefore, it be assumed that persons between the ages of eighteen and sixty-five constitute half the population (which the enumeration of ages in 1821 shows to be very nearly the case), it will follow, that of those who may be considered the marriageable portion of the community, about thirty in every thousand (or three per cent.) are married yearly. The portion, therefore, whose signatures appear in the marriage registers of a single year, is sufficiently small to be easily affected by accidental circumstances; and it cannot safely be asserted that the thirty in one thousand, from whose signatures we would draw an inference respecting the other nine hundred and seventy, may not happen to consist of more than the proportionate number of uneducated persons. It must not therefore be hastily assumed, upon the evidence afforded by the returns of a single year, that the inhabitants of any particular county or district are less educated than their neighbours. The experiment must be repeated often, and be attended with similar results, before this inference can be drawn with safety; and it is only when returns of the same description, given for several successive years, shall have exhibited similar facts, that it will be perfectly justifiable to arrive at any unfavourable conclusion with respect to any particular district."

From the registers of marriages deposited in his office during the year ending June 1839, the registrar-general has constructed a table, exhibiting the proportion per cent. in the metropolis, in each English county, and in North and South Wales, of the persons married who have signed with their marks. This return indicates a decided superiority with regard to education, or rather the ability to write, in the metropolis, as compared with the rest of England and Wales, and, next to the metropolis, in the north of England. The counties in which the proportion of persons married who are unable to write is greatest, appears to be in Lancashire, Bedfordshire, Monmouthshire, and Wales. There is one remarkable circumstance apparent in this table, namely, that throughout the whole of England and Wales, without a single exception, the ability of the men to write appears superior to that of the women. The proportions per cent., for the whole kingdom, of the parties who have signed the registers with marks, are thirty-three in the number of males, and forty-nine in that of females, the mean number being forty-one.

It must be remembered that these calculations regarding the ability to write give no insight into the amount and nature of the education *now* afforded in England, and that they are only applicable to the past, a period of between ten and twenty years ago. "Inability to write," says the registrar-general, "is, without doubt, indicative of considerable deficiency in other kinds of elementary education. Opinions will differ as to the extent to which such deficiency may from thence be inferred; and this is a question the solution of which I will not attempt."

We shall conclude our brief notice of the report before us with an extract of a novel and interesting kind, containing an account of the number of marriages that occur at the various stages of human life throughout this kingdom. "The average age at which persons are married in England and Wales has never yet been ascertained, nor do the returns deposited in this office enable me to do so with certainty; for the column headed 'age' in the register of marriage is required to be filled not by the actual ages of the parties married, but only by a statement whether each is of full age or a minor. There was, however, considerable misapprehension on this subject, notwithstanding my endeavours to circulate information, when the recent registration and marriage-acts first came into operation; and it appeared, on the reception of the quarterly returns of certified copies, that in many districts the precise ages of the parties married had been uniformly inserted. This being the case, and as the information is of a novel kind, I subjoin the result of an examination of the recorded ages in 4858 marriages, which, as they are not selected instances, but belonged to districts varying greatly in situation and character, and included every marriage in such districts, thus comprising persons of every class, may be presumed to be a fair example of the ages at which marriages occur throughout the whole kingdom.

Ages.				Men.		Women.
15 and under	20			159		688
20	25			2536		2527
25	30			1150		861
30	35			398		320
35	40			219		187
40	45			156		134
45	50			103		76
50	55			70		38
55	60			39		17
60	65			19		6
65	70			4		4
70	75			4		0
75	80			1		0
				4858		4858"

The result of calculations made on this abstract by the registrar-general, showed that the average age of marriage was, for men, about twenty-seven years; for women, twenty-five years and a few months.

CHARLOTTE AND SUSAN—AN IRISH STORY.

Charlotte Murray and Susan Mills were companions in their childhood. The first of them was the daughter of a poor widow, who supported herself and her children by cultivating a few acres of inferior land, situated in a lonely part of the county of Clare. Charlotte, the eldest of the family, was trained in her youth to every species of rural labour, and more particularly to the task of bringing turf from the adjoining hills. In this occupation she was often joined by the children of the neighbourhood, and, in especial, by Susan Mills, the daughter of a farmer of the better class, who lived hard by. Susan did not absolutely require to work like Charlotte, but she followed the same employments as the latter, from a love of companionship and amusement. The two girls remained in their native place till they grew to womanhood, and by this time their respective characters were in part developed. Susan, who was very pretty, displayed an early love of dress and show. The other had neither the same inclinations, nor the means of indulging them, though she was scarcely less comely than her friend.

Susan was the first to quit her home. Her father declined in circumstances, and she had to look out for a place. She had, according to her mother's notions, received a good education—that is to say, she read fluently, could write a little, was very expert at her needle, and had a tolerable knowledge of mantua-making; she was generally handy, and had a good address. With such qualifications, it was not difficult for her to procure a place in a respectable family, where her business was to take care of children, and occasionally to wait upon her lady. This situation pleased Susan particularly. She received from her mistress frequent presents of clothes, which, by her expertness and ingenuity, she made look nearly as good as new, and which, though she was kept pretty busy, she contrived to display to the admiring eyes of the village beaux. When she had been about a year at Mrs Halford's, the widow Murray, understanding that a person was wanting there to assist the housemaid, and to do the drudgery of the nursery, applied for the place for her daughter, and obtained it. Susan was by no means pleased at this arrangement, as she did not desire to have another pretty girl to share with her in the attentions of the smart young men who frequented Halford Hall. Upon reflection, however, she judged that her own superior elegance of attire, and coquettish airs, would always ensure her a decided preference. Charlotte had, indeed, but little opportunity of attracting admiration, for she had a great deal to do.

Her early habits of laborious industry, however, enabled her to perform her task with ease and cheerfulness; she gave her whole mind to her business, and soon became the most efficient servant in the house. Susan, adroit and clever, was, while under her mistress's eye, an excellent attendant; but the moment she could escape with impunity, she made no scruple of leaving her business and running off in search of diversion. It was Mrs Halford's custom to visit the nursery every night, to see that the children were asleep and the maids in bed. One night after the lady's visit was over, Charlotte, who had been in a sound sleep, was awakened by the cries of one of the children who usually slept with Susan: on rising to see what was the matter, she was surprised to find that Susan had left the room, and was gone down stairs. Having quieted the child as well as she could, she returned to her own little charge, and continued awake, watching for the return of her fellow-servant; but one o'clock, two o'clock struck, and no Susan

* 3d and 4th Vict. cap. 99.

Digitized by Google

appeared. She came at length stealthily up, and admitted, on seeing Charlotte awake, that she had been down stairs, having a drop of punch and a cup of tea with the cook, and one or two "boys," *cousins* of that personage. Charlotte remonstrated with her friend, saying how angry the lady would be at the children being left. Susan admitted this, but "if she had come up, sure you could tell her I only went down to warm a drop of milk for the child, and that you'd run and call me."

"I'd run and call you with pleasure, Susan; but as to telling any lies about it, it's what I wouldn't do for my own sister."

"Oh, you are mighty nice, indeed; maybe you'd be glad to tell a white lie for yourself yet."

Susan afterwards endeavoured to prevail on Charlotte to take advantage of the casual absence of their mistress, and join a junketting party by night.

"I thank you kindly for your good nature, Susan," said Charlotte; "but my mother charged me on my duty never on any account to leave the child I had the care of to another."

"Well, you must take your own way—I spoke for the best."

Having once resisted the temptation, every succeeding trial became more easy to Charlotte, particularly as her fellow-servants soon gave up as vain the attempt to persuade her to join them. But she had trials of another kind. Those who know any thing of young girls must be aware that it is a serious grievance to them, especially if they be handsome, to be obliged to appear in a dress inferior to that of their companions. Now Charlotte had determined in her own mind that she would save out of her wages what would help to pay the rent for her mother, whom she knew to be hard pushed to make it up. To effect this, it was absolutely necessary that she should purchase for her own use none but the plainest clothes. Meanwhile Susan, always flauntingly dressed, spent her time in gaiety. By means of great natural quickness, and various expedients, she had contrived to elude detection, not only with respect to her evening amusements, but to many little absences during the day, which she timed so well, that her mistress never missed her. There was scarcely a party, high or low, from that given in the exalted mansion of the thriving shopkeeper or collector of excise to the more humble festivities of the gardener's cottage, which did not boast of Susan as its greatest ornament. Admirers of all classes swelled her train, and she gave sufficient encouragement to each to retain him in her chains. Yet, with all these advantages, it may be fairly questioned whether Charlotte were not in reality the happier of the two; she enjoyed that constant serenity of mind which the consciousness of having performed our duty to the best of our ability produces, and she had not left it in the power of any one to injure her by reports to her disadvantage; while Susan, on the contrary, lived in constant fear lest any of her manœuvres should be betrayed by some spiteful enemy or treacherous friend.

The long wished-for Easter at length arrived, and Charlotte set out with a light heart to visit her friends, taking with her the small sum which she had accumulated by her industry and self-denial. Her mother, and her little brother and sister, were watching for her at the door; and their joy at seeing her, and the widow's surprise and gratitude at sight of the little sum she had saved, amply repaid her for all her sacrifices. A young sailor, who had come up from the shore, where he occasionally resided, to visit a cousin who lived upon the mountain side, chanced to be in the widow's house at the moment when Charlotte entered; and had not her whole mind been absorbed by the joy of meeting her friends, it is probable that she would have noticed him more than she did, for there was something striking and pleasing in his appearance. He was tall, of a fine figure, and, though but a common sailor, he had, by seeing something of the world, acquired an ease of manner and deportment not usual in his sphere of life, while his open honest countenance had lost nothing of the ingenuous expression it bore when first he left his native village. This young man, who was a good judge of beauty, and did not consider fine clothes necessary to make a fine woman, was attracted by Charlotte's rosy cheeks and soft blue eyes, but he was still more struck by the affectionate pleasure he saw in her countenance at the meeting with her family. And when he heard from his cousin of her dutiful conduct towards her mother, and the self-denial she had practised in the performance of it, he longed to be better acquainted with her—he visited her mother's cottage every evening during her stay, and was more and more pleased with her conversation.

Soon after Charlotte returned to her place, she happened to go at an unusually early hour to the breakfast-room to seek for some of the children's things which had been forgotten there the night before. As she approached the door, she thought she heard a key turned in a lock in a hurried manner, and on entering, she saw Susan carrying away something in her apron. A lump of sugar, dropped as she went out, showed what that something was. Charlotte had always wondered how her fellow-servant, even with her superior wages, could afford tea morning and night, while she herself took strabout or porridge. A suspicion arose, in spite of Charlotte's desire to think well of Susan; and when the latter offered some of her tea to her early friend, the offer was not accepted. Charlotte also ventured to remonstrate with Susan on the score of the encouragement given by the latter to a squireen called O'Flaherty, a wild young man, and who was even said to have a wife already, though one deserted by him. But the remonstrance was unheeded.

About this time, a young man of respectable station, named Davis, began to pay some attentions to Charlotte, and on one occasion asked her to go to a sort of fair and dance at some distance, where Susan and others were to be. Mr and Mrs Halford were from home with the children, and "there could be no harm," Susan said, "in going." But Charlotte had not asked leave to absent herself, and her well-regulated mind shrunk from any act unknown to her master and mistress. At the same time, she had a great desire to see the sport with others. After being long pressed by Susan, Charlotte retired to the nursery, and sat down to consider. before the young beaux came to escort the party. "If I wait for the boys," said she, "it is all over with me; I shall never be able to resist their persuasions and flattery; I'd best take myself out of the way before they come. And it's what I'll do," said she, starting up and running in search of the old gardener, a staid, prudent man, and very good-natured. To him she hastily explained the state of her affairs. "And now, Thomas," said she, "what I'll do is this—I'll go and hide behind the high yew hedge by the garden gate, till the bustle is over, and they are all gone; and when you hear them calling for me, do you tell them that I went out of the way purposely, and that it's useless to wait for me." The gardener promised to obey her directions; and she retired to her hiding-place, where she waited about an hour, which appeared to her at least three. She was so tired of waiting, that she said to herself, "They must have gone by though I did not hear them, and I may go out;" but just as she was preparing to emerge from her obscurity, she heard the voices of the happy party, laughing and talking as they passed. She distinguished Mr Davis's voice, repeating her name with expressions of regret. Soon the sounds died away in the distance; and when they were irrevocably gone, poor Charlotte's resolution gave way, and she indulged in a hearty fit of crying.

She at length dried her eyes, and, angry at her own foolish regrets, sat down with her psalm-book before the kitchen-fire, where the old gardener was smoking his pipe. A knock came to the door, and she thought some one had returned for her. She was so much agitated, that the old gardener was obliged to open the door; at which appeared, not Mr Davis, but a very different sort of person—the young sailor whom Charlotte had seen several times at her mother's. He entered with a smiling air.

"Will you receive a visiter from your own country, Miss Charlotte, who brings you news of your mother and family?" said he, producing a letter.

"My mother? oh, when did you see her—is she well?"

"Quite well, and commissioned me to deliver this into your own hands, and to bring her an exact account of your health and welfare; and I assure you I never received a commission with greater pleasure in all my life. I met some of your acquaintances going to a great party; upon my inquiring for you, they laughed, and said, they supposed you knew what you were about, and waited at home on purpose to receive me. I told them I was not so happy as to be able to believe that, as you knew nothing of my coming. And now, may I presume to ask how it happened that you did not accompany them?"

"I will tell you," said the gardener; "it was because she preferred her duty to her pleasure."

The young man looked at Charlotte with respect and admiration.

"I should count myself very fortunate," said he, "if Miss Charlotte would permit me to remain for an hour or two, to talk to her of her friends."

"And so you shall," said the old gardener. "Nurse and I are going to our dish of tea, and I invite you to take share of it, whether Charlotte asks you or not."

Willie Hewson, for that was the young sailor's name, contrived to make the evening pass so agreeably, that Charlotte ceased to regret the amusement she had lost; he told some humorous stories with great effect, sung several sea songs, and showed that ardent desire to please which seldom fails in attaining its object. From this hour, Mr Davis's attentions had no longer any chance of becoming acceptable to Charlotte; neither could her fellow-servants, by all their exaggerated descriptions of the delights of the show, cause one sigh of regret for the pleasures she had missed.

From the time of Susan's visit to the show, where she, it was well known, had met Mr O'Flaherty, her daily absences became so frequent, that her mistress's suspicions were at length awakened, and it was announced to her that unless she was more careful in her conduct, she must not expect to retain her situation. This intimation was received in sullen silence, and the next day, when Mrs Halford inquired for Susan, she was nowhere to be found. She had been seen in company with her lover early in the morning, and it was soon ascertained that they had gone off together. There were various reports concerning them for some days. It was at one time asserted that they were actually married.

Charlotte was now installed in her old friend's place, but she did not hold it long. Her mother grew so ill, that the dutiful daughter found herself incapable of staying away from home. She went home, and, by her kind tendance, restored the widow to some degree of health; but, alas! all her exertions could not keep the farm in their hands. They fell behind with the rent, and lost the ground. Then Charlotte was compelled to look for some other means of supporting her mother and the two younger members of the family. The only employment which she could think of was that of gathering sea-weed on the beach, about three miles from the cottage. This weed was sent to Limerick to make kelp. She spoke to her mother of the plan. "Charlotte dear," said she, "you don't know what you undertake, nor the slavery of it. You must be down upon the beach soon after break of day, and there you must stay till nightfall; and you'll have nothing to eat the whole long day but a few cold potatoes or a bit of bread, for you must be sensible that I could not spare the little girl to go with your dinner to you, and then you'll have to come home in the cold and the wet after a hard day's work; you don't know what it is."

"Mother dear, have not I been out many a bitter day upon the mountains, and was never the worse for it; and sure it's not harder on me than upon others; and wouldn't it be worse to me an hundred times to see you want? So, mother dear, with the blessing of Heaven, I'll begin on Monday morning."

Charlotte found it, as her mother had said, a hard life, but she was strong and hearty, and her health did not suffer. She pursued her work with diligence, even when winter made it more severe. Nothing occurred to her worthy of mention, till, one day, a ship came into the harbour, and a boat from it put William Hewson ashore. His eye caught the figure of Charlotte on the beach, and he was sadly surprised to see her appearance indicating such extreme poverty.

"Do my eyes deceive me," said he, "or do I really see Charlotte Murray?"

Charlotte, slightly colouring, replied—"You do indeed, Mr Hewson. Our circumstances are much changed since you were here, and I am doing my best for our support."

"It is like yourself, Miss Charlotte; happy the parent that has such a daughter, and happy the man who gains such a wife."

During the period that Willie Hewson remained at home, he regularly joined the party on the beach; and never had Charlotte found the most delicate work in her lady's dressing-room so agreeable an occupation, as that of gathering sea-weed on the beach, when thus accompanied. But the day at last arrived when he must depart upon another voyage: he sailed, however, with improved prospects, as mate to a small trading vessel bound for Guernsey and the coast of France. About a month after his departure, as Charlotte was one evening returning from the shore wet and weary, she saw her little brother Dicky running down the mountain path with a face of consternation.

"What is the matter, Dicky?" said she—"oh, speak! what is the matter?" "Charlotte dear," said Dicky, "mammy is very bad, very bad entirely—screeching with the pain. Hurry home!"

Charlotte did hurry home, and sure enough she found her mother very ill. Great was the distress of the daughter; and it would have been greater had not the storminess of the night brought to the cot a gentleman seeking shelter. He got a seat by the side of the fire, and there overheard a remarkable discourse for such a place. The family had not one penny in the house, excepting a pound-note intrusted by a cousin to the widow. This note Charlotte wished to use in bringing a surgeon and procuring medicines, hoping to make it up afterwards. The sick woman would not hear of this for an instant. Struck by the scene, the traveller caused the surgeon to be sent for at his own cost. The widow suffered much; but the medicines given to her brought relief, and on the following day she was pronounced out of danger. The kind traveller called to see her; and after learning how she was, asked Charlotte who "the Willie Hewson was, whose name she had invoked in her distress." Charlotte told with a blush; and the gentleman surprised her by announcing himself as a relation of Hewson, just returned from India. "I must see Willie's father, who is my own full cousin," said Mr Hewson. "I know not what he may be now, but he was the best-natured fellow that could be; many a scrape he got me out of in my wild days."

"And he is still an excellent, kind-hearted person," said the widow; "but, poor man, he is quite disabled this many a year, and has nearly lost the use of his limbs, with the hardships he went through at sea. But he has the comfort of as good a son as can be in the world, I believe; he maintains his father and brothers, and portioned his sister, and had her well married, though he could badly spare the money at the time. I'm sure, sir, you'd like Willie. I'm sorry he's absent at present."

Mr Hewson was much pleased with what he saw at the cottage of Willie's father, and still more with what he heard of the young man from less partial judges than the Widow Murray or her daughter. He promised to renew his visit when Willie should return from his voyage. This happened in the course of a few days: the voyage had been prosperous—the young sailor was in high favour with his captain. When Willie learned all that Charlotte had suffered in consequence of her mother's illness, he said—"There is but one thing to be done, my dear Charlotte, and that is for us to be married before I depart upon another voyage; we have enough now to maintain the two families when joined, though it would be too little for them when separate, and you and your mother will be the means of making my father comfortable in his old days. So no more objections, my love, but take your own faithful Willie for your protector for life."

"Oh, Willie dear, how could I burden you with another family—you that are struggling to support your father and brothers, and find it hard enough to do that?"

"I shall have double strength and courage, Charlotte, when once I have secured you mine; for often, when I have been far away upon the seas, the notion that something might happen, and I might lose you for ever, would come across me, and my very heart would sink within me."

How the debate between the lovers would have ended, though it may be surmised, can never be decidedly known, for it was interrupted by the arrival of the stranger, who declared himself happy in having at length an opportunity of becoming acquainted with a relation who stood so deservedly high in the esteem of his neighbours. Willie's appearance did not disappoint his cousin, who was pleased with the ingenuous modesty of his look and manner. As soon as they were in private together, Mr Hewson began to question him as to his views and prospects in life; and soon perceived that his surmises were just, and that to be united to Charlotte was the wish nearest to Willie's heart. "From what I observed during the night I passed in the Widow Murray's cottage," said Mr Hewson, "I do not think that you, my young friend, could choose from a better stock; and I for my part should be glad, while I am assisting my relation, to be the means of rewarding the self-denying honesty and contented industry of that family. Do you think you have acquired sufficient knowledge of seafaring business to make a fit captain of a small trading vessel?"

At these words, Willie Hewson's eyes sparkled, and his cheeks glowed with delight; but checking his transports, he answered modestly—

"It is not for me, sir, to judge about myself—I will refer you to my captain; but if an earnest desire to acquire nautical knowledge, and a close attention to the duties of

Digitized by Google

my calling are of any avail, I believe I might venture upon such an undertaking."

"Very well; I will inquire into the business, and if I find you well qualified for it, I will, if you please, purchase a neat little vessel in which you may make short trading voyages that will not take you too long from your family; out of the profit of these voyages you shall, by degrees, pay me the price of the vessel. I shall also present you with a small sum as a portion for Charlotte, and this will serve to furnish your outfit, and to put your house in better repair."

The captain's report of William's diligence, prudence, and sobriety, as well as of his proficiency in all knowledge requisite for his station, was so satisfactory, that it confirmed Mr Hewson in his purpose. The vessel was purchased, and a tight little ship she was, and well rigged out; she was christened "The Lovely Charlotte," and on that same day Mr Hewson, acting the part of a father, bestowed the hand of her namesake upon the newly made captain. We will not attempt to describe the delight and gratitude of the youthful pair, the joy of their aged parents, nor the heartfelt satisfaction of the generous author of their happiness.

Charlotte was now in comparative comfort, and might, if she had chosen, have even lived luxuriously; but she was formed of a different temperament. Though Mr Hewson never proposed any time for the repayment of the debt due by Willie, the new-married wife thought that the task of restoration could not be too soon set about, and accordingly she at once began a course of frugality, which never ceased till she had paid up the whole sum, and had made her husband in reality master and owner of the Lovely Charlotte. Willie, or Captain Hewson, as we should call him, would often entreat her to give herself more indulgences; but she resisted all his persuasions. The consequence was, that her children were early inured to habits of economy, which served them through life.

And what was the end of Susan Mills? She came to see Charlotte, and boasted greatly of her grandeur. She invited Mrs Hewson to come and see her; but it was only after a lapse of several years that Charlotte, chancing to be near Carbery Lodge, as O'Flaherty's mansion was called, went to see her old friend, of whose history she of late knew nothing but by vague report. She was surprised, on entering the domain of Carbery, to see such an air of desolation all around: the fences were broken down, and the cattle strayed unheeded through the screen of fir-trees, where they were committing the most cruel devastations. Some children were playing near the hall door, which opening suddenly as Charlotte approached, a little boy rushed out sobbing violently with rage and grief; for the latter he seemed to have some cause, for his head was cut and bleeding.

"What is the matter, my dear?" said Charlotte; "how were you hurt?"

"It was—it was mamma," said the child, crying more bitterly; "she banged the door of the press against my head, and all because that lying fellow there," said he, looking at his eldest brother, "told her I took the cake."

"And so you did, you dirty brat, with your ugly broken nose; you are the picture of old cankered granny—and mamma says so."

"Dirty brat yourself, I'm heir of Carbery Lodge."

Charlotte's little girl who had accompanied her, scared at the sounds of fraternal discord, to which she was unused, took refuge beneath her mother's cloak. "Oh shame, shame," said Charlotte, taking the wounded boy by the hand, "brothers to use such language to one another. Come with me, and I'll ask your mamma to put some plaster to your head to cure it." "No, no," said the boy, breaking from her, "I'll go and complain to grandmother."

Charlotte, shocked at this scene, knocked timidly at the door, which was opened by a fat woman, with a red face, and eyes that sparkled with rage; she had the handle of a sweeping-brush in her hand, with which she seemed prepared to oppose the entrance of the intruder. Upon seeing Charlotte, she stopped short; and after a pause exclaimed—"It is, it is Charlotte, I declare!" and her countenance relaxing from its stern expression, Charlotte, to her utter surprise, perceived that the fat red-faced woman was no other than Susan. Endeavouring to conceal her consternation at this discovery, she replied to Mrs O'Flaherty's complimentary speeches as well as she was able. "I'm sure I am happy to see you at last," said the lady; "better late than never. But I'm sorry you didn't see Carbery Lodge when my furniture was new; those children, there's no bearing them, they are so wicked, and so arch—see the figure they've made of every thing. It was only last night that brat smashed my beautiful chandelier that cost me my good three pounds; and see the way they burned my carpet, the rogues, with the poker."

The drawing-room did, indeed, exhibit the appearance of a place where all the imps of mischief had been let loose. The curtains, of a bright salmon colour, bordered with green, showed evident marks of dirty hands having been wiped in them; the sofa had been originally of the same hue, but had now exchanged it for that of the yellow clay regularly imported upon the children's shoes from the muddy ground before the door; then the gaudy beauties of the many-coloured paper on the walls were quite defaced by spots of grease and ink, dispersed over it with a profusion that seemed rather the effect of design than of chance—all, in short, within doors and without, bore the marks of reckless waste and comfortless extravagance. But nothing she had seen so much distressed Charlotte's feelings as the change in the appearance of her old companion. Six years before, Susan had been a very lovely woman, now scarce a trace of beauty remained; her face and neck, for the graceful turn of which she had been famed, were frightfully swollen; her cheeks, which had been tinged with the most delicate peach colour, were now of a fiery red, and blotched with scurvy; the pretty though coquettish expression of her countenance was exchanged for a look of lowering discontent; her figure, once so light and agile, was heavy and unwieldy, and her whole appearance gave too much colour to reports which had been spread of her having acquired a taste for spirituous liquors—reports which Charlotte had been unwilling to credit, but which a very disagreeable smell of whisky which pervaded the house too strongly confirmed.

"Well, and what will you take after your journey, Mrs Hewson?" said Susan; "a drop of punch would do no harm, and there's hot water ready," added she, rising to call the maid.

"Not any punch for me, Mrs O'Flaherty, I thank you kindly; but, if it wouldn't be too troublesome, a little tea would be the greatest treat you could give me, for it's a thing I don't very often use."

"And is that the case, my poor Charlotte? Well, I didn't think Captain Hewson was the sort of man to scrimp you that way! Why, even the wife of a common labourer sits down to her tea quite regular now-a-days; and he, that has such opportunities of getting it *cheap*, too, to deny you. Indeed, I'm very angry with him."

"Then you needn't, Mrs O'Flaherty. It isn't Willie's fault, indeed it isn't; for though he wouldn't get it the way you mean, for fear it would teach him to be a smuggler, it's often, from the very first, he pressed me to take it both morning and evening; but I considered that we were deeply in debt, and couldn't count any thing our own till we were clear; so I wouldn't be indulging myself, and I got only just what served the old people, that hadn't their appetites rightly."

"Well, to be sure, every one knows their own business best; but, for my part, I'd think myself fairly lost without my tea. The best I have, both green and black, and coffee, too—so you may take your choice."

"Coffee is very good, and Willie's always telling me so, but somehow it comes a little strange to me; so the black tea, ma'am, if you please, being what I'm used to, is what I'd like best."

"You shall have it, and I'm sorry you'll not let me order something more comfortable. As it happens, Mr O'Flaherty has taken away the key of the cellar in his pocket, or I could offer you a glass of wine, for we have both red and white in the cellar plenty."

"I don't in the least doubt it, ma'am, but wine is a thing quite out of my line."

While Charlotte was taking her tea, Susan began a long story of complaints, which may be too easily imagined to require any notice from us. It is sufficient to state, that Susan felt her domestic grievances the more keenly, because her attention was not called from them by the employments which generally occupy the time of those born in her station; and unable, from her want of education, to substitute the pursuits which interest the higher classes of society, she sought a temporary oblivion of her sorrows in the use of ardent spirits. This fatal resource, as usual, aggravated every evil, increasing the strength of her vindictive passions, till they rendered her an object of terror to her children, hatred to her servants, and disgust to her neighbours.

As Charlotte approached her own happy home, her spirits recovered from the depression produced by the scenes she had witnessed at Carbery Lodge; her little boys, who had been eagerly watching for her return, came running to meet her.

"Oh, mother, mother, how long you have been away; and the 'Lovely Charlotte' is come in, and father has brought such beautiful things—a gown all over moss roses for you, and a doll for Peggy, and a great big ship, with real mast and sails, for Tommy and me, and he's longing so to see you."

The gown all over moss roses was not requisite to hasten Charlotte's steps to meet her husband.

"This has been a prosperous voyage, my beloved wife," said he, as he embraced her. "I have cleared sufficient to discharge our debt to our generous relation. Such strict economy will be no longer necessary, and I shall have the pleasure of seeing you enjoy those comforts from which you have so long debarred yourself."

Mr Hewson was much pleased by the integrity, industry, and self-denial evinced by his cousins in the early liquidation of their debt; and, like a prudent merchant, who, finding his first venture succeed, is inclined to risk another on a similar speculation, he began to consider in what manner he could best dispose of the price of the "Lovely Charlotte" for the benefit of his relations.

His namesake and godson, little George, though not quite such a genius as his fond parents fancied, was a fine intelligent boy, very assiduous, and desirous of improvement. Mr Hewson proposed taking upon himself the care and expense of his education, so as to fit him for entering as midshipman on board an East Indiaman, a situation where he would have the benefit of his relation's interest to obtain promotion, in case he deserved it. The delight with which this proposal, far exceeding their most sanguine hopes, was received by the parents, may be easily imagined.

Little George, profiting by the advantages bestowed upon him, conducted himself in such a manner as to give the greatest satisfaction to his friend and protector. When of a proper age, he was put on board an India ship, where his strict attention to the duties of his station obtained the approbation of his superiors. Rising gradually in his profession, he at length obtained the command of a vessel, and his benefactor had the pleasure of seeing him return from a successful voyage, as captain of an East Indiaman.

It was now in George's power to be of use to his brothers and sisters by his assistance. They were happily and respectably settled in life, while his continued good conduct, and dutiful affection towards his parents, rendered him the pride, delight, and support of their declining years.

Very different was the fate of the unfortunate Susan. Her love of spirituous liquors increased to such a degree, that her constitution, though naturally strong, could no longer withstand its effects. She lingered some months under a painful disease, uncheered by the kindness or sympathy of friend or relation, and sunk into the grave in the prime of life, with the painful conviction that her death would be regarded by her children with indifference, and hailed by her husband with undisguised satisfaction.

ENGLISH FARMERS' CLUBS.

Among the information of various kinds which we were able to pick up during a late visit to England, was the gratifying intelligence that there is an awakening interest in agricultural improvement on something like a general plan.

Two or three years ago, a great agricultural society was formed, on the model of the Highland Society of Scotland. This we noticed at the time as a thing auguring much good, and we are glad to find that the prediction is so far proved to have been a true one. For some time there have also existed local agricultural societies, which have in various respects proved advantageous in their respective districts. Other, and more familiar institutions, have at last sprung up. These are called farmers' clubs, and consist altogether of rent-paying agriculturists, it being essential to their existence and utility that no landed gentry, however much they may aid the exertions of their tenantry, shall belong to them. Composed of a class of men of similar pursuits, education, and ability, farmers' clubs are remarkable for an easy and agreeable sociality, free alike from the envy and the scarcely less mischievous veneration which beset a body composed of unequal classes. The institution of farmers' clubs is not exactly a new thing in Britain, for one has been in existence at Hawick in Roxburghshire for upwards of half a century, and we have heard of one or two more in other parts of Scotland. They are, however, new in England, and have spread chiefly in the last and present year; much of the credit of their origin being due, we believe, to Mr Shaw, the present active and intelligent editor of the *Mark Lane Express* and *Farmer's Magazine*. The leading object of these associations of farmers, is the diffusing of practical information on subjects in which all are professionally interested. The club meets once a-month, on an appointed evening, near the full moon; drinking or smoking, we believe, is not generally allowed; but simple refreshments, such as tea or coffee, may be introduced. A chairman is appointed to preserve order, and lead the conversation or discussion to topics calling for notice. A secretary keeps a journal of transactions and of papers read, and an abstract is periodically furnished for publication in the Farmer's Magazine, whereby the various societies throughout the kingdom obtain some idea of what the others have been engaged upon.

Looking over the first report of the Beccles Farmers' Club, we find, for example, the following topics agitated:—The most economic and best mode of cutting wheat; the most effectual means of destroying the "black caterpillar;" subsoil ploughing; the best steeps for grain; the best manner of keeping cart-horses, resumed from the November meeting. "The member who introduced the last question, stated it to be one of considerable difficulty, upon which it was not easy to arrive at a satisfactory conclusion. After a few preliminary observations, the method of feeding horses with *cut chaff* was discussed and strongly recommended. As economy appeared the great desideratum, it was considered that a small portion of straw might be mixed with the hay for cutting, and that during the winter months bean-stalks might be given. Under these circumstances, however, an increased quantity of corn would be necessary. Some members stated that, when the allowance of hay or clover was stinted, it would be found desirable to grind the corn, by which means the chaff would be better consumed than when the corn was given whole. After a somewhat lengthened debate, the following was agreed to:—Resolved, that it is the opinion of this meeting, that the most approved method of keeping cart-horses is to allow them each twelve stones of hay per week, and one bushel of oats, or an equivalent of bear-meal and pollard, as winter keep; a small quantity of straw cut into chaff is considered advantageous in point of economy. Through the summer it is desirable to feed them upon tares or other green meat in yards, in preference to turning them out on the pastures. And also that yards, with hovels for feeding and lodging, are preferable to confinement in the stable, either winter or summer."

This short extract will afford a tolerably correct notion of the subjects and mode of discussion at these farmers' clubs. In fact, each speaker narrates his own experience for the benefit of his neighbours; and the territorial holding of each farmer may be described as a species of experimental farm, upon which new methods of culture may be practised. It is quite pleasing to learn that a taste for rational and scientific discussion has reached the farming class in England. That class, it is notorious, both from habits of thought and circumstances, has fallen behind the more active order of mechanics and traders. The clubs we speak of will, doubtless, help powerfully to quicken the intellect, and enrich, in a pecuniary sense, the very numerous body of cultivators. It may be stated, as a general truth in statistics, that each county in England could, with better skill, be made to yield produce to the value of one million of pounds sterling per annum above what is at present taken off the ground

Digitized by Google

as crop. The scope for improvement, therefore, being immense, why not hasten to take advantage of it!

In an essay on the subject of these clubs, in the Farmer's Magazine for December 1839, the following observations occur:—"If, then, the farmers of England wish to extend their knowledge, and to improve their cultivation, through the discoveries of science, let them establish societies like the mechanics' institutions, at which they can discuss the merits of new discoveries, or the improvements in the practice of old, and profit by the experience of those who have had greater opportunities of devoting their time and attention to the science of agriculture. * * It has been impossible for persons engaged in agriculture to procure any books treating on that science but at a heavy outlay of money, purchasing them at their sole expense;" but by means of farmers' clubs, a library of the best works and periodicals in this department of literature will become readily available. The amount of subscription for support of the library and institution is trifling. "The experience of the Harleston Club proves, that five shillings per annum from each member, with no forfeits for non-attendance at the meetings, is amply sufficient to secure all the advantages contemplated."

Referring to the number of the Farmer's Magazine above quoted, for much useful information respecting the mode of instituting and conducting Farmers' Clubs, we close our remarks with explicitly recommending agriculturists in all parts of the United Kingdom to follow the excellent example now brought under their notice.

GURNEY'S VISIT TO THE WEST INDIES.

Joseph John Gurney, a respectable member of the Society of Friends, and, as it seems, a preacher or missionary, having returned lately after a three years' absence in various parts of North America and the West Indies, has written and published an account of his journey, in the form of a series of letters to Henry Clay, Esq., of Kentucky.* Mr Gurney's object in performing this tour, was to observe the condition of the emancipated negroes in our colonies; and his reason for addressing his collected information to Mr Clay, will be comprehended from the following passage:—"On our return from the West Indies to the United States, my companions and myself spent ten days in the city of Washington, while Congress was in session. We found no difficulty in obtaining private interviews with the President, the secretaries of the different departments of government, and many of the most influential members of Congress of both parties. To these gentlemen we related the principal particulars of our West Indian tour, and stated the evidence with which we had been furnished, of the beneficial working of freedom among the negroes of the West Indies, in a pecuniary, civil, and moral point of view. Our narration was listened to with great attention, and by no individual more so than by Henry Clay of Kentucky. Notwithstanding the conspicuous part which that statesman has of late years taken in defence of the slavery of the United States, we had abundant proof that his mind is not steeled against a lively feeling of interest in the cause of emancipation; and we have a strong hope that the practical views developed in the present volume will ere long be embraced by him, in reference to the slave states of North America. In the mean time, as it was my object to convince the more reasonable of the pro-slavery party, I believed it best to address my letters to a gentleman who is generally regarded as belonging to that class. In making this selection, I had of course no reference to the side which he is known to take in the politics of the United States. It was my wish to interest persons of all political parties in America, in the same great cause of sound policy, justice, and humanity."

It can hardly fail to appear as somewhat Quixotic in an English Quaker to attempt to change the current of sentiment in the States respecting the legalised sale and slavery of human beings. Nevertheless, as every such attempt helps to disabuse public prejudice, and to increase the number of friends to emancipation, we have to thank Mr Gurney for his enlightened efforts, and trust to their swelling the tide of freedom. We are very glad to observe, that this conscientious describer of things as they are, fully corroborates the statements we lately had an opportunity of presenting from official documents, respecting the condition of the West Indian peasantry. We promise the reader some very delightful extracts on this highly important subject.

In company with Mahlon Day, and a young friend, who undertook to act as attendant and helper, Mr Gurney sailed from New York on the 22d November 1839, in the Camilla, with the design of proceeding, in the first instance, to Santa Cruz, a West Indian island belonging to Denmark, and in which slavery still exists. The sail into the tropical seas was exceedingly pleasant, after leaving a cold northern clime; and after a prosperous voyage of two weeks, the party landed at Fredericksted, or West End in Santa Cruz. Having made a tour to various parts of this very beautiful and productive island, which at the time was covered with the most luxuriant and splendid plants, the author is able to say something of the appearance and general condition of things. He mentions, that slavery in the Danish West Indies is much modified of late years, but still hangs as a dead weight on the energies of society. "I understand (he observes) that the slaves form about four-fifths of the population, and are in number about 19,000. Time was when the treatment to which they were exposed was harsh and severe, and then their numbers were constantly declining. Of late years, however, the Danish government has instituted various restrictions which have ameliorated the condition of the slaves. They are not allowed, as I understand, to be worked longer in the day than from six o'clock in the morning to the same hour in the evening, with intervals (not always long enough) for breakfast and dinner. Legal provisions are made respecting food and clothing. The driver in the field is not permitted to carry any more terrible instrument than a tamarind switch of moderate size; and twelve lashes with the rope, and a short period of solitary confinement (mostly, I believe, in a light room), are the extent of punishment which even the manager or master is permitted to inflict. This rope, however, is a dangerous instrument of torture; and I am told that the reduction of the allowed number of lashes, from thirty to twelve, is no matter of law, but the simple result of the imperative benevolence of the governor-general, Von Scholten. Any negro has a right to buy his own freedom; and, in case of need, the price is settled by a public appraiser. The consequence of these benevolent provisions is, that the condition of the slaves is improved, and their number is now kept up, with a very small increase." Nevertheless, the degradation caused by slavery in these islands, "the low physical, intellectual, and moral condition of the slaves, as compared with that of the liberated negroes of the British islands, is obvious and unquestionable. The worst feature of the system is the 'Sunday market,' as it is called. The slaves are allowed no one of the working days of the week for their own business. The consequence is, that multitudes of them throng from the country (often from a great distance) into the towns of Bassin and West End, on the first day of the week, with their provisions and fruits for sale. The rum shops are hard by the market places. The buyers, of course, misuse the day as well as the sellers; and the scene is one not only of busy traffic, but of noisy merriment, idleness, and dissipation.

It was very satisfactory to us to learn from our friend Captain Van Scholten, the brother of the governor-general (then in Denmark), that a commission had been appointed at Copenhagen, to inquire into the state of these colonies, with a view to emancipation. In the mean time, seven large buildings have been erected in different parts of the island, to serve as chapels and schools, for the religious and literary instruction of the negro population. They are not yet in use; but several of the planters are making laudable exertions for the education of their slaves in reading, and in a knowledge of the Scriptures. A coloured person of the name of Macfarlane, in every way adapted for the office, is employed for the purpose; this school circulates, with excellent effect, from one estate to another. Having been taught their moral and religious obligations, the negroes on these estates are already greatly improved, and are much more useful to their masters than in the days of their ignorance.

The schools held on the first day of the week, under the care of the members of the Episcopal church, at Bassin and West End, are attended by several hundreds of black, mulatto, and white children. Some of the planters and their wives are united with coloured persons and others, as instructors in these schools; and the blessed work is carried on, both among the teachers and the taught, without prejudice of caste or distinction of colour."

Mr Gurney adds the following piece of information, which suggests a valuable hint:—"We were glad to be informed of the existence of an institution in the Danish West Indian islands (derived of course from the parent state), which operates most beneficially in promoting the peace of the inhabitants. It is the Court of Reconciliation, in which all disputes and questions of civil right must be submitted to arbitration, before they can become the subjects of suits at law. In this court of amicable adjustment, such matters are almost universally settled. The consequence is, that the legal profession in Santa Cruz is nearly a sinecure, and can scarcely be said to exist at all. Such a provision would be invaluable in the British West Indies, where proceedings at law are a perpetual source of irritation and vexation." The writer might have added, that such an institution might, with equal propriety, be established in Britain, where the protracted and expensive process of litigation is a disgrace to the country.

Mr Gurney next sailed to St Thomas, another Danish island, where slavery happens to be on a much worse footing, and where he could not hear any favourable accounts of the black and coloured population. "There are but few married couples among them—loose and low habits appear to be general. No one can aver that slavery in St Thomas is attended by any one advantage, temporal, civil, moral, or spiritual." But worse than this can be said against the island. "The Spanish and Portuguese slave vessels frequently come to this port to be fitted up for their nefarious adventures on the coast of Africa; here they have free ingress and egress, without the smallest interruption from the Danish men-of-war on the station; and, on some occasions, they have actually received their supplies of gunpowder from the fort itself." Friend Joseph asks why these things are permitted in the face of British treaties, which is a question much easier asked than answered. Great Britain cannot act as police-officer to the whole earth.

Leaving this poor specimen of the Danish possessions, the author and his companions proceeded, on the last day of December, to Tortola, a British island, which presented quite another aspect. It is worth while to hear what were the writer's impressions in landing upon and perambulating this small insular territory. "We could not but feel an intense interest in making our first visit to a British island, peopled with emancipated negroes. Out of a population of nearly five thousand, there are scarcely more than two hundred white persons; but we heard of no inconveniences arising from this disparity. We had letters to Dr Dyett, the stipendiary magistrate, and to some of the principal planters, who greeted us with a warm welcome, and soon relieved us from our very natural anxiety, by assuring us that freedom was working well in Tortola. One of our first visits was to a school for black children, under the care of Alexander Bott, the pious minister of the parish church. It was in good order—the children answered our questions well. We then proceeded to the jail, in which, if my memory serves me right, we found only one prisoner—with the jailor and the judge! Our kind friend, Francis Spencer Wigley, Chief-Justice of the British Virgin Islands, happened to be there, and cheered us with the information that crime had vastly decreased since the period of full emancipation. I looked over the list of commitments to the jail, which, for the most part, are summary for petty offences, and observed that, in the last six months of 1837, the number committed was 186, and in the last six months of 1839, only 75; making a difference of 111 in favour of freedom. With regard to heavier offences, the three preceding courts of session (embracing a period of nine months) were occasions of perfect leisure—not a single criminal indictment at any of them.

In the afternoon, we presented one of our letters to William R. Isaacs, a most respectable old gentleman, who was once president of the island. He was confined to his bed with a sprained ankle, and kindly allowed me the use of his excellent riding-horse during our stay at Roadstown. He is himself a considerable proprietor, and was then acting as attorney to Reid, Irving, and Co. of London, owners, by mortgage tenure, of a large part of the island. In these two capacities, our elderly friend had *fifteen hundred* free negroes under his care; and since all his habits had long been associated with the old system, we could not but regard his testimony as of peculiar value. He speedily informed us, of his own accord, that his labourers were working well. 'I have,' said he, 'no complaint to make.' The fact that so large a proportion of the island had passed out of the hands of the proprietors, into those of the merchant and money-lender, was a conclusive evidence against slavery. With this evidence we could now contrast the happy testimony of our friend in favour of freedom.

The next morning we mounted our horses at an early hour, and, in company with Dr Dyett and R. V. Shew, an influential planter, visited President Isaacs' principal property. I observed a large company of negroes, male and female, at work on the brow of a lofty hill. I rode up to them, in company with the overseer, and found them heartily at work. They were engaged in the laborious occupation of holing—that is, digging holes with the hoe, for the reception of the canes—and protecting each hole (as was necessary on that steep declivity) with a firm embankment. Those who best understood the subject, freely acknowledged that their work was excellent. We afterwards witnessed similar scenes, and received accounts equally satisfactory, on the sugar plantations belonging to R. V. Shew and Judge Wigley. The wages of these labourers are small, only sixpence sterling per day, with a trifling increase during crop time; but I was assured that the privileges which they enjoy, of a cottage, with good provision-grounds, rent free, and plenty of pasture for their stock, at least double the amount of their wages. The present condition of the planters in Tortola is not very favourable, from long-continued droughts, and a consequent short crop; but I hope that more prosperous seasons will soon lead to an increase of wages. This is obviously the best method of preventing the migration of the peasantry to Trinidad, to which colony many of them have been lured by emissaries sent out for the purpose—under the hope of larger returns for their labour. In the mean time, I am quite willing to acknowledge, that the labourers of Tortola appeared to us to be in a condition of considerable ease and comfort.

Among the vegetables which they cultivate in their provision-grounds, we observed the *pigeon pea*, a shrub which grows here in great quantities, and produces a nutritious pea for the table; also the *cassava*. It has been remarked, that a piece of ground cultivated with this root will produce more food for man than under any other cultivation whatever. It is a singular circumstance that its juice is a deadly poison; but after this has been pressed out, the farinaceous substance which remains is made into an excellent thin bread, like the Scotch oat-cake in appearance, but more agreeable to the palate.

* A Winter in the West Indies, by Joseph John Gurney. Murray: London.

After regaling ourselves with a plentiful breakfast at Judge Wigley's pleasant residence on the top of a lofty hill, we pursued our course through scenery of uncommon beauty—in parts almost of a Swiss character. There are no roads on this island for carriages—only rocky and precipitous mountain paths, for journeys on horseback or foot. The wild flowers are still more beautiful here than in Santa Cruz. The great aloe, called the century plant, abounds, and has a very picturesque appearance; and there are many prodigious plants of the cactus tribe. Pink, purple, red, and yellow convolvuluses, are seen creeping about in all directions; and the splendid 'pride of Barbadoes' is common. The white jasmine occurs in the hedges; and a small tree, called the *panchepan*, bears profuse bunches of large white flowers, of fragrant jasmine odour. The brown pelicans float about the coast in great numbers; and we were told that the neighbouring low island of Anegada is frequented by the flamingo. At the distance of many hundred yards, when on the brow of a lofty hill, we distinctly saw a shark playing among the waves—an evidence of the remarkable clearness both of the air and water. Many of the hills are covered with luxuriant 'guinea grass,' and afford excellent pasture for cattle, sheep, and goats. A large proportion of these animals belong to the negroes. The cows are sleek and beautiful, and the milk excellent.

Another day was spent in a boat excursion to the western extremity of the island, in order to visit some of the estates under the care of our friend Isaac Thomas, another of the principal attorneys. In the course of our voyage, the sailors caught some fish, so curiously striped and spotted as to receive the name of 'lizard' fish; and, on landing, we observed the shore strewn with handsome specimens of the echinus, or sea egg. We found the sugar plantations, under the care of our friend, in fair order. He employs two hundred and fifty free negroes, and assured us that 'he had not the slightest complaint to make respecting them.' On the examination of the accounts of two of the properties, it appeared that he was decidedly saving money by the substitution of free labour, on moderate wages, for the dead weight of slavery.

At the different places at which he touched, Mr Gurney took occasion to exercise his religious vocation, though, with becoming modesty and good taste, he says comparatively little on that point. At Tortola, he observes that "freedom is working well as a handmaid to religion." At one time, the island was the seat of a little Society of Friends; there are no members in the present day, but it is interesting to know that the moral worth of these good people has left a happy influence on a small community of negroes, who are settled as tenants in common on an estate once belonging to Samuel and Mary Nottingham, Quakers of high character. "About sixty years ago they liberated their slaves, from conscientious motives, and gave them their estate at Longlook, on the eastern coast. A letter of Christian advice, addressed to their predecessors by these pious persons, then living at Bristol, is still cherished by the negroes on the property, about sixty in number, and held as a sort of title-deed to the estate. We had great pleasure in visiting them. Their land is on the brow of a mountain, and a considerable part of it is well cultivated with yams and other vegetables. We held a religious meeting with them in the largest of their cottages, and were entirely satisfied with their respectable appearance and orderly behaviour.

In the afternoon we crossed the water, on a visit to the African settlement at Kingstown Bay. It consists of several hundred Africans, taken out of captured slave ships, and located on a tract of land allotted them by order of the British government. We had heard reports of their poverty and idleness; but these were belied by their decent and respectable appearance. A church is now in course of building for their use, under the orders of the Bishop of Barbadoes; and a school has been already formed for the education of their children. About three hundred of them assembled, under the shade of a large tamarind tree, and it has seldom fallen to my lot to address a more feeling, or apparently more intelligent, congregation. One thing is clear and unquestionable—that the African mind is abundantly susceptible of instruction in the great doctrines and principles of the Christian religion."

From this island Mr Gurney proceeded to St Christopher's, with the social condition of which he expresses a like satisfaction. On the morning after his arrival, "I mounted," says he, "one of the governor's horses, and enjoyed a solitary ride into the country. Although it was the seventh day of the week, usually applied by the emancipated labourers to their private purposes, I observed many of them diligently at work on the cane grounds, cutting the canes for the mill. Their aspect was that of physical vigour and cheerful contentment; and all my questions, as I passed along, were answered satisfactorily. On my way, I ventured to call at one of the estates, and found it was the home of Robert Claxton, the solicitor-general of the colony, a gentleman of intelligence and respectability. He was kind enough to impart a variety of useful, and, in general, cheering information. One fact mentioned by him is highly encouraging. Speaking of a small property on the island belonging to himself, he said, 'Six years ago (that is, shortly before the act of emancipation), it was worth only L.2000, with the slaves upon it. Now, without a single slave, it is worth three times the money. I would not sell it for L.6000.' This remarkable rise in the value of property, is by no means confined to particular estates. I was assured that, as compared with those times of depression and alarm which preceded the act of emancipation, it is at once general and very considerable. I asked the President Crook, and some other persons, whether there was a single individual on the island who wished for the restoration of slavery. Answer, 'Certainly not one.'

As to the staple article of sugar, we found the island in a condition of prosperity. It was supposed that the crop on the ground, which to us appeared heavy and luxuriant, would produce at least the usual average of 7000 hogsheads; and no difficulty whatever was apprehended in realising it. We accompanied our friend Burt to Ottley's—a well-managed sugar estate, belonging to himself and Judge Wigley of Tortola—where we again examined the process of sugar-making, and again saw the negroes diligently at work, on the day which they usually reserve for their own business.

The day's wages, in this island, are from 7d. to 9d. sterling per day, besides the usual privileges; but the negroes have no difficulty in earning from 2s. to 3s. sterling per day by job work. Under this system, particularly, they perform a far greater quantity of work in a given time than could be obtained from them under slavery. When we called on our excellent friend R. Cleghorn, a faithful and intelligent stipendiary magistrate, he summed up his favourable report of the labourers of St Christopher's by the following emphatic remark—'They will do *an infinity of work for wages*.'

This state of things is accompanied by a vast increase in their own comforts. Our friend Cadman, the Methodist minister, was on this station, during slavery, in the year 1826. He has now returned to it under freedom. 'The change for the better,' he observed, 'in the dress, demeanour, and welfare of the people, is *prodigious*.' The imports are vastly increased. The duties on them were L.1600 more in 1838 than in 1837; and in 1839 double those of 1838 within L.150. This surprising increase is owing to the demand on the part of the free labourers for imported goods, especially for articles of dress. The difficulty experienced by the gentry living in the town, in procuring fowls, eggs, &c., from the negroes, is considerably increased. The reason is well known—the labourers make use of them for home consumption. Marriage is now become frequent amongst them, and a profusion of eggs is expended on their wedding cakes! Doubtless, they will soon learn to exchange these freaks of luxury for the gradual acquisition of wealth.

We had much pleasure in calling at the Moravian establishment at Cayon, under the care of Brother Münzer. It seemed to be admirably conducted: he has three hundred children in his school. Another of their establishments at Basse-terre is equally prosperous. We visited the school there, and examined the children. Their answers to our questions were lively and correct. Crime and petty offences are greatly diminished since the date of full freedom. Education in useful knowledge and religious instruction are rapidly advancing. There are nine churches on the island under the Establishment; six Methodist chapels, and three Moravian institutions. The Moravians have 3000 members by birth and otherwise; the Methodists 2899 in church communion, besides attendees. These numbers include a vast proportion of the population, which is calculated at 20,000."

This must conclude our extracts from Mr Gurney's work for the present.

INTERVIEW BETWEEN GEORGE III. AND JOSEPH LANCASTER.

On entering the royal presence, the king said, "Lancaster, I have sent for you to give me an account of your system of education, which, I hear, has met with opposition. One master teach five hundred children at the same time! How do you keep them in order, Lancaster?" Lancaster replied, "Please thy majesty, by the same principle thy majesty's army is kept in order—by the word of command." His majesty replied, "Good, good; it does not require an aged general to give the command—one of younger years can do it." Lancaster observed that, in his schools, the teaching branch was performed by youths who acted as monitors. The king assented, and said, "Good." Lancaster then described his system; and he informed me that the royal party paid great attention, and were highly delighted; and when he had finished, his majesty said, "Lancaster, I highly approve of your system, and it is my wish that every poor child in my dominions should be taught to read the Bible; I will do anything you wish to promote this object." "Please thy majesty," said Lancaster, "if the system meets thy majesty's approbation, I can go through the country, and lecture on the system, and have no doubt, but in a few months I shall be able to give thy majesty an account where ten thousand poor children are being educated, and some of my youths instructing them." His majesty immediately replied, "Lancaster, I will subscribe L.100 annually; and," addressing the queen, "you shall subscribe L.50, Charlotte and the princesses L.25 each;" and then added, "Lancaster, you may have the money directly." Lancaster observed, "Please thy majesty, that will be setting thy nobles a good example." The royal party appeared to smile at this observation; but the queen observed to his majesty, "How cruel it is that enemies should be found who endeavour to hinder his progress in so good a work!" To which the king replied, "Charlotte, a good man seeks his reward in the world to come." Joseph then withdrew. It may here be stated, that every succeeding monarch of England, including her present majesty, has followed George III.'s example.—*Croston's Sketch of Joseph Lancaster's Life.*

HAL PIERSON'S HALF-CROWN.

Hal Pierson was an idiot, or *innocent*, as weak persons are called in Yorkshire, who was benevolently reared and protected by the family of Sir George Armitage, some eighty or more years ago. Hal, though weak of intellect, was extremely shrewd, and even witty at times. He loved money, as *all* fools and *some* wise men do. A casual visiter to the family had given him half-a-crown. Hal was delighted; but he had heard in the servants' hall that money makes money, and a vague wish arose in his mind to multiply, if possible, the coin of which he had become possessed. There was a young carpenter, named Robby, who worked by the year in the family, and who, hearing Hal inquire how he might increase his treasure, told him to put it into a hole in the wall, which Hal immediately did. It is to be premised, that this poor innocent knew not the comparative value of silver and copper. Robby, taking advantage of his ignorance, and eager to play a trick upon him, changed the coin for a few coppers, with which Hal was at first much pleased; but, by and bye, one of the under-servants explained the matter, and Hal vowed vengeance against the carpenter. Whether he executed it or not, the reader will presently see.

Hal was always ready to do errands, and *sometimes* did them well. At all events he was no niggard of his time or trouble, when he liked his employer. His will was good, but his power weak. At one time a young lady, Miss Jenny Ayrton, being on a visit at Sir George Armitage's, to her great vexation discovered that she had forgotten a rich pair of ruffles and lappets. Every body was busy; much company was expected, and a splendid toilet necessary. Poor Miss Jenny, in all the sorrows of beauty and eighteen, addressed herself in vain to the servants for a trusty messenger to dispatch four miles for these important articles. Not one could be spared, until a good-natured little dairy-maid, a simple cowslip of the north, suggested an application to Hal Pierson. He could take a message; was very fond of Miss Jenny; it was a fine day, and only four miles. But Hal had a dislike to carrying a note or letter, ever since a celebrated humourist, in the practical joke line, had given him a note, desiring the bearer might be rewarded for his pains with a tumbler of hot salt and water. No—Hal would have nothing to say to a note; but undertook cheerfully to go and fetch the ruffles and lappets. It was explained to him by Cowslip what they were, and he sapiently replied, "I naw Jenny Ayrton wants her handy-cuffs and pinniers." He repeated this several times to imprint it on his memory. Cowslip thought it would be all right, and Hal started. The whole way, as he went, he repeated aloud to himself, "I'se come for Jenny Ayrton's handy-cuffs and pinniers." As his habit was never to walk but to dance along, clapping his hands as he went, this formed the burden of the song, which helped him on the way. Arrived at the house, he repeated his lesson; but no one knew what he meant, and, to his evident distress, he had to go back without his errand. On his return, he explained that they would not give him any "handy-cuffs or pinniers." Miss Ayrton then tried again to make him understand by showing him her every-day ruffles; but said that, being in the country, and company expected, she wished her best to be sent. He then willingly undertook to return, though he had already walked or danced eight miles in her service. This time he tried hard, and said "ruffles and lappets" all the way; but he chanced to get a fall, which completed the before muddled state of his brains, and when he rose, he had only a vague recollection of cuffs, and that they should be smarter than usual in the country. So he arrived at Miss Ayrton's house, shouting out, "Ruff cuffs and country cuffs." More puzzled than ever, the servants stood in dismay, until, out of breath and patience with his now twelve miles' walk, Hal insisted upon having various articles of the female wardrobe exhibited to him, when, his desire being complied with, he quickly pounced upon the commodity wanted. Having been allowed to take a pair of ruffles and lappets of rich point-lace, which he triumphantly attached to his walking staff, he set out, puffing and blowing, upon his second return to Sir George Armitage's, where he presented himself to the anxiously expecting young lady, just in time to decorate her fair person with the result of his sixteen miles' labour. But he had his reward; for Miss Ayrton smiled, and her smile was at that period of her life witchcraft itself, even to such a being as Hal Pierson.

Hal wore Sir George Armitage's livery when he chose, for he never was constrained by his kind benefactor, whose motive for keeping him in his household was pure benevolence. Sauntering, as was his custom, one day by the river side, he saw a young gallant riding on the other bank. Hal owed him a grudge for having once given him a pinch of very strong snuff. The young man had no remembrance of the joke or the person of the fool; and he asked him if the river was fordable there. Hal replied, "Yea." "Are you sure? Have you seen any one pass it to-day?" "Troth and I have—a maist respectable family, father, mother, and young ones," replied Hal; "they came over right

Digitized by Google

merrily this morn's morning." Upon this assurance, the young man put his horse to the stream, and though the animal, with instinctive sagacity, hesitated, whip and spur soon compelled him to go in. It was wonderful that both were not drowned. After a hard struggle, horse and rider gained the bank, which Hal no sooner observed than he ran off, to avoid a resentment expressed by menaces both loud and deep. The cavalier made the best of his way to the great house, to prefer his complaint against one bearing the Armitage livery having endangered his life. All the servants were summoned. He could not identify the mischievous one, until somebody suggested the possibility of its being Hal Pierson. Hal was sought for, and brought into presence; but all he could be got to say in answer to his master's queries and reproaches, was that he had seen a very respectable family pass that morning, the grey drake, his duck, and ducklings, and therefore he guessed a goose might do the same. Here was the pinch of snuff revenged.

Hal had hitherto never done any thing very dangerous; but Robby was now to reap his reward for the dishonest tricks played with poor Hal's half-crown, as well as for a long course of minor teasings and annoyances. For some time Hal had contented himself with hiding the young carpenter's tools, or telling tales of him to his sweetheart, the pretty young housemaid; but Robby at last provoked him beyond what was safe with a being of his order. Watching his opportunity one day, when, as usual after dinner, he took a short nap in the workshop, Hal entered unperceived, and accomplished his purpose. He then returned to the servant's hall. By his exulting looks, the servants concluded he had been in mischief, but thought no more about the matter. Supper time came, and as Robby was a merry fellow, and the life of the party, his absence was remarked. At length Hal observed, "I've played him a bonny trick this time." "Why, what have you done now?" cried the others, crowding round him; "what have you hid now?" "Oh, I've hid his head under the shavings, and when he wakes, he'll be troubled to find it." Misgivings arose from this declaration, and they went in a body to the workshop to see what he had really done, when, horrible to relate, it was found that the idiot had cut off the unfortunate young man's head while he slept, and hid it under the shavings. Hal, who had accompanied them, seemed quite astonished to find Robby dead. He tried to put on the head again, and, on finding that the effort was of no use, burst into tears. His delinquency of course subjected him to a trial, which took place at York, when, his imbecility being clearly proved, instead of committing him for the remainder of his life to a prison, the judges gave him over to the care of his humane protector, Sir George Armitage, in whose family he remained well watched; but his spirits never afterwards rallied. He was often found sitting by the side of a brook, mingling his tears with the stream. He never spoke a word respecting the melancholy event; but no power could induce him to approach the workshop, or take in his hand any edged tool. He pined, and his weak intellect becoming more and more feeble, his health suffered, and he died a premature old man, grey-headed under thirty years of age. The remembrance of Hal Pierson's half-crown survived him, and has become a by-word to express any futile and wild scheme for increasing money. Miss Jane Ayrton lived to nearly eighty years of age, and, near the end of her days, communicated these anecdotes to a descendant, the individual who now gives them to the world.

WOUNDING THE BODY AS A RELIGIOUS EXERCISE.

[From "Observations on the Influence of Religion upon the Health and Physical Welfare of Mankind, by Amariah Brigham, M.D." Boston: 1835.]

Wounding or cutting the body has been often resorted to as a religious exercise. This was the custom of the prophets of Baal; as we read—1st Kings, xviii. 28—"They cried aloud, and cut themselves after their manner with knives and lancets, till the blood gushed out upon them." It is probable that something like this was practised by the Hebrews, as in Leviticus, xix. 28, it is written—"Ye shall not make any cuttings in your flesh for the dead, nor print any marks upon you."

Plutarch, in his book "De Superstitione," tells us that the priests of Bellona, when they sacrificed to that goddess, were wont to besmear the victim with their own blood. The Persian magi, according to Herodotus, used to appease tempests and allay the winds by making incisions in their flesh. Strabo alludes to the practice of the Etruscan priests tearing their own flesh, and cutting themselves in different parts of the body, and of walking on fire.

Under this head, also, I should place the practices of the Hindoos, and particularly those in honour of Shivu, the destroyer. These are, falling on iron spikes, piercing the tongue and the sides, swinging by hooks fastened into their flesh, &c. The following picture, from Ward, will suffice.

"This god (Shiva) is represented in various ways; sometimes as a silver-coloured man, with five faces; sometimes with three eyes and one face. Another image of this deity is the lingu, which is nothing more than a smooth black stone, in the form of a sugar-loaf. This is often made of clay, for extemporaneous use.

An abominable festival in honour of this god is celebrated, when many Hindoos, assuming the name of *sunyasees*, inflict on themselves the greatest cruelties. On the first day of the festival, these sunyasees cast themselves from a bamboo stage, with three resting-places, the highest about twenty feet from the ground; from this height these persons cast themselves on iron spikes, stuck in bags of straw. These spikes are laid in a reclining posture, and when the person falls, they almost constantly fall down, instead of entering his body. There are instances, however, of persons being killed, and others wounded, but they are very rare. A few years ago, a person at Kideerpooru, near Calcutta, cast himself on a knife used in cleaning fish, which entered his side and caused his death. He threw himself from the stage twice on the same day; the second time (which was fatal) to gratify a woman with whom he lived. In some villages, several of these stages are erected, and as many as two or three hundred people cast themselves on these spikes, in one day, in the presence of great crowds of spectators. The worshippers of Shivu make a great boast of the power of their god, in preserving his followers in circumstances of such danger.

In the year 1806, I went to Kaleeghatu, in company with two or three friends, to witness these practices; at which place we arrived about five o'clock in the morning. We overtook numerous companies who were proceeding thither, having with them drums and other instruments of music; also spits, canes, and different articles to pierce their tongues and sides. Some, with tinkling rings on their ankles, were dancing and exhibiting indecent gestures, as they passed along, while others rent the air with the sounds of their filthy songs. As we entered the village where the temple of this great goddess is situated, the crowds were so great that we could with difficulty get our vehicles along, and at last were completely blocked up. We then alighted and went amongst the crowd. But who can describe a scene like this! Here, men of all ages, who intended to have their tongues pierced or their sides bored, were buying garlands of flowers to hang around their necks, or to tie round their heads—there, others were carrying offerings to the goddess; above the heads of the crowd were seen nothing but the feathers belonging to the great drums, and the instruments of torture which each victim was carrying in his hand. These wretched slaves of superstition were distinguished from others by the quantity of oil rubbed on their bodies, and by streaks and dots of mud all over them. Some of the chief men belonging to each company were covered with ashes, or dressed in a most fantastic manner, like the fool among mountebanks. For the sake of low sport, some were dressed as English women, and others had on a hat, to excite the crowd to laugh at Europeans. As soon as we could force our way, we proceeded to the temple of Kalee, where the crowd, inflamed to madness, almost trampled upon one another, to obtain a sight of the idol. We went up to the doorway, when a brahmin, who was one of the owners of the idol, addressed one of my companions in broken English:—'Money—money—for black mother!' My friend, not much liking the looks of his black mother, declared he should give her nothing. From this spot we went into the temple yard, where two or three blacksmiths had begun the work of piercing the tongues and boring the sides of these infatuated disciples of Shivu. The first man seemed reluctant to hold out his tongue, but the blacksmith, rubbing it with something like flour, and having a piece of cloth betwixt his fingers, laid firm hold, dragged it out, and placing his lancet under it in the middle, pierced it through and let the fellow go. The next person whose tongue we saw cut, directed the blacksmith to cut it on the contrary side, as it had been already cut twice. This man seemed to go through the business of having his tongue slit with perfect *sang froid*. The company of natives were entirely unmoved, and the blacksmith, pocketing the trifling fee given by each for whom he did this favour, laughed at the sport. I could not help asking whether they were not punishing these men for lying. After seeing the operation performed on one or two more, we went to another group, where they were boring the sides. The first we saw undergoing this operation was a boy, who might be twelve or thirteen years old, and who had been brought thither by his elder brother to submit to this cruelty. A thread rubbed with clarified butter was drawn through the skin on each side, with a kind of lancet having an eye like a needle. He did not flinch, but hung by his hands over the shoulders of his brother. I asked a man who had just had his sides bored, why he did this? He said he had made a vow to Kalee at a time of dangerous illness, and was now performing this vow. A bystander added, it was an act of holiness or merit. Passing from this group, we saw a man dancing backwards and forwards, with two canes run through his sides, as thick as a man's little finger. In returning to Calcutta, we saw many with things of different thicknesses thrust through their sides and tongues, and several with the pointed handles of shovels, containing fire, sticking in their sides. Into this fire, every now and then, they threw Indian pitch, which for the moment blazed very high. I saw one man whose singular mode of self-torture struck me much. His breast, arms, and other parts of his body, were entirely covered with pins, as thick as nails or packing needles. This is called *sara-phora* (piercing with arrows). The person had made a vow to Shivu thus to pierce his body, praying the god to remove some evil from him.

On the following day, in the afternoon, the ceremony called *Churuku*, or the swinging by hooks fastened in the back, is performed. The posts are erected in some open place in the town or suburbs. They are generally fifteen, twenty, or twenty-five cubits high. In some places a kind of worship is paid at the foot of the tree of Shivu, when two pigeons are let loose, or slain. In other parts, that is, in the neighbourhood of Calcutta, the worship of Shivu is performed at his temple, after which the crowd proceed to the swinging posts, and commence the horrid work of torture. The man who is to swing prostrates himself before the tree, and a person, with his dusty fingers, makes a mark where the hooks are to be put. Another person immediately gives him a smart slap on the back, and pinches up the skin hard with his thumb and fingers, while another thrusts the hook through, taking hold of about an inch of the skin. The other hook is then in like manner put through the skin of the other side of the neck, and the man gets up on his feet. As he is rising, some water is thrown in his face. He then mounts on a man's back, or is elevated in some other way, and the strings which are attached to the hooks in his back are tied to the rope at one end of the horizontal bamboo, and the rope at the other end is held by several men, who drawing it down, raise up the end on which the man swings, and by their running round with the rope, the machine is turned. In swinging, the man describes a circle of about thirty feet diameter. Some swing only a few minutes, others half an hour or more. I have heard of men who continued swinging for hours. In the southern parts of Bengal, a piece of cloth is wrapped round the body underneath the hooks, lest the flesh should tear and the wretch fall and be dashed to pieces, but the whole weight of the body rests on the hooks. Some of these persons take the wooden pipe, and smoke while swinging, as though insensible of the least pain. Others take up fruit in their hands, and either eat it or throw it among the crowd. I have heard of a person having a monkey's collar run through his flank, in which state the man and the monkey whirled round together. On one occasion, in the north of Bengal, a man took a large piece of wood in his mouth, and swung for a considerable time without any cloth round his body to preserve him, should the flesh of his back tear. On some occasions, these sunyasees have hooks run through their thighs as well as backs. About the year 1800, five women swung in this manner, with hooks through their backs and thighs, at Kidurpooru, near Calcutta. It is not very uncommon for the flesh to tear, and the person to fall; instances are related of such persons perishing on the spot. A few years ago a man fell from the post at Kidurpooru, while whirling round with great rapidity; and, falling on a poor woman who was selling parched rice, killed her on the spot: the man died the next day. At a village near Bujbuj, some years since, the swing fell and broke a man's leg. The man who was upon it, as soon as he was loosened, ran to another tree, was drawn up, and whirled round again, as though nothing had happened. I have heard of one man's swinging three times in one day on different trees; and a brahmin assured me that he had seen four men swing on one tree, and while swinging, this tree was carried round the field by the crowd."

FASHIONABLE SPORTSMEN.

The Countess of Blessington, in her "Victims of Society," draws the following picture of this class of persons:—

"A young man of fashion, for to such only does my censure apply, thinks that certain expenses are indispensably necessary to his happiness. The cost of a wife, he calculates, must diminish the means of gratifying his personal luxuries; therefore he will not marry until he shall have lost the taste and activity for shooting, hunting, and yachting. Then, however, the funds appropriated to these expensive pursuits may, he thinks, be directed to the support of a matrimonial establishment.

How could a young man of fashion exist without a shooting place in the country, with a train of keepers to preserve his game, and dogs to run it down, whatever may be the cost? A moor in the Highlands of Scotland for grouse-shooting, it would be impossible to forego: and a party to partake its amusements must be assembled. This gratification is obtained at the sacrifice of several hundreds; but the payer has the pleasure of reading in the papers, that he and his guests shot so many hundred brace of birds on certain days, and *he* is satisfied.

Many are they who frequent the Highlands with little or no desire for shooting; but who, having no rational pursuit, are at a loss to know how to employ the two months that intervene between the close of the London season and the opening of the hunting one; consequently, at the mandate of fashion, seek this mode of getting rid of time.

The young man of fashion must, therefore, hunt at Melton; and to do so with 'decent dignity,' requires an establishment of grooms and helpers that would astonish Nimrod himself, could he behold them; and the bills for which seldom fail to astonish the purses of their owners.

But it is not the horses and grooms alone that consume thousands at Melton: the *chasseurs* find that French cooks alone can produce such banquets as they require to recruit their exhausted frames, and collect at their tables the 'best society.'

During the interminable evenings, the chase of the day furnishes the inexhaustible topic of conversation, each biped arrogating to himself the merit that belongs solely to his more intelligent quadrupeds. Prolix details of asserted equestrian prowess—each narrator the hero of his own tale—enlivened by episodical histories of their

Digitized by Google

favourite hunters, past and present, fill up the hours that intervene between dinner and the period of retiring to bed; unless cards or dice are introduced, to diversify this rational mode of whiling away the drowsy hours.

Many of the *chasseurs* at Melton are as little partial to hunting as those who frequent the Highland moors are to grouse-shooting. The truth of this assertion is best proved by the joyous alacrity with which, the moment a frost sets in, they rush up to London, like boys released from school, and plunge into all the amusements and dissipation of the metropolis, until a thaw sends them down again, with lengthened faces and shortened purses, to renew their sport.

How often is the thermometer examined with wistful eyes, and an approach to the freezing-point hailed with pleasure! You will naturally wonder why so heavy an expense as a hunting-establishment is incurred, if they who entail it on themselves like not the amusement. Fashion, ostentation, and the puerile desire of even that species of celebrity which this extravagance can acquire, furnish the inducements; added to the reflection of the utter impossibility of otherwise filling up the winter months."

A GLIMPSE OF EARLY KENTUCKY LIFE.

The following is from a series of papers by Mr Washington Irving, entitled "The Early Experiences of Ralph Ringwood," which are now in the course of appearing in *The Knickerbocker*, the well-known American Magazine:—

"Bob Mosely's house was a tolerably large bark shanty, with a clap-board roof; and there were assembled all the young hunters and pretty girls of the country, for many a mile round. The young men were in their best hunting-dresses, but not one could compare with mine; and my raccoon cap, with its flowing tail, was the admiration of every body. The girls were mostly in doe-skin dresses, for there was no spinning and weaving as yet in the woods, nor any need of it. I never saw girls that seemed to me better dressed; and I was somewhat of a judge, having seen fashions at Richmond. We had a hearty dinner, and a merry one; for there were Jemmy Kiel, famous for raccoon hunting, and Bob Tarleton, and Wesley Pigman, and Joe Taylor, and several other prime fellows for a frolic, that made all ring again, and laughed, that you might have heard them a mile.

After dinner, we began dancing, and were hard at it, when, about three o'clock in the afternoon, there was a new arrival—the two daughters of old Simon Schultz; two young ladies that affected fashion and late hours. Their arrival had nearly put an end to all our merriment. I must go round about in my story, to explain to you how that happened.

As old Schultz, the father, was one day looking in the cane-brakes for his cattle, he came upon the track of horses. He knew they were none of his, and that none of his neighbours had horses about that place. They must be stray horses, or must belong to some traveller who had lost his way, as the track led nowhere. He accordingly followed it up, until he came to an unlucky pedlar with two or three pack-horses, who had been bewildered among the cattle-tracks, and had wandered for two or three days among woods and cane-brakes, until he was almost famished.

Old Schultz brought him to his house; fed him on venison, bear's meat, and hominy, and at the end of a week put him in prime condition. The pedlar could not sufficiently express his thankfulness; and when about to depart, inquired what he had to pay? Old Schultz stepped back with surprise. 'Stranger,' said he, 'you have been welcome under my roof. I've given you nothing but wild meat and hominy, because I had no better, but have been glad of your company. You are welcome to stay as long as you please; but, by zounds! if any one offers to pay Simon Schultz for food, he affronts him!'

The pedlar admired the hospitality of his host, but could not reconcile it to his conscience to go away without making some recompense. There were honest Simon's two daughters, two strapping, red-haired girls. He opened his packs, and displayed riches before them of which they had no conception; for in those days there were no country stores in those parts, with their artificial finery and trinketry, and this was the first pedlar that had wandered into that part of the wilderness. The girls were for a time completely dazzled, and knew not what to choose; but what caught their eyes most were two looking-glasses, about the size of a dollar, set in gilt tin. They had never seen the like before, having used no other mirror than a pail of water. The pedlar presented them these jewels without the least hesitation; nay, he gallantly hung them round their necks by red ribands almost as fine as the glasses themselves. This done, he took his departure, leaving them as much astonished as two princesses in a fairy tale that have received a magic gift from an enchanter.

It was with these looking-glasses, hung round their necks as lockets by ribands, that old Schultz's daughters made their appearance at three o'clock in the afternoon at the frolic of Bob Mosely's, on the Pigeon-Roost Fork of the Muddy.

By the powers, but it was an event! Such a thing had never before been seen in Kentucky. Bob Tarleton, a strapping fellow, with a head like a chestnut-burr, and a look like a boar in an apple orchard, stepped up, caught hold of the looking-glass of one of the girls, and gazing at it for a moment, cried out, 'Joe Taylor, come here! come here! I'll be darn'd if Patty Schultz aint got a locket that you can see your face in, as clear as in a spring of water!'

In a twinkling all the young hunters gathered round old Schultz's daughters. I, who knew what looking-glasses were, did not budge. Some of the girls who sat near me were excessively mortified at finding themselves thus deserted. I heard Peggy Pugh say to Sally Pigman, 'Goodness knows, it's well Schultz's daughters is got them things round their necks, for it's the first time the young men crowded round them!'

I saw immediately the danger of the case. We were a small community, and could not afford to be split up by feuds. So I stepped up to the girls, and whispered to them, 'Polly,' said I, 'those lockets are powerful fine, and become you amazingly; but you don't consider that the country is not advanced enough in these parts for such things. You and I understand these matters, but these people don't. Fine things like these may do very well in the old settlements, but they won't answer at the Pigeon-Roost Fork of the Muddy. You had better lay them aside for the present, or we shall have no peace.'

Polly and her sister luckily saw their error; they took off the lockets, laid them aside, and harmony was restored; otherwise, I verily believe there would have been an end of our community. Indeed, notwithstanding the great sacrifice they made on this occasion, I do not think old Schultz's daughters were ever much liked afterward among the young women.

This was the first time that looking-glasses were ever seen in the Green River part of Kentucky!"

A LANDLORD'S SPEECH TO HIS TENANTS.

It is not often that after-dinner speeches bear inspection afterwards by unconcerned parties. The following does. It is the substance of what was said by the Earl of Stair (lately Sir John Dalrymple of Oxenford), at a dinner given by him, on the 8th September, to four hundred persons, tenants on the large Galloway estates which have come to him with his peerage. We would hope to escape blame for, contrary to our wont, admitting the reference to politics in the latter part of the speech, a part of it which seems necessary to complete the picture of benevolent liberality which the whole may be said to form. Were all landlords to act on the improving maxims of the Earl of Stair, what a powerful home mission they would form amongst our rural population!

"I rejoice to find myself in the midst of my tenants. The cordial reception I have met with amongst you, and your kindness in coming here this day, both tend to rivet the link that naturally unites us, and equally tend to an increase of that interest which I am disposed to take in you as part of my family, and as my friends. I have said before, and I cannot say it too often, that no separate interest can subsist between landlord and tenant. If you thrive, I thrive. On your well doing will depend my comfort, my honour, and my character, for I shall stand high, or the reverse (and it is right that it should be so), as I act justly or unjustly by you. Entertaining such sentiments, my first duties will consist in an encouragement of moral and religious feeling amongst my tenants, and a gradual improvement of my estates. The most likely way to make them happy and good is to teach them when young to know right from wrong, and that can only be effectually done by education. Whenever, therefore, I can encourage good and moral feeling, you will find me anxious to do so; and, as the best means of effecting it, I will willingly contribute to the improvement or increase of schools to be open to all, so that every child on my estate may be brought to know his God and the duty he owes him. The next object of my solicitude will consist in an encouragement of improved agriculture. The first of all improvements consists in draining and enclosing. My tenants will, therefore, find me willing to assist them in both, in as far as my means will admit of. In the best cultivated districts in Scotland, sheep stock is universally encouraged. I observe in the Stair leases that the tenants are in general precluded from having such stock. I am willing, where it is advisable, to alter such clauses. I have my doubts, too, whether the growth of turnips is sufficiently attended to in this county. In order, therefore, to encourage an improved system of agriculture, and to create a little emulation, I, as President of the Agricultural Society, promised two premiums of L.20 and L.10 for the best managed farms in the Rhinns district. These two prizes apply to the county in general, so you will have your chance for them along with others. But in my private capacity, I feel I may give a few smaller prizes amongst my own tenants, without injury to, or interfering with, the society. I propose, therefore, giving for the best kept fences on a farm, not under 100 acres, thorn or beech being preferred to any other fence, where circumstances allow of them—1st prize, L.10; 2d prize, L.5. To the tenant who makes the most and the best drains—1st prize, L.10; 2d prize, L.5. To the tenant who has, in well-cleaned and well-manured turnips, the greatest proportion of his land under tillage, not less than ten acres of turnips, and eating off at least one-half of them with sheep—1st prize, L.10; 2d prize, L.5. To the neatest and best kept cottage and cottage garden on the estate—L.5. And to the tenant who shows most activity in getting in his harvest—1st prize, L.10; 2d prize, L.5. (Prolonged cheering.) I will allow you to choose your own judges, so that any three or five, along with Mr Guthrie, may judge of and award the prizes. But I will give no prize to any tenant who burns his wreck (I mean the weeds gathered off the fallow land), which I observed was much done when I was here in the spring. Wreck, when carted and put into heaps, forms, when mixed with lime, the best of all composts; or, when first gathered, if put at the bottom of a muck-hill, it will greatly increase the quantity of manure; but to burn it is absolute waste; and, for myself, I would as soon think of burning straw. I said that I wished to see my tenants comfortable and happy. I hope I may be permitted further to say that I shall have a pride in seeing them independent. (Great cheering.) Whatever is due to me, I shall expect them to pay—whatever is not due, I will never exact. Whenever, therefore, they are called upon to exercise their political privileges, I wish them to do so honestly and manfully—not allowing themselves to be dictated to by me, were I disposed to attempt it, but only asking how their consciences bid them vote—being assured that he who obeys his conscience will never displease me. I should feel degraded myself were I compelled to vote one way, while my known opinions were in another; and I shall never attempt to inflict upon you what would prove humbling to myself. I believe the poorest voter has his own notions of what is good and right as deeply implanted in him as I have; and it is by allowing him to act up to his honest feelings that he is to be made a happier and a better, a more prosperous and a more thriving man. This is a subject on which I have thought much, and it is one on which I have had experience. Reflection shows me that my system is just, and experience shows me that it is politic, though I never think of it in that light myself; for, whilst tenants may be led by kindness and consideration, I have always seen that the devil himself won't drive them, and I like them all the better for it."

ANTIDOTES FOR POISONS.

When poison has been swallowed, ascertain from the patient what the nature of the poison is. If mineral, that is, either corrosive sublimate or arsenic, give a teaspoonful of sulphur, or half a teaspoonful of pearl-ash, or a wine glass of soap-suds; afterwards give a teaspoonful of antimonial wine, and plenty of warm water. If vegetable, or oil of vitriol, aquafortis, or oxalic acid, give pearl-ash, or chalk, or magnesia or soap-suds, in plenty of warm water, with a dessert spoonful of antimonial wine, or a scruple of simple powder of ipecacuanha. If laudanum, give a teaspoonful of domestic mustard, and keep the patient walking. If carbonic acid, or fumes of charcoal—open air, keep the body cool; medical aid is required.—*Newspaper paragraph.*

"CHRONOMOROS."

"In all the actions that a man performs, some part of his life passeth. We die with doing that for which only our *abiding life* was granted. Nay, though we do nothing, Time keeps his constant pace, and flies as fast in idleness as in employment. Whether we play, or labour, or sleep, or dance, or study, *the swiftness goeth, and the sand runneth.*"—Owen Feltham.

Wearied with hearing folks cry
That Time would incessantly fly,
Said I to myself, "I don't see
Why Time should not wait upon me;
I will not be carried away,
Whether I like it, or nay."
  There is not a labour more vain,
  Than turning the hour-glass again!

I said—"I will read and will write,
And labour all day and all night,
And Time will so heavily load,
That he cannot but wait on the road;"
But I found that, balloon-like in size,
The more fill'd, the faster he flies;
  And I could not the trial maintain,
  Without turning the hour-glass again

Then said I—"If Time has so flown
When laden, I'll leave him alone;
And I think that he cannot but stay,
When he's nothing to carry away!"
So I sate, folding my hands,
Watching the mystical sands,
  As they fell, grain after grain,
  Till I turn'd up the hour-glass again.

Then I cried in a rage, "Time *shall* stand!"
The hour-glass I smash'd with my hand;
My watch into atoms I broke,
And the sun-dial hid with a cloak!
Now, I shouted aloud, "*Time is done!*"
When suddenly down went the sun;
  And I found, to my cost and my pain,
  I might buy a new hour-glass again!

Whether we wake or we sleep,
Whether we carol or weep,
The sun, with his planets in chime,
Marketh the going of Time;
But Time, in a still better trim,
Marketh the going of him!
  One link in an infinite chain,
  Is this turning the hour-glass again!

The robes of the day and the night
Are not wove of mere darkness and light:
We read that, at Joshua's will,
The sun for *a Time* once stood still!
So that Time by this measure to try,
Is *petitio principii*;
  For Time's *scythe* is going amain,
  Though he turn *not* his *hour-glass* again.

And yet, after all, *what is Time*,
Renown'd in reason and rhyme?—
A phantom, a name, a notion,
That measures duration or motion?
Or but an apt term in the lease
Of beings, who know they must cease?—
  The hand utters more than the brain,
  When turning the hour-glass again!

The king in a carriage may ride,
And the beggar may crawl at his side
But still, in the general race,
They are travelling all the same pace—
And houses, and trees, and high-way,
Are in the same gallop as they:
  We mark our own steps in the train,
  When turning the hour-glass again!

People complain, with a sigh,
How terribly chroniclers lie;
But there is one pretty right,
Heard in the dead of the night,
Calling aloud to the people,
Out of St Dunstan's steeple,
  Telling them under the vane,
  Each to turn up his hour-glass again!

MORAL.

Masters! we live here for ever,
Like so many fish in a river;
We may mope, tumble, or glide,
And eat one another beside;
But whithersoever we go,
The river will flow, flow, flow!
  And now that I've ended my strain,
  Pray turn me that hour-glass again!

[The above appears amongst the original poetry in the new volume of a tastefully conducted annual work, *Fulcher's Ladies' Memorandum-Book and Poetical Miscellany*; published by G. W. Fulcher, Sudbury; and Suttaby & Co., London.]

CHAMBERS'
EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 463. SATURDAY, DECEMBER 12, 1840. PRICE THREE HALFPENCE.

A FEW WEEKS FROM HOME.

VISIT TO CANTERBURY.

HE who visits Kent, and does not make a pilgrimage to Canterbury, is no true lover of antiquity. The memory of St Augustine and St Thomas-à-Becket, it is to be feared, he cares nothing for; and, to say the least of it, the scenes immortalised by Chaucer and Shakspeare can have no influence on his fancy. Now, that kind of heresy is not to my mind. I can be as commonplace and utilitarian as you please, but still have a corner of the mind to spare on the existing memorials of past events—things which elevate the range of the imagination, and harmlessly delight the feelings. Come, then, let us wend across the downs and along the bosky avenues which lead towards Canterbury. Let us see the spot, and the actual objects in stone and mortar, which, five hundred years ago, attracted the reverence of thousands of pilgrims. Let us visit the sepulchre of Augustine, and the shrine of Becket!

Things have greatly altered in Kent since Falstaff proposed to set out for Gad's Hill, and there make an onslaught on the caravans of pilgrims who were "going to Canterbury with rich offerings, and the traders riding to London with fat purses." The truth of the matter is, that what with good macadamised roads, stage-coaches, and railways, the country stands a fair chance of being stripped of every bit of romance. Will it be credited?—the far-famed Cliff at Dover—Shakspeare's Cliff—is now perforated with a railway tunnel! Soon we shall be whisked in no time from the Borough to the Straits of Dover, and the towers of Canterbury will be passed at the rate of forty miles an hour. Such are modern improvements. No man has the comfort of now being robbed on his journey, let him wish for it ever so much. Falstaff and Prince Hal did not live in the age of locomotives.

With the sad reflection that we live in the nineteenth century, and have not the privilege of being kicked and cuffed as we should have been three or four centuries ago, let us take things as they happen to be. Here is an omnibus moving off from Ramsgate to Canterbury. One of the pilgrims is a good, dear, kind old soul—a lady who has at least attained the shady side of sixty—probably a widow: well, so much the better, we are sure to have an agreeable chat together. "This is a fine evening, ma'am, for a journey; few passengers, though: do you go all the way?" "Oh dear, yes, sir; I am returning to one of my homes at Canterbury: it will be quite pleasant on the road, I am sure, the sun is sinking so very beautifully in the west—very so, indeed." "Then you have more than one home?" "Oh dear, yes, sir; I have a house in Ramsgate and a house in Canterbury, and I just make myself happy, sometimes in the one and sometimes in the other." "But that must be very troublesome, I should think—you must travel a great deal." "Oh dear, yes, sir; but I like travelling very much, and I never allow any thing to vex me." "Perhaps you don't travel with much luggage—only some trifle, such as that basket." "Oh dear, sir, that basket is my bird's travelling carriage; that I always carry on my knee." "Your bird! do you always travel with your bird?" "Oh dear, yes, sir; I could not go any where without my poor little Dicky; and he is very fond of travelling also." "What sort of a bird is he?—probably a parrot." "Oh dear, no, sir; he is a lark." "A lark, for all the world! is he not inclined to fly up against the roof of his carriage, or disposed to pine with the close imprisonment?" "Oh dear, no, sir; he is the nicest, quietest, and best-behaved of birds. Sometimes, poor little creature, when he catches a glimpse of daylight through the covering, he will give a bit of a fly; but, you know, sir, I have lined the roof of the basket with a matting of fine wool, and he has a nice fresh turf, cut from the Downs, for a floor to stand upon; and so, you see, sir, he cannot hurt himself. I have travelled six hundred miles with Dicky this season, and, the good creature, he has never uttered a murmur." "The companionship of your bird seems to give you much happiness. Perhaps you have had losses in your family, and now find a pleasure in the society of this innocent little animal." "Oh dear, sir, I have a family of five children, and two-and-twenty grandchildren, and I am the happiest woman in the world. I never knew what it was to have a single vexation. It was a great trial, to be sure, when my daughter married and went to India; however, I said to myself, says I, what is the use of repining? Every thing is ordered for the best. There is a superintending Providence in India as well as in England. And so, when I thought of this, I was quite happy. It is always right to be happy, whatever takes place." "Well, that's good philosophy, at all events. I hope you have had the pleasure of seeing your daughter return?" "Oh dear, yes, sir; she has now been back for three years and two months: and I see her, as well as all my other children, very often, and my dear little grandchildren too; and I am as happy as the day is long." "That's very delightful; I wish every body could say as much. Pray, may I ask if Dicky is equally contented with his lot?" "Oh dear, yes, sir. Dicky and I are old friends. I purchased him at Maidstone four years ago next Easter, and he is quite domesticated—quite: he was a mere infant, as I may say, when I got him, and he does not care for being any where but with me. Poor little fellow [*peeping into the travelling carriage on her lap, and addressing Dicky*], there's a good dear Dicky. You will soon be home in your pretty cage at Canterbury; and you will see the sun rising in the morning over the trees of the Danejohn, and then you may sing as loudly as you please. Poor dear Dicky!"

Such was the good old soul who formed one of our travelling companions, and whose odd kind of attachment to her feathered companion formed a topic of conversation during our journey across the wolds of Kent. The country as you advance improves in appearance. The farms are large and seemingly well cultivated, and occasionally we pass through a neat old-fashioned village, with a church and churchyard embowered in tall and broad-spreading trees. The district is that in which the madman Thom committed his extravagances a few years ago—a circumstance reflecting little credit on the common sense of its inhabitants, who, however, I am disposed to think, are not more ignorant than the bulk of the rural population of England, and in regard to exterior decency and love of cleanliness, are infinitely superior to the most intelligent of the Scottish peasantry. As respects physical qualifications, "the men of Kent" have been long noted for their superiority.

Canterbury, which we reached after a ride of a few hours, is a town of great antiquity, and like York, to which it bears a resemblance, consists of a cluster of confused and narrow streets of brick houses, in the centre of which rise the lofty towers of the cathedral. The situation is upon a plain of limited dimensions, or, strictly speaking, in the vale of the small river Stour, which passes through it, and at the distance of two or three miles is environed with moderately high hills of considerable fertility and beauty. Canterbury partakes in a large degree of the unchangeful character of every thing English. The walls, it is true, are removed; only one gateway, a huge machicolated mass, has been suffered to stand, and there are numerous signs of advancing taste; still, the place is essentially antique, with all kinds of outs and ins, strangely shaped windows and roofs, and the same confined thoroughfares which existed centuries ago. Boring your way through an alley from what may be called the chief street, you reach the precincts of the grand ecclesiastical structure, round which the town has gradually crept as if for protection. Let us pause for an instant, to run over the primary history of the edifice.

It is probably not very generally known, that England once formed a favourite field for rearing slaves—white ones, of course—for the markets of Southern Europe, in the same manner as Kentucky now produces that article of commerce for some of the adjacent states of America. A parcel of English slaves having, about the year 596, been carried to Rome and there exposed for sale, Gregory, the reigning Pope, was inspired with sorrow and concern for their appearance, and formed the design of converting their countrymen to the Christian faith. It is indisputable that Christianity was known in some parts of Britain before this period, but it had no existence throughout the southern part of the island, and therefore the design of this benevolent prelate is worthy of the highest commendation. Gregory dispatched Augustine with forty Benedictine monks to Christianise England; and having fortunately gained over Ethelbert, King of Kent, to their views, the object of their mission was accomplished. Great numbers were converted and baptised; and Ethelbert, in token of his piety, gave up his palace in Canterbury to St Augustine. At the same time, the king retired to a residence which he built at Reculver, a small remaining portion of which, consisting of a postern gateway of red brick, may still be observed by the tourist. The palace at Canterbury and adjoining buildings were afterwards converted by St Augustine into a cathedral and priory, dedicating both to the honour of Christ. St Augustine also procured means to found a magnificent abbey in another part of the town or suburbs; but as the institution was suppressed in 1539, and the edifice is now a ruin, or devoted to secular purposes, no more need here be said regarding it. The main object of interest in the present day is the cathedral, which has undergone so many alterations and extensions in the course of time, as to partake of a singularly mixed character, though exteriorly appearing as a work in the rich Gothic of the eleventh and twelfth centuries. Its first great restoration was accomplished by Lanfranc, the archbishop who was appointed by William the Conqueror. Having found it in a ruinous condition, the result of a disastrous fire in the year 1097, he pulled down the greater part of the building, and began its re-erection with arches of a bolder sweep and columns of more elegant proportions. The work was carried on under the direction of Prior Conrad, and during the prelacy of Anselm, successor to Lanfranc. The taste and ability of the architects appear to have excited the wonder of their contemporaries. "Nothing similar," according to William of Malmsbury, "was to be found in England, either for the brilliancy of the painted windows, the splendour of the marble pavement, or the pictured roof, which attracted the eyes of beholders." In less than a century after the installation of Lanfranc, the archbishopric was bestowed on Thomas-à-Becket (1162). The cathedral now became the scene of an event which may be said to have been the making of Canterbury. We allude to Becket's assassination. Henry II., it will be remembered, had little difficulty in restraining the powers of the barons, and of preserving peace generally among his lay subjects; but in attempting to abridge the

Digitized by Google

exorbitant privileges of the clergy, he was resolutely opposed, and by none more so than Thomas-à-Becket, Archbishop of Canterbury, who considered the priesthood to be justly exempt from all civil restraint. Some of Henry's courtiers thought they could not do him a better service than to rid him of this annoyance, and accordingly seized an opportunity of cutting down Becket while engaged in the offices of religion at an altar in his own cathedral (Dec. 22, 1170). For his concern in this foul transaction, Henry, as well known to the reader of history, had to perform a humiliating penance, receiving eighty lashes on his bare back from the monks of Canterbury.

While the murder of Becket was still fresh in the public remembrance, the cathedral was again (1174) consumed by fire; but this proved rather a fortunate circumstance than otherwise, for the prior and clergy levied such exorbitant offerings from the zealots who crowded to the scene of Becket's murder, as enabled them to rebuild and vastly extend the edifice, on a scale of singular magnificence. Their main design seems to have been the extension of the church to the eastward, elevating the floor of the new part considerably above that of the rest of the building; they also added several parasitic chapels in this quarter to the main edifice. Beneath the elevated part, which is reached by flights of steps from the choir, and was intended for the site of the high altar, they constructed a series of low vaulted chapels or apartments, entered by a side door, and which are now called the undercroft. After the completion of the alterations, and when fitted up with all the splendours of Catholic worship, the spectacle from the centre of the nave on the west must have been beyond conception imposing. To add to the effect, and excite the devotional feelings of the multitudes who thronged to the cathedral from all parts of the country, the bones of Becket were removed from their resting-place in the vault to which they had originally been consigned, and placed in a shrine on an esplanade at the top of the highest flight of steps adjacent to the grand altar, and therefore in a convenient situation for being seen and visited. The scene of enshrinement, which is open around, and is really a beautiful aisle or chapel, in some measure detached from the choir, was henceforth called Becket's crown. The translation of the remains of St Thomas, as he was now entitled, took place on the 7th of July 1220; the occasion was one of extraordinary solemnity and rejoicings—the pope's legate, the archbishops of Canterbury and Rheims, and various bishops and abbots, carrying the coffin on their shoulders, and the king (Henry III.) attending, to grace the ceremony with his presence. The expense attending this ceremony was immense; for one thing, the archbishop provided refreshments, with provender for horses, along the line of road from London, a distance of fifty-six miles, for all who chose to attend. Artificial fountains were dispersed about the city of Canterbury, which ran with wine, and nothing was wanting to give full effect to this triumph of priestly power. The upper part of Becket's skull, which had been severed by his murderers, was preserved by itself on the highly decorated altar. According to the fashion of the time, pilgrimages were now made from all parts of Christendom to the shrine of St Thomas at Canterbury, and the offerings formed a princely revenue to the establishment. Besides these customary gifts of the pious, the clergy drew an incredibly large sum at the celebration of Becket's martyrdom, held as a kind of jubilee every fifty years. We are told that the confluence of people of all ranks who attended these ceremonies amounted to at least a hundred thousand in number, and the estimate of their oblations at the saint's shrine was beyond the bounds of belief. There had been seven of these jubilees before the Reformation; the last of them was in 1520, in the time of Archbishop Warham. Cranmer, the successor of this prelate in the see of Canterbury, and other reformers, put an end to these and such like follies. At the same time, the priory was dissolved, and the church despoiled of a thousand elegant and ancient objects, including the rich ornaments of Becket's shrine. But this clearing at the Reformation fell with a moderate degree of force, in comparison with the great blow which the church received during the troubles of the civil war in 1641, when the Puritans doomed the entire fabric to destruction. The dean and canons were turned out of their stalls, a newly erected font was pulled down and sold piecemeal; inscriptions, figures, coats of arms in brass, were torn off from the ancient sepulchral stones; the graves were ransacked for the sake of plunder, and the revenues were confiscated by government. The excesses of the army and populace during this period are still a matter of sad tradition in the English cathedrals, and the keepers of these structures always refer with melancholy interest to Cromwell, as the great destroyer of their beauties. If an angel has lost a nose or a saint his head, if monuments are laid waste and ornaments wanting, it was all done by Cromwell. Cromwell, in the estimation of beadles, must have been an awful monster; and he certainly did bring things to a serious pass, when, in 1649, an ordinance of state was issued for pulling down and selling the materials of all cathedral churches. By some fortunate circumstance, this law was never fully acted upon; at any rate, the cathedral of Canterbury escaped demolition; and on the re-establishment of monarchy, it was repaired and fitted up for the celebration of religious service, at an expense of L.12,000.

Having thus glanced at the eventful history of the cathedral, we may proceed to take a walk through it. On entering by an old arched gateway from a lane in the town, we find ourselves in the close or precincts, which have unfortunately, and with the usual disregard of taste, been encroached upon by rows of shabby brick houses; wherefore, instead of a fine open esplanade all round the structure of the cathedral and its various offshoots, we can in reality see it only on one side (the south) and the west end, which we first approach from the entrance; the remainder being huddled up among old houses and walls, in a manner savouring little of regard for the beauties of the architecture. Let us, however, exercise a little patience: during the last few years the dean and chapter have been actively restoring some of the more dilapidated portions of the edifice, an entire tower at the west end being evidently new. Perhaps it is intended to clear away the odious mass of paltry dwelling-houses which confine the north side and east end of the building.

The general exterior aspect of the cathedral resembles that of York Minster. The form is that of a cross, with a central tower of unrivalled workmanship, reaching to a height of 234 feet. The size of the whole fabric is immense, and embraces a great number of chapels, crypts, and by-places, which are not ordinarily seen in cathedrals. It will afford an idea of the dimensions and effect on the eye, when we mention that the length from east to west, inside, is 514 feet, height of the vaulted roof 80 feet, breadth of the nave and side-aisles 71 feet, and breadth of the cross-aisles from north to south 124 feet. The interior of the nave, to which we are first admitted, at the south-west corner, is at present cleaned with a lightish colouring matter on the walls, and all damages in the stone pillars repaired. Along this spacious arcade we are led towards the enclosed choir, which we perceive at the distance of 178 feet, and at the head of a flight of steps. The time of my visit being just as morning service was about to begin, I took a seat among the side stalls during its continuance. I regret to say that I never heard the fine language of the prayers and lessons worse read. The most meritorious official appeared to be the organist, whose voice in accompaniment to the chants was of the best order. Among other alterations and improvements, the organ has been placed in a concealed situation in the space above the side-aisles, and is played upon by means of communicating wires, as I should suppose, in a seat in the choir. In altering the sides of the choir, a less happy exercise of taste has superseded the ancient carved stalls by a bald Gothic screen, glazed, and painted white.

At the conclusion of the service, I was conducted along the floor towards the flights of steps, at the head of which once blazed the high altar, in all the splendour of silver, gold, and precious stones. This inner portion of the choir is lined with various monuments of distinguished bishops and other churchmen, in a wonderfully good state of preservation, considering the handling they must have undergone. By a side door we are conducted round to Becket's crown, which, as I have said, is a kind of circular chapel adjoining the extremity of the choir. This is the most beautiful point in the whole building. The light graceful pillars, in pairs, supporting the Gothic arches above, the lofty roof, the windows of painted glass in the aisles beyond, and the tessellated pavement where once stood the shrine of St Thomas, form a spectacle at once impressive and deeply interesting. The costly shrine of Becket has, as may be supposed, been completely cleared away, and the inlaid floor is free from all trace of having once been the scene of concourse, with the exception of a hollow, worn in the marble, as it is said, by the kneeling of hosts of pilgrims.

From this part of the building we are conducted round to the northern aisles, and led down to a dingy side-chapel in the northern transept, called the Martyrdom. Here, before the altar of St Benedict, Thomas-à-Becket was slain, and the precise spot is marked by a piece of stone inserted in the dark-coloured pavement. This piece of lightish stone, if the conductress is to be believed, has replaced a portion of the original marble slab, which was marked by the blood of Becket, and which was transferred as a relic to Rome. In the Martyrdom, at this spot, King Edward I. was married to Margaret of France by Archbishop Winchelsea, in the year 1299. The great northern window, to which we next turn, is of painted glass, with figures of prophets, apostles, and canonised bishops, in splendid costume. Adjoining, we are led through the chapel of Our Lady, possessing a beautiful screen of open arches; next we have a peep in at the chapter-house, a grand and solemn apartment; and, finally, are ushered into the ambulatory of the cloisters—a walk with groined arches overhead, and open on the inner sides to a grass plot, in which repose the mortal remains of numerous friars and monks who fretted their little hour within the precincts of the hallowed domain.

Altogether, the cathedral, whether taken as a whole or in detail, is a work of exceeding grandeur, and with exquisite beauty of form, possesses a profound historical interest. As a relic of the past, independently of its value as a specimen of highly finished Gothic architecture, it is unquestionably, along with all similar structures, worthy of national preservation. As respects its service to religion and morality, it may be pronounced absolutely useless—the neighbouring district, as has been proved, being no more the better for its existence than if it were an empty ruin.

I have occupied so much space in describing, however superficially, the far-famed cathedral of Canterbury, as to have left little room to say any thing respecting other objects of interest in the town. Upon the whole, taking out the cathedral, Canterbury has not much to show. In walking towards the southern environs to see the ruins of the ancient castle, I had occasion to pass through an open piece of pleasure ground, lying close upon what remains of the old rampart of the town in this direction, and called by the odd name of the Danejohn, which, it seems, is a corruption of *donjon*, or keep, such a building having once occupied the spot. The area of the field is laid out with an avenue of trees, and is principally otherwise a grassy esplanade, open freely to all the inhabitants. Along the southern verge is the city wall, but furnished throughout its length of several hundred yards with a grassy mound inside, on which is a promenade, commanding a pretty extensive view of the country beyond. About the middle of the promenade is a pyramidal mound, with a spiral walk to the summit, on which is placed a monumental shaft of stone, dedicated by the civic corporation to the donor of the field. It is pleasing to mention the fact of this valuable gift to the town. In 1790 the field was presented by Mr Alderman James Simmonds for the use and recreation of the inhabitants, in all time coming; and being kept in neat order by gardeners appointed for the purpose, it now forms a handsome pleasure-ground, the more valuable from the want of any other place of open-air recreation in the city.

ONE FAULT.

A NOVEL under this title, by Mrs Trollope, was published about a year ago,* and no doubt enjoyed its share of popularity amongst novel-readers. We are not of this class; but having been almost accidentally made acquainted with "One Fault," we have found in it so much of a useful and instructive tendency, that we would fain bring it under the notice of that portion of the public who, like ourselves, are little accustomed to peruse works of fiction, and may therefore not as yet have seen the work in question.

The book opens with the description of a rector's family of amiable character, residing in one of the most beautiful parts of Somersetshire. It consisted of Mr and Mrs Worthington, two daughters, Margaret and Isabella, just arrived at womanhood, and a son, Charles, as yet only a youth of sixteen. Two unmarried sisters of Mrs Worthington, Christina and Lucy Clark, the former an eccentric blue-stocking, and the latter a gentle and kind-hearted woman, lived upon a small income at Appleton, two miles from the rectory. A young friend of Charles, named Alfred Reynolds, a student at Winchester, and the son of a widow of narrow fortune, loved Isabella, but possessed too much honour, in his present circumstances, to make her aware of the fact. She was just completing her eighteenth year, a sweet sylph-like creature, with the finest dark hair and eyes in the world, and dispositions of so delightful a kind as rendered her the favourite of her whole family, and particularly that of an aged uncle of her father, a Colonel Seaton, who for many years had lived at the rectory.

There was nothing in the characters of these personages to distinguish them from the mass of society of their own grade. They only come under our notice in consequence of a connexion which they formed with the great landlord of their neighbourhood, Mr Wentworth. This gentleman possessed an ample fortune, was young and handsome, and bore an unsullied reputation. When, in consequence of seeing Isabella at a county ball, he called upon Mr Worthington, and asked leave to pay his addresses to her, the family regarded her as a singularly fortunate creature; and she was herself gratified beyond hope, for she had also admired Mr Wentworth, and was already prepossessed in his favour. After the most generous settlements, the marriage took place, and Isabella was all at once transferred from obscurity to the possession of Oakton Park, one of the most magnificent mansions in the county.

The young pair proceeded to Paris. The dull road from Calais to that city was passed over without Isabella feeling that it was in the least a grievance. "It was the delight of believing that she was beloved; it was the sweet sensation of warm and tender gratitude to the companion whose love had surrounded her with so many joy-creating circumstances; it was the thought of the happiness she should take back to the

dear home she had left, when she returned to tell them of the wonders she had seen and the delight she had felt;—it was this that made her endure the toilsome way so cheerfully." The morning after their arrival, the gay-spirited girl looked out with rapture upon the gardens of the Tuileries, and expressed the utmost eagerness to go abroad; but her husband coldly interposed. He must first send cards to the embassy, and go to secure seats for the opera. She good-humouredly proposed to amuse herself in the interval, by looking out at the window; but this also he disapproved of, as exposing her to the gaze of every body. Then she said she would ensconce herself in the corner of the sofa, so that "no one should penetrate the secret of her existence till his return." The least approach to a joke displeased Mr Wentworth, and something, not exactly a frown, but a general darkening of the countenance, was the consequence; but she did not happen to see it, and was still happy. While he was away, she wrote a long letter full of high spirits to her parents. He returned, uneasy from being disappointed of seats, and, when he saw her five or six scribbled pages, he suspected that she might have repeated her joke as to her ensconcement from the vulgar gaze. Matters, however, afforded no room for an outbreak of spleen, until, he having rung the bell to order the carriage, that he might drive her to a fashionable hair-dresser, she unluckily said, "Mr Wentworth, ... had not James better carry my letter to Lord G***'s before he comes round with the carriage?" This fairly overset her husband's already displeased mind; and, "What can your letter contain, Isabella," said he, "of such extreme importance as to render it necessary to destroy all the arrangements I have made for the morning—and that, too, only in order that it may reach the embassy so very many hours before the post goes out? Do just as you please, however. Never mind about the carriage, James. Take this letter to the English embassy. You remember where to find it, I suppose." Vexed and slightly frightened, the lady beseeched him never to do what she asked, when he did not quite approve of it himself. But—"I have no wish to be a tyrant, Isabella," replied he gravely. "You must use your own judgment upon all ordinary occasions," &c. He then abruptly went out, and spent the forenoon moodily in the Champs Elysées, while the young wife remained in the hotel, bewailing the ignorance which had caused her so greatly to offend her husband.

In the evening, she enjoyed the performances at the Théâtre Français much too heartily for his grave and haughty taste. But the admiration excited by her beauty reconciled him, for her beauty was what had caused him to stoop to her rank, and he delighted to see its power acknowledged by others. "On the whole, Isabella, after nearly a fortnight's sojourn, would, if questioned on the subject, have been ready to declare herself very happy. And yet the countenance which she daily studied with more and more anxiety, was occasionally obscured by a cloud, whose cause she was unable to explain; but she still took it for granted that it must arise from some ignorance or deficiency in herself. Watchfully, most watchfully, did she labour to discover wherein she had failed, whenever an air of cold stiffness took place of the fond gallantry which still distinguished her husband's demeanour towards her; and thankfully would she have welcomed any remonstrance that might have helped her to become any thing and every thing he wished. But nothing beyond an occasional blighting, though silent, look of estrangement, had yet occurred to give her the first lesson on the instability of human happiness; and more than once, when her young heart was heavy within her, she hardly knew why, she endeavoured to accuse herself of caprice and *exigence*, rather than conceive it possible that the man she so earnestly desired to believe perfect was out of humour without a cause."

They frequented the *salons* of a gay English resident, Mrs Clifton Darville, and there Isabella shone for the time as a brilliant novelty. One evening, seated on a sofa, she became the centre of the general conversation, every one delighting in the naïveté with which she defended Shakspeare from the derogatory remarks of Voltaire. Wentworth, naturally shy and uncondescending, and never forgetting what might be thought of the comparatively recent rise of his family, was carried beyond common bounds by the *éclat* which attended his wife, and was induced to say to the Duc de B****, who was contending with her for the superiority of the Merope to Coriolanus, "Let me challenge you to make a party with my young wife to decide this question—come and pay us a visit at my London mansion next spring, and I will undertake that Coriolanus shall be played to you." The Duc was hanging at the moment on some words of Mrs Wentworth, and did not on the instant reply. Wentworth, thinking himself insulted, coloured to the temples, and led his wife from the room, in a state of agitation not to be described. As they drove home, he did not fail to make her participate in his own anguish, and announced his intention of returning to England on the morrow. She retired to rest, with a spirit deeply wounded, and sadly in contrast with the splendours which surrounded her.

Next day, amongst other preparations for departure, it was necessary to write apologies to various parties with whom they had engagements. Mr Wentworth imposed this duty upon his wife, who was ill qualified for it, not being accustomed to devise fair excuses. When he found she had only stated that they were about to leave Paris, he remarked that her notes would appear cold, and, struggling with ill-suppressed anger, he required her again to sit down to her desk. She did so with her usual cheerful obedience, but had to ask him what she should say. He dictated an apology, in which the sudden arrival of letters of importance from England was represented as the cause of their departure. Half supposing him in jest, she said, "But I cannot say that, Marmaduke, for it is not true." A frantic burst of wrath was the consequence. "Leave me!" he cried, . . . "leave me, if you please. . . . I have not been accustomed at any period from childhood to the present hour to be treated with indignity." She started from her place as he spoke, like a frightened fawn, and, seeking refuge in her chamber, sunk on her knees and burst into tears. The lovely bright-souled Isabella was now fully aware of the character of the man to whom she had united herself, and feared too truly that misery must be her future lot.

She sought to relieve her mind by taking an interest in the arrangements for the journey, but, after an hour or two had elapsed, received a letter from her husband, written from a neighbouring room. Wentworth, it must be observed, was one who never supposed he could himself be wrong. His native pride had been fostered by vicious education; he had been accustomed to exercise his will in every thing, to admit of no opposition in his domestic circle, and to charge upon others the faults of which he acquitted himself. At the same time, he was most scrupulous to observe all the external decorums required of a gentleman, and while expressing the most cutting things, never used an uncivil phrase. His letter reminded her of the inferiority of her station and education, which, he said, rendered her ignorant of the observance a high-bred gentleman required in all who approached him. It was his duty to remedy this deficiency by pointing out her errors, and he hoped she would be a docile scholar. He called upon her above all things to remember the devoted attachment he had shown to her in raising her to his own station, and hinted that he expected it to be repaid in obedience and constant endeavours to please him. When he appeared displeased, she was to understand that he must have good reasons for it. Thus lectured on her future duty, he expected her to enter the drawing-room immediately, with a smiling countenance, giving him the assurance that his admonitions had been received as they deserved. And then he concluded by signing himself her affectionate husband. Isabella could not read this paper without feeling that she was treated unjustly, and, for the first time, she was conscious of regarding her husband with a feeling allied to contempt. She had to try, nevertheless, to appear with the requisite countenance. On entering the room, she found her husband still betraying appearances of agitation; but he instantly made an effort also, and, approaching in a manner meant to be tender, said, "Kiss me, my love." Isabella hardly knew why this obliging command seemed more difficult to obey than any other he could have imposed upon her. In half an hour after, they were on their way to England.

Every day made her more and more fully aware that she was thenceforward to move, act, and think, only according to the imperious will of her husband. She yielded a little more than was quite agreeable to him, and the following speech was therefore pronounced one day, after he had drawn up a window in the carriage which she had just let down: "My dear love, I think the air may be too much for you. But do not scruple to object to any thing I do, that you may not happen to like;—it will in no way displease me: indeed, on the contrary, I should rather like it, as I feel great interest in discovering what your feelings and sentiments are on all subjects. And when it happens that I do not perfectly agree with you, it need produce no mortification on your part, as, of course, dearest, I shall never scruple to set you right. Ask, then, for every thing you wish, my dearest Isabella, with perfect confidence that I will never abuse the trust you have reposed in me by permitting the slightest thing that I do not perfectly approve."

The morning after their return to the splendours of Oakton Park, the young wife's heart yearned to go to see her own family; but though permitted to do so, and even to give them an invitation to dinner, she was also made to feel that she must not hereafter expect to see much of them, or to see her husband pay them much courtesy. She had made up her mind, that, if possible, no word or look on her part should betray that she was disappointed with her husband. Yet they perceived that she did not look well, and old Colonel Seaton beheld her with a melancholy feeling, which he did not express, and no one thought of penetrating. The party, excepting the colonel, accompanied her to Appleton to see Isabella's aunts, and much hilarity prevailed amongst them all, while the young wife "sat in the midst of them, the centre, as they fondly imagined, of all their joys, yet conscious herself that a blight hung upon her, which sooner or later must spread among them all." Her carriage returned to the rectory at Abbot's Preston, filled with her friends, and her father laughingly conversing with them from the coach-box, when, to her horror, she beheld her husband approaching. The affectionate greetings of the worthy family were received with cold politeness by the severe-natured squire; and Isabella readily traced in his countenance the slight rigidity which denoted displeasure. To add to the mishap, it was ten minutes after the dinner hour before she reached the drawing-room at Oakton, where she found her husband in a stiff and silent mood, though perfectly polite. The dinner passed without softening his feelings, and when she had drunk one glass of wine, he said to her, "'Do you make a habit of sitting long after dinner, Mrs Wentworth?' 'Oh, no!—I am quite ready to go,' she replied, rising; upon which he darted to the door, and having opened it for her, bowed gravely as she passed." While she sat dispirited in the drawing-room, she received a *second* letter from her husband, written as before from a neighbouring apartment. He began smoothly—lamented the necessity of finding fault, but took credit for the sense of duty under which he acted, and the certainty that he could never say any thing ungentlemanlike to her. He then adverted to the disgust with which he had been filled two hours before by finding one of his carriages used as a stage-coach. "Can I ever forget the close-packed female heads, obtruded, amidst unseemly bursts of laughter, to enjoy the waggeries of the outside passenger who sat beside the coachman?" A lecture followed on Isabella's being late at dinner; and, after lacerating her feelings by the most cutting remarks on those dearest to her, he concluded by calling upon her to prove that she appreciated his "delicacy and kindness," by meeting him at coffee as sweetly serene and as tenderly affectionate as he could wish. She wished to obey the behest, but natural feeling broke out at his approach in the words "Oh Marmaduke—I do so dearly love my father!" This overset his whole plan of operations; and "Leave me, madam, leave me, if you please!" sounded in her ears. She could not this time, but, seizing and kissing his hand, beseeched forgiveness. The humility soothed him, and he condescended to bend forward his lofty head and kiss her forehead. "'Do not abuse my excessive tenderness,' he said, 'but henceforward receive all I say as you ought to do. You are forgiven!' and again he kissed her."

"When moralists, religionists, and philosophers of all sorts, set about reasoning on the phenomena of the world we live in, and, contemplating the mass of human misery to be found therein, trace it to all the fearful crimes that since the fall of man have found their way into the heart, they overlook one little cause of suffering, which blights more happiness, and neutralises a greater portion of God's bounteous favours, than all the other heinous enormities of our depraved race put together. This hateful, stealthy, heart-destroying blight, is often found where every thing like atrocious vice is utterly unknown, and where many of the very highest virtues flourish. Probity, liberality, temperance, observant piety, may all exist with a SOUR TEMPER; yet many a human being has been hung in chains whose justly punished deeds have not caused one-hundredth part the pain to his fellow-men which a cross temperament is sure to give."

The nice, fastidious, and pompous nature of Wentworth, sat uneasily under the infliction of the company of next day; and matters were made worse by the good humour of the guests, who as yet dreamt not that Isabella was under the dominion of a tyrant. A new "waggery" of the rector made the host pale with anger; and, in the drawing-room, a free and easy address from the eccentric blue-stocking aunt, put him into a transport of rage, which, however, he took care to conceal by leaving the room. This led to a violent scene afterwards, in which the unhappy young wife was made fully aware of the disgust which Mr Wentworth felt for her humble relations. A settled sadness now took possession of her, and led to a conviction on the part of her husband that she was bad-tempered, for, like most such persons, he mistook the consequences of his own sourness for sourness in its wretched and disconcerted victim. This notion, strange to say, was not disagreeable to him; it fortified him in his self-acquitting habits.

A few days afterwards, the young pair received a visit from the dowager Mrs Wentworth, a heartless woman of fashion, still, comparatively speaking, young—faultlessly elegant, smooth of speech, but possessed by the most hostile spirit towards Isabella, whom she had considered as a most unsuitable match for her son. During the first evening, Wentworth pointed her out as a mirror of every grace and virtue to his wife, whom he rebuked for trifles in her presence. In some arrangements, afterwards, Isabella endeavoured to occupy the exact place in the group which the dowager thought proper to assign her; but this was not at all times an easy matter. If she withheld the expression of her opinion, "You seem to care very little about it," was the observation that followed; and if she unhappily differed from her on any point, the result was much worse, being invariably finished by a remark that "any thing was better than a dispute;" while, when she pronounced a cordial approval, and agreement in opinion, all notice whatever in return was carefully avoided. There was an eternal schooling about every thing she said and did, that required more than angel patience to endure, and the slightest word displeasing to their self-esteem was set down to "her unhappy temper."

The delicate and interesting situation in which she was soon after declared to be, procured her some temporary relief. Her friends were allowed to visit her in a private way in her room; and her husband was so

Digitized by Google

much pleased as to yield to a wish that a Mr Norris, a young clergyman affianced to Margaret, should succeed the Oakton rector on his expected demise. But some unlucky circumstances took place. The eccentric aunt came one day in her outré attire and manner, and, making her way to Wentworth's library, asked, in a free and easy way, for the loan of a particular book. She was received with a tremendous frown, and a declaration that his servants should for the future save him from her "ribald jestings and low-bred impertinence;" to which she replied, by reminding him that his grandfather was a commoner, while hers was a baronet of old creation; and then left him in a state of irritation, fearful even to his mother to behold. The very next morning, the young rattling brother Charles, newly returned from Oxford, and not at all aware of the austere character of Wentworth, thought he would give his sister a gay surprise, by coming to Oakton with cloak and guitar to treat her to an early serenade. After being with difficulty saved from summary ejectment from the park at the command of its master, he was introduced to the breakfast table, where he was treated with the greatest coldness, and soon made aware that his sister was miserable. These two incidents procured for Isabella another letter from her husband, in which he declared that her family had become the bane of his existence, and that he dreaded the consequences as to his own health; with many more particular remarks as to their dress, manners, and station, of the most cutting nature. Obliged, half an hour after, to drive out with him, he found her in tears, and this led to new upbraidings. He was astonished to find that his just and necessary rebuke, in which he had avoided every harsh word and ungentlemanlike expression, should affect her so, and set it all down to temper. The marriage of Margaret approached, and he was anxious that neither he nor his wife should be present at it. Earnestly attached to her sister, she made for once a small effort to oppose his will, but met with such a reply as to leave her no inclination to repeat the experiment. She became, indeed, a completely passive being in the hands of her husband, obliged to act by his command in the most trivial as well as the most important matters, nearly denied all intercourse with her family, shut up amidst splendours which she might call hers, but with a heart that had no enjoyment in life, and which revolted at the very caresses which her husband thought should have been a consolation for every pain his wholesome counsel inflicted.

One day, the unhappy lady indulged for a few minutes in a conversation with her sister, the one standing in the park, and the other in Mr Norris's rectory garden. Wentworth, chancing to observe them, visited his wife immediately after with a letter, in which, amidst other severities, he spoke of placing the Norrises at a distance by withholding the presentation to the rectory. The pain of this infliction was so acute that Isabella fainted, and the premature birth of a weakly heir followed. The event procured for her some slight indulgences, but, after a proper interval, the old system of rigid subjection and suffering was resumed. Her simplest acts and words were interpreted by her tyrant into symptoms of bad temper, and were punished by poignant reproaches. She placidly submitted to all, fearful lest any genuine mark of spirit should be employed as a reason for substituting a foster-mother to her child. To avoid having her relations present at the christening, the family was removed to London, where equal miseries attended her. She was now a thin and pale creature, the very ghost of her former self. Yet not the most faint idea ever visited the mind of her husband, that the change was solely owing to his imperious and irritable temper. One tremendous fit of passion, followed by a letter, was brought on by her saying, without the slightest tone of pique, that, if she were too ill to preside at the christening dinner, the elder Mrs Wentworth would fill her place; another was induced by her sister, Mrs Norris, writing her a letter of dry detail, indicating a fear that it was sure to meet his eye. The time had now come when she wished herself dead. Her distresses were, if possible, increased by his discharging an affectionate and sympathising country girl, who, since her marriage, had acted as her maid. For the sake of her health and that of her infant, they removed to Shanklin in the Isle of Wight, where a man of doubtful character, named Nutcomb, contrived to insinuate himself into the good graces of the usually reserved Wentworth, and by flattery to engage him in play. The infant now pined and died, and Isabella returned to Oakton, as a being who was not to be long in this world. Her husband, leaving her there, with strict injunctions against intercourse with her family, proceeded to London to attend his parliamentary duties; but he had not been many days in town, when an accidental meeting with Nutcomb, whom he had discovered to be a gambler by profession, and a man of base designs, led to a duel, in which Wentworth fell.

The intelligence threw the already much weakened Isabella into a state of stupor, from which she was with difficulty recovered by her friends. Carried immediately to her former happy home, she was nursed back into being by the exercise of the greatest tenderness, but it was long before a conscientious feeling towards her late husband would allow her to indulge even in a tranquil cheerfulness. By wise expedients, her friends at length succeeded in re-establishing that health which nothing but mental suffering had ever endangered. She revived to the possession of an ample fortune, which, from the first, had been settled upon her by her husband, who, it must be remembered, had had but *one fault*. The conclusion of her story will be readily imagined. Alfred Reynolds became in time the happy husband of a wife whom he was well fitted to render happy, and the life of Isabella Worthington was thenceforward one of peace and true enjoyment.

The terrible effects of a proud and irritable nature—in short, of bad temper—are shown in the most striking light by this domestic tale. There was not one of the world's set of vices in Wentworth's character; he had an ample fortune, an elegant person, a cultivated mind—every one, indeed, of the advantages that can belong to men of his class. But he was himself the victim of the most harassing sensations, and a source of distress inconceivable to all intimately connected with him, and even to those whom he loved, or thought he loved, in consequence of *one fault*—a bad temper. How afflicting such a consideration! How important to take every means possible to check and regulate such a disposition in its earliest manifestations! It is in vain to say that marriage and other associations with such persons should be guarded against. No being can be altogether shut up from the power of troubling others in one way or another. It is only by the proper and timely use of strong moral corrections that the evil can be even mitigated; and amongst these we would reckon such affecting pictures of the vice and its consequences as that presented in the book of whose merits and interest we have here given, we fear, but a faint abstract.

OCCASIONAL NOTES.

ON A WELL-KNOWN COUPLET.

Dr Johnson, in the lines which he added to the "Traveller," says,

> "How small, of all that human hearts endure,
> That part which laws or kings can cause or cure."

This sentiment is sometimes quoted as the expression of a truth, and, doubtless, it has imposed upon many minds. It is of importance to observe that, pronounced as it was by Johnson, and sanctioned by Goldsmith, it is nevertheless grossly untrue. Laws and governments both do cause and could cure many of the ills endured by human hearts. We shall here say nothing of any evils which are caused by governments, for our meaning and motives might be misinterpreted. With regard to the other division of the subject, a very few words might, we think, prevent any desponding or dreamy politician from ever again quoting the couplet in confirmation of an argument. A government, for instance, has it in its power to establish a good police; this, by protecting property, may be the means of preventing many evils. It has it in its power to establish good sanatory regulations, which may tend much to the benefit of the people. Twelve thousand people die annually of small-pox in Great Britain, in consequence of the ignorant perseverance in inoculation: here government very rightly interferes, and says there shall be no inoculation under penalty of a month's imprisonment. Does it not here cure a great evil? Leave a people to themselves in a large city, and probably no such thing as a right sewerage will be found amongst them. Proprietors of houses already built and occupied will think they can do without sewers: builders will rear new streets, and never once think of spending money on this kind of convenience. But government can come in and compel proprietors to have sewers, whereby the health of the people will be preserved instead of destroyed. See a poor widow in the midst of five young children, immediately after the husband and father has been carried off by a contagious fever, generated or at least favoured by the want of sewerage in a large city, and quote the couplet after that, if you can. To bring this point out more clearly, we may advert to the fact that in England there is a law to enforce sewerage in new streets, and not in Scotland: now, if government can prevent the evil to the south of the Tweed, it can surely prevent it to the north also. Again, government may establish and encourage education, and, by moralising the people, save them from many evils. What has given to Scotland all the benefits of her parish schools, such as they are, but a dictum of the government of a former age? What is giving to Prussia the advantage of an universal system of education, but the government? We are apt, when we see a person suffering under some actual ill in a private domestic scene, to think that surely this is a matter quite independent of government; but it may not be so. Possibly, if the government had established some particular regulation, or in time set up some institution, long wished for but never obtained, the evil might not have taken place. There are, no doubt, many things beyond the proper range of the operations of a government, and many things which it would only spoil by interfering with; but at the same time there are many of our most private concerns in which we might experience its beneficial influence, supposing it to be guided upon enlightened principles, and not thwarted by the selfishness or ignorance of particular individuals and parties.

TREATMENT OF NEW IDEAS.

A new idea or invention is first met with universal distrust. It will never do; the man is an enthusiast; it is highly dangerous, &c. &c. The thing *does* nevertheless, perhaps; and then all the very same people who formerly denounced it as an innovation, turn round and say, "Oh, all that was quite well known before."

GOOD AND BAD IN THE SAME CHARACTER.

Many are highly estimable in one relation to their fellow-creatures, and not in another. For instance, present any unfortunate, or feeble, or depressed person to their consideration, and they will be untiring in the exercise of benevolence towards that person. But present to their consideration any person of superior qualities or in superior circumstances to their own, and they immediately appear as if the spirit of malice were in undisputed possession of them. This alternation between benevolence and its opposite is ruled by self-esteem. In the first case, the self-esteem is pleased in contemplating an inferior; in the second, offended in regarding a superior. One character may thus appear very different to different persons—kind and genial to some, and bitter and malignant to others; as the shield was thought to be gold by the gentleman who came from the west, and silver by the gentleman who came from the east. It is needless to remark that so very bad a fault as envy cannot be palliated by the exhibition in the same character, towards other objects, of any amount of benevolence.

THE LEARNED PROFESSIONS.

We have been informed that lately there has been a great falling-off in the number of young men who attend medical classes, with a view to the profession of the surgeon or physician. Some professors have not above a half, and others two-thirds, of their former number of pupils. The number of students for other professions is likewise diminishing. This is altogether a gratifying piece of intelligence. The vanity of parents has long deluged the country with a class of persons possessing the education of gentlemen, yet without the means of respectable subsistence; in other words, there have been about ten times more medical practitioners, lawyers, and clergymen, than there have been any demands for. We have heard it stated, that in Scotland alone, there are at all times eight hundred young men ready for vacancies in church livings, although not more than twenty or thirty vacancies occur annually.

We wish we had the power to impress parents with the monstrousness of the error, or rather crime, which they commit in bringing up their children to any of these learned professions, without the means of supporting them in a respectable style till they procure settled situations in life. The sufferings in mind as well as body frequently endured by young men reared to these professions, but without any prospect of employment, are exquisite in the extreme. After years of study, they find themselves mere hangers-on upon society. They observe their old school-fellows "getting on" in their different callings—some actively engaged in trade, and perhaps making fortunes; others are farmers in comfortable circumstances, with a family rising around them; others have gone abroad, and, as they hear, occupy excellent situations in the colonies—all, at least, are doing *something*, while they are doing *nothing*. But even while doing nothing, they have to support a handsome appearance; they must live apparently well, dress well, and keep company with the set most proper to their station; and all this only by drawing on already exhausted parents, by incurring debts, or by other shifts and schemes which involve no small degree of secret suffering to the feelings. Do not let it be imagined that this is a fanciful picture. Were it proper to do so, we could tell innumerable cases of a most heart-rending nature, which have fallen within our own limited observation. And not alone are the young men themselves blighted; their parents generally live to suffer for their folly, and to repent that they should ever have thought of rearing their son to be a gentleman, or, strictly speaking, a *downdraught*.

We are glad to find that this frenzy is abating. Within these last ten years, people have begun to exercise a little more common sense in the education and rearing of their children. Many now reason in this manner: "I once thought of bringing up my son George to one of the learned professions, but I understand from every body that such a step would be very dangerous; besides, it would take a great deal of money—probably not less than eight hundred pounds, one way and another—ay, perhaps, far more, if I should have to keep him for a number of years. Well, that settles the point. I will much rather give him a plain useful education; and when the time comes, if I can spare it, let him have a few hundred pounds to set him up in some kind of business. The eight hundred pounds that it would take to make him a doctor, would be much better bestowed in putting that amount of cash into his pocket, and sending him off as an emigrant to the colonies. Or, now that I think on't, why should *one* of my family get all I can spare? I'll keep the eight hundred pounds, and we'll all emigrate together, and so every one of us will get the good of it." Capitally reasoned, good Mr Father-of-a-family.

Digitized by Google

Stick to the point of giving your sons a really *useful* education. Let them by all means be instructed in English literature, science, and mathematics, which may be done at little expense. We live in a new world, in which these branches will work wonders in getting young men forward.

LOUIS-PHILIP—HIS LIFE AND ADVENTURES.

THE present King of the French is a most remarkable man, not more in the vigour which he shows as the occupant of a difficult political situation, than in the extraordinary adventures through which he passed in early life. While evidently possessing high natural endowments, it seems not less clear that he has been indebted for much of his success as a ruler to the great knowledge of the world which he acquired in the school of adversity, and to the chastening effect which poverty is calculated to have upon the character of the high-born. Louis-Philip has not become acquainted with men through the glozing medium of courtiers' tongues, but by personally studying them in all classes as an equal. The very experience he has had of a lowly and straitened condition, makes him perhaps more at his ease in a high one. Lately conversing with an eminent English political personage at an almost *tête-à-tête* dinner, he said, "Do you know why I am perhaps the most suitable man to be a king of all who now reign in Europe?" His guest knew not what to reply to a speech so full, apparently, of vain glory; but his majesty instantly added, "Kings, you know, have not the easy situations they once had: now, no one can be so prepared for any fortune as I, for I am the only man amongst them that has *brushed his own boots, and could do it again, if necessary.*" This anecdote we have heard through such a channel as assures us of its truth; and it is highly characteristic of the man.

Louis-Philip, born in 1773, and now consequently sixty-seven years of age, was the son of the Duc d'Orleans, who played a well-known part in the French Revolution, and was one of the many victims of the Jacobin party in their period of triumph. The Orleans branch of the Bourbon family originated in Philip, a younger son of Louis XIII., created Duc d'Orleans by his brother Louis XIV., and from whom the French King is sixth in descent. It is a curious fact, little known, that, through his ancestress, the second wife of Philip Duc d'Orleans, who was a granddaughter of the Princess Elizabeth of England,* Louis-Philip, the *il*legitimate monarch of France, has a preferable *hereditary* title to the British throne to that enjoyed by our present gracious sovereign, whom God long preserve, the one being descended from Elizabeth's eldest son, and the other from her youngest daughter. Such of our countrymen as may be disposed to sneer at popularly appointed sovereigns, and at Louis-Philip in particular, would do well to ponder on this fact, the truth of which will be made clearly patent to them by an inspection of Anderson's Royal Genealogies. Having premised so much, we proceed to condense an interesting and apparently faithful biography of Louis-Philip, given in a recent American work.†

Louis, at the age of five years, was placed under the care of the Chevalier de Bonnard; but, in 1782, the direction of his education was intrusted to the Countess de Genlis, a lady who, notwithstanding her subsequent errors, was eminently qualified to be an instructor of youth. Louis, under the title of Duke of Chartres, entered active life as a soldier, and in 1791 he commanded a regiment of dragoons which bore his name. In this, as well as in all future conditions of life, he distinguished himself by great humanity, coolness of judgment, and inflexible integrity. While with his regiment at Vendôme, he succeeded in saving, by his courage and presence of mind, a non-juring clergyman on the point of being massacred by the populace, which accused him of having treated with contempt a procession headed by a constitutional priest. He shortly after gave a new proof of his humanity by saving a custom-house officer from drowning. On account of these honourable actions, the city of Vendôme decreed him a civic crown. In 1792, when France declared war against Austria, the Duke of Chartres made his first campaign. At the head of troops confided to him by Kellermann, he fought at Valmy; and afterwards, under Dumouriez, distinguished himself at the battle of Jemappes.

This may be said to close the first and happy period of the king's life. The democratic or levelling principle of the Revolution having triumphed, a decree of banishment was passed against all the members of the Bourbon family who remained in France. This decree was afterwards cancelled; but the duke, who had manifested, with more frankness than prudence, his horror at the revolutionary excesses, was exposed to an arrest against himself. He then resolved to quit the army and the country, and, with Madame de Genlis and his sister, took refuge in Switzerland, with but a small supply of money, and every where in danger of being captured. By the kindness of an old friend, General Montesquiou, also a refugee, he succeeded in getting admission for his early instructress and sister into a convent in Bremgarten. For himself, he was told there was nothing for him but to wander in the mountains, taking care to stay but a short time in any one place, until circumstances should become more favourable. The Duke of Chartres, satisfied with having placed his sister in security, followed this judicious advice. Alone and on foot, almost without money, he began his travels in the interior of Switzerland and the Alps. Every where he was seen contending with courage against fatigue and poverty. But his resources were entirely exhausted; and being recalled to Bremgarten by a letter from M. Montesquiou, he obtained, through the interference of that gentleman, the situation of professor at the college of Reichenau. He was examined by the officers of the institution under a feigned name, and though only about twenty years of age, was unanimously admitted. Here he taught geography, history, the French and English languages, and mathematics, for eight months, without being discovered. The simplicity of his manners prevented any suspicion being entertained of his elevated rank, and he was able to conciliate the esteem of the government and the gratitude of his pupils. It was at this place that he learned the tragical fate of his father. Some political movements taking place in the Grisons, Mademoiselle d'Orleans quitted the convent at Bremgarten, and joined her aunt, the Princess of Conti. M. Montesquiou thought that he might now give an asylum to the prince, of whom his enemies had for some time lost all trace. The duke consequently resigned his office of teacher at Reichenau, receiving the most honourable testimonials of his behaviour and abilities, and retired to Bremgarten. Here he remained, under the name of Corby, until the end of 1794, when he thought proper to quit Switzerland, his retreat there being no longer a secret.

We now find the Duke of Orleans, as he was entitled to be called since his father's decease, once more a wanderer, seeking for a place of repose free from the persecution of the French authorities and their emissaries. He resolved to go to America, and Hamburg appeared to him the best place for embarkation. He arrived in that city in 1795. Here his expectation of funds failed him, and he could not collect sufficient pecuniary means to reach the United States; but, being tired of a state of inactivity, and provided with a letter of credit for a small sum on a Copenhagen banker, he resolved to visit the north of Europe. This banker succeeded in obtaining passports for him from the King of Denmark, not as the Duke of Orleans, but as a Swiss traveller, by means of which he was able to proceed in safety. He travelled through Norway and Sweden, seeing every thing worthy of curiosity in the way; journeyed on foot with the Laplanders along the mountains, and reached the North Cape in August 1795. After staying a few days in this region, at eighteen degrees from the pole, he returned through Lapland to Torneo, at the extremity of the Gulf of Bothnia. From Torneo he went to Abo, and traversed Finland; but, dreading the vengeful character of Catherine, he did not enter Russia.

It must be acknowledged that Louis was now turning the misfortunes of his family to the most profitable account. By bringing himself into contact with every variety of life, and adding the treasures of personal observation to the stores of learning with which his mind was fraught, he was preparing himself for that course of events which has given him such a powerful influence over the destinies of his own country and of Europe. The bold and rugged scenery of these arctic regions, and the simple and unpretending kindness of the inhabitants, must have produced a vivid impression upon a young man of his rank and previous pursuits, sent forth under such circumstances to commence his novitiate in the world.

After completing the examination of these ancient kingdoms, and after having been recognised at Stockholm, he proceeded to Denmark, and, under an assumed name, withdrew himself from observation. During his expedition, no improvement had taken place in his pecuniary resources or political prospects; but no reverses could shake the determination he had formed not to bear arms against France, and he declined the invitation of Louis XVIII. to join the army under the Prince of Condé.

His father had perished upon the scaffold, his mother had been imprisoned at Paris, and his two brothers, the Duke de Montpensier and the Count de Beaujolais, had been shut up in the Castle of St Jean, at Marseilles, where these young men, in the morning of life, without a fault but that of their birth, were treated with the utmost cruelty. Gradually, the severity against the Duchess of Orleans was relaxed, and she was released from prison, though still subjected to a rigorous surveillance. Her great moral worth may have had its effect in procuring this change, for all accounts represent her as adorning the high position she filled in society.

Her eldest son had taken his measures with such prudence, that the French government had lost all traces of him. But the mystery in which he had enveloped himself, probably increased their suspicion of his designs, and their desire to discover him—always jealous of this only branch of the Bourbon family which seemed to have left in France any favourable recollections of the past, or any reasonable hopes for the future.

The French political agents in the proper quarters were instructed to exert themselves to discover, if possible, his place of refuge. Attention was particularly directed to Prussia and Poland, in one or other of which countries he was thought to be. But these efforts were baffled, and were finally succeeded by an attempt of a different character, making such an appeal to the feelings of the son and brother, as left him no hesitation in accepting the offer of a more distant expatriation, which was made to him. A communication was opened between the Directory and the Duchess of Orleans; and she was given to understand, that if she would address herself to her eldest son, and prevail upon him to repair to the United States, her own position should be rendered more tolerable, and the sequestration removed from her property; and that her two youngest sons should be released, and permitted to join their brother in America. To this proposition the Duchess assented, and wrote a letter to her son, recommending a compliance with the terms proposed, and adding—"May the prospect of relieving the suffering of your poor mother, of rendering the situation of your brothers less painful, and of contributing to give quiet to your country, recompense your generosity!"

The government charged itself with the dispatch of this letter to the exile, and a new effort was made for his discovery. When other means had failed, their chargé-d'affaires at Hamburg applied to a Mr Westford, a merchant of that city, who, from some circumstances, was supposed to be in correspondence with the prince. This suspicion was well founded; but Mr Westford received with incredulity the declaration of the chargé-d'affaires, that his object, in opening a communication with the duke, was to convey to him a letter from his mother, on the part of the government; and disclaimed all knowledge of his actual residence. He, however, immediately communicated to the duke a statement of what had taken place, and the latter determined to risk the exposure, in the hope of receiving a letter directly from his mother. He was actually in the neighbourhood of Hamburg, though in the Danish states, where he had changed his residence from time to time, as a due regard to secrecy required. An interview between the duke and the French chargé was arranged by Mr Westford at his own house in the evening; and where, after the receipt of his mother's letters, Louis signified at once his acceptance of the terms proposed, and his determination to embark for the United States without delay. He immediately wrote a letter to his mother, commencing with the declaration—"When my dear mother shall receive this letter, her orders will have been executed, and I shall have sailed for the United States."

The ship "American," Captain Ewing, a regular trader between Philadelphia and Hamburg, was then lying in the Elbe, preparing for departure. The duke, passing for a Dane, applied to the captain, and engaged his passage for the usual amount, at that time thirty-five guineas. He had with him a faithful servant, long attached to his person, whom he was anxious to take. But the captain, for some reason, seemed unwilling to receive him, and told his importunate passenger, that the services of this man would be useless to him upon the voyage; and that when he reached the United States, his servant would certainly desert him. He was, however, finally persuaded to yield, and the servant was received for seventeen and a half guineas.

The duke was anxious to escape observation in Hamburg, and asked permission of the captain to repair on board his ship, and remain a few days before her departure. The captain, with some reluctance, consented to this unusual proposition; though it afterwards appeared that this step, and the mystery which evidently surrounded his young passenger, had produced an unfavourable impression upon his mind.

Late in the night preceding the departure of the ship from the Elbe, when the duke was in his berth, an elderly French gentleman, destined to be his only fellow cabin passenger, came on board. He understood English badly, and spoke it worse; and perceiving the accommodations far inferior to those he had anticipated, he set himself to find fault with much vehemence, but with a garrulity wonderfully checked by the difficulty he encountered in giving vent to his excited feelings in English. He called for an interpreter; and, not finding one, he gradually wore away, if not his discontent, the expression of it, and retired to rest. In the morning, seeing the duke, his first inquiry was if he spoke French; and perceiving he did, he expressed his gratification, and said, "You speak very well for a Dane, and you will be able to get along without my instruction. You are a young man and I am an old one, and you must serve as my interpreter." To this the duke assented; and the old gentleman, who was a planter from St Domingo, on his way to his native island, commenced the enumeration of his grievances. The first related to himself, and the second to the ship. He had no teeth, and the cook no soft bread, and he said it was impossible to sail in a vessel not provided with the means of baking fresh bread; that such an arrangement existed on board all the French ships; and that he could not eat the American biscuit. The captain coolly told him, "There is my beef, and there is my bread; and if you are not satisfied with my fare, you can leave the ship." The impatient planter, unwilling to relinquish the chance of revisiting his native country,

* The first wife of Philip was a daughter of Charles I., and through one of his children by that princess the Sardinian family derived their claims to the British throne.

Digitized by Google

thought it better to risk his teeth rather than disembark, and continued on board. There were many steerage passengers, Germans and Alsatians, emigrating to the United States. The ship left the Elbe on the 24th of September 1796, and after a pleasant passage of twenty-seven days, arrived at Philadelphia. Shortly before entering the Capes of the Delaware, the duke, unwilling that the captain should learn his true character from public report after reaching his destination, disclosed to him who he was. The captain expressed his gratification at the communication, and frankly stated, that the circumstances under which he had come on board had produced an impression upon his mind unfavourable to his young passenger; that in striving to conjecture what could be his true position, he had come to the conclusion that he was a gambler who had committed himself in some gambling speculations, and that he was seeking secrecy and refuge in the new world. The chances of luck had indeed been against his new acquaintance, and he had lost a great prize in the lottery of life; but he had preserved those better prizes, an approving conscience, and an unblemished reputation. The other passenger, the St Domingo planter, remained in ignorance of the name of his cabin companion, till he learned it in Philadelphia, when he called to make known his surprise, and to tender his compliments.

The first quarters the duke occupied, after reaching Philadelphia, were the lower part of a house belonging to the Rev. Mr Marshal, and adjoining a church in Walnut Street, between Fourth and Fifth Streets; and here he remained anxiously awaiting the arrival of his two brothers. They had embarked at Marseilles, on board a Swedish ship, the "Jupiter," and had a tedious and unusual passage of ninety-three days. This delay led the duke to fear, either that some accident had befallen them at sea, or that the French government had failed to fulfil the promise which had been made to himself and his mother. However, their arrival put a stop to his sad forebodings; and, after their union, the three brothers removed to a house belonging to the Spanish consul, in Sixth Street. Here they passed the winter, mingling in the society of Philadelphia, and forming many acquaintances, whose names appear to be fresh in the recollection of Louis Philip—such as Mr Bingham, Mr Willing, Mr Dallas, Mr Gallatin, Mrs Powell, &c. Philadelphia was at that time the seat of the federal government, and General Washington was at the head of the administration. The three young strangers were presented to him, and were invited to visit Mount Vernon after the expiration of his term of service. The duke was present at the last address delivered by General Washington to Congress, and also at the inauguration of Mr Adams, when his venerable predecessor joyfully took his leave of public life.

During the season, the Duke of Orleans and his brothers visited Mount Vernon, passing through Baltimore, where he renewed an acquaintance previously formed in Philadelphia with General Smith; and crossing the *site* of the present city of Washington, where he was hospitably received by the late Mr Law, and where he met the present General Mason of Georgetown. This most respectable man is well remembered by the king, who loves to speak of the hospitality of his house, and of his personal kindness—evinced, among other circumstances, by his accompanying his three young guests in a visit to the falls of the Potomac. From Georgetown the party passed through Alexandria, and thence went to Mount Vernon; where they were most kindly received, and where they resided some days.

While at Mount Vernon, General Washington prepared for the exiled princes an itinerary of a journey to the western country, and furnished them with some letters of introduction for persons upon the route. They made the necessary preparations for a long tour, which they performed on horseback, each of them carrying, in a pair of saddle-bags, after the fashion of that period, whatever he might require in clothes and other articles for his personal comfort. The travelling map of the three princes is still preserved, and furnishes convincing proof that it has passed through severe service. The various routes followed by the travellers are strongly depicted in red ink; and by their extent and direction, they show the great enterprise displayed by three young strangers, to acquire a just knowledge of the country, at a time when the difficulties of travelling over a great part of the route were enough to discourage many a hardy American.

Louis, in not long since showing this map to an American gentleman, mentioned that he possessed an accurate account, showing the expenditure of every dollar he disbursed in the United States. It is an example of business habits worthy of all praise and imitation. This attention to the important concern of personal expenditure was one of the characteristic features of Washington; and both of these celebrated men were, no doubt, penetrated with the conviction that punctuality is essential to success.

Our adventurers took the road by Leesburg and Harper's Ferry to Winchester. Here they dismounted at a house kept by Mr Bush; and who that knew this pleasant hospitable town forty years ago, did not know Mr Bush, and his quiet, comfortable public-house? They next proceeded by Staunton and Abingdon to Knoxville and Nashville. From the latter place, they took their departure for Pittsburg, which they reached, after passing through Louisville, Lexington, Maysville, Chilicothe, Lancaster, Zanesville, Wheeling, and Washington, in Pennsylvania. When traversing the Barrens in Kentucky, they stopped at a cabin, where was to be found "entertainment for man and horse," and where the landlord was very solicitous to ascertain the business of the travellers—not apparently out of any idle or interested curiosity, but because he seemed to feel a true solicitude for them. It was in vain, however, that the duke protested they were travelling to look at the country, and without any views of purchase or settlement. Such a motive for encountering the trouble and expense of a long journey, was without the circle of the settler's observation or experience; and he could only believe it by placing these young men quite low in his scale of human intelligence, and seemed to regard them with a feeling of pity or contempt. In the night, all the travellers were *stowed away* upon the floor of the cabin, with their feet towards a prodigious fire. This Green River cabin, like all its congeners, had but one room; and while the guests were stretched upon the floor, the landlord and his wife occupied their *puncheon* bedstead, which was pinned to the logs forming the side of the mansion. In the night, the duke overheard the good man expressing to his wife his regret that three such promising young men were running uselessly over the country, and wondering they did not purchase land there, and establish themselves creditably.

Here we shall in the mean while close our narrative, and conclude it in another paper.

THE HEAD AND THE HEART.

TRANSLATED FROM THE DUTCH.

The Head and the Heart are things which the world more frequently talks about than knows—two precious jewels, which they who possess speak but little of, just as every sensible rich man avoids speaking of his riches. If we consider the Head and the Heart attentively, we shall be led to view the former as a man, and the latter as a woman. The Head, like a man, is domineering and impatient; the Heart, like a woman, is tender and kind. When two Heads come into contact, a violent concussion generally ensues; when, however, two Hearts meet, in a minute they may be seen whispering together with female confidence.

The Head is a man, and therefore it calculates the course of exchange and the motions of the planets—peeps into committees and cabinets, unfolds financial operations, and plans battles; the Heart weaves love-knots, and lays the foundation of matrimonial alliances, for it is a woman.

Masculine indulgence sometimes grants the Head its hours of rest; the Heart, on the contrary, is continually in disquiet, for it is a woman.

The Head, like a man, seeks its happiness in possessing; the Heart, like a woman, is happy only when it can communicate what it possesses.

Man, the Head, endeavours to *meditate* on God, and halts in his presumptuous efforts; woman, the Heart, *feels* God, and this feeling gives her peace and happiness.

When a Head gets into company with Heads of inferior rank, if it be very courteous, it will, with true manly condescension, lower itself to them, and the offended Heads, therefore, secretly hate it; the female tender Heart, on the contrary, raises inferior Hearts to itself, and for this kindliness reaps gratitude and love.

The Head condemns, the Heart excuses; the Head revenges, the Heart forgives; the Head is ingenious, the Heart is feeling; the Head wounds, the Heart heals; the Head conquers, the Heart captivates; the Head is therefore a man, and the Heart a woman. We could carry this comparison still farther, and say, Head and Heart are husband and wife, for Head and Heart, as we have just seen, are always of different opinions. The Head, like my lord husband, blusters and commands; the Heart lets it speak, and takes its own way after all, like my lady wife.

My Lord Head makes his approach with a graceful bow; my Lady Heart storms us with sweet glances and tender words.

The Head, according to the custom of reckless husbands, has recourse to the Heart only when the world has soured and sickened it, and rushes again into the tumult of life, ungrateful as a husband, as soon as the Heart has tenderly smoothed the furrows which chagrin had ploughed on his brow.

When Head and Heart happen to dispute, the Heart, as the wife, has commonly the last word, and on such occasions the Head displays a gallantry which other husbands are deficient of—it is silent when the Heart becomes clamorous.

If Mr Head tyrannises over Mrs Heart, it makes but an unhappy union; but the most miserable household of all is, when Mr Head is under *petticoat government*.

If Mr Head becomes bankrupt, ten to one but it is Mrs Heart's fault.

But too often Head and Heart live together like a fashionable pair of the present day—where the one is to be found, we may be almost certain not to find the other.

The Head, as husband, is the first to hold his tongue when he is in the right; the Heart, as wife, cries the loudest when she is most in the wrong.

But I begin to perceive I have betrayed a number of the secrets of my Lord Head and my Lady Heart; and who knows but I had done better to save myself the trouble, for I am convinced that, independently of this, neither are strangers either to my male or female readers.

THE BRITISH ASSOCIATION AT GLASGOW.

THE NEW MECHANICAL POWER FROM ELECTRO-MAGNETISM.

In the Section of Mathematical and Physical Science, on Tuesday, September 22, Professor Jacobi of St Petersburg, noted as the first experimenter on the electro-magnetic power as a mechanical force, read a paper on that subject, from which it appears that a great advance has now been made towards the economic use of electro-magnetical machines as a motive power. Mr Jacobi described a series of experiments which he had made at St Petersburg for ascertaining the best means of producing and applying this force. We cannot hope to make these intelligible to our readers; but it appeared that several laws of great importance had been ascertained by the learned professor, and that he had satisfied himself as to the best form of the rods and coils to be used in the mechanism. He then announced the interesting fact, that a boat had last year been propelled upon the Neva at St Petersburg, by means of electro-magnetic machines. This boat was twenty-eight feet in length, by seven and a half in breadth, drawing 2½ feet of water. It was furnished with a small machine, which was set in motion by a battery of sixty-four pairs of platina plates, each having thirty-six square inches of surface, and charged with nitric and diluted sulphuric acid. *The boat moved, with fourteen persons on board, at the rate of three miles an hour.* This degree of success is, of course, far from being sufficient to cause electro-magnetic power to supersede steam; but every thing of this nature is liable to progress. The first steamboat moved at about the same rate. Professor Jacobi's boat, when tried in 1838, with a much more complicated battery, and charged with sulphate of copper, moved at only 1¼ miles an hour. At the first experiment made with the power, at Konigsberg, in 1834, only a weight of twenty ounces was lifted. These facts give reason to hope that, ere long, the electro-magnetic power will be developed in sufficient force, in a sufficiently economical manner, and with a mechanism occupying such space, as will enable it to take the place of steam, by sea as well as land. Its peculiar importance in regions where coal is not to be got, is too obvious to require being insisted on.

INCREASE OF COLOUR BY INVERSION OF THE HEAD.

On the same day, in the same section, Sir David Brewster read a paper on the fact long known to artists and tourists, that the colours of external objects, and particularly of natural scenery, are greatly augmented by viewing them with the head bent down, and looking backwards between the feet, that is, by inversion of the head. The colours of the western sky and purple tints of distant mountains are, according to Sir David, beautifully developed by these means; those which, in ordinary circumstances, appear of a French grey colour, displaying a brilliant blue or purple tint when the head is inverted. This phenomenon has been ascribed to various causes. It has been thought to arise from the objects, in these circumstances, falling upon a part of the retina not accustomed to the exercise of vision; but this, Sir David thinks, cannot be the true explanation, as landscapes may be inverted by reflection without altering the colour, but when these inverted images are looked at with the head inverted, the increase of colour will be observed. Another theory is, that when the head is inverted, the legs protect the eyes from lateral light; but neither can this be the cause, for, in standing upright, and protecting the eyes even in a greater degree from the approach of light sideways, no increase of colour takes place. The theory with which Sir David at last rested satisfied, was suggested to him by what had been known to take place in an inflamed eye, namely, a great increase of apparent light. He believes that the phenomenon is occasioned by the increased quantity of blood thrown into the vessels of the eye when the head is inverted, the increased pressure thus produced upon the retina, and the increased sensibility thus given to the sentient membrane.

REPRODUCTION OF PARTS IN THE LOWER MARINE ANIMALS.

The power possessed by some of the lower orders of creation to supply any part of their bodies which may have been cut away, is one of the most curious problems in science. It is a power totally absent in vertebrate animals, and, indeed, we have to go low down in the scale before we find any trace of it. It is first found, we believe, in crustacea, or shelled fish. It is possessed, however, to a far more wonderful extent, by that humble class of marine animals, the polypi, which can scarcely be distinguished from plants, and whose growth seems to proceed upon principles greatly resembling vegetation. Yet some of these animals are of highly complicated structure, and exercise many surprising functions. At this meeting of the association, appeared a gentleman who has perhaps devoted more time and pains to the investigation of their economy than any other existing naturalist—Sir John Graham Dalyell of Edinburgh. He gave, in the Section of Zoology, a remarkable

Digitized by Google

account of two of the order, the Holothuria and Amphitrite, which we find thus reported in the *Athenæum*:—

"The adult *holothuria* resembles a cucumber, or a sausage, from six to twelve inches long, purple, yellow, grey, or white. Some thousand suckers cover it like a shaggy coat, or disposed in rows according to species, affixing it firmly to solid substances, where it remains quiescent in a crescentic form during the day. But when evening comes, a tuft, protruding from the larger extremity of the crescent, unfolds into a capacious funnel, composed of eight, or ten, or twenty beautiful branches implanted on a shelly cylinder, in the centre of which is the mouth. Each branch now begins to sweep the water in succession, and descends almost to the root within the mouth, in a contracted state, whence it arises to enlarge anew. These evolutions are protracted until the latest hour; but as morning dawns, the whole apparatus is withdrawn, the skin becomes close and compact as before, and a fountain begins to play from the opposite extremity. This singular animal is liable to lose all the preceding organic apparatus, consisting, in the *Holothuria furus*, of eight larger and two smaller branches (*tentacula*), together with the cylinder, mouth, œsophagus, lower intestinal parts, and the ovarium, separating from within, and leaving the body almost an empty sac behind. Yet it does not perish. In three or four months all the lost parts are regenerated, and a new funnel composed of new branches as long as the whole body of the animal, begins to exhibit the same peculiarities as the old one, though longer time be required to attain perfection. Other species of the holothuria divide spontaneously through the middle, into two or more parts—all becoming ultimately perfect, by the development of new organs. Yet the anatomical structure of the whole genus is so complex, as to defy the skill of anatomists in discovering the proper functions of some of the parts. A single holothuria has produced 5000 ova in the course of a night. The young resemble a white maggot, when the size of a barleycorn. The animal may lose and regenerate its organs more than once: it is very rarely to be procured entire; nor until the drawings now laid before the association, has it been even represented alive and perfect. A specimen survived with Sir John about two years. The *Amphitrite* is an animal still more interesting, from the faculties it possesses, and the properties which it enjoys. Various species inhabit the Scottish seas, all occupying tubes either of their own manufacture, by a process truly mechanical, or in a thin silken sheath formed by an exudation from the whole body, or they rest amidst a thick tubular mass of transparent jelly, also of animal secretion. The body of the *Amphitrite ventilabrum* extends twelve inches or more in a serpentine form, consisting of 350 segments, crowned by a beautiful, varied coloured plume of eighty or ninety fleshy feathers, and terminated by a double gland. These (the branchiæ) are arranged as a funnel or shuttlecock, three inches deep, and resembling the finest flower, with two spines in the centre, and each feather is bordered by at least 500 cilia or fleshy hairs along the shaft. This, which is the most timid of creatures, dwells in a black, leathern-looking, perpendicular tube, two feet high, entirely of its own manufacture, rooted by the lower extremity. Singular to be told, the observer possesses the ready means of inducing the humble tenant to display its powers. If, while stretching its beautiful plume above the orifice of the tube, and spreading it to enjoy the circumambient element, he drop a little muddy matter from above, an interesting spectacle ensues—immediately all the feathered apparatus is seen in action, though the animal be apparently still. Forty thousand cilia are at work, and a mass is soon discovered accumulating at the bottom of the funnel. Being thence transmitted to the mouth, it is imbued with gluten, and discharged as paste on the edge of the orifice of the tube. There the creature, having raised itself still higher, performs a slow revolution while moulding the paste into proper form, by means of two organic trowels, prolonged from a fringe around the neck. With these it beats down the paste, and clasping over the edge of the tube, smoothes its materials into symmetry as if it were by the operation of human hands; but on the slightest alarm the plume collapses, the artist sinks below in an instant, and remains with the orifice closed, until, believing the danger over, it may rise to resume its task in security. As specimens occur of different dimensions, let the observer cut a fragment off the lower end of the tube, which is always longer than the tenant: it will be affixed again where desired. Treating a number thus, and tossing them into a glass jar of sea water, a grove will arise before him, from the animals fixing them anew, and protruding like so many revolving flowers, to collect muddy drops from above, with which he provides them. The adhesion is accomplished from a glutinous or silky sheath, which the double terminal gland seems instrumental in producing. Should the amphitrite be mutilated of the anterior part, the whole will be regenerated; nay, should a fragment of the smaller or posterior extremity be severed from the body, an entire plume, spines, mouth, and trowels, will be generated to crown the anterior part of this fragment, and render it a perfect animal. It is very remarkable, that the powerful reproductive property of the genus is not confined to the visinity of the lost organs, the elements of others reside in different and distant parts of the body, from whence human perceptions cannot discover any likelihood of their evolution by means of their own energies. The adult *Amphitrite bombyx*, which obtains a silken sheath merely by spontaneous exudation from the body, is about three inches long, of which a third part is the plume, consisting of sixty or seventy feathers (branchiæ). Two artificial sections of the body of a vigorous specimen speedily invested themselves with a sheath, wherein they reposed quiescent. The organisation of the upper portion remained in its original state; the middle section acquired the wanting parts, and a plume of eight feathers was generated by the lowest section, though this section had been only two lines, or the sixth part of an inch, in length. Thus three plumes existed at once, with all their appurtenances, on what had been a single animal."

BEYROUT—THE DRUSES.

The following extracts from the journal of an Ayrshire gentleman, who lately returned from a three years' tour in the East, appeared a few days ago in the *Ayr Advertiser*; and having been brought under our notice by one of his relatives, we consider them worthy of being offered for the perusal of our readers:—

"September 3, 1838.—Arrived at Beyrout, after two months' overland journey from Alexandria, by way of Jerusalem, Tiberias, Acre, Tyre, and Sidon.

Beyrout possesses more stir and bustle, from its commercial character, than any town I have yet seen in Syria. Its situation is beautiful. From a small eminence near the gate, there is a splendid panorama of the distant Lebanon hills; to the east a long, low promontory, on the end of which are situated the Lazaretto buildings, near which the vessels ride at anchor in the roads; and all round the town richly wooded environs, dotted with villas, and the country residences of the merchants. The town itself is surrounded with a Genoese wall, of no great strength; and the harbour is commanded by an old fort or castle, in a ruinous condition. I returned again to Beyrout in January 1839, and, as I remained there for six weeks, had an opportunity of making myself acquainted with the city, surrounding country, and inhabitants. There are several British mercantile houses in Beyrout. There are also several French, and some Italian merchants established there. Mr Moore, the British Consul, resides in a handsome house near the bay. Mr Chasseaud, the American Consul, has also a large house situated close to the sea, which must have been much exposed in the late bombardment. There is a small pier for loading boats, but insufficient to afford shelter to vessels of any size; and the roads are so exposed, that ships, when it comes on to blow, generally make for the mouth of Nahr-el-Kelb, or the Dog River, where they are more sheltered.

Several American missionaries have taken up their residence in the environs of Beyrout; and though, in general, I am no great admirer of the missionary system, I could not help appreciating the unpretending nature of their labours, and the real good they are accomplishing, by means of schools and a printing-press of their own, by which they distribute a great deal, not only of religious, but of general information. I found them, in themselves, pleasant people, and in their well-regulated families have, at various times, spent both pleasant and profitable hours. Mr Thompson, one of their principal members, married Mrs Abbot, the wife of our late consul at Beyrout. Every Sunday they perform divine worship in the Presbyterian form, in the American consulate, and are attended by their own families, and the resident Frank merchants, almost all of whom, here as well as in Aleppo, are Scotch, principally from the west of Scotland. Mr Hield is, I believe, the only exception.

Along the shore of Beyrout there are some slight traces of the ancient city—tanks hollowed out of the rock, some pieces of rough mosaic work, over which the road now passes, and fragments of strong walls, though their era is more doubtful.

Sept. 6, 1838.—Left Beyrout for Deir-el-Kamer, the country of the Druses, which we reached on the following day. The village itself occupies the side of a hill, and on the opposite mountain, crossing a deep ravine, are the palaces of the prince, and the various buildings connected with the royal establishment. The whole country is richly wooded, the mountains being covered with vines and olives in terraces, and watered by small canals or streamlets, which are made to fall in cascades in various places, adding greatly to the beauty of the place. The palace where the Emir Beschir, or sovereign, holds his levee, is a very splendid building, the finest I have seen in Syria. It consists of a spacious court formed by the royal stables, at one end of which is a handsome entrance or staircase, supported by columns which lead to a passage, having on each side the chambers of the officers of the household, &c. Beyond this is a fine area, surrounded by columns, with a handsome fountain playing in the centre. To the left of the entrance, and in a second spacious court, is the Divan, where the emir administers justice and receives audience; and opposite is a handsome façade, adorned in the eastern style with arabesque work, where the armoury, &c., is kept. The other palaces, three in number, belong to his sons, and he has a private one where his wife lives. Of these we only saw the exterior, which are also handsome, though on a smaller scale.

We were lodged in the principal palace, and during the day amused ourselves watching the arrival of mules and horses, loaded with the arms given up by the Druses in consequence of the late capitulation. A French dragoman, and some of the officers of the household, paid us a visit in the evening, and from them we acquired as much information as we could upon the Druses generally, and the particulars of the late war.

The Druses are a wild, ungovernable race of people, inhabiting principally this district of Syria, though scattered over the whole country. Equally opposed to Turk and Christian, they stand alone in the world; and over their religion, domestic life, and internal government, there hangs a mystery which has never been cleared up. From some of their books, however, captured by Ibrahim Pacha in the war, it is ascertained that they worship Hakem-Bamri, who was the fifth of the Fatimite Caliphs, about the year 400 of the Hegira. One class is set apart as ministers of their religion, and initiated into all its mysteries, but the mass of the people are, I believe, themselves perfectly ignorant of it. By many people they are supposed to be descendants of the crusading armies. They are certainly a race quite distinct from the Arabian tribes.

The Emir, or Prince of the Druses, as he is generally called, should more properly be denominated the Prince of the Christians, himself and the greater part of his subjects being of that persuasion. The Druses are the refractory part of his population, being as often at war with himself as with the other tribes of Syria—totally undisciplined and unofficered, they owed their successes in the late unequal struggle to the nature of their country, and their intimate acquaintance with all its localities. Like the Highlanders of our own country, or the Swiss in their memorable contest with the Austrians, their tactics have always been to inveigle the soldiers into the mountain passes, where neither cavalry nor artillery can act, and there, sheltered by the rocks, they pour an incessant fire, and hurl stones upon the confused and terrified soldiery, who fire at random upon an invisible foe. About eight months ago (in February 1838), irritated by some very impolitic and unnecessary harshness exercised towards them by Ibrahim Pacha, and particularly galled by the laws which compelled their young men to serve as soldiers, of which they have great detestation, they broke out into open hostilities in the Houran, massacring some Egyptian troops. War being thus declared, 4000 Druses from Deir-el-Kamer joined the original insurgents, and marched towards Damascus, in the vicinity of which it was carried on till within three weeks ago, when they were finally subdued, and bound by treaty to deliver up their arms, which are now collected all through the country by Ibrahim's officers, and by his orders delivered to the Christians for their own defence, and for keeping down the Druses in future. The total number of soldiers who fell in the contest is about 15,000, whilst the entire loss of the Druses was not 3000 men.

September 8, 1838.—To-day we had an audience of the old gentleman, who received us very graciously. He is a fine-looking old man, with a long white beard; he is about seventy-five years of age, fifty of which have been passed upon the throne. Sovereign of a large district of country, he is independent as far as regards the government of his kingdom, election of his offices, laws, &c., but pays a tribute of 6000 purses (about L.30,000) to the Porte, through the hands of Mehemet Ali. The number of acknowledged Druses in his dominions, who pay tax to him, is about 25,000; the Christians about 35,000. By his first wife, now dead, he has three sons, the second of whom is expected to be his successor. By the laws he may leave the kingdom to which of his sons he chooses, but six years ago the Salic law was passed, excluding females from the succession. His present wife is a young woman, not twenty years of age, by whom he has one daughter."

CAMILLA COLVILLE.

A TRADITION OF THE COUNTY OF DURHAM.

In the early part of the last century, Edward Colville, who had realised a competency as a butcher and grazier, resided in a mansion called the White House, which may still be seen in the vicinity of Gateshead. The respectability of his character, and the style in which he lived, were such as to admit of his daughter Camilla attending the assize balls in Newcastle, though these were then fully as exclusive as they are at present. Gifted by nature with an elegant person, and with some advantages of education, Camilla was a young lady eminently qualified to grace those assemblages. It is not therefore surprising, that at one of them she had the good fortune to attract the attention of a young nobleman, Lord Osmilton, the eldest son of the Earl of Tankerville. It occasioned no small flutter in the room, when this gentleman, after the proper formalities, requested of Miss Colville the honour of being allowed to walk a minuet with her. She blushingly consented, and rarely had the ball-room of Newcastle exhibited a more striking display of graceful movement than what was displayed while this stately dance was in the course of being performed. Lord Osmilton was charmed beyond all measure by the beauty of his partner, and, as he handed her to her carriage, or whatever other conveyance her father's fortune allowed of, he only vowed that the first should not be the last night of their acquaintance.

The next day beheld the heir of the house of Tankerville, at an hour which would now be considered preposterously early, calling at the White House to pay his respects to its fair tenant. Next day, and the next again, he renewed his visits; and, in short, his attentions became so conspicuous, that the young lady's father, from being simply flattered by the notice of a person of rank, began to fear that feelings might arise between the parties which would only lead to disappointment. Perhaps he had even graver fears, which any one acquainted with the maxims of the gentlemen of that age will not deem to have been at all unreasonable. It was only in the immediately ensuing age that Richardson drew the character of Sir Hargrave Pollexfen.

He therefore made some efforts to keep Lord Osmilton out of the company of his daughter, but with no great success. Denied admittance to the house, the

Digitized by Google

young noble still could beset her when she went abroad, seat himself near her at church, and get insinuated into any little social party where she was expected. Mr Colville at length saw it to be necessary to take very decided measures, and he resolved to place the young lady for some time in a new and distant home. A relation of his had been long settled as a merchant in Holland. In the hands of that gentleman he thought she would be quite safe from Lord Ossulton's addresses. He had also very opportunely a friend who conducted a vessel of his own regularly between South Shields and the ports of Holland and the north of France. By means of this friend it was comparatively an easy matter to get the young lady conveyed to her new home. It may here be remarked, that the ship-owners, who in those days navigated their own vessels from South Shields, were a highly respectable class of men, generally possessing good education and manners, and living, when at home, in a style of considerable dignity. Amongst the descendants of more than one of them, might be found members of both houses of parliament. They took the name of Captain, and had, we believe, some solid grounds for doing so, as trading beyond certain latitudes and longitudes specified by Queen Elizabeth, gave masters of merchant vessels a modified permission to assume that title. Captain Aubane readily entered into the views of his friend Colville, and undertook to convey the young lady in safety to her relative in Rotterdam. She was, accordingly, conducted in the most private manner to South Shields, and put on board his vessel. How she felt on the occasion, has not been remembered by tradition; but if, as is likely, she regarded her lover with affection, and deemed the voyage a compulsory exile, the authority of parents was in those days too awful and inflexible to admit of her making any thing like effectual remonstrance.

The voyage passed in safety; Camilla was consigned to her father's Dutch friend; and Captain Aubane returned with the pleasing intelligence that all was safe. If Mr Colville, however, believed that Lord Ossulton had been "thrown out," he was mistaken; for, before many weeks had elapsed, his lordship made his appearance in Rotterdam, and became as troublesome to the family who had charge of his mistress, as he had formerly been to her father. The Linden Walks lent their shade to certain meetings of the lovers, and, when such meetings were denied, his lordship made signals of affection from the street, which Camilla could furtively read in the friendly mirror projecting from the parlour window. The Dutch friend now became more distressingly alarmed than ever the father had been, in as far as a responsibility for the interests of another is more harassing than responsibility for interests of one's own. He therefore resolved to get quit as soon as possible of his fair but perilous charge. Captain Aubane, ere long, returned to Rotterdam for another cargo, and, when he was about to sail, Camilla was once more put on board his vessel.

Behold the belle of Newcastle again at sea. But now it was with very different feelings that she crossed the German Ocean; and for this change there was no doubt good cause. The Dutch coast had for a day been lost in the blue distance; sea and sky were the boundaries of the sailors' sight; and honest Aubane was congratulating himself on the prospect of soon committing Miss Colville in safety to her father's keeping, when, descending into the cabin, how was he astonished to behold, kneeling at her feet, that very Lord Ossulton who was the cause of all his apprehensions, and whom he supposed to have been left lamenting on the quay of Rotterdam! He soon learned that the lover had contrived, by the connivance of a sailor, and, doubtless, with the concurrence of his mistress, to secrete himself on board the vessel a little while before it sailed. It was too late to think of returning to the Dutch harbour to put Lord Ossulton ashore; but, in allowing him to proceed on the voyage, Aubane resolved to make him as little the better of his contrivance as possible. Exerting the authority which his position gave him, he commanded the young lord to withdraw from the cabin, and not to appear there again, unless in his company, and by his express permission. He also stipulated that, while he was himself on deck upon duty, Lord Ossulton, to make sure of obedience to the rules, should remain beside him, at whatever time of day or night, and under whatever circumstances of weather. The lover found himself compelled to submit to all these restrictions; but the privilege of seeing his mistress once a-day, even in the presence of a third party, served in no small degree to reconcile him to their strictness.

In the course of the voyage, which was not a short one, the heir of Tankerville made a more favourable impression on the mind of Aubane than he had done on the less enlightened and more jealous nature of the young lady's father. Aubane became convinced that, however frivolous or otherwise objectionable might have been the feelings with which he at first regarded Camilla, he was now inspired by an honourable affection. He was also induced to believe the young man when he protested, in the most earnest manner, that the future happiness of his life depended on his obtaining the hand of Miss Colville. The South Shields ship-owner did not, indeed, like the idea of encouraging a young nobleman in an object which must be regarded with dislike by his father and other relations; but on this point also his scruples were at length overcome, doubtless by persuasives strictly honourable. The consequence was, that on arriving at South Shields, he allowed Lord Ossulton to become an inmate of his house, in company with Camilla, until the consent of her father was obtained, and the necessary preparations were made for their marriage. With respect to the feelings of the lover's family, tradition is silent; we may well believe that they were not favourable, for the union of the pair is known to have taken place at Jarrow church, the ancient seat of the Venerable Bede; a place of worship which, from some local prepossession, has been for ages the resort of young couples seeking to enter the bonds of wedlock without the consent of parents.

After the ceremony, the pair took up their residence with the lady's father at Gateshead, where they resided for some years. At length the death of his father made Lord Ossulton Earl of Tankerville, the second of the title; and Camilla Colville, as Countess, became entitled to the chief seat in the splendid halls of Chillingham Castle. Our heroine was afterwards one of the ladies of the bed-chamber to Queen Caroline, the consort of George II. She played her part as a peeress with a due portion of dignity and spirit, and continued, long after being the mother of three children, to be one of the most beautiful women at the English court. She survived her husband in a long dowagerhood, and died in 1775, at the age, it has been said, of 105; but this is probably a mistake, though it is likely that her term of years much exceeded that ordinarily allotted to the children of Adam.

SONG.

BY MR ANDREWS.

(Sung at a public dinner at Boston, U. S., in honour of Mr Cunard's introduction of steam navigation between England and America.)

What projects men make—what queer turns they take,
Since *steam* has improved our condition;
They never are still, but must cure or must kill
With steam physic or steam ammunition.
But a short time ago, to a quack you would go,
To steam a fat man to a thinner;
Now changed from all that, if you wish to get *fat*,
Come to Barton's and eat a *steam dinner!*
Oh dear! think of a scheme, odd though it seem—
I'm sure 'twill succeed if you make it by steam.

You may sleep, you may dream, you may travel by steam,
For the outcry is still to go faster;
And what does it reck, should you o'en break your neck,
If 'tis *steam* that brings on the disaster?
* * * *
Oh dear! think of a scheme, odd though it seem—
I'm sure 'twill succeed if you work it by steam.

East Boston one day, we have heard people say,
Was nought but a desolate island;
But making by steam, they fill'd up the stream,
And turn'd the wet dock into dry land.
Then with a steam chain it grappled the main—
What noddle but follows my ditty?—
No longer alone, but '*bone of our bone*,
And flesh of the flesh' of the city.
Oh dear! think of a scheme, odd though it seem—
I'm sure 'twill succeed if you work it by steam.

How timid and slow, but a few years ago,
The world hobbled on in its motion;
Old Europe seem'd far as the fix'd northern star
O'er the boundless expanse of the ocean.
But though it was hard—at the word of Cunard,
Britannia herself is a rover;
Old England awhile, that '*fast anchor'd isle*,'
By *steaming* is now '*half-seas over*.'
Oh dear! think of a scheme, odd though it seem—
I'm sure 'twill succeed if you work it by steam.

BONS-MOTS OF OTHER DAYS.

By *bon-mot* is literally signified a good-word, or, as we may translate it, a happy saying, or some kind of observation which is at once witty and to the point. Some nations excel in uttering bon-mots, but none more so than the French and Irish, both of whom possess that liveliness of fancy that carries them on to cleverness of repartee, perhaps with little regard to consequences. The English are poor at this species of jocularity, and the Scotch more so. Among the ancient Romans there were many clever utterers of bon-mots. The following are a few tolerably good ones, along with some of a later date, collected from an old book in the French language, which has chanced to come into our hands.

One day, the philosopher Bias found himself in the same vessel with a crowd of sorry scoundrels. A tempest came on; and instantly the whole band began to invoke the succour of the gods. "Be quiet, you wretches!" said the sage; "if the gods perceive that you are here, we are gone!"

A musician complaining that the tyrant Dionysius gave him nothing, after promising him much, for the exercise of his art—"You fool, we are quits," said the tyrant; "you tickled my ears, and I did the very same by yours."

Antiochus, King of Syria, caused the numerous army which he had assembled against the Romans, to defile before Hannibal, and pointed out with pride to the Carthaginian hero the arms of the infantry, glittering with gold and silver, and the cavalry, whose horse-trappings, bits, and saddles, as well as their armour, were loaded with golden ornaments. The elephants were decorated in a similar manner. Having shown all, Antiochus triumphantly asked the Carthaginian if he did not think that all this would do for the Romans? "Oh, yes," returned Hannibal, "even if they were more greedy than they are."

A Roman captain, having gone over to the camp of Pompey from that of Cæsar, declared to Cicero that he had come off so hurriedly that he had not even thought of bringing his horse with him. "You have provided," replies Cicero, "much better for your horse's safety than for your own." After the defeat (thus foreseen) of Pompey on the plains of Pharsalia, the captain Nonius said to Cicero, "Be of good heart; we have yet left seven eagles." "An excellent thing, if we had to fight with jays," replied the orator.

The Emperor Domitian was accustomed at his leisure hours, to shut himself up alone in his chamber, and there indulge in the amusement of sticking flies with a pin. A courtier inquiring one day if there was any one with the Cæsar, "No one," said Vibius-Crispus; "not even a fly."

Charlemagne studied to bring around him, by liberal donations, all the most learned men of his age. He was less successful, however, than he could have wished, and complained of this, one day, to the learned Alcuin. "Would to heaven," said the monarch, "that I had about me twelve such men as Jerome and Augustin!" "What, sire!" replied Alcuin, "hath the Creator of heaven and earth but *two* men of such merit, and you would have *twelve?*"

Thomas Aquinas entered the chamber of Pope Innocent IV. whilst large sums of money were being counted there. "You see," said the pontiff to him, "that the church has been blessed, and is no longer in the state in which she was when it was said, 'Silver and gold have I none.'" "It is true, holy father," said Aquinas; "but neither can she now say to the paralytic, 'Take up thy bed and walk.'"

Henry IV. of France one day reached Amiens after a long journey. A local orator was deputed to harangue him, and commenced with a long string of epithets. "Very great sovereign, very good, very merciful, very magnanimous"—— "Add, also," interrupted the king, "very tired!" A famous physician having quitted Calvinism for Catholicism, Henry said to his Protestant minister, Sully, "My friend, your religion is surely very ill. The doctors give it up." The same monarch was one day harangued by a speaker in a small country town, during whose discourse an ass brayed at a short distance. "One at a time, gentlemen," said the king.

One of the kings of Spain had been unsuccessful in war, and had lost several provinces; yet he received, notwithstanding, the title of *the Great* from his courtiers, and, the more unfortunate he grew, was the more rigid in exacting such honours. "Yes, he is Great," said a wit, "just as a ditch is great. The more earth you take from it, the bigger it becomes."

The Duke of Roquelaure was any thing but beautiful. Meeting one day a very ugly country squire who had business at the court, the duke introduced him to the king, saying that he lay under the weightiest obligations to the gentleman. The king graciously accorded to the squire the desired favour, and then asked Roquelaure what was the nature of his obligations to the other. "Ah, sire, without this dog, I should be the ugliest man in your majesty's dominions," was the answer.

The judge Le Coigneux desired his macer of the court, named Maillard, to keep the auditory silent at a trial. The macer accordingly bawled out "silence" every instant, though no voice was in action but his. The old judge at last cried to him testily, "Macer, make Maillard be quiet."

The celebrated Malherbe dined one day with the Archbishop of Rouen, and fell asleep soon after the meal. The prelate, a sorry preacher, was about to deliver a sermon, and awakened Malherbe, inviting him to be of the auditory. "Ah, thank you," said Malherbe; "pray excuse me; I shall sleep very well without that."

The Abbé Regnier, secretary of the French Academy, once made a collection of money among the members for some common purpose. He went round at a meeting with his hat, receiving the contributions. Not perceiving that the president Rose, a very miserly person, had dropped in his share, the abbé presented the hat again to him. The president declared that he had made his contribution, and Regnier said, "I believe it, but I did not see it." "And I," says Fontenelle, "saw it, but could not believe it."

A peasant went into a large city, and, among other objects that struck his fancy, was arrested by a banking-office, where he saw people go out and in, without getting any goods, apparently, as in other shops. He ventured to enter and ask the teller what was sold there. "Asses' heads," was the sneering answer. "What a business you must have!" said the rustic; "I see you have but one left."

It would often be better not to attempt to reward a brave action, than to reward it ill. A soldier had his two arms carried off at the wrists by a shot. His colonel offered him a crown. "It was not my gloves, but my hands that I lost, colonel," said the poor soldier reproachfully.

A man of genius was one day told that he would be introduced to a person worth knowing—"a person," said the intending introducer, by way of particular commendation, "who has actually got by heart the whole of Montaigne." The man of genius coldly replied, "I have the work here."

A prelate had gone to Rome, in expectation of a cardinal's hat. He returned home, however, without obtaining the object of his wishes. Soon after, he went to court and paid his compliments to the king, but was so hoarse with a cold, that he could scarcely make himself intelligible. The king afterwards chanced to express his surprise that the prelate should have so exposed himself as to catch cold. "Ah, your majesty need not wonder at that," said a wit, "since the prelate came from Rome without the hat."

NUMBER 464. SATURDAY, DECEMBER 19, 1840. PRICE THREE HALFPENCE.

ANATOMY OF ENGLISH RESERVE.

EVERY one must know and have often laughed at the story told of two Oxford students, one of whom, in boating on the Isis, fell into the water, and seemed in imminent danger of being drowned, while the other, a good swimmer, looked on from the Magdalene Bridge, and contented himself with remarking, "Bless me, what a pity I never was introduced to that man!—perhaps I might have been able to save his life!" This is a pretty fair hit at that ultra delicacy of English gentlemen, which forbids them to address each other without being previously attested for by a common acquaintance. We find the following remarks on the same point in De Tocqueville's work, "Democracy in America:"—

"If two Englishmen chance to meet at the antipodes, where they are surrounded by strangers whose language and manners are almost unknown to them, they will first stare at each other with much curiosity and a kind of secret uneasiness; they will then turn away, or, if one accosts the other, they will take care only to converse, with a constrained and absent air, upon very unimportant subjects. Yet there is no enmity between these men; they have never seen each other before, and each believes the other to be a respectable person. Why then should they stand so cautiously apart? We must go back to England to learn the reason.

As aristocratic pride is still extremely great amongst the English, and as the limits of aristocracy are ill-defined, every body lives in constant dread lest advantage should be taken of his familiarity. Unable to judge at once of the social position of those he meets, an Englishman prudently avoids all contact with them. Men are afraid lest some slight service rendered should draw them into an unsuitable acquaintance; they dread civilities, and they avoid the obtrusive gratitude of a stranger quite as much as his hatred.

Many people attribute these singular anti-social propensities, and the reserved and taciturn bearing of the English, to purely physical causes. I may admit that there is something of it in their race, but much more of it is attributable to their social condition, as is proved by the contrast of the Americans.

In America, where the privileges of birth never existed, and where riches confer no peculiar rights on their possessors, men unacquainted with each other are very ready to frequent the same places, and find neither peril nor advantage in the free interchange of their thoughts. If they meet by accident, they neither seek nor avoid intercourse; their manner is therefore natural, frank, and open. It is easy to see that they hardly expect or apprehend any thing from each other, and that they do not care to display, any more than to conceal, their position in the world. If their demeanour is often cold and serious, it is never haughty or constrained; and if they do not converse, it is because they are not in a humour to talk, not because they think it their interest to be silent.

In a foreign country, two Americans are at once friends, simply because they are Americans. They are repulsed by no prejudice; they are attracted by their common country. For two Englishmen the same blood is not enough; they must be brought together by the same rank. The Americans remark this unsociable mood of the English as much as the French do, and are not less astonished by it. Yet the Americans are connected with England by their origin, their religion, their language, and partially by their manners: they only differ in their social condition. It may therefore be inferred, that the reserve of the English proceeds from the constitution of their country much more than from that of its inhabitants."

There is truth in this explanation of De Tocqueville; but it does not appear to us to be the whole truth.

In America there are few diversities of rank. The great bulk of the people are brought to a level by two causes—their being universally engaged in active pursuits, and their having each and all exactly the same political privileges. But where a decided diversity of rank does exist, we find as great reserve between the classes as in England. The white and coloured population keep apart, even in churches. The reserve in this case is, however, merely an exception that serves to confirm our rule. The people are upon the whole a nation of equals, and there is therefore not much occasion for punctilios in their intercourse with each other.

In England, on the contrary, there is a great variety of grades, of which the following are, we think, pretty well marked:—the titled and landed class; the class landed though not titled; the class of capitalists living independently of exertion; the established and privileged clergy; the mercantile and manufacturing class; the shop-keeping class; the operative class. All of these are in considerably different circumstances from each other, possess different degrees of political influence, and enjoy peculiar degrees of public respect. Differences in title, wealth, and importance of function, become therefore readily recognised, and are intensely appreciated. As a necessary result, there is a habit on the one hand of exacting respect on account of grade, and on the other of paying it, which strikingly marks our society. In phrenological language, self-esteem and veneration are brought into great activity amongst us.

To show how expressly these feelings are evoked by the peculiarities of our social condition, and so far to confirm De Tocqueville's views, it may be observed that the effect is different in different places. In a cathedral town, or in a Bath or Cheltenham, where a great number of the superior classes reside, this peculiar tone of English society is much more strongly brought out than in the manufacturing towns. These are comparatively in the condition of the American population—a mass of active equals. The natural frankness and good humour of the national character are there allowed free play, exactly as in New England; and when the inhabitant of a more aristocratic town goes to such a place, he feels precisely what the Halls and Hamiltons seem to have felt in America—namely, surprise at a familiarity which, though it may flow from the heart, and be accompanied by much practical kindness, is too opposite to respect to be strictly pleasing. This tends to prove the continued national identity of the Americans and English, and to show how much it is in consequence of social institutions that any diversity appears.

There is, then, in England what there is not in America—a habit of exacting and paying deference with a regard to differences of rank, privilege, and possession. With this habit, it is easy to see, an universal frankness and unreserve is totally incompatible. As well expect to see a community of purse established in a society composed of rich and poor, as a community of dignity in a society framed, as ours is, on a scale of real or implied rank. Each person, finding a real advantage in his rank, must naturally be disposed to preserve its distinctions, in his own case, with all possible care. Nor is it alone a matter of individual feeling: a member of a particular class is under a duty to his class in preserving its distinctions; and if he fails to do so, he is soon admonished of his error by the public opinion of his class. Hence in a great measure that *reserve* which distinguishes English manners: it is simply the guard which caution puts upon a dignity always in danger of being overlooked.

It must also be observed, as an almost unavoidable consequence of our differences of rank, that there is, in this country, a constant struggle upwards. So many advantages are seen to attend grade, that the members of each class seek eagerly to attain a place in the next above. This is an element of the question which those below are apt to overlook, but, in reality, it operates very powerfully. We do not, of course, justify the system which produces such results, but as long as the system is what it is, its results appear to us to be quite unavoidable. As certainly as there is hauteur and reserve on the one hand, is there a bustling anxiety on the other to fight up into the superior position, or to obtain a share of its advantages. Acquaintances are sought that they may be turned to advantage in obtaining some cherished object, whether it may be of a directly sordid kind, or only that privilege of mingling in refined circles, which in the mean time gratifies taste, and, in the long run, may lead to advantages of a more solid nature. So calculating is this propensity, that schools are selected for children, not with a regard to the education to be acquired in them, but that the children may form acquaintances which will prove useful in helping them on in future life. This policy makes its appearance in our most familiar maxims. "Always seek society rather above than below you," is one of those advices which every old person feels himself called upon to give to every young one. John, proceeding to the academy, is enjoined to make friends with the boys whose fathers are members of parliament, as he may be the better for them hereafter. Where such aggressive policy is pursued on the one hand, we cannot much wonder that a defensive policy is followed on the other—that the rich shun the needy as upon the whole troublesome associates—that the members of a superior rank put on discouraging looks at balls—and that the aristocracy seek schools for their children to which none but their own class have admission. There are two interests concerned, and they act as opposite interests always do. The hauteur of the upper ranks is not, of course, always justly due in the particular instances where it is shown; but it is a habit induced by the frequent occasion for its exercise. And, aggressions being more generally experienced from those who are nearly equals, than from classes considerably distant in rank, we can easily see how, in the gamut of society as in the musical scale, *seconds* are always the least harmonious.

It is not the mere anxiety to preserve grade, with all its presumed advantages, which operates in keeping classes apart. If the feelings of those who act under this policy were candidly inquired into, we believe it would be found that jealousy of aggression is, in many cases, less the animating motive, than is a feeling which, for want of a more exactly suitable name, we must call taste. In America, there is but a small and unimportant class who are quite independent of business; but in England, the portion of the community who are in this condition is very great. There is, indeed, a full half of the classes we have enumerated as composing British society, who live independently of traffic. This is a broad feature of distinction between the two countries, and one which could not exist without producing a great difference in their manners. Those who prosecute business, and those who do not, though they may mutually respect each other, are under the influence of such different ideas, and feel

Digitized by Google

their minds tending to such different objects, that they never can on any great scale be agreeable society to each other. The business man despises the vapid life and trivial amusements of the leisurely classes; and the leisurely classes have as little toleration for the acquisitive maxims, and sharp and knowing style of mind, which prevail in the business classes. The one class is concerned about necessities which the other has long got over and thrown beneath their feet: the other is concerned about nicetics which the inferior has not yet learned to appreciate, and never will till wealth and leisure be acquired. Removed high into the region of taste and refinement, the English leisurely class are disgusted by every association with that very mercantile industry and ingenuity which are the boast of their country, and the original source, in a vast number of instances, of their own affluence. It seems most absurd that such should be the case; but there is no preaching down any great law of human nature. Accustom any one to live apart from and independently of all homely things, and he will in time find it painful to be brought into contact with them. It is also to be observed, that no rational person amongst the English leisurely class is insensible, abstractly, of the importance of industrious occupation both to individuals and to the nation; they only do not feel that their daily comfort admits of an intimate personal connexion with the classes who are thus engaged. This is a distinction which must be universally intelligible. There are few so humble but they may look to an inferior class whose toils they respect and applaud, but from whom they would not be disposed to select their company.

It is not alone the direct operation of these causes which we have to take into account. Wherever a principle operates in many instances, it is sure to be attended by an extensive imitation. The jealousy of real rank, and the fastidiousness of real taste, set examples which are followed in grades where pretensions to either are more than dubious. In such circumstances, mutual repulsion becomes, as it were, the cue of society, just as, under the opposite circumstances of America, a "hail fellow, well met" feeling is the leading characteristic. To this we are to trace some of the best points of humour in modern English literature, where persons of a humble order are represented as affixing the terms "low" and "vulgar" upon classes or persons in no appreciable degree inferior to themselves.

While thus doing our best to analyse the causes of English reserve, we trust it will never be supposed that we wish in any degree to justify or defend it. As far as our own feelings are concerned, we should be amongst the last to take that ground. We must, in common with all benevolent men, lament that this essentially feeble and unmanly characteristic should have been so extensively introduced into English society. At the same time, we are anxious to have and to give a clear view of its causes; and to this object the present paper is confined. We must attribute it mainly to the existence of large titled and leisurely classes. If there be any advantage in an aristocratic grade, or in the realisation of large capitals in the hands of individuals, we must consider the reserve which marks our national manners as a drawback or deduction from it. No good is unmixed with evil, and this is no exception from the rule. It is curious, however, to trace the operation of natural causes in moral affairs. In New Zealand, the young men who, had they remained at home, would have been as delicately reserved as any of their compeers, are *roughing it* contentedly in fustian jackets, hewing trees, building houses, carrying luggage from the ships, and staking off potato gardens. No one there feels humiliated by doing any thing which circumstances render necessary. When we see such things result when "the influences" are withdrawn, can we doubt that such things would still have been amongst us, if "the influences" had never existed? Geology shows us that various climates have prevailed on the spot of earth we now inhabit, and that in each case the appropriate plants and animals occupied the soil. Were it once more to become torrid, the *calamites* and *equisetaces* of our coal beds would doubtless again arise by the banks of our streams, and the elephant would again roam through our forests. An *institution* seems to be not less certain in producing its effects upon the moral soil. The Anglo-Saxon nature, under a general equality of condition, becomes what we see it in America, in our large towns, and in our colonies; in the opposite state, it becomes what we see it in British society at large.

THE JEWELLER OF STRASBURG.

In the ancient city of Strasburg, lived Stephen Lenoir and his family. That family was small—so small, indeed, as scarcely to deserve a collective appellation—its whole members consisting of Stephen Lenoir and his daughter Manon. Lenoir was a man of middle age, and by profession a working jeweller. He had learned his trade in Paris, which was his native place, and bore so high a character for skill, attention, and industry, as to receive more employment than he could well accomplish. Of course, so far as his work was concerned, Stephen was brought into frequent contact with various classes of the community, as he executed tasks both for professional and private employers. Otherwise, he dwelt with his daughter in perfect solitude. In the midst of fellow-creatures, they associated with none. They had not only no friends, but even no acquaintances. Since Stephen Lenoir had arrived with his infant girl in his widowed arms, for fifteen long years, scarcely a human being, excepting the two settled inmates, had been seen within the walls of their little dwelling. What was the cause of this? Was it unsociableness of temperament on the part of the jeweller? Partly so, perhaps; but it arose still more from the sufficiency of what he possessed within to satisfy all his wishes, and occupy his thoughts. Manon and his business were to him all in all. Not a thought had he beyond these, at least after the loss of his wife, who had been the sun of his existence, and whose death cast a partial gloom over his whole remaining days. To Manon he was the kindest of fathers, and did for her in childhood a thousand kind offices, such as man seldom fulfils, being at once nurse, companion, and teacher. As she grew up to womanhood, she repaid him by becoming in turn the guardian of his comforts, as well as by the gentleness and affectionate docility of her nature. Her comeliness, too, was remarkable, and endeared her the more to her father, from recalling to him the memory of his wife, of whom she was the very image.

Day by day, month by month, year by year, Manon tripped up and down her paternal habitation, or sat by her low court-window, carolling gaily, like a happy though a prisoned bird. The floors, the tables, the walls, the ceiling, and, in truth, every spot and corner of the apartment, which, with the exception of a little garret and a small room with a bed-closet, formed nearly their whole house, were clean in the extreme; and the few table-utensils that were arranged on the walls, glittered like a river in the sun. Oft, indeed, did Manon cleanse and scour what was never soiled. Then her bird in the window occupied a portion of her time, for she not only fed her starling duly, but taught it to repeat the airs which she had caught from poor street-minstrels, and tamed it so, that it spent much of its time close by her side. Manon had her knitting and her sewing to attend to, moreover, these being the only arts which she had been compelled to learn out of doors; and duly as the cathedral bell tolled the morning and mid-day hours, her round and smooth brow, with the brown tresses clustering about it, and the blue eyes sparkling beneath, full of affection and cheerfulness, would be protruded within her father's work-room, and the announcement made, that she had the meal of the hour in readiness. Absorbed in these simple duties did Manon pass the years of her girlhood, having scarcely a thought beyond her own limited sphere.

She was seventeen years old, when an event of some moment marked the career of her sire and herself. Stephen Lenoir was compelled, in a case of peculiar emergency, to take an assistant into his workshop. He was very averse to this proceeding, but a piece of elaborate work required from him could not be executed otherwise in due time. The task, too, could only be performed under his own eye, and, if not executed at all, a considerable loss would be the consequence. Now, money had become insensibly dear to Stephen—how dear, he had as yet no perfect conception. He had laid by a pretty large sum, and, having few legitimate objects to expend it upon, such as most men have for the most part in plenty, it had become prized by him for *itself*. This growing passion had produced no perceptible change in his affection for his daughter, and perhaps it was with a view to her future comforts that he had at first taken pleasure in accumulating. However this may be, Stephen, on the present occasion, felt such a pang at the thought of losing the large sum to be gained by the execution of the required work, that he mastered his reluctance to the admission of any one to the privacy of his house, and engaged an assistant for the term of a few weeks.

This assistant chanced to be a young countryman of his own, travelling for the better acquirement of skill in his trade. Bertrand Lafont was not a youth of very striking appearance, but still he was comely; and his modesty and intelligence were calculated to win by degrees the affections of those around him. For several weeks he was daily in company with Manon at meals, and at other times also for brief periods; and a mutual attraction between the two was the consequence. One day, when the absence of Stephen unexpectedly left them alone at dinner, Bertrand took courage almost to avow his affection, and did not find himself discouraged by its simple and innocent object. However, no further opportunity for an understanding between them occurred, until particular circumstances occurred, of a nature calculated to draw Manon's attention entirely to another subject.

Since the entry of Bertrand into the house, a change had been observed by her to come gradually over her father's conduct and temper. When he rose in the morning, it seemed as if his night's rest had done him no good. He looked pale and exhausted, and in the evening he would sit for hours in silence, as if brooding on some unpleasing subject. He was late in retiring to rest, and Manon even thought that she could occasionally hear him stirring late in the night, when her own first slumbers were over. She at first thought that an unusually important task had brought with it unusual care and toil, and that he might be ill in body; and she affectionately pressed him to attend to his health, and take additional repose. To her great pain, her advice was repulsed with peevishness, almost with harshness. This was the first time in her life that she had found herself so spoken to by her father, and the gentle Manon dropped many a secret tear in consequence. Her grief was the greater, as her father grew worse day by day. When he was obliged to go out, she observed him, though covertly, to cast uneasy and even suspicious looks both at Bertrand and herself. The cause Manon could not guess at, or if she did guess at any cause, it seemed one quite inadequate to produce such effects.

One morning all the symptoms of her father's distemperament appeared to be aggravated. He sent out Bertrand upon some errand or other of business, and immediately afterwards called Manon to him. She went, and found him in visible agitation. "Oh, Manon," said he, taking her hand in his, "my own Manon, daughter of my poor Louise, would you, could you, deceive your father?" "Not for worlds," returned the daughter, into whose eyes the sight of her father's distress called immediate tears; "not for worlds would I deceive you!" Stephen looked earnestly at her. "I cannot doubt you," said he at length; "when I gaze at those innocent eyes, and think that they have ever beamed on me with duty and love. And yet, by night—and when you are away from my sight—oh, Manon, I have terrible thoughts." The daughter was greatly shocked at this open avowal of distrust on her father's part towards her. "Father, what have I done to incur suspicion from you?" said she, with swimming eyes. "Oh, dear father, some evil spirit suggests these thoughts! If you have seen aught amiss, tell me, and believe that your Manon will obey you before all the world, and that she never could or can do any thing to vex the parent she so loves." Stephen was again silent for a moment. He then kissed his daughter's brow, and said, "I *believe* you, Manon. Something has occurred to fret me. Go, my dear child, and think of this no more."

However, matters were not mended subsequently. Stephen altered his strange conduct but for a short time, and then relapsed, and grew daily worse, so much so as to treat Manon with habitual harshness. Her consciousness of Bertrand's affection could not make up to the poor daughter for this alteration in her father's behaviour—a change wrought in but a few short weeks. An open avowal of his love was finally made by Bertrand. It was made one day when he found Manon in tears, after her father's temporary departure from the house. The simple girl made no attempt to deny that the young man possessed her affections, but said at the same time that she would never quit her father. "We may live with him, or at least *beside* him, Manon," replied the lover. The young maiden sighed. "Once I could have dreamed of such a thing, but not now, not now," said she; "and you too, Bertrand, you have friends and a home elsewhere." "I can have no home henceforth, no place worthy to be called a home, Manon, where you are not," returned the youth warmly. He took Manon's hand; it was not withdrawn from his grasp, and he proceeded to draw such a picture of possible felicity for them, as made the poor girl's heart full almost to overflowing. The discourse of the pair, however, was suddenly interrupted by the sound of an approaching footstep. They separated from each other's side with a degree of confusion inseparable from the nature of their late converse. Stephen almost started when he saw them. For the first time he seemed to have been struck with the possibility of an attachment springing up between them. On that evening he was more thoughtful and gloomy than usual.

The next morning witnessed an unexpected and melancholy scene. Stephen Lenoir rose from breakfast, as he was in the habit of doing, and entered his workshop, fastening the door behind him. Imme-

Digitized by Google

diately afterwards, however, he uttered a loud cry, and issued, exclaiming wildly, "I am robbed again—robbed of all! I am a beggar!" He sprung upon Bertrand at the same time, and accused him fiercely of the robbery. "Father! dear father!" cried the agitated Manon, clinging to her parent, "he is innocent! he is innocent!" Stephen Lenoir turned upon his daughter, and shook her off violently. "Be silent, shameless and unnatural girl! You are his accomplice—yes, I am robbed by my own flesh and blood! But I will have it back, or, by the heaven above us, both of you shall die on the scaffold!" The excited tones of Stephen had by this time caused some of the neighbours to hurry to the door. The jeweller called to them to bring the street police, which they were ready and active enough in doing. In the mean time, Bertrand allowed himself to be held by Stephen, but at the same time calmly declared his innocence. He also addressed a word of solace to poor Manon, telling her that "her father would soon discover his error." Perhaps this appearance of mutual intelligence only served to irritate the jeweller more deeply. When the police came, he declared his conviction that he had been partially robbed several times by Bertrand, and at last had been stripped by him of all his earnings. In a voice husky from contending emotions, he also declared his belief that his own daughter was an accomplice in the crime. A shudder ran through the frames of all present at the charge. The solitary life of Manon had prevented any one from acquiring a perfect knowledge of her character, but her youth, beauty, and distress, would have moved the coldest heart to pity. However, Stephen Lenoir reiterated his accusation, and the final issue was, that Bertrand and Manon were taken into custody, and conducted to prison.

The examination of Lenoir brought out the following statement. The fruits of his savings were kept by him in a small strong box in his workshop. Soon after he had taken Bertrand Lafont as his assistant, he had missed a portion of his money. At this he was surprised beyond measure, being unable to conceive in what way it had disappeared. He at the very first suspected Bertrand; but on a second robbery taking place, which must have been effected between night and morning, he could not but conclude, that if Bertrand was the plunderer, he must be assisted, as he did not sleep in the house, by one who *did* sleep there. The idea of Manon being concerned, however (Stephen said), had been originally rejected by him with horror, until a third robbery by night forced the suspicion strongly upon him. Yet he could not make up his mind to the belief that his child would injure him in thought or deed. At length, his strong box was plundered between night and morning of all that remained in it; and having discovered on the previous evening that a private correspondence existed between Manon and Bertrand, he had been driven to the conviction of the truth. Hence the exposure of the pair. In answer to questions from the magistrate, Stephen stated that the box had always been opened without violence, though he had regularly kept the key in security in his bedroom.

The magistrate admitted that the circumstantial evidence seemed strong against Bertrand and poor Manon. With what conflicting emotions Stephen Lenoir's breast was agitated on that night, when he returned *alone* to his home, we shall not attempt to describe. Sometimes his wrath and avarice were in the ascendant, and at other times he wept bitterly, and was on the point of rushing out to bring his child back to her home, and beseeching her pardon. At length, he felt the necessity of sleep, and thought to secure it by a draught of spirits. He took a large one, and in replacing the glass, the tremulous state of his nerves was shown by his allowing it to fall and be shivered to pieces. He then went to bed, and slept. It was broad morning when he awoke to a consciousness of what had passed. Slowly and sadly he was in the act of rising, when he became conscious of stiffness and pain in one of his feet. Throwing off the bed-clothes, he beheld it covered with clotted blood. A large wound was the cause. Reflecting with surprise and alarm upon this accident, he remembered the fall of the glass. But at that time his foot had been covered by a thick shoe. The shoe was by the bed-side; he took it up, and found not the slightest mark upon it. Stephen lay back on his couch in thought. Suddenly a strange idea occurred to him. He started hurriedly from his bed, and rushed to the small retired closet whence he had taken the spirits on the night before. On the floor of it he saw the broken glass. The largest piece had blood upon it. He *must* have been there in the night, and necessarily in his sleep! Wildly Stephen looked about him, and grasped a board which covered a small recess in the wall. The board came away in his hands, and there he beheld his hoarded money lying—the stores of which he had been deprived! Well he knew those coins; he required not to count them. "My Manon! my innocent Manon!" cried Stephen, striking his forehead; "the boy! the guiltless boy! My own base and sleepless avarice has been the plunderer of my hoards!"

Whoever saw and knew Stephen Lenoir on that morning, as he rushed through the streets to the office of the magistracy, believed that they saw a man rendered insane by his misfortunes. But soon the story of the somnambulist—who, from an unhappy and diseased passion of avarice, had actually robbed himself—was noised abroad, and all were glad at the surprising and almost accidental exculpation of the young pair. It would be vain for us to attempt to describe how Stephen Lenoir's grey hairs pressed the ground that morning at the feet of his own child, and how the gentle Manon embraced his neck, and besought him to take comfort. Nor shall we endeavour to paint how beautifully Manon blushed through her tears, when her penitent father placed her hand in that of Bertrand, and said, "My son, if you truly forgive me, we shall part no more!"

This, gentle reader, is a story as true as the Proverbs of Solomon.

THE COTTON MANUFACTURE IN AMERICA.

JAMES MONTGOMERY, a person skilled in the manufacturing of cotton, left his native country (Scotland) in 1836, to find employment among the factories of the United States; and being engaged as superintendant in certain mills at Saco, in Maine, he may be presumed to have formed a pretty accurate idea of the process of manufacturing in that country. To render the information which he has acquired useful, he has, at the solicitation of friends, drawn up, and published in a convenient form, an account of the cotton manufacture as practically conducted in America.* As this subject must be interesting to a number of our readers, we propose to aid Mr Montgomery in the diffusion of his carefully collected information, by giving a few condensed details from his volume.

The cotton manufacture in the United States, which is now a formidable rival to that of Great Britain, has altogether come into existence since 1790. All the attempts to introduce it previous to that period were fruitless; and it was not till a person, skilled in the prosecution of the art in England, carried his experience to the American market, that it began on a proper or flourishing footing. The individual here referred to was Mr Samuel Slater, a young man who had been bred under Mr Strutt at Milford, near Belper, in Derbyshire. First as an apprentice and then as a superintendant, both as respects the making of machinery and in the manufacturing department, he acquired a complete knowledge of the Arkwright mode of spinning; and when he heard by report that the States of North America were offering bounties for the introduction of the art, he resolved on proceeding thither, and give the land of his adoption all the benefit of his practical knowledge and enlarged experience. He knew that it was impossible to take any patterns or drawings along with him, as the government restrictions were very severe, and the customhouse officers scrupulously searched every passenger for America. Having, however, carefully studied the whole mechanism of the factory, and fixed the remembrance of it in his memory, he baffled this contemptible restriction; and carrying his designs in his head across the Atlantic, he landed at New York in 1789. Here he met Messrs Almy and Brown, two individuals who were anxious to secure his services; and proceeding to Pawtucket, he immediately commenced making machinery, principally with his own hands. Such was his activity, that, "on the 20th of December 1790, he started three cards, drawing and roving, together with seventy-two spindles, entirely upon the Arkwright principle." Never were efforts more signally successful. In fourteen months, Mr Brown informed the secretary of the Treasury that machinery and mills could be erected in one year to supply the whole United States with cotton yarn, and thus render its importation unnecessary.

In 1798, Mr Slater entered into partnership with some manufacturers (the daughter of one of whom he had married), under the firm of Samuel Slater and Company. He built his second mill on the east side of the Pawtucket river, and was proprietor of one-half the stock. From this mill preceded many young men skilled in the craft of manufacturing, and by that means his improvements were widely spread over the country, so that the business has from that time to the present been rapidly extending over the United States. Mr Slater's business was so prosperous, that about the year 1806 he invited his brother, Mr John Slater, to come to America, and he in all probability brought with him a knowledge of the most recent improvements made by English spinners. The now flourishing village of Slatersville in Smithfield was then projected, in which John Slater embarked as a partner, and in June of the same year he removed to Smithfield as superintendant of the concern. In the spring of 1807 the works were sufficiently advanced for spinning; and up till the present time they have been under the management of that gentleman, in an uninterrupted state of improvement. About 1814, the power-loom was added to the process of spinning, by means of patterns brought by a Mr Gilmour from Glasgow, and who was invited by Mr John Slater to Smithfield. Besides making and bringing the power-looms into operation, Mr Gilmour introduced the machine for dressing the warp, and also the hydrostatic press for pressing and packing cloth. Gilmour, we are told, was a man of great mechanical genius, but neglected to turn his talents and opportunities to account, and at ... death of ... [illegible] stances. The ... a different enemy, being ... and persevering.

We have now to show how from a small ... in 1790, the cotton ... a great standing in the United States. ... now established in a very great ... there are three divisions ... nominated the ... first comprehends ... and the eastern parts of ... or middle district ... chusetts, Rhode Island, ... New York, New Jersey, ... chusetts, taken altogether, ... cotton manufacture and ... is Lowell. According to ... appointed by Congress ... progress of spinning ... goods—the number of ... of spindles 1,246,503, of ... employed in the manufacture ... total employed, 67,466. In these facts were contained, both the spinning and weaving ... largely increased. Mr Montgomery ... "the amount of capital invested in ... Massachusetts in 1831 was 12,931,000 dollars ... it had increased to 14,369,719 dollars, being nearly 12 per cent. in the space of only five years; but allowing the rates of increase since 1831 to be 10 per cent. all over the Union, the amount of capital now invested in the cotton manufacture cannot be less than 45,000,000 of dollars, equal to £9,375,000 sterling, being about a fourth part of the capital invested in the cotton manufacture of Great Britain."

Lowell, as we have already mentioned, is the principal manufacturing town in the United States, or, as it may be called, the Manchester of America. As a place of such importance is peculiarly deserving of notice, we shall extract the following account, which is quoted from the Lowell Journal, a weekly newspaper:—

"The territory of Lowell is about four square miles, and contains upwards of fifteen thousand inhabitants.† About eighteen years ago the whole of this was owned by a few honest farmers, who obtained subsistence for themselves and families by the cultivation of this comparatively barren spot, and the fish they caught in the Merrimack and Concord rivers; and being situated at the confluence of these two rivers, was called Chelmsford Neck, and originally by the Indians, Wamaset.

For centuries it lay with its vast resources slumbering in its bosom, unsuspected and unknown. But the spirit of improvement came, and its touch, like that of the magic wand, has turned this seeming wilderness, not simply into a fruitful field, but into a busy, enterprising, and prosperous city.

In 1819, Kirk Boot, Esq., a wealthy merchant of Boston, explored this place in the habit of a hunter. He discovered its resources, and immediately, in company with several other rich merchants of that city purchased the land and water privileges.

They were incorporated by the name of the Proprietors of the Locks and Canals on Merrimack river, and commenced operations by digging a canal from the Pawtucket Falls, easterly one mile and a half, where it emptied itself into the Concord river. This canal is sixty feet wide, and carries in depth eight feet of water. This is their grand canal; lateral branches are cut, which carry the water to the several manufactories, from which it is discharged into the Merrimack or Concord rivers. They then erected a large machine shop, and commenced building machinery. This company sell out the privileges to manufacturing companies, dig the canals, erect the mills, and build the machinery, all ready for being put in operation; they do all this cheaper than any other company will do it; and these are the only terms on which they will sell the privileges.

The Locks and Canals Company have a capital of 600,000 dollars, and employ about 500 workmen in the machine shop and otherwise. A part of their lands has been sold out to individuals at an enormous advance on the original price. Land for which they paid 20 or 30 dollars per acre, has been sold again for one dollar per square foot: there is still a portion of their land on hand unsold.—Kirk Boot, Esq., acted as their agent till his death in 1837.

Lowell was incorporated in 1824 into a town distinct from Chelmsford, and received its name from Francis C. Lowell, Esq., who was amongst the first to introduce manufactures in this place. There are now twenty-seven factories in operation, besides print works, bleacheries, &c., and there yet remain unoccupied privileges for nearly as many more: when these are taken up, as in all probability they will, they will then afford means of subsistence to other 20,000 inhabitants, making the whole about 40,000.

A new canal has been lately cut, which furnishes sites for about a dozen mills. A railroad of two tracts has been completed between Boston and Lowell, which is found to be of mutual advantage to both places, but especially to the latter. There is also a steam-boat plying between Nashua (another manufac-

* A Practical Detail of the Cotton Manufacture of the United States of America. Glasgow: John Niven, Jun.; Whittaker and Co., London. 1840.

† This was the number of inhabitants at the time the article was written, but according to a late statement in the same paper it appears there are now 20,000.

Digitized by Google

turing place) and Lowell, a distance of fourteen miles, which likewise co-operates with the railroad.

The total amount of capital invested for manufacturing purposes at Lowell, was, at the beginning of 1839, about 9,000,000 dollars, equal to L.1,875,000 sterling." There are ten incorporated companies in the place: one company has a large machine shop for making machinery for the cotton and woollen manufactures, railroad cars, engines, &c.; they employ in general upwards of 500 hands. Company No. 2 (we purposely omit names) have five large cotton mills, besides print works; they run 37,984 throstle spindles, work 1300 power-looms, and give employment to 1300 females and 637 males; they make upon an average 220,000 yards of cloth per week, and use about 50,000 lbs. of cotton in the same time. Company 3 have a large printing establishment and three cotton mills; they run 20,992 throstle spindles, 564 looms, employ 830 females and 230 males, make about 100,000 yards of cloth, and use about 40,000 lbs. of cotton, weekly. Company 4 have two cotton mills; they run about 11,776 throstle spindles, 380 looms, employ 470 females and 65 males, make about 100,000 yards of cloth, and use 40,000 lbs. of cotton, weekly. Company 5 have one cotton and one carpet manufactory; they run 5000 throstle spindles, besides those used in the woollen manufacture, 154 cotton and 70 carpet looms, employ 400 females and 200 males, make 2500 yards of carpeting, 150 rugs, and 60,000 yards of cotton cloth per week. Company 6 have two cotton mills, run 11,264 throstle spindles, 352 looms, employ 460 females and 70 males, and make 90,000 yards of cloth weekly. Company 7 have two mills, run 11,520 throstle spindles, 404 looms, employ 460 females and 70 males, and make 125,800 yards of cloth weekly. Company 8 have five extensive factories and a bleachery, run 31,000 throstle spindles, 910 looms, employ 1250 females and 200 males, and make about 200,000 yards of cloth weekly. Company 9 manufacture broad cloths and cassimeres, and have two mills and a dye-house; they make 6300 yards of cassimere and 1500 yards of broad cloth weekly. Company 10 have four large elegant factories, containing 29,248 throstle spindles and 830 looms in operation; they employ 950 females and 120 males, and turn out 155,000 yards of cloth weekly. Besides these principal establishments, may be added an extensive powder mill, bleachery, flannel mills, cord and whip factory, planing machine, reed machine, flour, grist, and saw mills, glass works, and a foundry. The first company above mentioned can furnish complete machinery for a mill containing 5000 throstle spindles, with weaving in proportion, in four months.

We might abridge accounts of various other manufacturing towns and villages in the States; but we think the foregoing presents a fair specimen of the whole. It appears that the agent of power is almost universally water; but to what extent this proves a saving is not shown by the author. Probably it is of little moment, in comparison with other items. The details which Mr Montgomery presents respecting the nature of the machinery employed, and charges of various kinds, in Great Britain and America, compose the bulk of the volume; but being purely technical, any notice of them here would be out of place. After giving a vast amount of information on these points, he arrives at the following generalised summary:—

"The amount of goods produced is much greater in America than in Great Britain; but the hours of labour are somewhat longer in the former than in the latter country. The cost of the buildings, machinery, &c., is a great deal higher in America than in Britain, as well as the general rate of wages, particularly in the carding department. After comparing the advantages and disadvantages of each, it appears that the British manufacturer can produce his goods at least 19 per cent. cheaper than the American. This, however, is more than neutralised by the cheaper rate at which the latter can purchase his cotton. The circumstance of America being a cotton-growing country, will always give to her manufacturers advantages of which the British cannot generally avail themselves.

In every description of goods in which the cost of the raw material exceeds the cost of production, the American manufacturers have a decided advantage over the British. And they have availed themselves of this advantage to improve the quality of their goods; as any person who has had an opportunity of comparing the domestics manufactured in the two countries, can have no hesitation in giving the preference to those manufactured in America; and the experience of every British manufacturer engaged in producing this description of goods has painfully convinced him, that the superior quality of the American goods is gradually driving him from every foreign market. On this subject Mr William Gemmell of Glasgow states in his affidavit (as given in Mr Graham's pamphlet on 'The impolicy of the Tax on Cotton Wool'), that although he was for several years in the habit of supplying Chili with cotton domestics, he has latterly been obliged to abandon the trade, in consequence of being unable to compete with the manufacturers of the United States.

Hitherto the British have enjoyed a monopoly in the manufacture of fine goods; but the resources of the Americans will very soon enable them to compete successfully even in these. No people in the world are more enterprising, none more ready to pick up and avail themselves of every improvement by which their interest is to be advanced; and there is no doubt, that, in a few years, they will adopt a more economical method of getting up their works, a more improved system of general management and conducting of the various processes, which will enable them, even in the finer goods, to compete successfully with the British."

In conclusion, it may be learnt from these observations, were other evidence wanting, that the British cotton manufacture is but barely pre-eminent over that of the Americans; and were the latter a little more skilful and exact in a few points, they would at once, from being able to buy the raw material cheaper, become powerful competitors with the British. That they will ultimately attain the nicety in execution, of which they at present fall short, there can be no doubt; but when this may happen is a question of difficult solution, for it might be retarded to an indefinite period by the Americans finding a large and profitable outlet to their agricultural produce, thereby throwing their capital into more remunerative channels, and raising the wages of their labourers. At present, as it is, the American mill-spinners can with difficulty keep up an efficient staff of skilled hands, in consequence of the temptation of high wages among the agriculturists; and it appears to us that Great Britain could not inflict a more deadly blow on the growing strength of the manufactures of America, than inviting the exportation of agricultural produce from that country. This, however, involves speculations on which we have no wish to enter.

SPONTANEOUS FIRES.

WITHIN these few years it has been satisfactorily ascertained that fires occasionally occur from spontaneous ignition—certain substances lying in a compact mass burst into a flame without any one at the time expecting such a catastrophe, and thus a serious conflagration is originated, greatly to the surprise of all concerned. Several distressing burnings of ships at sea (generally when cotton formed the cargo), have lately taken place from this cause. Mr Abraham Booth, lecturer on chemistry, Hackney, has written a letter to the Lord Mayor of London, drawing his lordship's attention to this important subject; and for the sake of giving publicity to Mr Booth's intelligent explanations respecting the spontaneous combustion of bodies, we extract the following passages from his communication:—

"Permit me to draw your attention to a series of circumstances which, in my view, are the causes of many fires, for the origin of which no adequate cause can be assigned; I allude to the phenomena of spontaneous combustion. This subject is now attended with greater interest, from its having been proved that the conflagration which caused the destruction of her Majesty's Ship Talavera, at Devonport, was owing to this circumstance. My attention was more particularly called to the subject of spontaneous combustion in 1829, from the circumstance of the execution of a young man named James Butler, who was convicted on a charge of setting fire to a floor-cloth manufactory. After his execution I became acquainted with the details, and, after most closely and carefully investigating the subject, came to the conclusion that he was an innocent victim of the law—in which view I was supported by my friend the late Dr Gordon Smith, then professor of medical jurisprudence at London University College, Dr Birkbeck, and several other scientific men.

In a letter to a public journal about that time, I drew attention to the variety of circumstances under which spontaneous combustion would take place (in all about forty instances); and I then felt that my researches and remarks might be of some benefit to the community, from the circumstance that they were printed and suspended on boards, as cautions against fire, in the different dockyards and other public establishments in the kingdom. Whether this reasonable precaution is now withheld, I know not.

The cases under which spontaneous combustion of animal and vegetable substances will take place, are such as no ordinary sagacity can foresee, nor prudence prevent. In the official reported list of fires, the majority of causes are unknown, whilst another large portion are only conjectural. The science of chemistry may, however, advantageously lend its aid; and some of its investigations on the subject have been matters of high interest. The most memorable instance on record is that of a series of fires which took place at St Petersburg in 1780 and 1781, when a frigate, with several other vessels and houses, were destroyed, supposed to have been the work of an incendiary. A scientific commission was appointed by the Russian government to inquire into the subject, who found that the self-enkindling substances were charcoal and hemp oil. In 1757, the royal dockyard at Brest was nearly destroyed by spontaneous combustion taking place in the rope-yard; when some of the old workmen declared that the same thing had happened some years ago, but that, conceiving it impossible for the bales to take fire of themselves, they had concealed the accident, for fear of being taxed with negligence, and punished accordingly. On Thursday, July 3, 1760, a fire, from spontaneous combustion, broke out in the rope-yard of the royal dockyard at Portsmouth, which caused much mischief. It would be tedious to relate the other various circumstances under which spontaneous combustion will take place, such as with hay, corn, flax, cotton, wool, turf, flour, saffron, and other vegetable substances; rags, oatmeal, charcoal; woollen cloth and cotton goods; roasted coffee and chocolate; bales of woollen yarn or cloth, waste cotton or rags used in cleaning oil, paint, floor-cloth, pyrites, coal, &c., although the subject is one of considerable importance in our domestic security.

My object in this communication is to suggest to your lordship the desirableness of making the subject I have referred to one of more general attention, and that, in order to prevent the so frequent recurrence of evils the most lamentable in our social and domestic economy, it would be extremely desirable that a code of cautions should be drawn up, explaining chemically the circumstances under which a fire may take place, and which no ordinary caution can prevent, whether in manufactories, public establishments, or even private houses."

THE TEMPERANCE MOVEMENT IN IRELAND.

A GENTLEMAN of our city, high in legal function and in public respect, who lately made a tour in Ireland, has recalled our attention to the Temperance Movement in that country,* by sending to us a variety of recent documents connected with the subject, which he had been at the pains to collect for our use. He says, in a letter accompanying the enclosure, "Depend on it, the change in Ireland at present is most visible and important. In travelling through the country, I only once saw a person drunk on the roads; and the state of the jails which I visited, in the districts formerly most disturbed, abundantly attests the reality of the changed habits and improved morals and condition of the people. In Clonmell (county town of Tipperary) the average number of prisoners in former years was 500, now there are only 320; in Cork the numbers are reduced from 700 to 400. These facts speak for themselves. There has not been an execution in Cork for six years, although the population of the county exceeds 800,000." We feel that there is something very arresting in the testimony of our correspondent; and it is supported from other quarters. The following is from the new work on Ireland by Mr and Mrs S. C. Hall:—

"In reference to the extent to which sobriety has spread, it will be almost sufficient to state, that during our recent stay in Ireland, from the 10th of June to the 6th of September 1840, we saw but six persons intoxicated; and that for the first thirty days we had not encountered one. In the course of that month we had travelled from Cork to Killarney—round the coast; returning by the inland route, not along mail-coach roads, but on a 'jaunting-car,' through byways as well as highways; visiting small villages and populous towns, driving through fairs, attending wakes and funerals (returning from one of which, between Glengariff and Kenmare, at nightfall, we met at least a hundred substantial farmers, mounted); in short, wherever crowds were assembled, and we considered it likely we might gather information as to the state of the country and the character of its people. We repeat, we did not meet a single individual who appeared to have tasted spirits; and we do not hesitate to express our conviction, that two years ago, in the same places and during the same time, we should have encountered many thousand drunken men. From first to last, we employed, perhaps, fifty car-drivers; we never found one to accept a drink; the boatmen of Killarney, proverbial for drunkenness, insubordination, and recklessness of life, declined the whisky we had taken with us for the bugle-player, who was not 'pledged,' and after hours of hard labour, dipped a can into the lake and refreshed themselves from its waters. It was amusing as well as gratifying to hear their new reading of the address to the famous echo—'Paddy Blake, plase yer honour, the gintleman promises ye some coffee whin ye get home;' and on the Blackwater, a muddy river, as its name denotes, our boat's crew put into shore, midway between Youghal and Lismore, to visit a clear spring, with the whereabouts of which they were familiar. The whisky-shops are closed or converted into coffee-houses; the distilleries have, for the most part, ceased to work; and the breweries are barely able to maintain a trade sufficient to prevent entire stoppage. Of the extent of the change, therefore, we have had ample experience; and it is borne

* Some account of this extraordinary movement was presented in No. 431, published in May last, being an extract from Tait's Edinburgh Magazine.

Digitized by Google

out by the assurances of so many who live in towns as well as in the country, that we can have no hesitation in describing sobriety to be almost universal throughout Ireland."

Mr and Mrs Hall speak hopefully of the continuance of the reformation, mentioning that there is now something disreputable in being a drunkard, and that there is a general sense of the advantages flowing from temperance. They also give their valuable testimony (being conservatives both in politics and religion) to the absolute groundlessness of the idea that any danger to the state lurks in this moral reformation—an idea so gross and so ridiculous, that we should not, for our own part, have thought of alluding to it, if we had not found it noticed by these esteemed writers. Amongst other interesting facts, they narrate the following:—

"We entered one day a cottage in a suburb of Cork: a woman was knitting stockings at the door; it was as neat and comfortable as any in the most prosperous districts of England. We tell her brief story in her own words, as nearly as we can recall them. 'My husband is a wheelwright, and always earned his guinea a-week: he was a good workman, and neither a bad man nor a bad husband; but the love for the drink was strong in him, and it wasn't often he brought me home more than five shillings out of his one-pound-one on a Saturday night; and it broke my heart to see the poor childre too ragged to send to school, to say nothing of the starved look they had out of the little I could give them. Well, God be praised, he took the pledge; and the next Saturday he laid twenty-one shillings upon the chair you sit upon. Oh! didn't I give thanks on my bended knees that night? Still, I was fearful it wouldn't last, and I spent no more than the five shillings I was used to, saying to myself, Maybe the money will be more wanted than it is now. Well, the next week he brought me the same, and the next, and the next, until eight weeks passed; and, glory be to God! there was no change for the bad in my husband; and all the while he never asked me why there was nothing better for him out of his hard earnings: so I felt there was no fear of him; and the ninth week when he came home to me, I had this table bought, and these six chairs, one for myself, four for the children, and one for himself. And I was dressed in a new gown, and the children all had new clothes and shoes and stockings, and upon his own chair I put a bran-new suit; and upon his plate I put the bill and *resate* for them all—just the eight sixteen shillings they cost that I'd saved out of his wages, not knowing what might happen, and that always before went for drink. And he cried, good lady and good gentleman—he cried like a babby; but 'twas with thanks to God: and now where's the healthier man than my husband in the county Cork, or a happier wife than myself, or dacenter or better-fed children than our own four!' It is most unlikely that such a family will again sink into poverty and wretchedness."

The documents forwarded by our correspondent are chiefly placards, issued by humble advocates of the cause, for the purpose of keeping up the feeling in its behalf. Though rude in form and style, and often sadly illogical, they breathe the spirit of enthusiasm, and we have no doubt must conduce to the object in view. One is in the form of a dialogue between a teetotaller and a publican, the latter of whom is beaten out of all his objections to the cause in grand style. Another contains a song evidently designed as an imitation of the well-known one of "St Patrick;" the following are the two concluding stanzas:—

"How long these man-traps* kept it up
To rob us of our money,
With—'Paddy, take another sup,
'Twill do you good, my honey.'
'No, Mr Malt, I hate your hog-wash,
I now have got my senses;
Keep you your poison—I'll keep my cash
For family expenses.'

Success to Reverend Father Matt,
We'll give him all his merit;
He's done much more than old St Pat—
He's banish'd the evil spirit!
We'll drink his health in water clear,
In tea and coffee, civil;
But as for whisky, ale, and beer,
They may go," &c.

The placard, of which this song forms the conclusion, is headed with the words "SOLEMN FACTS," in large letters!

A "Life of Mr Mathew,"† by the Rev. Mr Birmingham, a brother of the same priesthood, supplies some particulars of the late proceedings of the Apostle of Temperance. In external features they have been sufficiently remarkable. The public is generally aware that the movement for the first time attracted notice in August 1839, till which time Mr Mathew had confined his exertions to Cork. In December he visited Limerick, where thousands upon thousands of the country people assembled to pay their vows of abstinence before him. The streets became so densely crowded on this occasion, that several of the Scots Greys were lifted horse and man from the ground, and many persons, eager to approach the reverend father, ran, for that purpose, "quietly and securely on the heads and shoulders of the vast assemblage." A scene which soon after took place at Parsonstown was not less striking. "In front of the chapel was stationed a large body of police, presenting a very fine and well-disciplined force; outside these were the rifles, on bended knees, with bayonets fixed and pointed, forming a barrier to oppose the rushing multitudes; whilst within and without this barrier, to keep the passages clear, the cavalry, 'in all the pomp and circumstance of glorious war,' with flags waving to the winds, moved up and down in slow and measured pace. Beyond, and as far along the streets as the eye could reach, were the congregated masses, swaying to and fro with every new impulse, and by their united voices producing a deep indistinct sound, like the murmur of the ruffled waters of the sea. Within the vicarial residence, and in strong contrast to the stirring scene without, sat the mild, unassuming, but extraordinary man, round whom had collected this display of martial pomp and numerical force." From Borrisokane, where he arrived unexpectedly, he designed to proceed as soon as he had inducted the few people of the place. The news, however, of his being there spread in the country around. Multitudes threw aside the implements of their labour, and hurried to the town to enlist themselves under his banner. As each group was dispatched, he prepared to hurry away; but still another approached. "Fatigued and breathless, men, women, and children hurried forward indiscriminately to take the pledge. Mr Mathew could not bring himself to disappoint such eagerness or damp such ardour. He was consequently obliged to remain; and standing on a stone seat under a venerable ash tree—now more venerable than ever—he received in this small town, without any previous notice having been given, seven or eight thousand souls."

Mr Birmingham speaks strongly of the mild and affectionate character of this singular man. Amongst those who came before him at Borrisokane, was one Paddy Hayes, a man noted for intemperance, his drunken moments greatly exceeding his moments of soberness. "I intimated this man's approach to Mr Mathew. In a moment the advocate of temperance ordered a passage to be cleared, and Paddy Hayes to be admitted. With a smile in which benignity and confidence were mingled, he extended his hand to the penitent drunkard, saying—'Come forward, my poor fellow, you are worth waiting for.' The postulant cast himself on his knees, with a 'Heavens bless *you*, Father Mathew,' took the pledge, and received the blessing. This man is now an industrious and exemplary character."

At Nenagh, there was the usual parade of military force to ensure order. "With the sound of trumpet, each batch was admitted through a street or lane into an open area, where having taken the pledge, they withdrew by another way, and were succeeded by a fresh batch of applicants. On the day of Mr Mathew's ministry in Nenagh, about twenty thousand persons ranged themselves under the peaceful standard of temperance." At Galway, where he soon after preached, "his labours in administering the pledge were much obstructed, notwithstanding all efforts to the contrary, by the ungovernable impatience of the countless postulants. They could scarcely be restrained from using towards him what might be called a holy violence." Notwithstanding these disorders, he here received about a hundred thousand converts in two days! In a progress which he made from Galway, by Loughrea, Portumna, Borrisokane, and Roscrea, the neighbouring population might be said to pour themselves *en masse* upon his way. The towns were in succession filled with vast multitudes waiting to be received by him, and already proving the steadfastness of their intentions, by abstaining from liquor and from every kind of excitement. In two days, he administered the pledge to eighty thousand persons in the barrack-yard of Loughrea. As many more received it in the course of his journey between Galway and Portumna, at which last place the number was thirty thousand. On all these occasions, "he admonished the people on the nature of the promise they were about to make, and the inviolability with which it should be observed. He said to them that, when casting off the yoke of intemperance, they should also abandon every other vice, such as rioting, faction-fighting, private combinations, illegal oaths, taking of fire-arms, serving threatening notices, &c. He exhorted them to forget religious animosities, to live in peace with all, to observe the laws of God and man, and to respect the powers that be, not from fear, but for conscience' sake."

These events occurred so lately as last March. At the close of the month, he arrived in Dublin, in order to preach a sermon in behalf of a female orphan institution. The whole of the tickets of admission to a church capable of containing six thousand persons were engaged two days beforehand. Vast multitudes filled the neighbouring streets during the whole time of the sermon. As he pronounced the text, "Whence shall we buy bread that these may eat," he looked down affectionately on the orphans ranged beneath him. The sermon contained many passages of the purest eloquence. "If I were to pause," said he, "to enumerate but the hundredth part of the many generous deeds of mercy performed even by the poorest of the poor, of which I myself have been witness, I would occupy the whole of the time which this discourse should last. Permit me, however, to state one simple case of facts:—A poor woman found in the streets a male infant, which she brought to me, and asked imploringly what she was to do with it. Influenced, unhappily, by cold caution, I advised her to give it to the churchwardens. It was then evening; on the ensuing morning, early, I found this poor woman at my door; she was a poor water-carrier; she cried bitterly, and said—'I have not slept one wink all night for parting with that child which God had put in my way, and if you will give me leave, I will take him back again.' I was filled with confusion at the pious tenderness of this poor creature, and I went with her to the parish nurse for the infant, which she brought to her home with joy, exclaiming, in the very words of the prophet—'Poor child, though thy mother has forgotten thee, I will not forget thee!' Eight years have elapsed since she brought to her humble home that exposed infant, and she is now blind from the constant exposure to wet and cold; and ten times a-day may be seen that poor water-carrier passing with her weary load, led by this little foundling boy. Oh, merciful Jesus, I would gladly sacrifice the wealth and power of this wide world, to secure to myself the glorious welcome that awaits this poor blind water-carrier on the great accounting day! Oh, what, compared to charity like this, the ermined robe, the ivory sceptre, the golden throne, the jewelled diadem!" The collection at this sermon amounted to the extraordinary sum of L.350.

Mr Mathew appeared every day during the ensuing week in the space behind the Customhouse, to receive converts from intemperance. Notwithstanding bad weather, there was a large and enthusiastic attendance, and about seventy thousand took the pledge, "amongst whom were persons of different religious persuasions, of every age and every rank, and a considerable number of the city constabulary and the military then stationed in Dublin."

A twelvemonth ago, Mr Mathew did not dream of ever moving beyond his own pastoral bounds; but, being induced to go to Limerick, and finding success there, he was tempted to visit other places, till at length, during this year, he might be considered as, for the time at least, an itinerant advocate of the cause. His course through Ireland has every where been attended by the same moral phenomena—an almost universal prostration of the Catholic people in his path, to signify before him their resolution henceforward to live a sober life. We find him, in September,* at Sandyford near Dublin, speaking of having then added *two and a half millions* to the Cork Total Abstinence Society!—and these every where remarked as the most moral and peaceable of the community. On this occasion, he made some remarks on the consequences which naturally arise from an application of money to the production of real instead of delusive comforts. The people, he said, in the parishes where the society had existed for two years, were astonished at the increase of their wealth. "The men have always something to clothe their children, and to make their wives happy, and they have always, besides, a little to put into the savings' bank. When I now travel through the country on Saturday evening, I am quite proud to see the working man walking home quietly from market, with his basket or handkerchief under his arm, containing bread, and tea and sugar, for the use of his family at home, instead of returning, as he formerly did, in a fit of beastly intoxication, with his big stick in his hand, ready to lay it on every person he met, or on his wife and children when he got home. The people are, besides, no longer afraid of the magistrates and the police, and they now look upon them as their friends and protectors, instead of their persecutors. When a policeman will now enter any of your dwellings in search of a culprit, you will have only to say 'I am a teetotaller,' and he will at once wish you good morning, and go in search of the offender elsewhere."

At a previous visit to Dublin (in June), he was received with great honour at the seminary of Maynooth. For thirty miles round, the people flocked to that little town, to make sacrifice of their former habits in his presence. "The chariot, the gig, the jaunt, the dray, the humble donkey-car, and the couch of sickness, attested the universality of the movement. In the immense multitude, not one man was intoxicated, not one word of anger or levity was heard; and though infants, cripples, and infirm old people, were wedged together in dense confusion, not one accident occurred. All was deep devotion, faith sufficient to work miracles, and a sense of awful and imposing solemnity. The gentry as well as the poor, the priesthood as well as the people, knelt before him in humility, with bared heads, under the canopy of heaven." In about twelve hours, 35,000 had taken the pledge on the streets. Eight professors in the college, and 250 students, joined the society on this occasion. The scene at their induction in the great hall is described as having been grand and impressive in an extraordinary degree.†

Such are the last accounts we have of the proceedings of Father Mathew. There can be no doubt, we think, that he has succeeded in spreading a great moral epidemic through his native country. The whole symptoms, including the eagerness manifested in many instances to be touched by him for disease, lead to this conclusion. It naturally seems strange that, where many zealous men formerly succeeded with difficulty in converting tens or twenties to temperance, this man should in a single day bring his twenty or forty thousand into the fold, and seem to require nothing but time and continued health and strength, to reform a whole nation. But this wonder is entirely owing to

the limited ideas we as yet have of MORAL INFLUENCE. Exalted sentiments of benevolence, unmixed by a single particle of sordidness and selfishness, and conjoined with fair intellectual endowments and the gift of fluent oratory, form a power compared with which all others sink into insignificance. Men have all of them sorrows to be sympathised with, aspirations to be directed and encouraged, consciousness of error to be awakened and stimulated into good resolution: when the man possessing the above power comes before his fellows and addresses them on these points, not merely by the words of his mouth, but by the example of his own conduct, and by well-timed allusions to the things which form their religious faith, the effect is overpowering. Theobald Mathew seems one of those rare individuals whom nature has qualified to work such wonders. We are told that, ever since his becoming a clergyman, he has devoted himself to tasks of benevolence for his flock. Not only did he show that untiring zeal, for which the humble Catholic clergy are remarkable, in visiting the sick and comforting the afflicted, but he entered into the temporal concerns of his people, was noted for his willingness to become the executor of wills in behalf of widows and orphans, and was resorted to on all hands as an arbiter in disputes of every kind. His charities were far beyond his means. He also acquired fame for a magnificent church which he built, and for obtaining a burial-ground for the Catholic inhabitants of Cork. It is evident that the veneration to which these acts had entitled him, would give him a great advantage in addressing the people on the subject of a vice which they could not but be sensible was most detrimental to all their best interests. The penetration of a superior understanding gave him other advantages. Former temperance preachers had caused their converts to *sign* the pledge. He saw that this was a dilatory process, inconsistent with great results. He adopted the mode of repeating the pledge before a great number at once, who all said it after him: thus he obtained for his cause the benefit of that mutual support and mutual fomentation which attends the bringing together of great multitudes entertaining a common object. In the very form of his pledge there was something emphatic and impressive—"I promise, with the Divine assistance, as long as I shall continue a member of the Total Temperance Society, to abstain from all intoxicating drinks, except for medicinal and sacramental purposes; and to prevent, as much as possible, by advice and example, drunkenness in others." When this has been said by the crowd of postulants, he extends his hand over them, and pronounces a short prayer—"May God Almighty bless you, and grant you strength and grace to keep this promise!" Then he descends from his place, and signs each kneeling votary with the cross, in which sign alone, he adds, can they hope to persevere and conquer. It may easily be imagined that the first successes which Mr Mathew gained by these means would be followed by greater and greater, until, even in his own limited district, something like supernatural influence would be attributed to him. This notion once established amongst a people notedly excitable, and universally under strong religious feeling, it is easy to see how his simple bodily presence in any district would be sufficient to prepare the inhabitants for abandoning drunkenness. The first steps are in this, as in most other cases, difficult; but when a certain power has been attained, it can be easily exercised. Portumna sinks before the influence which has already reduced Loughrea; and, after Portumna has fallen, Roscrea can no more hold out, than it could have resisted the troops of General Ginkle after the surrender of Limerick.

Where a conversion has been so sudden, and conducted in so wholesale a fashion, doubts naturally arise as to its permanency. On this point we shall adduce the evidence of Mr Birmingham. During the two years that the society had existed up to April last, "few, very few—I might say none, comparatively speaking—have violated the pledge; and these, for the most part, touched with sorrow and remorse, have returned to renew their promise. Our people," he adds, "have never been known to swerve on matters regarding general religious discipline or doctrine, and they look upon their pledge as a religious engagement, in the observance of which they believe their honour, their national character, and [the good of] their souls to be deeply involved. Again, the multitudes will sustain each other by their example. Experience, also, has made them taste the bitter fruits of intemperance: it will now make them feel and appreciate the comforts, the happiness of temperance; and this will be another powerful inducement to their perseverance." We are not sufficiently sanguine to hazard a prediction on this point, but of course hope the best, and feel in the mean time able to say that the history of "revivals" is not unfavourable to the prospect of the reform being permanent, at least to a considerable extent. Of the five hundred persons at the Kirk of Shotts in Scotland, and the thousand at a particular place in the north of Ireland, whom the celebrated John Livingstone converted respectively by a single sermon, it is on record that many continued all their days under steadfast religious impressions. The same fact was remarked with regard to the Cambuslang converts of the succeeding century, and indeed of almost every other set of persons brought under religious convictions in similar circumstances. We can scarcely, then, reasonably doubt that much of the frenzy, to call it so, which Father Mathew has excited, will remain in a goodly twilight state *at least*, during the future times of Ireland.

LOUIS-PHILIP—HIS LIFE AND ADVENTURES.

CONCLUDED.

AT the termination of the previous paper, we left the Duke of Orleans and his two younger brothers pursuing a journey of difficulty and danger through the western wilds of the United States, and we now continue the narrative of their adventures.

At Chilocothe, the duke found a public house kept by a Mr M'Donald, a name well known to the early settlers of that place; and he was a witness of a scene which the progress of morals and manners has since rendered a rare one in that place, or, indeed, throughout the well-regulated state of Ohio. He saw a fight between the landlord and some one who frequented his house, in which the former would have suffered, if the duke had not interfered to separate the combatants. The second in command, who distinguished himself at the battles of Fleurus and Jemappes, performed, in the ancient capital of the north-western territory, the office of mediator between two rival powers!

At Zanesville the party found the comfortable cabin of Mr M'Intyre, whose name has been preserved in the king's memory, and whose house was a favourite place of rest and refreshment for all the travellers who at this early period were compelled to traverse that part of the country. At Pittsburg the travellers rested several days, and formed an acquaintance with some of the inhabitants, and particularly with General Neville, so well known for his respectability and amiable qualities. They met there Mr Brackenridge, afterwards Judge Brackenridge, whose peculiar characteristics were equally visible in his rambling satire called "Modern Chivalry," and in his personal eccentricities, both as a lawyer and a magistrate; but withal a man of genius, of unquestioned probity, and of much intelligence.

From Pittsburg the party travelled to Erie, and thence down the lake shore to Buffalo. At Cattaraugus, they found a band of Seneca Indians, to whom they were indebted for a night's hospitality; for there were then few habitations but Indian wigwams upon the borders of our internal seas, and still fewer vessels, except birch canoes, which sailed over their waves. Among this band was an old woman, taken prisoner many a long year before, and now habituated to her fate, and contented with it. She was a native of Germany, and yet retained some recollection of her native language and country; and the faint, though still abiding, feeling which connected her present with her past condition, led her to take an interest in the three young strangers who talked to her in that language and of that country, and she exerted herself to render their short residence among her friends as comfortable as possible. The chief assured the travellers that he would be personally responsible for every article they might intrust to his care; but that he would not answer for his people unless this precaution was used. Accordingly, every thing was deposited with the chief, saddles, bridles, blankets, clothes, and money; all which being faithfully produced in the morning, the day's journey was commenced. But the party had not proceeded far upon their route, when they missed a favourite dog, which they had not supposed to be included in the list of contraband articles, requiring a deposit in this aboriginal custom-house, and had therefore left it at liberty. He was a singularly beautiful animal; and having been the companion in imprisonment of the two younger brothers at the Castle of St Jean, they were much attached to him. The duke immediately returned to seek and reclaim the dog, and the chief, without the slightest embarrassment, said to him, in answer to his representations, "If you had intrusted the dog to me last night, he would have been ready for you this morning, but we will find him." And he immediately went to a kind of closet, shut in by a board; and on his removing this, the faithful animal leaped out upon his masters. The travellers pursued their way to Buffalo, and there crossed to Fort Erie, and then repaired to the Fall of Niagara on the Canadian side, the state of the country on the American side intercepting all direct communication between Buffalo and the cataract.

From Buffalo they proceeded to Canandaigua, through a country almost in a state of nature, and by paths, rather than roads, which to this day seem to furnish Louis-Philip with his *beau ideal* of all that is marshy and difficult, and even dangerous, in travelling. In one of the worst parts of this worst of roads, they met Mr Alexander Baring, the present Lord Ashburton, whom the duke had known at Philadelphia, where he had married a daughter of Mr Bingham.

They now continued their route to Geneva, where they procured a boat and embarked upon the Seneca Lake, which they ascended to its head; and from here they made their way to Tioga Point, upon the Susquehannah—each of the travellers carrying his baggage, for the last twenty-five miles, upon his back. The load was no doubt heavy, and the task laborious, but I am strongly inclined to believe,* that the burden which Louis-Philip now bears is more oppressive than the weight which the Duke of Orleans carried through the forest and over the hills of the Susquehannah. From Tioga, the party descended the river in a boat to Wilkesbarre, and thence they crossed the country to Philadelphia.

I have found in a French publication a letter dated from Philadelphia, the 14th of August 1797, written by the Duke de Montpensier to his sister, the Princess Adelaide of Orleans, in which he describes the incidents and impressions of this journey. Having ascertained from the proper quarter that this letter is a genuine one, I have thought that an extract from it would not be unacceptable; and here it follows:—

"I hope you received the letter which we wrote you from Pittsburg two months since. We were then in the midst of a great journey, that we finished fifteen days ago. It took us four months. We travelled, during that time, a thousand leagues, and always upon the same horses, except the last hundred leagues, which we performed partly by water, partly on foot, partly upon hired horses, and partly by the *stage*, or public conveyance. We have seen many Indians, and we remained several days in their country. They received us with great kindness, and our national character contributed not a little to this good reception, for they love the French. After them, we found the Falls of Niagara, which I wrote you from Pittsburg we were about to visit, the most interesting object upon our journey. It is the most surprising and majestic spectacle I have ever seen. It is a hundred and thirty-seven (French) feet high; and the volume of water is immense, since it is the whole river St Lawrence which precipitates itself at this place. I have taken a sketch of it, and I intend to paint a *gouache* from it, which my dear little sister will certainly see at our tender mother's; but it is not yet commenced, and will take me much time, for truly it is no small work.

To give you an idea of the agreeable manner in which they travel in this country, I will tell you, my dear sister, that we passed fourteen nights in the woods, devoured by all kinds of insects, after being wet to the bone, without being able to dry ourselves; and eating pork, and sometimes a little salt beef, and corn bread."

On their return to Philadelphia, the brothers found their finances so exhausted, that they could not quit the city during the prevalence of the yellow fever. But their mother having recovered a part of the property of the family, hastened to send them the necessary resources; and in September they undertook another excursion, which this time led them to the eastern part of the United States. They proceeded to New York, and thence by the Sound to Providence and Boston. In this metropolis of New England they remained some time, greatly satisfied with the hospitality and kindness of the inhabitants. Louis-Philip yet speaks of General Knox, Colonel Pickering, Mr Otis, and others, whom he met here. They continued their journey by the way of Newburyport and Portsmouth, to Portland; and from this last place they returned to Boston, and thence took the route by Hartford, New Haven, and New London, to New York. Governor Clinton, Judge Jay, Colonel Burr, and Colonel Hamilton, appear to have been well known to Louis-Philip.

While at New York, the brothers learned from the public papers that a new law had just decreed the expulsion of all the members of the Bourbon family yet remaining in France from that country; and that their mother had been deported to Spain. Their object was now to join her; but, owing to their peculiar circumstances, and to the war between England and Spain, this object was not easily attained. To avoid the French cruisers upon the coast, they determined to repair to New Orleans, and there to find a conveyance for Havana, whence they thought they could reach the mother country. They set out, therefore, for Pittsburg on the 10th of December 1797; and upon the road, fatigued with travelling on horseback, they purchased a waggon, and, harnessing their horses to it, and placing their luggage within, they continued their route more comfortably. They arrived at Carlisle on Saturday, when the inhabitants of the neighbouring country appeared to have entered the town for some purpose of business or pleasure, and drove up to a public-house, near which was a trough for the reception of the oats which travellers might be disposed to give their horses, without putting them into the stable. A quantity of oats was procured by the party, and poured into the trough; and the bits were taken from the horses' mouths, to enable them to eat freely. The duke took his position in the waggon, looking round him; when the horses being suddenly frightened, ran away with the waggon, which, passing over a stump, was upset and broken. The duke was thrown out, and somewhat injured. In early life, he had luckily been taught a little of every thing; and, among other acquirements, he was able to open a vein quite *surgically*. He is said to carry a lancet with him in all his excursions, and an incident of recent occurrence shows that this precaution is a wise and humane one.

Louis-Philip immediately perceived that his situation required he should be bled; and making his way, as he best could, to the tavern, he requested permission of the landlord to perform the operation in his house, and to be furnished with linen and water. The family was kind, and supplied him with every thing

* It is necessary to remind the reader that the bulk of this account of Louis-Philip is abridged from the work of an American author, entitled "France, its King and Court."

Digitized by Google

he required; and he soon relieved himself by losing a quantity of blood. The circumstances, however, had attracted general attention, in consequence of the accident to the waggon, and of the injury to the traveller, and still more from the extraordinary occurrence of auto-phlebotomy; and a large crowd had collected in the tavern to watch the result of the operation. About this period, the New England states were sending out those swarms of emigrants to Ohio, who went to lay down the forests before them, and to build up their fortunes in the west. Louis-Philip speaks English as well as an American or an Englishman, and no accent would betray that he was a Frenchman. It is probable, the curious spectators thought he was a Yankee doctor, going to the west to establish himself, and to vend medical skill and galenicals. Apparently well satisfied with the surgical ability which the new Esculapius had just displayed, they proposed to him to remain at Carlisle, and to commence there his professional career, promising to employ him, and assuring him that his prospect of success would be much more favourable than in the regions beyond the mountains.

When our party reached Pittsburg, they found the Monongahela frozen; but ultimately the travellers continued their voyage, and met with but one sinister accident. By the inattention of the helmsman, the boat struck a tree and stove in her bows. All the crew, princes and hired men, went to work; and after twenty-four hours the damages were repaired, and they reached New Orleans in safety, on the 17th of February 1798.

From this city, they embarked on board an American vessel for Havana; and upon their passage they were boarded by an English frigate, under French colours. Until the character of the cruiser was ascertained, the three brothers were apprehensive that they might be known and conducted to France. However, when it was discovered, on one side, that the visiter was an English ship, and, on the other, that the three young passengers were the princes of the house of Orleans, confidence was restored, and the captain hastened to receive them on board his vessel, where he treated them with distinction, and then conducted them to Havana.

The wanderers attempted in vain to get a passage to Europe. Notwithstanding their regret at being obliged to live out of France, they would have been contented in obscurity, if they could have obtained the means of an honourable subsistence. Their reception by the Spanish authorities, and the inhabitants of Havana, gave them some hopes; but the court of Madrid disappointed them by forcing them to quit the island of Cuba. The brothers now proceeded to the English Bahamas, where they were kindly received by the Duke of Kent, who, however, did not feel authorised to give them a passage to England in an English frigate. They were not discouraged, but sailed in a small vessel to New York, whence an English packet carried them to Falmouth, and they arrived in London in February 1800. The duke still desired most earnestly to see his mother, and the English government allowed him to take passage in a frigate to Minorca. The war between Spain and England threw many obstacles in the way of the interview between the duke and his remaining parent, and he was obliged to return to England without seeing her. He then established himself, with his brothers, at Twickenham, on the banks of the Thames, where he gained the esteem of all who knew him. During his stay in Great Britain at this period, he visited many parts of the country, and studied with great zeal its political economy and laws. The Duke of Montpensier died in the year 1807. Count Beaujolais was in feeble health, and was ordered by the English physicians to visit a warmer climate. The duke accompanied him to Malta; from thence to Sicily; but before their arrival at the latter place, the young prince died. At Mahon, after many adventures, the duke had the gratification of meeting his mother, from whom he had been separated sixteen years.

A brighter day was now dawning on the house of Orleans. In November 1809, the duke was married at Palermo to the Princess Amelia, daughter of the King of Sicily, and of exceedingly estimable character. After the fall of Napoleon, the Duke of Orleans returned to Paris, and enjoyed the happiness of finding himself in a country which had not forgotten his former services. On the return of Napoleon in 1815, he sent his family to England, and was ordered by the king, Louis XVIII., to take command of the army of the north. He remained in this situation until the 24th of March 1815, when he gave up the command to the Duke of Treviso, and went to join his family in England, where he again fixed his residence at Twickenham. On the return of Louis XVIII. after the Hundred Days, an ordinance was issued, authorising, according to the charter, as it then stood, all the princes of the blood to take their seats in the Chamber of Peers; and the duke returned to France in September 1815, for the purpose of being present at the session. Here he distinguished himself by a display of liberal sentiments, which were so little agreeable to the administration, that he returned again to England, where he remained till 1817. He now returned to France, but was not again summoned to sit in the Chamber of Peers, and remained therefore in private life, in which he displayed all the virtues of a good father, a good husband, and a good citizen.

The education of his family now deeply engaged his attention. His eldest son, the Duke of Chartres (now Duke of Orleans), was instructed, like his ancestor Henry IV., in the public institutions of the country, and distinguished himself by the success of his studies. The family of Louis-Philip was ever a model of union, good morals, and domestic virtues. Personally simple in his tastes, order and economy were combined with a magnificence becoming his rank and wealth, for the restoration of his patrimony had placed him in a state of opulence. The protector of the fine arts, and the patron of letters, his superb palace in Paris, and his delightful seat at Neuilly, were ornamented with the productions of the former, and frequented by the distinguished men of the age.

The events of the revolution of 1830 need not here be related; it is sufficient to state that, on the abdication of Charles X., the Chamber of Deputies invited the Duke of Orleans to assume the executive power, under the title of lieutenant-general of the kingdom; and in a few days afterwards he was offered the vacant throne. Having taken the required oath to the constitution, he was proclaimed king, under the title of Louis-Philippe. It is not our desire to enter upon any account of his political conduct since his accession to the throne. It has been marked by great prudence, love of order and peace, and a wish for gradual meliorations and improvement.

Though considerably advanced in life, his constitution is vigorous, and there are no marks of declining years about him. His frame is bulky, but there is much ease in his movements, and his whole carriage is marked by that happy address which good taste and the polished society in which he has moved, have enabled him to acquire. He belongs to that small class of men, the individuals composing which you cannot meet in a crowd or pass in the street, without turning round to regard them, and involuntarily asking yourself who they are. He speaks and writes English as fluently as any Englishman or American, and possesses a familiar knowledge of most modern languages. He is very ready in conversation, and displays great tact and judgment in his observations. In the execution of his public duties, he is said to be prompt and active, and, it is known, he exercises a degree of control over his ministry which almost goes beyond the bounds of constitutional monarchy.

The court of France, under the auspices of the queen, is acknowledged to form a pattern for royalty. The thirty-first year of her marriage has just expired, and she and her husband, once poor, are now at the summit of human power, with a most interesting family of seven children, and, as is known to every body, with the warmest attachment to each other. In the bitterness of French political discussions—and bitter enough they are indeed—no whisper of calumny has ever been heard against the queen; and one who could pass through this ordeal, has nothing more to dread from human investigation. A kinder and more anxious mother is nowhere to be found; and she is a sincere believer in the Christian religion, and devout in the performance of its duties. Her charity is known throughout the country, and appeals for the distressed are never made to her in vain. In the performance of her regal duties, while her bearing is what the nature of her position requires, there is a kind affability which seems continually seeking to put all around her as much at their ease as possible.

The king's sister, the Princess Adelaide, forms a part of the royal family, and she is said to be one of the most devoted sisters that brother ever possessed. It would seem like panegyric were I to report to you the *golden opinions* which this elevated lady has won for herself. In the qualities of head and heart, all who know her award to her the meed of praise. Religious, charitable, exemplary, she is one of those who adorn high places by higher virtues.

The Duke of Orleans, the eldest son of the king, and the heir of the monarchy, is now about thirty years of age. He is a young man above the middle stature, and of rather a slender form. But he is well made, with a symmetrical figure, and he is one of the most graceful men I have ever seen. His countenance is remarkably handsome, and there is something very prepossessing in his whole appearance. He speaks English with great ease and fluency, and with very little foreign accent. In conversation he is ready and unassuming, evincing the general knowledge of a well-educated man of the world. Having no direct constitutional position with reference to the administration of the government, he has evidently kept himself aside from the course of its operations, committing himself with none of the parties who are contending with each other for power. In all this he displays great judgment, and a profound knowledge of his countrymen. Every reader must recollect the dissensions which have existed in the English royal family, ever since the accession of the house of Brunswick to the throne, and the disastrous effects which these have produced upon the parties themselves, as well as upon public men and measures. And similar scenes of internal discord have too often existed in other reigning families of Europe, where the ambition of the prince has overpowered the duties of the son, and a deplorable spectacle of filial disobedience, and sometimes of parental harshness, has been offered to the public curiosity. But this state of feeling is unknown in the family of Louis-Philip. There is no political *coterie* round the prince royal, seeking by present opposition to lay the foundation of future power. The whole family seems united in the bonds of common affection; and the example they thus offer is as refreshing to the philanthropist as it is useful to the country.

The wife of the Duke of Orleans is a Princess of Mecklenberg-Schwerin, and she has brought to her high station qualities eminently fitted to adorn it. She is tall, with a singularly expressive and attractive countenance, and a general deportment at once dignified and easy. Though she came to France a stranger and a Protestant, yet she has conducted herself with such exemplary propriety that all tongues are loud in her praise, and her husband is considered equally fortunate, as a prince and as a man, in the choice he has made. The duchess is well versed in English literature.

The four younger sons of the king are the Duc de Nemours, the Prince de Joinville, the Duc d'Aumale, and the Duc de Montpensier. The first is in the army, and has already given proofs of conduct and courage which have drawn upon him the applause of his fellow-citizens, and excited their hopes. His personal bearing at the storming of Constantine is said to have been remarkable for self-possession and intrepidity. He is a young man, with light hair and light complexion, slim and apparently slender in his form, but with a handsome face and polished manners; and these advantages are set off by a modesty of deportment, which, in any station of society, and at his time of life, would be highly creditable, and which is still more so in the position that he occupies. Those who know him speak very favourably of his endowments, and he has participated in that careful education which Louis-Philip has deemed essential for all his children—an education not conducted in the seclusion of the domestic circle, but intrusted to the public institutions of the country, where all these young men have been brought into contact with youths of their own age, and where their faculties have been strengthened, and their minds disciplined, by the competition of their companions, and by the regulations of these establishments. The Prince de Joinville is a captain in the navy, and lately was in command of a frigate in the East. The two remaining sons of the king are yet so young that it would not be proper to attempt to give any sketch of their characters or endowments. They are fine-looking young men, with expressive countenances and very prepossessing appearance.

COLONISATION.

At a fête given by the Plymouth Company of New Zealand, at Plymouth, on the 30th October last, Sir William Molesworth delivered an eloquent and convincing speech on the general question of colonisation, which we here present in a somewhat abridged form.

Sir William began by adverting to the efforts of the Company, of which he is a director. He said they were mainly animated by a desire to afford to a portion of our suffering population a better field for their industry than what could be obtained in their native country. It was this desire of new fields which, centuries ago, caused western Europe to be overspread by the ancestors of its present races. He then proceeded as follows:—"The same spirit moved our more immediate ancestors to seek in the new world a refuge from the tyranny of the Stuarts, and bade them fly from their comfortable homes to the wilderness, in pursuit of that freedom of conscience and thought, which is the loftiest aspiration of the human mind. There, contending with a rigorous climate, a barren soil, and warlike savages, their undismayed energies have built up an empire which, in its noblest object, the happiness of its people, surpasses all others on record in ancient or modern times. As a parent is proud of the virtues and prowess of his offspring, so ought we to rejoice in the industry, intelligence, and well-being of our kinsmen of America. They are men of the same bold, hardy, and persevering race with ourselves, animated by the same feelings, actuated by the same motives, enjoying similar institutions, and as such as nearly allied to us as if they were subject to the same sovereign authority. Be assured, that in the conquest which they have commenced of the new world, they will never rest satisfied till they have covered with their multitudes all the vast continent which extends from the Atlantic to the Pacific, and reaches from the Arctic Pole to Cape Horn. Such have hitherto been the effects of the colonising spirit of our race—the subjugation of Europe, and the substitution of an advancing for a decaying civilisation—the peopling, I may say the creation, of America. Nor have we in the present age degenerated from the virtues of our ancestors. Our flourishing settlements in Australia and Van Diemen's Land at best the undecaying vigour of the spirit of colonisation, and that we still aspire to give an all but universal empire to the name and language of the Anglo-Saxon. But how different are our conquests from those of our progenitors! They acquired their possessions by the sword and the spear: we make use of the ploughshare and the steam-engine. Under our influence, the forest and the morass are changed into fertile and cultivated fields, rich with waving harvests, or covered with numerous flocks and herds. Great cities spring up, as it were, by magic, in the wilderness, containing all that art, science, and civilisation can contribute to redeem and improve mankind. The wretched savage, who wanders naked in the desert, becomes the object of our protection and regard, and is carefully instructed in the sacred mysteries and morality of our holy religion; and the result is knowledge, happiness, peace, and good-will amongst men. This is a true and not exaggerated picture of the benefits which colonisation has conferred on America and Australia. Nor less conspicuous are the advantages that have redounded to the parent state. I will make no reference to the vast extent of our colonial

Digitized by Google

empire, upon which the sun never sets, and in which is to be found every climate with its peculiar productions. These considerations fill the mind with ideas of enormous power and dominion; but, in my humble judgment, they do not alone display the especial advantages of colonisation to the parent state. Those advantages are to be traced in the effects of colonisation on commerce, industry, and manners. Compare England in the sixteenth century, when colonisation was about to commence, with what it is at the present moment. In the reign of Elizabeth, the clothing and even the luxuries of the richest class were of the rudest description, and such as the poorer orders would now despise. Cotton, tobacco, and sugar, were all but unknown, or at least unattainable, except at enormous prices. With the emigration of Englishmen to the new world, these and other productions were discovered, cultivated, and sent home in return for the produce of our industry. The new desires, thus created, stimulated our exertions to gratify them. Hence, a sudden and rapid development of the useful arts. Manufactures sprung up in every direction, and along with them agriculture flourished. The seas were covered with fleets of merchantmen, busily engaged in exchanging the productions of Englishmen in different hemispheres. The sea-ports were crowded with ships, and became important cities; witness Bristol and Liverpool. In the interior of the country large towns were built, for the sole purpose of manufacturing the raw produce of America; as, for instance, Manchester, and other towns in Lancashire. Thus society was profoundly agitated, the middling classes became wealthy, acquired influence, and, ultimately, predominance. The feudal aristocracy disappeared; the power of the crown was diminished; and liberty was established upon a rational and solid basis. In bringing about these beneficent results, colonisation has had no small part. Without doubt, other and more important causes have likewise contributed. But I deem it impossible to over-estimate the influence on our wealth and prosperity of the circumstance, that some of the most productive portions of the globe are possessed by men of our own race, with wants, habits, and inclinations similar to our own, able and willing to purchase British goods, and affording numerous and daily increasing markets for our manufactures. What, I ask, is this but the result of colonisation? Could it have existed without colonisation? Would America have been the same source of wealth and enjoyment to us, if its forests had been unfelled by Englishmen, and its fierce savages had remained undisputed lords of the soil? Could the same results have been brought about by any other people? I point to South America with its scattered and rude population, its intestine wars and constituted anarchy—I point to the colonies of the Spaniard, the Portuguese, and the French—and I answer, none but the Anglo-Saxon could have worked the wonders of North America. We are by nature a colonising people. God has assigned to us the uninhabited portions of the globe, and it is our duty to take possession of them." [Sir William then adverted to the colonisation of New Zealand, and the peculiar plans of Mr Wakefield. He was himself, he said, deeply interested in New Zealand, having a brother amongst the first settlers. This young person had gone thither with his cordial approbation and concurrence.] "For in my humble judgment, a young man with active body and vigorous understanding, who has his fortune to make, cannot seek it in a better manner than in the colonies, especially in those of the southern hemisphere, where the climate is similar to our own. In this country every occupation is overstocked; in every employment competition is excessive; the profits of capital are scanty, and there is no room for competitors. Look at the number of barristers without briefs—of lawyers without fees—of doctors without patients. Behold the swarms of clergymen that crowd into the church without any special vocation for that sacred office, and awaiting in vain expectation for some scanty living. The army and navy are equally overstocked. In the same manner I might go on enumerating every description of trade and industry, showing in all an excess in the number of competitors, and a state of general uneasiness. It is only, therefore, after a long life of patient and painful toil, and in too many cases not even then, that a prudent man, who does not possess the gifts of fortune, can indulge in the social affections—become a husband, and the honoured father of a family. It is unnecessary for me to dwell upon the unhappiness which ensues, and the injury done to morality. It is but too well known to all persons who have reflected upon the social condition of mankind. Nor will I speak of the lamentable effects upon the social condition of women—the blighted affections, the misery, and unhappiness, which are to be attributed to the causes that I have just mentioned. The deepest sorrow and compassion must fill the mind of every man who has carefully considered these subjects, and traced the moral as well as the physical consequences of over-competition in this densely peopled country. How different is the scene in the colonies of the southern seas! There industry and capital meet with a reward three times greater than in this country. There, with moderate prudence and exertion, every man and every woman can obtain a comfortable subsistence; and a numerous offspring, instead of being a burden, is the greatest of benefits. What, then, hinders multitudes from hastening to these lands of promise? Surely abundance there is better than penury here. Why do not the younger branches of our aristocracy, instead of wasting their time at home in sloth and idleness, or in the iguoble attempt, and henceforth, I trust, a vain one, to quarter themselves upon the resources of the nation—why do not they, I repeat, lead forth numerous bands of emigrants to the colonies? Can they have a more honourable or useful occupation? By putting themselves at the head of systematic colonisation, they would confer a lasting benefit on their country and themselves, and gain a renown in history similar to that of the Raleighs, the Gilb—s, the Drakes, and other worthies, distinguished in the annals of the planting of America. You, intrepid men, who are about to leave these shores, emigrants to New Zealand, bright prospects are before you. Go, then, accompanied with every auspicious omen. Be the pioneers of civilisation. Imitate your forefathers: subdue the forest—carry your name, and your language, and your arts, and your institutions, into the wilds of the southern hemisphere. Let the sea and the land be alike witness of your toils. Become the founders of a mighty empire in a new world of your own creation. Thus accomplish the destiny of your race. It is true, you are few in number, but not more numerous were those who first landed in this kingdom with Hengist and Horsa, and still fewer were the pilgrim fathers of the thirteen millions of America. Go, then, be bold yet prudent. Place firm faith and reliance in yourselves. And remember in the hour of peril, that there are no dangers nor difficulties that the energy of the Anglo-Saxon man has not already overcome. Go, then, and prosper. And that happiness and every success may attend your steps, is the humble prayer which all here present offer up in your behalf."

YOUTH AND SUMMER.

[BY MARY HOWITT.]

Summer's full of golden things!
Youth it weareth angel's wings!
Youth and love go forth together,
In the green-leaved summer weather,
Fill'd with gladness!

Summer, rich in joy it is,
Like a poet's dream of bliss;
Like unto some heavenly clime!
For the earth in summer time
Doth not wear a shade of sadness!

Radiant youth! thou art ever new
Thine's the light, the rose's hue;
Flowers' perfume, and winds that stir,
Like a stringed dulcimer,
All the forest!

Joyous youth! thou art fresh and fair,
Wild as wildest bird of air;
Thou, amidst thy ringing laughter,
Look'st not forward, look'st not after,
Knowing well that joy is surest!

Brighter than the brightest flowers;
Dancing down the golden hours;
Thus it is in every land,
Youth and love go hand in hand,
Link'd for ever!

Youth, thou never dost decay!
Summer, thou dost not grow grey!
We may sleep with Death and Time,
But sweet youth and summer's prime
From the green earth shall not sever!

—*Fisher's Drawing-Room Scrap-Book.*

THE GREAT DRINK.—A FATAL CURE.

Those who know the Highlanders best will acknowledge that there are many observances practised by them which are productive of much mischief. This is particularly the case as to their domestic remedies; and we cannot but record a fatal instance of this, in the hope that others will take warning. There is a remedy of great credit, as usual, in almost all diseases, known by the Gaelic phrase signifying the "great drink," which is intended to produce a copious perspiration. A few weeks since, a lad of eighteen or nineteen years, who had been complaining of some rather obscure internal disease, and was continuing in much the same state under medical treatment, hearing of this cure, urged his father to give it to him. After much entreaty, he yielded, and one evening administered the following draughts:—The first was a bowl of gruel, with milk and butter, and two glasses of whisky; this was followed in a brief space by a tumbler of toddy made with two glasses of whisky; and in a short time after two tumblers of hot porter followed, the whole wound up by a glass of raw spirits. These were administered within an hour and a quarter, and the lad fell into a profound sleep, from which he awoke next morning about six, and expressed himself free from pain. His father, however, became alarmed, when he observed that he spoke feebly; and other symptoms very speedily appeared, indicating a fatal issue to the experiment. In an hour he was dead, and the blood began to ooze out of his mouth. The event has caused a great, and it is hoped a salutary, sensation in the district.—*Inverness Courier.*

SUPERIORITY OF MORAL TO PHYSICAL FORCE.

Among the operatives there is continually manifested a growing sense of the superiority of moral force to physical strength. Mischievous as *strikes* and *turns-out* are, they exhibit features which must afford some consolation to the philanthropist and the moralist. There is a firmness of purpose displayed on these occasions—an iron spirit of endurance, which it would be the worst of all mistakes to confound with sulky obstinacy; it is the repose of conscious strength; it is founded on a mistaken notion of right, but in spite of the mistake, the notion of rectitude, whenever present, cannot but be influential, and hence it is an invariable rule, that whenever a strike has led to an act of violence, the whole matter is at once ended—the moral cohesion which held the workmen together is melted and solved by crime; each man is anxious to disclaim any participation in outrage, and quietly returns to his employment.—*Dr Taylor's Natural History of Society* [*new work*].

EFFECT OF MUSIC ON A MANIAC.

An intimate acquaintance waited on Madame Camporese one evening, to make a request. In the hospital for the insane, a man was confined, literally music mad; he had lost his senses on the failure of an opera, in which the labour of the composer was greater than the excellence of his music. This unfortunate had heard of Camporese, whose fame filled the city of Milan, and conceived a strong desire to hear her. For a while his representations passed unheeded; he grew ungovernable, and had to be fastened to his bed. In this state Camporese's friend had beheld him. She was dressed for an evening party when this representation was made to her. She paused a moment on hearing it; then throwing a cloak over her shoulders, said, "Come, then." "Whither?" "To the Ospedale." "But why?—there is no occasion to go now; to-morrow, or the next day." "To-morrow!—no, indeed; if I can do this poor man good, let me go instantly." They went. Being shown into a room separated from that of the maniac only by a thin wall, Camporese began to sing one of Haydn's melodies. The attendants in the next room observed their patient suddenly become less violent, then composed, and at last he burst into tears. The singer now entered; she sat down, and sang again. When she had concluded, the poor composer took from under his bed a torn sheet of paper, scored with an air of his own composition, and handed it to her. There were no words, and nothing in the music; but Camporese, running it over, sang it to some words of Metastasio, with such sweetness that the music seemed excellent. "Sing it to me once more," said the maniac. She did so, and departed, accompanied by his prayers and the tears of the spectators.—*Seven Years of the King's Theatre.*

ISSUE OF AN IMPROVED AND EXTENDED SERIES OF

CHAMBERS'S

INFORMATION FOR THE PEOPLE.

In an Octavo form,

Uniform with the "People's Editions."

THE "INFORMATION FOR THE PEOPLE," published in 1833–4, consisted of fifty sheets in large quarto, each (with a few exceptions) containing a summary of a particular branch of human knowledge. The large sale which this work continues to experience as a volume, has suggested to the Editors the propriety of throwing it into the more convenient form of royal octavo, and at the same time extending and improving its contents.

They have therefore respectfully to announce, that the issue of AN EXTENDED AND IMPROVED EDITION OF THE "INFORMATION FOR THE PEOPLE" will commence on the first Saturday of January 1841, and continue, at the rate of a sheet every Saturday, till the work is completed. It will consist of 100 sheets, or double the former number, and treat more than double the former number of subjects. The existing articles will be in many instances re-written, and in all so greatly improved, that the work, considering at the same time its being so much extended, may, without much impropriety, be described as *one altogether new*. The New Series will also have the advantage of an arrangement of subjects in some degree accordant with their natural order, and it will be more extensively illustrated by Wood Engravings. Completed in two volumes, containing 1600 double-columned pages, at the price of *twelve shillings and sixpence*, it will be A COMPREHENSIVE POOR MAN'S CYCLOPÆDIA, AND PERHAPS THE MOST STRIKING EXAMPLE YET GIVEN OF THE POWERS OF THE PRESS IN DIFFUSING USEFUL KNOWLEDGE.

List of Numbers in the New Series, as nearly as it at present can be given.

Astronomy, or System of the Universe. Geology, or Structure of the Earth. Geography; Descriptive and Political. Physical History of Man. Ancient History; Egypt; Arabia Petræa. History of the Jews; Palestine. History of Greece and Rome. History of the Middle Ages; Crusades. History of Great Britain and Ireland. History of Great Britain and Ireland—continued. History of Great Britain and Ireland—concluded. Constitution and Resources of the British Empire. Description of England. Description of London. Description of Scotland. Description of Ireland. Description of the United States. Emigration to the United States. Emigration to Canada. South America. The West Indies. The East Indies. China. Australia. Van Diemen's Land; New Zealand. Zoology; Mammalia. Birds. Fishes, Reptiles. Articulata. Mollusca and Zoophytes. Vegetable Physiology; Botany. Animal Physiology. The Ocean; Maritime Discovery; Navigation. The Whale; Whale Fisheries. Commerce; Money; Banks. Roads; Canals; Railways. Political Economy. Principles of Civil Government. Laws—History and Nature of. Superstitions. Mahommedan and Pagan Religions. History of the Bible, and Evidences of Christianity. History of the Church and Religious Denominations. Natural Theology. Private Duties of Life. Public and Social Duties of Life. Life and Maxims of Franklin. Preservation of Health. Proverbs and Old Sayings.

Natural Philosophy. Mechanics; Machinery. Hydrostatics and Pneumatics. Meteorology; the Weather. Optics; Acoustics. Ventilation; Lighting; Heating. Electricity and Galvanism. Chemistry. Chemistry applied to the Arts. Phrenology. Logic. Education—Practical Directions on. Principles of Population; Poor-Laws. History of Languages; Writing. English Literature; Books. English Grammar. French Grammar. Arithmetic; Interest Tables. Measurement; Land-Surveying. Drawing and Perspective. Painting and Sculpture; Engraving. Art of Printing. Architecture. History of Inventions and Discoveries. The Steam-Engine. Mining; Coal; Salt. Miscellaneous Manufactures. Manufactures of Silk, Cotton, Linen, and Woollen. Agriculture. Dairy Husbandry. Horses and Cattle. Sheep. Dogs. Pigs, Poultry, Pigeons, Cage Birds. Bees. Domestic Economy; Cookery. Kitchen Gardening. Kitchen and Flower Gardening. Trees; Forests; Orchards. Gymnastic Exercises. Out-of-Door Sports. Angling. In-Door Amusements. Chronology, &c. &c.

The work will be sold in single numbers at 1½d.; and in monthly parts at 7d.

Published by W. and R. CHAMBERS, Edinburgh; W. S. ORR and Company, London; W. CURRY, Jun. and Co., Dublin; and sold by all booksellers who usually supply Chambers's Journal.

EDITORIAL NOTE.

We have lately been prevented from answering a number of letters on subjects which seemed to require attention, in consequence of having been unable to read the names subscribed by the writers. The practice of signing names in an affected and confused manner, so as to be unintelligible, is either very heedless or exceedingly silly; and we beg to say that, as respects communications to ourselves, it will be impossible for us to give any attention to them, unless both letter and subscription be written in a clear round hand.

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row.
Printed by Bradbury and Evans, Whitefriars.

CHAMBERS'
EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 465. SATURDAY, DECEMBER 26, 1840. PRICE THREE HALFPENCE.

THE INTERNAL MAN.

THERE are some well-known and amusing instances of men who, though giving the highest satisfaction to the public in the line of life which they pursue, conceive themselves nevertheless to have been designed by nature for something quite different. We have seen a clever theatrical exhibition by Mr Yates, in which the comic Liston was represented as being convinced that tragedy was properly his forte, and the not less comic Mathews as believing himself to have been only prevented from shining in Romeo by the accident of a weak leg. The late Mr Weekes, known in provincial theatres as a good performer of low Irish characters, and whose figure, face, and manner, all alike precluded the idea of his even attempting any serious line in the drama, used to avow his conviction—and never did he say any thing more irresistibly ludicrous—that he was by the turn of his mind fitted for high tragic parts. To judge from his own account, fat and fortune alone had made him a comedian. He would withdraw to a little distance, assume an attitude, put on a look, and speak a few grave lines, by way of proving his assertion, but only, of course, with the effect of more thoroughly convincing the beholder that tragedy and he could never have agreed. Yet there could be no reasonable doubt that he thought as he spoke, and that, all the time he elicited shouts of laughter as a bog-trotter with buskins composed of straw-ropes, he regarded himself as one who ought to have been exciting pity and wonder as Brutus or Hamlet.

It has been observed of several other men remarkable for their power of raising comic ideas, that they were themselves essentially melancholy. The story of Carlini—who, after maddening Paris with fun, took an excursion to raise his spirits, in the course of which, consulting a physician for his melancholy, he was recommended to go and see himself—is well known. Burns, who could, both by his conversation and verse, excite mirth beyond most men, was from his early boyhood habitually melancholy. It resided in his constitution. It has been said of Grimaldi, that he was a dull, heavy-looking man off the stage. In his life by Mr Dickens, he is only allowed to have been a feeling and timid man; but even these peculiarities are considerably different from what might have been expected of one of the greatest exciters of laughter who ever lived. It is said of Mr Liston that he used to be in the habit of sitting up, after his mirth-stirring performances, to read Young's Night Thoughts. Mr Hood has been spoken of as a melancholy man; but this is probably an exaggeration. He is only, perhaps, quiet and somewhat reserved, with a grave look. Such is also the external demeanour of another of the most remarkable comic writers of the present age, the author of the Sayings and Doings of Sam Slick. Miss Kelly, off the stage, had a strong expression of melancholy in her countenance. In a Liverpool periodical publication, a few years ago, a very witty lady of that neighbourhood was said to have died, in an asylum, in a state of melancholy madness; and a living man, who could make one's sides ache at any time with his comic songs, was described as of so grave a face that he obtained universally the nickname of Mr Dismal. There is great probability that Shakspeare, whose comic is certainly as strong as his tragic genius, and whose active period of life was wholly devoted to the entertainment of his fellow-creatures, was in his private moments a melancholy man. This impression is forcibly conveyed by his sonnets, which are full of bewailings, not only respecting an apparently hopeless passion, but respecting his fortune, station, and whole course of life. He speaks of his nature being *almost* subdued to *what it works in*, "like the dyer's hand," thus plainly intimating his conviction that that which he *did* and *seemed* before the world was not the thing which his nature designed him to *do* and *be*, but something, merely, which external circumstances pressed upon him.

We also sometimes find a wonderful discrepancy between the professional pursuits or public character of a man, and the tastes which he indulges in private. Judging from experience, it seems quite impossible, from a man's public character, to predicate what he occupies his mind with in his leisure moments. Some of the most drudging, commonplace-minded men (to appearance) will be found in private indulging in some taste, such as for pictures or the belles lettres, arguing the existence of a totally different character beneath the surface. A merchant noted for the keenness with which he follows every means of money-making, and the closeness with which in general he holds his gains, will be found to have a warm interest in missions, or the slavery-abolition cause, or some other thing which we might suppose none but a man of enlarged and active sympathies would care for. Look at that other man! He is a hardened Edinburgh writer to the signet—a being apparently composed altogether of conveyancing, multiplepoindings, and wadsets. You might meet him fifty times on business, and you would never dream that he had a single idea beyond things of the same nature with those you have been conversing upon. Yet that man is the moving-spring and leader of a society for promoting kindness to animals! A friend of ours, who belongs to one of the legal bodies of our Scottish capital, observing that a particular brother of the society had many books sent home to him from the library, was curious enough to inquire of what nature these books were. His curiosity was the greater, that the gentleman in question appeared to him an unusually steady and plodding man—one, apparently, who had not a single thought for any thing but his business. What was his surprise to find that this individual read nothing but the Greek and Roman classics, and was privately known to a few persons to be profoundly and critically acquainted with them! When one drops into a public office, he is apt to be greatly impressed by the mechanical regularity of the scene. The officials look like pieces of clockwork set to do certain duties, and it is scarcely possible to force the mind to regard them as men animated by ordinary passions. Yet there is perhaps not one of all these stiff, formal-looking beings, who does not indulge in some curious out-of-the-way taste or hobby in his private and ex-officio character. One is perhaps the very Yorick of some amazingly funny tavern club. Possibly that dull-looking man at a back desk, if rigidly cross-examined, would be found to be the identical F. R. or T. S. who signs as secretary the advertisements of the meetings of the ODD FELLOWS. There is now, in a public office in Edinburgh, an elderly gentleman, who, from any thing that could be seen about him at his desk, would merely pass as a steady demure officer, who had grown from a boy in the chronicling of certain dry details, and was content to think of nothing else. Yet this gentleman is a most profound student of the etymologies of European and eastern languages, and has written little tracts on obscure texts which have attracted the attention of English bishops. One of our gas companies has an official whose duty is that of an examiner of metres, and who executes his appointed functions with care and propriety; yet this common-place looking personage, who seemingly is only knowing in the comparative lustre of jets, argands, and batwings, is one of our most skilful cultivators of flowers, and possesses an almost unrivalled collection of ranunculuses and tulips: professionally he moves amidst gas pipes; interiorly he enjoys the delights of an exquisite flower garden. Not long ago, in one of the public offices, there was a still more curious example of a man of two occupations. He was employed, and had been employed all his days, at some labouring business connected with the establishment, and which he had to perform in a half-subterranean room down stairs. There he moiled from year's end to year's end, to all appearance a quiet, willing, and contented slave, without a single notion in his head beyond his unvarying range of duties. This man, however, was in his secret mind devoted to sport. He had always a little wiry terrier to trot behind him—at least his friends always thought it one terrier; but in reality, we believe, it was a long succession of wiry little terriers, melted from similarity into the image of one. With this he would sometimes have a summer evening's amusement among the mole-hills about Bearford's Parks or Canonmills. He generally had one or two cocks feeding in some of the bye-corners of the cellarage, designing to show them off in proper time in some obscure pit where the scattered remnant of cock-fighters still continue occasionally to snatch a fearful joy. We have heard that a solemn *Board*, sitting up stairs, were astonished one day, in the course of their deliberations, to hear a repeated crowing below them, somewhat like that which warns away the ghost of the buried majesty of Denmark; a mystery which they were quite unable to solve at the time, and which many of them no doubt regard to this day as one of those singular things which can scarcely be ascribed to natural causes. Our friend, moreover, rarely wanted a kite or gled, which he was contented to keep in his subterranean dwelling at a vast expense of collops, without ever putting the creature to its proper use in sport. In fact, it might be said that he had scarcely any of the ordinary enjoyment of the animals he kept: he only found, perhaps, that it was worth all the trouble and expense, merely to have those creatures about him which are commonly used in the sports of men more fortunately circumstanced. They at least enabled him to live in association with the *idea* of those doings, in the reality of which he would have delighted to mingle.

Every one must be familiar with similar instances of men who were privately and within themselves something different from what they commonly appeared. Thomas Britton, the musical small-coal-man, was an example that made a considerable figure in London at the beginning of the last century. Externally and by day a retailer of coal, crying his wares about the streets, he was *within* a man of refined musical genius, round whose humble fireside the most elegant people of the time were contented to gather in the evening, in order to join in his concerts, or to hear them. A few years ago, there was a butcher in the Edinburgh market who spent his whole spare time in reading books of a profoundly philosophical character. Hobbes, Hutcheson, Stewart, and Brown, were his constant companions, and *Bacon* was alike familiar to him in all senses of the word. At the same time, the magistrates of Dundee had a servant, wearing their livery, who was by many degrees the most learned man in the town. Thirty years ago, James Alexander, an old man, who stood as a porter in Calton Street in Edinburgh, would have been found, if traced to his lowly home in a back street, pursuing experiments in electricity with a tolerable variety of self-made machinery. To go from a humble

Digitized by Google

to an exalted instance, we have Walter Scott's own confession that he conceived himself to be naturally a soldier. With regard to his children's tutor, Mr Thomson, he used to say, "Lameness, in his case, *as in mine*, spoiled an excellent life-guardsman." A high military spirit runs through all his writings, and shows how germane that profession and all its associations were to him, all the time that he *practised* life as a man of the pen. Men baulked, as he was, of being what their inclinations lead them to, generally endeavour to make their sons what they in vain wished to be themselves. Such was his case. It is a fine feeling, but not always productive of good effects. Many a man has been sent into a learned profession, not because of his natural qualifications for it, but because his father looked back to a painful time when he would have fain devoted himself to study, but was impelled by stern fortune to enter upon some grosser drudgery.

Variances that appear almost unaccountable, are sometimes found in the characters of men. A person, noted, if for any thing, for a certain cool effrontery which ordinary men would have vainly attempted to rival, once confessed to a friend, who has reported to us the story, how sadly he was troubled with bashfulness. Nor let this be smiled at incredulously. It is highly probable that the self-confident part of the man's nature had all the time to keep up a struggle with some element of sensitiveness and modesty, which he felt to be in the highest degree distressing. Again, we have heard of a clever active farmer, who, while universally respected as a first-rate practical agriculturist, a man of large means and liberal understanding, was accessible to no flattery on these accounts; but if you only told him that you had heard of his possessing a wonderful power of squeaking like a pig, and was extremely anxious to hear him try it, he would blush and hesitate, like a young lady asked to sing, disclaim all merit, say it was great nonsense, and, finally, after a sufficiency of pressing, he would exhibit as a pig, evidently believing that, if fortune had played him fair, he would have astonished the whole world by this art, instead of only being a respectable farmer.

These things seem to show that many, if not most men, have an interior self considerably different from that which appears before the world—something finer or meaner than the outer self, but always something very different—something which may be more genuinely the manifestation of the real character than the other, or which, so far from being that, may only be a kind of fancy character, which is entertained as one would keep a dress in which to appear at a masquerade.

When we see a man attain distinction in a particular walk, but nevertheless think himself designed for an opposite one, to which he appears to have no true vocation, it would be rash to say that he is under a delusion. The frequent existence of deep melancholy in those who appear votaries of Momus—a fact of which there can be no doubt—should make us cautious in denying that opposite intellectual powers may also exist. Perhaps the alleged power may be there, but be only marred by some little accident. The late Dr Thomas Brown was much laughed at for his anxiety to prove himself a poet; but though his poems are not poetical, many parts of his philosophical writings are full of the finest poetry of feeling, showing that the power was certainly there, as he supposed, whatever it might be which gave a cold air to his verse. So may it have been the strange visage of Mr Liston which disabled him from exhibiting the tragic power which he believed himself to possess.

On the other hand, it seems very likely that, in many instances, though there may be some trace of the supposed qualifications or inclinations, the individual attaches too much importance to them, and only dreams of another self. We are all naturally fond of going temporarily out of ourselves: it seems the principle concerned in much of our love of fiction, and also in the passion which many unhappily have for intoxicating beverages. Acting is natural to man, and acting before one's self is the most prevalent of all kinds of theatricals. Probably, in many cases, it is from this tendency, and with a very slight ground in truth, that individuals convince themselves that their tastes and powers suited them for things so different from those amidst which they live. A youth may feel it as a great hardship to "engross;" but, if he can persuade himself that nature intended him, instead of attending to that drudgery, to "pen a stanza," it must be very agreeable to his self-love, and tend greatly to alleviate the hardships of the desk. Merely in losing for a little time the sense of immediate realities, and in imagining ourselves something else, there is certainly the experience of new and unwonted sensation. Other faculties are called into exercise, and are found to give fresh pleasures. If there is a gratification in shifting the position of a limb, well may there be pleasure in going out of mental sensations which are common, into those which are the reverse.

At the same time, if we consider that the occurrence of a man of peculiar genius, and his falling into a suitable career, are, the one entirely, and the other almost entirely, a matter of accident, we cannot doubt that serious misapplication of minds frequently takes place. And to think of a man who feels incessant promptings within himself to some objects suitable to the greater and finer of his natural qualities, but is obliged by stern necessity to still them all in his bosom, and devote himself to some sordid pursuits which only call for those meaner qualities which he possesses in common with all men, seems to us one of the most affecting considerations that we can entertain respecting a fellow creature. Such a man lives on and on, and finally sees himself grow old and approach the end of his career, without ever having once the pleasure of acting according to the main dictates of his nature. Hope may have cheered the early part of his life, and to none could that comforter be more needful; but in the end he must feel as if he had been cheated out of every thing—cheated out of himself. In the consideration of misapplied minds, the frequency of the occurrence, and how pitiable it is, a generous mind must see a powerful reason, in addition to others, for hesitating before thinking meanly of any man on account of the humble functions which it is his lot to exercise. There is a class of religionists in the east who will strike no animal, from a belief that possibly the soul of some late endeared relative of their own may now occupy its body; just so, when we feel disposed to contemn the lowly duties of any man, we might do well to consider that possibly faculties are there which might, under advantageous circumstances, have ruled "listening senates," or "waked to ecstacy the living lyre."

SKETCHES OF SUPERSTITIONS.

SPECTRAL ILLUSIONS.—THIRD ARTICLE.

It is scarcely necessary to call to the reader's remembrance, that various maladies were formerly pointed out as capable of producing spectral illusions, by their effects on the brain and nervous system. In some cases, it was stated that the brain is directly diseased; in other cases, that the perceptions made by that organ are only indirectly deranged, by sympathy with some bodily malady. Madness, for example, having its origin in diseased cerebral structure, may be attended with spectral illusions; and disorder of the alimentary organs, caused by dissipation, may be an indirect source of them, the senses, and the brain which forms perceptions through their reports, being functionally disordered from sympathy. That a peculiar temperament of body, and, in part, a particular mental constitution, are requisite to give a predisposition to the affection, there can be little doubt. Some mental philosophers go a great way farther. The phrenologists hold that it is chiefly on a particular development of one portion of the brain, which they describe as the seat of the sentiment of Wonder, that the *tendency* to see visions depends. It is observed by them, that this "sentiment, when in a state of extreme exaltation (great development and high excitement), may stimulate the perceptive faculties to perceive objects fitted to gratify it; and that spectres, apparitions, spirits, &c., are the kind of ideas suited to please an inordinate Wonder." They class *pretenders* to supernatural messages and missions, the seers of visions and dreamers of dreams, and workers of miracles, among such patients. Separating the remark just quoted from its reference to the organology of the phrenological science, we may hold it to signify, that the sentiment of wonder, when predominant in an individual's mind, will stimulate those faculties which take cognisance of the forms, colours, sizes, &c., of material existences, to such a pitch of activity, that illusory perceptions of objects, characterised by qualities fitted to gratify wonder, will be formed in the brain.

It is chiefly for the purpose of laying before our readers a sample of the views of the phrenologists on this curious and important subject, that the present paper is added to our series. The following case, contributed sixteen years ago by Mr Simpson to the Phrenological Journal, No. 6, affords an interesting example of the manner in which spectral illusions are accounted for by the strict rules of this new mental science.

"Miss S. L., a young lady under twenty years of age, of good family, well educated, free from any superstitious fears, and in perfect general health of body and soundness of mind, has, nevertheless, been for some years occasionally troubled, both in the night and in the day, with visions of persons and inanimate objects, in numerous modes and forms. She was early subject to such illusions occasionally, and the first she remembers was that of a *carpet* spread out in the air, which descended near her and vanished away.

After an interval of some years, she began to see human figures in her room as she lay wide awake in bed, even in the daylight of the morning. These figures were *whitish*, or rather *grey* and *transparent*, like *cobweb*, and generally above the *size* of life. At this time she had acute headaches, very singularly confined to one small spot of the head. On being asked to point out the spot, the utmost care being taken not to lead her to the answer, our readers may judge of our feelings as phrenologists, when she touched with her forefinger and thumb each side of the root of the nose, the commencement of the eyebrows, and the spot immediately over the top of the nose, the ascertained seats of the organs of Form, Size, and Individuality! Here, particularly on each side of the root of the nose, she said the sensation could only be compared to that of running sharp knives into the part. The pain increased when she held her head down, and was much relieved by holding her face upwards. Miss S. L., on being asked if the pain was confined to that spot, answered, that 'some time afterwards the pain extended to right and left along the eyebrows, and a little above them, and completely round the eyes, which felt often as if they would have burst from their sockets.' When this happened, her visions were varied precisely as the phrenologist would have anticipated, and she detailed the progress without a single leading question. Weight, Colouring, Order, Number, Locality, all became affected; and let us observe what happened. The whitish, or cobweb spectres, assumed the natural *colour* of the objects, but they continued often to present themselves, though not always, above the *size* of life. She saw a beggar one day out of doors, natural in size and colour, who vanished as she came up to the spot. Colouring, being over-excited, began to occasion its specific and fantastical illusions. Bright spots, like stars on a black ground, filled the room in the dark, and even in daylight; and sudden and sometimes gradual illumination of the room during the night seemed to take place. Innumerable balls of fire seemed one day to pour like a torrent out of one of the rooms of the house down the staircase. On one occasion, the pain between the eyes, and along the lower ridge of the brow, struck her suddenly with great violence—when, *instantly*, the room filled with stars and bright spots. On attempting, on that occasion, to go to bed, she said she was conscious of an *inability to balance herself, as if she had been tipsy;* and she fell, having made repeated efforts to seize the bedpost, which, in the most unaccountable manner, eluded her grasp, *by shifting its place*, and also by presenting her with a *number* of bed-posts instead of one. If the organ of Weight, situated between Size and Colouring, be the organ of the instinct to preserve, and power of preserving equilibrium, it must be the necessary consequence of the derangement of that organ to overset the balance of the person. Over-excited Number we should expect to produce multiplication of objects, and the first experience she had of this illusion was the multiplication of the bedposts, and subsequently of any inanimate object she looked at, that object being in itself real and single; a book, a footstool, a workbox, would increase to twenty, or fifty, sometimes without *order* or arrangement, and at other times piled regularly one above another. Such objects deluded her in another way, by increasing in *size*, as she looked at them, to the most amazing excess—again resuming their natural size—less than which they never seemed to become—and again swelling out. Locality, over-excited, gave her the illusion of objects, which she had been accustomed to regard as fixed, being out of their places; and she thinks, *but is not sure*, that on one occasion a door and window in one apartment seemed to have changed places; but, as she added, she might have been deceived by a mirror. This qualification gave us the more confidence in her accuracy, when, as she did with regard to all her other illusions, she spoke more positively. She had not hitherto observed a great and painful confusion in the visions which visited her, so as to entitle us to infer the derangement of Order. Individuality, Form, Size, Weight, Colouring, Locality, and Number, only seemed hitherto affected.

For nearly two years Miss S. L. was free from her frontal headaches, and—mark the coincidence—untroubled by visions or any other illusive perceptions. Some months ago, however, all her distressing symptoms returned in great aggravation, when she was conscious of a want of health. The pain was more acute than before along the frontal bone, and round and in the eyeballs; and all the organs there situated recommenced their game of illusion. Single figures of absent and deceased friends were terribly real to her, both in the day and the night, sometimes *coloured*, but generally coloured. She sometimes saw friends on the street, who proved phantoms when she approached to speak to them; and instances occurred where, from not having thus satisfied herself of the illusion, she affirmed to such friends, that she had seen them in certain places, at certain times, when they proved to her the clearest *alibi*. The *confusion* of her spectral forms now distressed her. (Order affected.) The oppression and perplexity was intolerable when figures presented themselves before her in inextricable disorder, and still more when they changed—as with Nicolai—from whole figures to parts of figures, faces, and half-faces, and limbs—sometimes of inordinate size and dreadful deformity. One instance of illusive disorder which she mentioned is curious, and has the farther effect of exhibiting what cannot be put in terms except those of the derangement of the just perception of gravitation or equilibrium. (Weight.) One night, as she sat in her bed-room, and was about to go to bed, a *stream* of spectres, persons' faces, and limbs, in the most shocking confusion, seemed to her to pour into her room from the window, in the manner of a cascade! Although the cascade continued apparently in rapid descending motion, there was no accumulation of figures in the room, the supply unaccountably vanishing after having formed the cascade. Colossal figures are her frequent visiters. (Size.)

Real but inanimate objects have assumed to her the form of animals; and she has often attempted to lift articles from the ground, which, like the oysters in the pot-house cellar, eluded her grasp.

More recently she has experienced a great aggravation of her ailments; for, like Nicolai, she began to hear

Digitized by Google

her spectral visiters speak! (the organs of Language and Tune, or Sound, affected) With Mr R. of Hull the spectres always spoke. At first her crowds kept up a buzzing and indescribable *gibbering*, and occasionally joined in a loud and terribly disagreeable *laugh*, which she could only impute to fiends. These unwelcome sounds were generally followed by a rapid and always alarming advance of the figures, which often on those occasions presented very large and fearful faces, with insufferable glaring eyes close to her own. All self-possession then failed her, and the cold sweat of terror stood on her brow. Her single figures of the deceased and absent then began to gibber, and soon more distinctly to address her; but terror has hitherto prevented her from understanding what they said.

More lately still, she has seen distinct visions in *bright brass locks*, as we mentioned was the singular experience of the American gentleman, Mr R.

She went, not very wisely, to see that banquet of demonology, the Freischutz, and of course, for some time afterwards, the *dramatis personæ* of that edifying piece, not excepting his satanic majesty in person, were her nightly visiters. Some particular figures are persevering in their visits to her. A Moor, with a turban, frequently looks over her shoulder, very impertinently, when she uses a mirror.

Of the other illusive perceptions of Miss S. L., we may mention *the sensation of being lifted up*, and of *sinking down* and *falling forward*, with the puzzling perception of objects off their perpendicular; for example, *the room, floor and all, sloping to one side.* (Weight.)

Colours in her work, or otherwise, long looked at, are slow to quit her sight. She has noises in her head, and a sensation of heat all over it; and, last of all, when asked if she ever experienced acute pain elsewhere about the head than in the lower range of the forehead, she answered that three several times she was suddenly affected with such excruciating throbbing pain on the top of the head, that she had almost fainted; and when asked to put her finger on the spot, she put the points of each forefinger precisely on the organ of Wonder, on each side of the coronal surface!—the same points in which the gentleman in London, who was troubled with visions, was affected with pain. The organ of Wonder is large in Miss S. L., as it was in that gentleman."

In the same paper Mr Simpson adduces the singular illusive perceptions suffered occasionally by Mr John Hunter, the great anatomist, several of which are identical with Miss S. L.'s. In the eighteenth and other numbers of the Phrenological Journal, other cases of spectral illusions are mentioned, several with local pain, which are held to corroborate the inferences drawn from that of Miss S. L. But the case of that lady seems to us the most comprehensive on the subject.

In a subsequent paper by Mr Simpson (in No. 7), the most brief and satisfactory explanation of the illusions of the English Opium-Eater is given. The forms and faces that persecuted him in millions (Form diseased)—the expansion of a night into a hundred years (Time)—his insufferable lights and splendours (Colour)—his descent for millions of miles without finding a bottom (Weight or Resistance, giving the feeling of support, diseased)—all described by him with an eloquence that startled the public—are only aggravated illusions, due to his irregularities. It is extremely probable that the intoxicating gas affects the same organs.

A word of advice may now be given, in conclusion, to those who are subject to illusions of a spectral kind. If hysteria, epilepsy, or any well-marked bodily affection, be an accompaniment of these illusions, of course remedial measures should be used which have a reference to these maladies, and the physician is the party to be applied to. If, however, no well-defined bodily ailment exists, a word of counsel may be useful from ourselves. We believe that, in general, spectral illusions are caused by disorders originating in the alimentary system, and that the continued use of stimulating liquors is to be most commonly blamed for the visitation. If the patient is conscious that this is the case, his path to relief lies open before him. The removal of the cause will almost always remove the effect. At the same time, the process of cure may be slow. The imagination becomes morbidly active in such cases, and may maintain the illusions after the digestive system is restored to order. But this will not be the case long, for the morbidity of the imagination does not usually survive, for any length of time, the restoration of the sanity of the body. To effect a cure of the fundamental derangement of the alimentary system, aperient medicines may be used in the first instance, and afterwards tonics—nourishing food, in small quantities, at the outset—and gentle but frequent exercise in the open air. Last but not least, for the cure of the sufferer from spectral illusions, the indulgence in cheerful society is to be recommended. Solitude infallibly nurses the morbidity of the imagination. In some cases, where the system is much weakened, and the indulgence in stimulants has been long continued, it may be advisable only to drop the use of them by degrees. But the habit is broken off at once, for the most part, with safety, as Father Mathew's temperance experiences in Ireland satisfactorily prove. Even in the instances of the most inveterate drunkards, no harm followed from instantaneous abstinence. Therefore, as a *little* too often leads to *much* in the matter of drinking, those who would break off the practice should not be over indulgent to themselves, through fear of the consequences of change.

If opium have been the cause of the illusions, a *gradual* cessation from its use is advisable; and if the digestive functions have been deranged by it, the same course should be followed as in the case of ardent liquors.

Should the sufferer from spectral illusions be conscious of no error as regards the use of stimulatives or narcotics, some affection of the brain may be suspected, and headaches, as in the case of Miss S. L., will corroborate this suspicion. Local or general bloodletting will prove, in most cases, the best remedy. Leeches or cupping may be tried in the first place, and, if tried ineffectively, the lancet may then be employed.

We do not know that any thing beyond these general hints could here be added with propriety. It may even seem strange that this point should be at all adverted to, in a work which cannot pretend to speak authoritatively on matters involving medical practice; but since the previous papers on spectral illusions appeared, our advice has been requested, and we believe that the hints now given may be beneficially followed. Delicacy, however, should, in no case of the kind, prevent the physician being applied to; and we should be sorry if our remarks should lead any one to neglect that necessary step.

A SEA CHASE.

"Horst the peak of the mainsail, Jupiter; that rascal is gaining on us fast!" "Ow, massa, de mast be no able to bear more sail; he creak an' bend like a bamboo a'ready." "I can't help it—we must try; 'tis our only chance."

The game was fast becoming desperate. We were flying before a perfect hurricane, and had reluctantly taken in sail after sail, until we were now carrying but a small storm-jib and a half-set mainsail. The Water Lily was as pretty a little schooner, of some sixty tons, as the eye of a sailor would wish to look upon; and though I knew her spars were as fine bits of wood as Bermuda could turn out, yet it was with no little anxiety that I watched the increased yielding of the mainmast to the wind, as the long peak was pointed to the sky, spreading under it a broad white sheet of canvass. But it was our only chance of escape from our pursuer.

A brig of about 200 tons was on our track; her low, black hull, long yards, and gracefully cut canvass, proclaimed her "a clipper," and we had too little reason to doubt that she was a slaver and a pirate. This was the second day she had been evidently in chase of us. She hove in sight off the Isle of Saona, on the windward corner of St Domingo, and had ever since pursued us, as with the full determination to make us her prize. So long as the wind had been moderate, we had pretty well kept our ground, but since the gale had risen to such a height as to force us to take in sail after sail, and had stirred up such a sea that the poor Water Lily could scarce get through, the brig had gained on us rapidly.

As soon as I suspected she was in pursuit of us, I had determined to try rather a dangerous mode of escape, but one which, from its danger, I had hoped would be successful. We had passed the wide bay that closes in to that of St Domingo; and instead of standing out into the open sea to double Cape Mongon, a high bluff point, formed by the range of the Baruco mountains running down to the sea, I had kept the schooner's head close in to the land, determined to try to baffle our pursuer among the shoals and rocks that extend off this point. The schooner, being so much smaller, I thought might safely pass where the brig would be afraid to venture; but, to my great disappointment, I now saw that my calculations were wrong, for we were just coming upon the shoal that stretches from the small island of Beata to the point, and our persevering pursuer still kept straight upon our track. In vain we all gazed to catch the slightest deviation in her course, or the smallest alteration in her sails. Onwards she came, careering before the gale, under fore-top-gallant and top-sails; her foresail was half clued up, to allow her jib and staysail to draw, and perhaps to enable the helmsman more truly to shape his course in our wake; and as at this time (1812) the Western Archipelago was infested with pirates, as formidable as savagely cruel, I began to feel an uncomfortable apprehension that my earthly career, with its hopes, its fears, its ambitions, and its disappointments, was fast drawing to a close. The Water Lily mounted four twelve-pound carronades—formidable enough weapons when used at close quarters, and they had on a former occasion proved useful friends in repelling an attempt to take her by boarding when becalmed on this same coast of St Domingo. But our four guns and my crew of ten negroes, even though headed by their sable chief, Master Jupiter, would have proved but a mouthful to the blackguard that was now fast bearing down upon us. Old Jupiter knew this right well; and though he offered a sort of remonstrance at my order, he hastened to see it executed; and that done, he took his stand by the weather-shrouds, holding the peak haulyards, once turned over the belaying pin in his hand, and anxiously watched the motion of the seasoned spar, as it yielded to the heavier pressure of some passing gust, and then stood again stiff and erect, as in mockery of the howling storm. With a dozen such men as Jupiter, I would not have felt much hesitation in attempting to fight off the pirate. He was about six feet two in height, and proportionally stout. Some fifty summers had passed over his head, and I daresay he had been in as many scenes where a man's life depends on his own arm. From a kidnapper of negroes on the coast of Africa, he had passed through the several stages of piracy, chains, and slavery, and was now *first lieutenant* of the Water Lily, in the service of Messrs —— of Jamaica, and spent his time in running the schooner between the islands on mercantile and trading speculations. And as the old grizzly-headed negro now stood, with nothing on but a pair of duck trousers and a checked handkerchief round his head—his muscular chest and tremendous arms scarred and seamed with marks of former broils—you would have imagined him a fit representative of the merciless gang who were in pursuit. Yet Jupiter, whatever he had been, was now an honest and a faithful servant. He loved me like a father; we had been long together, and I had a sincere regard for the faithful old fellow. The only ornament he possessed, I believe, was a long knife, beautifully ornamented in the blade, which was fitted into a silver case, and studded with silver knobs over its shagreen handle. He always wore this knife secured by a silver chain round his neck, and thrust into the waistband of his trousers. There was a mystery connected with it that I could never fathom. The answer I always got was, "Neber mind, massa, old Jupiter hab him secret too; maybe he tell you some day;" and with this answer I was forced to be content.

The brig was by this time within less than a mile of us, and every moment was shortening the distance. The sea was running fearfully high, and the spray flew from the tops of the waves, as they curled before the wind, like a snow drift. Our little schooner seemed but a mere cockle-shell amidst the waters; she was at one moment borne aloft on the crest of some towering wave, that foamed hissing and boiling around her, as it were in utter vexation that we could not fly along with it from our pursuer; and, again, as the mass of water rolled away from under us, we sunk down into the "valley of waters," and for the moment the sail actually flapped in emptiness of wind ere we were again hurled onwards by the next vast billow that swept past, foaming and hissing like its predecessor.

It was truly a wild scene, and, without the additional excitement of a pirate astern, was enough to have created anxiety in the mind of the stoutest-hearted blue-jacket.

Our pursuer was now near enough to try the range of her guns; but, thanks to the rolling of the sea, and consequent unsteadiness of the mark, her shot had as yet passed harmlessly over our heads or fallen short. But this was not to last long. And as we were borne upwards by a huge sea, bang went the gun, and whirr-rr whistled a shot, seemingly close to us. "What think you of that, Jupiter?—the fellow is coming too close." "Tink, massa! me tink some of us lose our grog soon." I thought so too.

We were rapidly closing in with the land, and a high bluff point lay over our lee-bow, on the other side of which I knew the sea took a turn inwards at right angles, forming a fine large bay, where the whole navies of the world might have rode at anchor, sheltered from the gale that was now blowing. Towards this point I kept the schooner's head; and had resolved, should no other chance of escape present itself, of which at present I saw little, to run round under the shelter of the point, and in smooth water wait for the pirate, and endeavour to repel her attack. I mentioned this to my able sub, Master Jupiter, and was glad to find he entirely approved. "Ay, ay, maybe we lick 'em dam rascal after all. Old Jupiter lub more for fight nor be shot dis a way like a runaway nigger." Bang went another gun, whirr flew the ball, and our lee main-shrouds were as cleanly cut through as if a knife had severed them. "Eh—now dat too bad," growled old Jupiter. "Never mind, my lads," I cried; "give another haul on the weather topping-lift; it's a good thing it's not our weather shrouds." "Ay, dat true; noting so bad but he can be worse. Here, Cæsar, Jack, bring a gasket, and splice dem shroud; quick now, fore anoder shot ketch you."

The brig had now got within a quarter of a mile of us, and I saw that our chase was fast drawing to a close. The headland was close over our lee-bow, and there seemed no alternative but to sell our lives as dearly as

Digitized by Google

we could, for I scarce dared to hope that we would succeed in beating off the brig. The one gun that had been brought to bear on us still banged away; its shot flying sometimes near, and sometimes at a safe distance from us, and we were still creaking and straining under the canvass we had been able to stretch. Our men were now set to loading the carronades, and arms and ammunition were distributed—old Jupiter impressing upon the negroes, that the least they could expect, if captured, would be chains and a sale to a new master, and the most likely fate they would meet would be walking the plank. The poor fellows were quite willing to fight, from whatever cause it proceeded, and eagerly set about loading their guns. They were so engaged when a shot from the brig struck us just beside the helm, where I was standing, and ploughed up the planks of the deck in a deep furrow, half the length of the vessel, upsetting in its course one of the carronades, and pitching the negroes that were engaged in loading it heads over heels, like so many ninepins. A shower of splinters flew from the deck, and one poor fellow was hit severely; a ragged bit of wood penetrated deep into his thigh. He was taken below, and I felt in the loss of even one man that my chance in the desperate game was lessened.

We could now distinguish the deck of the brig crowded with men; and when I considered the little chance we had in a struggle against such fearful odds, I hesitated for a moment whether it would not be more advisable to run the schooner ashore, and trust to hiding ourselves among the thick bush that skirted the sea. I wavered in my idea of fighting, but we were now close upon the point. "Come, Jupiter, let go the peak haulyard, and then come and stand by the mainsheet; we'll have to jibe her to round that headland, and we must show as little canvass as possible, or we'll carry away our mast." Down came the peak as Jupiter let go the haulyard, and he turned to come aft to stand by the sheet. Bang went the heavy gun from the brig. The report was followed by a sound which I can best express by the word *smash*, and a short groan. Old Jupiter doubled up, and fell forward on his face. I rushed forward to pick him up, and saw that the poor fellow's career was over. A large, ragged, horrible hole appeared about the middle of his back, and the broken handle of the knife, fastened with the chain, protruded from the wound. It was a sickening sight. The negroes crowded around the body, and gazed upon it seemingly horror-struck. We lifted him up, but there was no sign of life; the huge ball had struck him in the pit of the stomach, just on his favourite knife, and had shivered it, forcing the fragments completely through his body. For the moment I was paralysed, and forgot every thing in sincere grief for the loss of my old servant, my faithful friend. But another shot from the brig roused me, as the ball whistled past. "Come, lads, there's no time to cry; but we'll revenge poor Jupiter—we'll fight that devil." "Ay, ay, massa, we'll fight dat debbil," echoed the men. I seized the helm, which had been quitted in the horror of the moment, and cast my eyes round me to see where we were, when—could I believe my sight!—we had opened up the bay, and a large ship stood beating out towards us, under top-gallants and topsails, and bearing at the mizen-peak the union-jack. Hurrah!—it is—it is an English frigate. She had taken refuge from the gale in the bay, and, hearing the firing, was coming out to see what it was. "Run Cæsar, Jack, Sambo, run below and fetch up the English ensign—run, ye rascals." And right willingly they ran to execute my orders. The signal haulyards were rove through the peak of the mainsail, and, as it was hanging against the mast, the cord would not run. The frigate was meeting us like the wind, and came on plunging and dashing through the sea most nobly. It seemed utterly incredible that she could carry so much canvass beating up against such a gale; but though her lee-scuppers were buried in the sea, as she heeled over to the storm, yet she dashed onwards, defying alike the wind and sea. Bang went her gun, and the shot skipped off the top of a wave ahead of us. "No, no, Master Skipper, we can't broach to in such a gale, and with your leave we'll do all we can, which is just to run before it; but we'll show you our colours." And I jumped on the stern-sheets, and extended in my hands the ensign. We were understood, and the frigate continued her course, closing in upon us as if to speak.

It was a glorious sight to see so gallant a vessel straining and tearing through the sea, as if rejoicing in the gale that threatened momentarily to send yards and sails in shivers to leeward. And to us the sight was doubly glorious, for in the presence of that ship we felt that we were saved. Onwards she came. I stood with the speaking-trumpet in my hand, ready to hail her. She was within a hundred yards, still dashing onwards; and I own I began to have some dread lest the vast mass, that came roaring up to us, might crush us into the "yeast of waves." But she was under too perfect command to cause any danger of a collision; just as she seemed to be upon us, her bows fell away, and she passed close under our stern. "Schooner, ahoy!—what brig astern?" roared the hoarse voice of the commander. "Pirates!" I answered. Dash—plunge—hiss—and she swept away past us, leaving a broad, white streak upon the water, to mark for an instant her track.

Her decks were crowded; every haulyard, clue-line, sheet, and down-haul, was manned by a cluster of sailors. Here, then, was the secret of this vessel's ability to carry so much sail in the teeth of such a gale of wind. Had the finger of the anxiously watching sailing-master but moved as a signal, in an instant every stitch of canvass would have been off the masts. This is the secret, and this is the advantage, of men-of-war. They are well and ably manned, and can face danger with the knowledge that they are always prepared to avert it. They may carry sail to the very verge of rashness, for they can shorten it in an instant.

But where was our pursuer? The brig, too, saw the frigate as she came out from behind the point. Her crew had been too long in the habit of avoiding such craft not to know well that now was the time, if ever, when there existed a terrible necessity to try the virtues of their beautiful vessel. At first there seemed some confusion on board the brig, but the captain's course was soon taken; his hope lay in following our plan, and trying to escape the frigate among the rocks and shoals through which we had just passed. The helm was put down, and the graceful brig came round to the wind, on the opposite tack from the frigate, bending over to the increased pressure until her fore yard-arm dipped into the wave. She plunged bows under into the sea, and seemed scarcely able to rise again under the mass of water that rushed over her decks. For an instant I thought she was over, but she struggled on; and though her crew might be seen clinging to the weather bulwarks and shrouds, no hand was stretched, and no order was given, or if given could not be executed, to reduce the canvass which threatened to drive her to the bottom. It was impossible that she could long stand under so much sail—she was literally buried in the sea—and after dragging her yard-arms through the waves for a few minutes, the main top-mast snapped, and top-gallant and top-sail fell over the side. A feeling of something like pity crept over us, as we watched with intense interest the death-struggles of the graceful brig. The piratical crew were forgotten, and we gazed on the beautiful craft as if she had been a thing of life, and was using her own faculties in these superhuman struggles for self-preservation; and when her main top-masts went over, an involuntary expression of regret burst from us all.

That pirate captain was no laggard, however, when there was work to do. He had lost all chance of getting to windward, but another and more desperate chance still remained. In an instant the helm was put up, the yards squared, and the now maimed brig resumed her course before the wind. The fore-sheets were brought home, and the fore-top-sail yard was manned by active hands to run out studding-sail booms. The frigate instantly wore, and the two now ran before the wind, the pirate a little astern, and the frigate gradually closing in upon her. The brig commenced her fire, and poured a broadside amongst the frigate's spars, in the hope that some lucky shot might wound a spar or rend a sail; and either a wound or rent would, with the wind that was blowing, have ensured the snapping of the spar or the splitting of the sail into ribands. Some little damage might have been done, but the frigate seemed not to heed it; she came on as regardless of the discharge as if the guns had contained but blank cartridge. She rapidly neared the brig, and fired a gun to bring her to. It was answered by a second discharge of her broadside, but it was a scattered firing. Confusion and terror began to affect the conscience-stricken crew. This discharge, however, broke the fore-top-gallant yard of the frigate; and the breaking of this spar would have told heavily against her had the chase been prolonged. The latter had, however, now no alternative but to return the fire of the brig; and most fearfully it was returned. Gun after gun blazed from the frigate's starboard broadside, until every cannon was discharged. The iron shower told with fearful effect upon her opponent; several of the poor fellows that were struggling to get out the studding-sail booms, dropped one after another from their hold. The cordage, which had before been tight and trim, now flew wildly and loosely to the gale; the foremast, deprived of its stays and braces, and probably severely wounded, waved unsteady for a few moments before the breeze, then snapped close by the deck, and fell forward with a crash, carrying with it sails, yards, and its whole tracery of cordage; and the poor brig, so shortly before so graceful and so perfect, bounding like an antelope over the waves, and bidding seeming defiance to the storm, now rolled heavily in the trough of the sea—a mere log upon the water.

The chase was over. The Water Lily had been flying on its course, for, having got rid of our pursuer, we did not change it, and we soon lost the frigate and her prize under the horizon. Poor Jupiter was rolled in his hammock, and dropped into the roaring sea in deep regret. Not a word was spoken as he was gently lowered over the side, but many a tear, that would not be repressed, rolled over the sable faces of his men.

Two days brought us to Montego Bay, and, before we departed, I had the pleasure of gratefully acknowledging, to the officers of H.M.S. S——, the signal service they had rendered me. And, if it can be so called, I had the satisfaction of seeing a parcel of the rascally pirates swinging at the frigate's yard-arms. Poor Jupiter's death stopped the channels of my pity for the scoundrels. The poor fellow's words were long remembered by me afterwards—"Some of us may lose our grog soon"—and seemed almost like a prophecy of his own fate.

OCCASIONAL NOTES.

TIC DOLOREUX.

THE following letter from a gentleman to another with whom we are intimate, describing how he was relieved from this excruciating disease, seems to us worthy of being made widely known:—

"I have to apologise for my having so long neglected sending you a statement of my case. It is as follows; and if its being made public can in any way subtract from the suffering of those who suffer under that dreadful disease, Tic Doloreux, I shall feel most happy. For nearly two years I suffered the severest torture from Tic Doloreux in the head (left side) and in the left thigh. I believe I may safely say that I tried every known remedy, without any apparent effect. For the last year I never had the slightest cessation of pain, without large doses of laudanum or morphia. For fourteen months I could not lie down in bed. In fact, the torture was so dreadful, that every morning at daylight I was thankful that I was not deprived of reason. I fortunately recollected that a friend of mine had derived great benefit from the use of electricity in a case of chronic rheumatism. This led me to try the new instrument called the 'Electro-Magnetico.' I procured one, and from the first application I felt somewhat easier; and after using it half an hour, I felt inclined to sleep. I continued the use of it for that period, morning and evening, for more than a week, at the end of which time I was perfectly free from pain, and began to enjoy my natural rest. It is now nearly five months since I left off using it, and I am truly thankful to say that I feel as well as ever I did in my life."

We need only add to the above, that the electro-magnetico is an instrument made and sold by philosophical instrument makers, and the application, we believe, consists in allowing a stream of electric fluid to flow from a wire into the part affected, the process giving no pain whatever. Any skilful surgeon could apply the remedy. Tic Doloreux being, in fact, a derangement of the nerves, or, as we may call them, the electric wires of the body, it is quite reasonable to suppose that the disturbance can be rectified by the artificial means now mentioned.

INNKEEPERS AND THEIR GUESTS.

On the 25th of October last, at about two o'clock in the morning, we (or, to speak plainly, one of the editors of the present paper and his wife) arrived at the ****** **** Inn, Newcastle, by the royal mail-coach from York. On entering the house, in which we designed to lodge for the night, we found only one waiter up; and on requesting that he would furnish us with some simple kind of refreshment, he point-blank and pertinaceously refused, alleging as a reason that nothing was left out at his disposal, and that he could offer no accommodation of any kind but a bed, which we might have if we pleased. Two other gentlemen, who arrived with us, met with the same refusal, greatly to their surprise and discontent. This conduct in a house which we had always heard well spoken of, appeared at the time as exceedingly inhospitable; and it was felt the more severely from our having—such had been the rapidity of our journey by railway and coach—tasted no food, a biscuit excepted, since breakfast the previous day. However, as the man kept his point, we were obliged to submit. It did not occur to us next day to challenge the conduct of the landlord of the inn—for of course he was bound by the acts of his servant—as illegal, but on reflecting on the matter afterwards, it appeared more than likely that he had committed a breach of common law in refusing refreshment to the guests who claimed his professional services. Having laid the case before a gentleman skilled in the English law, we find that this idea is correct; that the landlord in question committed such a transgression, and laid himself fairly open not only to the penalties of a legal action, but to the loss of his license. All this we mention, not from any vengeful recollection of the circumstance, which, indeed, we look back upon with jocularity more than any other feeling, but simply as a warning to all innkeepers, and to the keeper of the ****** **** in particular. The following is an extract from the legal opinion which we have obtained on the subject:—

"Judge Blackstone, in his Commentaries on the Laws of England, says* that inns, being intended for the lodging and receipt of travellers, may be indicted, suppressed, and the innkeepers fined, if they refuse to entertain a traveller without a very sufficient cause; and he alludes to the hospitable laws of Norway, which punish, in the severest degree, such innkeepers as refuse to furnish accommodations at a just and reasonable price. The late Lord Chief-Justice Kenyon, also, in pronouncing judgment in the case of Kirkman *versus* Shawcross,† gave it as his opinion that innkeepers are bound by law to receive guests who come to their inns, and are also bound to protect the property of those guests; and that they have no option either to receive or reject guests, nor can they impose unreasonable terms upon them. And an innkeeper continues so liable, notwithstanding he has

* Vol. iv. p. 167. † Term Reports, vol. vi. p. 17.

Digitized by Google

taken down the sign, provided he continue to carry on the inn as such.* There are, however, some exceptions to this general rule. For example, an innkeeper is not bound to receive a guest, or his horse, when the inn or the stable is so full that it cannot conveniently hold him or it; nor is he liable for not receiving a guest, unless he be tendered a fair remuneration for his accommodation, for he is not bound to give him credit.

It has likewise been held by the judges that the same liability attaches to the innkeeper as regards the reception of the horses of travellers; and that he is bound to receive the horses of those travellers who request it, even though themselves should resort for accommodation elsewhere, unless, as before stated, his stable be already full.

An innkeeper is under the same obligation to receive whatever *goods* his guests bring with them, and is also liable for any loss or damage of such goods, whilst the traveller remains as a guest in the inn with the same. But an innkeeper is not accountable for any injury done to the person of his guest whilst he remains in his house. The innkeeper is responsible for the safe custody of cloaks, coats, hats, or any baggage deposited in the traveller's room or lobby.

In the event of an innkeeper improperly refusing either to receive a traveller as a guest into his house, or to find him victuals or lodging upon his tendering him a reasonable price for the same, or refusing to make good the loss or damage of goods, the most common remedy is an action on the case at the suit of the party aggrieved; but it is said that an innkeeper so offending may also be indicted and fined at the instance of the crown."

It may be added that innkeepers are liable at *all hours* and *all days*, Sundays as well as others, to obey the above legal provisions. Their houses are licensed for the accommodation of the public, and the public are entitled to make every reasonable use of them, on offering a reasonable price. We trust that these explanations may not be without their use, for the guidance of both innkeepers and travellers; and we should think that the latter can have no difficulty, when aided by competent witnesses, to compel attention to their claims. As a word spoken in season, these passing hints on a point of some little importance in our social condition, may perhaps save litigation and obviate the chances of personal inconvenience.

BLIND POETS.

In the roll of the great poets of the past, two, who hold the very highest places, were, for an important period of their lives, unpossessed of the power of vision—Homer and Milton. Happily, as has been already remarked of them, these renowned followers of the muses had made good use of their eyes in youth, otherwise it is scarcely possible that they could have left to us the finished pictures of natural scenery and other visible objects of creation which are to be found among their compositions. Homer had reached manhood, and had written a considerable portion of the Iliad, before he was attacked by that disease of the eyes which robbed them of their wonted powers. But the whole of the Odyssey was composed after the occurrence of this great mishap. In the eighth book of that poem, while describing the bard Demodocus, he has evidently taken the opportunity of alluding to his own condition, and he does so in a strain of mingled regret and resignation. Demodocus, he says, was

> "Dear to the Muse, who gave his days to flow
> With mighty blessings, mix'd with mighty woe:
> With clouds of darkness quench'd his visual ray,
> But gave him power to raise the lofty lay."

We are not aware that Homer makes any other allusion to his sad defect. His successor, Milton, has referred to the subject more frequently, and the passages containing these references are among the most interesting in his whole works. Milton is stated by most biographers to have permanently lost his sight in 1654, after a progressive and warning decay of several years' duration. But it appears probable, from existing letters dated in the years 1653 and 1654, that the misfortune happened somewhat earlier. A letter of the first of these years describes him as then blind, and Milton, in 1654, speaks as if he had "lived (for some time) in constant darkness day and night." The Paradise Lost was not published till 1667, and we are certain that it was composed when the poet was perfectly blind. His excessive application to his studies caused his loss.

Most readers will remember the exquisitely pathetic passages in which the poet alludes to his blindness.

> "Oh dark, dark, dark, amid the blaze of noon,
> Irrecoverably dark, total eclipse,
> Without all hope of day! * * * * *
> But not to me returns
> Day, or the sweet approach of ev'n or morn;
> Or sight of vernal bloom or summer rose;
> Or flocks, or herds, or human face divine;
> But clouds instead, and ever-during dark
> Surrounds me, from the cheerful ways of men
> Cut off, and for the book of knowledge fair
> Presented with an universal blank."

Scarcely less pathetic is the sonnet in which the poet describes a dream with which he was visited after the death of his second and most beloved wife.

> "Methought I saw my late espoused saint
> Brought to me, like Alcestis, from the grave;
> Whom Jove's great son to her glad husband gave;
> Rescued from death, by force, though pale and faint.
> Mine—as whom wash'd from spot of child-bed taint,
> Purification in the old law did save,
> And such, as yet once more I trust to have
> Full sight of her in heaven without restraint—
> Came vested all in white, pure as her mind;
> Her face was veil'd, yet to my fancied sight,
> Love, sweetness, goodness, in her person shined
> So clear, as in no face with more delight;
> But oh! as to embrace me she inclined,
> I waked, she fled, and *day brought back my night!*"

Previous to the time of Milton, England possessed a sightless poet. This was old Father Gower, who was the contemporary and friend of Chaucer, and flourished at the close of the fourteenth century. Gower became blind in advanced life, and he laments the occurrence, very feelingly, in one of his Latin poems. His vernacular poetry was admired in his day, but is so obsolete in language and style as to be now very difficult of perusal.

Scotland, in the same age, had her "Blind Harry." Henry, "the Minstrel," unlike the preceding poets, was blind at his birth. This being the case, it seems extremely probable that his family were in respectable circumstances, and able to give him the advantages of a good education. No common training must have been required, to give one in his condition the degree of knowledge which his works show him to have possessed. Harry, as far as we know, does not directly allude to the defect with which he was afflicted, in his great poem on the career of Sir William Wallace. But the want of the sense of seeing is made in part apparent in his poetry by the comparative absence of similitudes derived from visible objects. The blind poet refers chiefly in his images to things of which the other senses could take cognisance. As an example, the following description of a wintry scene, modernised in language by the late Lord Buchan, may be given here. The bard says, that cold winter now his

> "aspect shows;
> Frost-bound the globe, while Boreas fiercely blows,
> Sweeping the snow along the rising hills,
> Which every glen and slanting hollow fills;
> Cold grew the beams of the far-distant sun,
> And day was finished ere 'twas well begun."

Here the frost-binding of the earth, the blowing of the wind, the sweeping of the snow along the heights and into hollows, and the coldness of the distant sunbeams, are all of them things sensible to one dispossessed of vision, and which may frequently have been *felt* by Harry, as he wandered over the country, passing from castle to castle to recite his compositions before the nobles and princes of Scotland. Such was the manner in which Blind Harry, like Homer, passed his life.

In the present work, some account was formerly given of the life of Dr Thomas Blacklock, another of the blind bards of Scotland. He was born in 1721, and had the misfortune to lose his eyesight at six months old. As he grew up, he showed a marked taste for literary pursuits, and produced many pieces of considerable merit. We find various allusions to his blindness scattered up and down his poetry, and particularly in one long blank-verse soliloquy, "occasioned (as the author tells us) by his escape from falling into a deep well, where he must have been irrecoverably lost, if a favourite lap-dog had not, by the sound of its feet upon the slight board with which the well was covered, warned him of his danger." We extract from this poem the subjoined lines:—

> "But oh! while others gaze on nature's face,
> The verdant vale, the mountains, woods, and streams,
> Or, with delight ineffable, survey
> The sun, bright image of his parent God;
> The seasons in majestic order round
> This varied globe revolving; young-eyed spring,
> Profuse of life and joy; summer adorn'd
> With keen effulgence, brightening heaven and earth;
> Autumn, replete with nature's various boon,
> To bless the toiling hind; and winter, grand
> With rapid storms, convulsing nature's frame;
> While others view heaven's all-involving arch,
> Bright with unnumbered worlds, and, lost in joy,
> Fair order and utility behold;
> To ME those fair vicissitudes are lost,
> And grace and beauty blotted from my view.
> The verdant vale, the mountains, woods, and streams,
> One horrid blank appear."

Such was the wailing of the poet, in his hour of agitation and alarm; but before he concludes the same piece, he recovers himself, reckons up his counter-advantages and blessings, and finds, on the whole, a large debt of gratitude due to the Disposer alike of good and evil.

Carolan, also, the extraordinary blind poet and musician of Ireland, has been the subject of a detailed notice in this Journal. It is not our purpose, therefore, to go over the particulars of his history in this place; we shall only quote one little piece, which contains an allusion to his blindness. It is a song to "Mable Kelly," one of the sweetly named daughters of his native land, whom Carolan loved to address. The translation is from Miss Brooke's Relics of Irish Poetry.

> "To thee harmonious powers belong,
> That add to verse the charm of song;
> Soft melody with numbers join,
> And make the poet half divine.
> The timid lustre of thine eye
> With nature's purest tints can vie—
> With the sweet blue-bell's azure gem,
> That droops upon its modest stem.
> How blest the bard, oh lovely maid,
> To find thee in thy charms array'd
> Thy pearly cheek, thy flowing hair,
> Thy neck beyond the cygnet fair.
> *Even he whose hapless eyes no ray*
> *Admit from beauty's cheering day;*
> *Yet, though he cannot see the light,*
> *He feels it warm, and knows it bright.*"

"Every reader of taste and feeling," says the translator of this piece, "must surely be struck with the beauty of the concluding passage. Can any thing be more elegant, or more pathetic, than the manner in which Carolan alludes to his want of sight?"

Edward Rushton, the only other sightless child of song to whom we shall refer on this occasion, was born at Liverpool in the year 1755. He read Anson's Voyages in boyhood, and was so much struck with them, that he resolved to be a sailor. Accordingly, he was bound apprentice to a merchantman, and made several trips to the tropics. While at Dominica, he was attacked with ophthalmia, and lost his sight, in his nineteenth year. He had already shown good natural parts, and his loss of vision perhaps tended to make him more reflective than previously. He began to compose verses, and with no mean ability, as the following very tender and affecting stanzas on his blindness will satisfactorily show:—

ODE TO BLINDNESS.

> "Ah! think if June's delicious rays
> The eye of sorrow can illume,
> Or wild December's beamless days
> Can fling o'er all a transient gloom:
> Ah! think if skies, obscure or bright,
> Can thus depress or cheer the mind—
> Ah! think, mid clouds of utter night,
> What mournful moments wait the blind!
>
> And who shall tell his cause for woe,
> To love the wife he ne'er must see,
> To be a sire, and not to know
> The silent babe that climbs his knee!
> To have his feelings daily torn,
> With pain the passing meal to find;
> To live distress'd and die forlorn,
> Are ills that oft await the blind.
>
> When to the breezy upland led,
> At noon, or blushing eve, or morn,
> He hears the red-breast o'er his head,
> While round him breathes the scented thorn:
> But oh! instead of Nature's face,
> Hills, dales, and woods, and streams combined,
> Instead of tints, and forms, and grace,
> Night's blackest mantle shrouds the blind.
>
> If rosy youth, bereft of sight,
> Midst countless thousands pines unblest,
> As the gay flower withdrawn from light
> Bows to the earth where all must rest:
> Ah! think, when life's declining hours
> To chilling penury are consign'd,
> And pain has palsied all his powers,
> Ah! think, what woes await the blind!"

Edward Rushton was the author of the well-known piece, "Mary le More;" and he also published many larger poems, all of them advocating the rights of humanity. He became noted in Liverpool, where he was long established as a bookseller, for his attachment to the cause of negro emancipation, and other similar questions. He died in 1814, at the age of 58.

THE PIECE OF A HUNDRED SOUS.

FROM THE FRENCH OF EUGENE GUINOT.*

A young and handsome pair had just returned from the altar, where their destinies were irrevocably united. They were about to start for the country, and they had bidden a temporary farewell to the friends who were present at the ceremony. For a short time, while their equipage was preparing, they found themselves alone.

The newly-wedded husband took one of his bride's hands into his own. "Allow me," said he, "thus to hold your hand, for I dread lest you should quit me. I tremble lest all this should be an illusion. It seems to me that I am the hero of one of those fairy tales which amused my boyhood, and in which, in the hour of happiness, some malignant fairy stept ever in to throw the victim into grief and despair!"

"Reassure yourself, my dear Frederic," said the lady; "I was yesterday the widow of Sir James Melton, and to-day I am Madame de la Tour, your wife. Banish from your mind the idea of the fairy. This is not a fiction, but a history."

Frederic de la Tour had indeed some reason to suppose that his fortunes were the work of a fairy's wand; for, in the course of one or two short months, by a seemingly inexplicable stroke of fortune, he had been raised to happiness and to wealth beyond his desires. A friendless orphan, twenty-five years old, he had been the holder of a clerkship which brought him a scanty livelihood, when, one day, as he passed along the Rue St Honoré, a rich equipage stopt suddenly before him, and a young and elegant woman called from it to him. "Monsieur, Monsieur," said she. At the same time, on a given signal, the footman leapt down, opened the carriage-door, and invited Frederic to enter. He did so, though with some hesitation and surprise, and the carriage started off at full speed. "I have received your note, sir,"

* The French periodical press is at present very prolific in short tales, such as the above. A few other specimens have from time to time been given in the pages of the Journal. The Editors may here remark that, in two or three instances, where only the idea of the story was taken up, or other extensive alterations made to adapt the story to the taste of a new public, the gentleman who furnished the articles did not deem it necessary to make reference to the original. Had the Editors been aware of this circumstance, they would have recommended an opposite course. In future, when any use whatever is made of the French feuilletons, scrupulous acknowledgment will be made. In the above piece, the translation closely follows the original.

Digitized by Google

said the lady to M. de la Tour, in a very soft and sweet voice; "and, in spite of your refusal, I hope yet to see you to-morrow evening at my party."

"To see *me*, madame!" cried Frederic.

"Yes, sir, you —— Ah! a thousand pardons," continued she, with an air of confusion, "I see my mistake. Forgive me, sir; you are so like a particular friend of mine! What *can* you think of me? Yet the resemblance is so striking, that it would have deceived any one." Of course, Frederic replied politely to these apologies. Just as they were terminated, the carriage stopt at the door of a splendid mansion, and the young man could do no less than offer his arm to Lady Melton, as the fair stranger announced herself to be. Though English in name, the lady, nevertheless, was evidently of French origin. Her extreme beauty charmed M. de la Tour, and he congratulated himself upon the happy accident which had gained him such an acquaintance. Lady Melton loaded him with civilities, and he received and accepted an invitation for the party spoken of. Invitations to other parties followed; and, to be brief, the young man soon found himself an established visitant at the house of Lady Melton. She, a rich and youthful widow, was encircled by admirers. One by one, however, they disappeared, giving way to the poor clerk, who seemed to engross the lady's whole thoughts. Finally, almost by her own asking, they were betrothed. Frederic used to look sometimes at the little glass which hung in his humble lodging, and wonder to what circumstance he owed his happy fortune. He was not ill-looking, certainly, but he had not the vanity to think his appearance magnificent; and his plain and scanty wardrobe prevented him from giving the credit to his tailor. He used to conclude his meditations by the reflection, that assuredly the lovely widow was fulfilling some unavoidable award of destiny. As for his own feelings, the lady was lovely, young, rich, accomplished, and noted for her sensibility and virtue; could he hesitate?

When the marriage-contract was signed, his astonishment was redoubled, for he found himself, through the lady's love, the virtual possessor of large property, both in England and France. The presence of friends had certified and sanctioned the union, yet, as has been stated, Frederic felt some strange fears, in spite of himself, lest all should prove an illusion, and he grasped his bride's hand, as if to prevent her from being spirited away from his view.

"My dear Frederic," said the lady smilingly, "sit down beside me, and let me say something to you." The young husband obeyed, but still did not quit her hand. She began, "Once on a time" —— Frederic started, and half-seriously exclaimed, "Heavens! it *is* a fairy tale!" "Listen to me, foolish boy," resumed the lady. "There was once a young girl, the daughter of parents well born, and at one time rich, but who had declined sadly in circumstances. Until her fifteenth year, the family lived in Lyons, depending entirely for subsistence upon the labour of her father. Some better hopes sprung up, and induced them then to come to Paris; but it is difficult to stop in the descent down the path of misfortune. For three years the father struggled against poverty, but at last died in an hospital.

The mother soon followed; and the young girl was left alone, the occupant of a garret of which the rent was not paid. If there were any fairy connected with the story, this was the moment for her appearance; but none came. The young girl remained alone, without friends or protectors, harassed by debts which she could not pay, and seeking in vain for some species of employment. She found none. Still it was necessary for her to have food. One day passed, on which she tasted nothing. The night that followed was sleepless. Next day was again passed without food, and the poor girl was forced into the resolution of begging. She covered her head with her mother's veil, the only heritage she had received, and, stooping so as to simulate age, she went out into the streets. When there, she held out her hand. Alas, that hand was white, and youthful, and delicate! She felt the necessity of covering it up in the folds of the veil, as if it had been leprosied. Thus concealed, the poor girl held out the hand to a young woman who passed —one more happy than herself, and asked 'A sou—a single sou to get bread!' The petition was unheeded. An old man passed. The mendicant thought that experience of the distresses of life might have softened one like him, but she was in error. Experience had only hardened, not softened his heart.

The night was cold and rainy, and the hour had come when the night police appeared to keep the streets clear of all mendicants and suspicious characters. At this period, the shrinking girl took courage once more to hold out her hand to a passer-by. It was a young man. He stopped at the silent appeal, and, diving into his pockets, pulled out a piece of money, which he threw to her, being apparently afraid to touch a thing so miserable. Just as he did this, one of the police came to the spot, and, placing his hand on the girl's shoulder, exclaimed, 'Ah, I have caught you, have I?—you are begging. To the office with you! come along!'

The young man here interposed. He took hold hastily of the mendicant, of her whom he had before seemed afraid to touch, and, addressing himself to the policeman, said reprovingly, 'This woman is not a beggar. No, she is—she is one whom I know.' 'But sir,' said the officer —— 'I tell you, that she is an acquaintance of mine,' repeated the young stranger; then turning to the girl, whom he took for an old and feeble woman, he continued, 'Come along, my good dame, and permit me to see you safely to the end of the street.' Giving his arm to the unfortunate girl, he then led her away, saying, 'Here is a piece of a hundred sous. It is all I have—take it, poor woman.'

The crown of a hundred sous passed from *your* hand to *mine* (continued the lady), and as you walked along, supporting my steps, I then, through my veil, distinctly saw your face and figure" ——

"*My* figure!" said Frederic, in amazement.

"Yes, my friend, *your* figure," returned his wife, "it was to me that you gave alms on that night! It was *my* life—my honour, perhaps—that you then saved!"

"You a mendicant—you so young, so beautiful, and now so rich!" cried Frederic.

"Yes, my dearest husband," replied the lady, "I have in my life received alms—once only—and from you; and those alms have decided my fate for life. On the day following that miserable night, an old woman in whom I had inspired some sentiments of pity, enabled me to enter as a sempstress into a respectable house. Cheerfulness returned to me with labour. I had the good fortune to become a favourite with the mistress whom I served, and, indeed, I did my best, by unwearied diligence and care, to merit her favour. She was often visited by people in high life. One day, Sir James Melton, an English gentleman of great property, came to the establishment along with a party of ladies. He noticed me. He returned again. He spoke with my mistress, and learnt that I was of good family—in short, learnt my whole history. The result was, that he sat down by my side one day, and asked me plainly if I would *marry* him.

'Marry you!' cried I, in surprise.

Sir James Melton was a man of sixty, tall, pale, and feeble-looking. In answer to my exclamation of astonishment, he said, 'Yes, I ask if you will be my wife? I am rich, but have no comfort—no happiness. My relatives seem to yearn to see me in the grave. I have ailments which require a degree of kindly care that is not to be bought from servants. I have heard your story, and believe you to be one who will support prosperity as well as you have done adversity. I make my proposal sincerely, and hope that you will agree to it!'

At that time, Frederic," continued the lady, "I *loved you*. I had seen you but once, but that occasion was too memorable for me ever to forget it, and something always insinuated to me that we were destined to pass through life together. At the bottom of my soul, I believed this. Yet every one around me pressed me to accept of the offer made to me, and the thought struck me that I might one day make you wealthy. At length my main objection to Sir James Melton's proposal lay in a disinclination to make myself the instrument of vengeance in Sir James's hands against relatives whom he might dislike without good grounds. The objection, when stated, only increased his anxiety for my consent, and finally, under the impression that it would be, after all, carrying romance the length of folly to reject the advantageous settlement offered to me, I consented to Sir James's proposal.

This part of my story, Frederic, is really like a fairy tale. I, a poor orphan, penniless and friendless, became the wife of one of the richest baronets of England. Dressed in silks, and sparkling with jewels, I could now pass in my carriage through the very streets where, a few months before, I had stood in the rain and darkness—a mendicant!"

"Happy Sir James!" cried M. de la Tour, at this part of the story; "he could prove his love by enriching you!"

"He *was* happy," resumed the lady. "Our marriage, so strangely assorted, proved much more conducive, it is probable, to his comfort, than if he had wedded one with whom all the parade of settlements and pin-money would have been necessary. Never, I believe, did he for an instant repent of our union. I, on my part, conceived myself bound to do my best for the solace of his declining years; and he, on his part, thought it incumbent on him to provide for my future welfare. He died, leaving me a large part of his substance—as much, indeed, as I could prevail upon myself to accept. I was now a widow, and, from the hour in which I became so, I vowed never again to give my hand to man, excepting to him who had succoured me in my hour of distress, and whose remembrance had ever been preserved in the recesses of my heart. But how to discover that man! Ah, unconscious ingrate! to make no endeavour to come in the way of one who sought to love, to enrich you! I knew not your name. In vain I looked for you at balls, assemblies, and theatres. You went not there. Ah, how I longed to meet you!" As the lady spoke, she took from her neck a riband, to which was attached a piece of a hundred sous. "It is the same—the very same which you gave me," said she, presenting it to Frederic; "by pledging it I got credit for a little bread from a neighbour, and I earned enough afterwards in time to permit me to recover it. I vowed never to part with it.

Ah, how happy I was, Frederic, when I saw you in the street! The excuse which I made for stopping you was the first that rose to my mind. But what tremors I felt, even afterwards, lest you should have been already married! In that case you would never have heard aught of this fairy tale, though I would have taken some means or other to serve and enrich you. I would have gone to England, and there passed my days, in regret perhaps, but still in peace. But happily it was to be otherwise. You were single."

Frederic de la Tour was now awakened, as it were, to the full certainty of his happiness. What he could not but before look upon as a sort of freak of fancy in a young and wealthy woman, was now proved to be the result of deep and kindly feeling, most honourable to her who entertained it. The heart of the young husband overflowed with gratitude and affection to the lovely and noble-hearted being who had given herself to him. He was too happy for some time to speak. His wife first broke silence.

"So, Frederic," said she, gaily, "you see that if I am a fairy, it is you who have given me the wand—the talisman—that has effected all!"

GURNEY'S VISIT TO THE WEST INDIES.*

SECOND NOTICE.

A FORTNIGHT ago we presented a brief outline of the early portion of Mr Gurney's tour of benevolence through the West India Islands. His object, as we stated, was to discover the precise condition of the liberated negroes, and to compare the existing and prospective state of things with that of the slave states of North America. Having visited St Christopher's and other islands, he proceeded to Antigua (January 1839), and thence to Dominica, finding in both that things are prosperous, the planters doing well, and the negroes industrious, peaceful, and comfortable. The striking facts seem frequently to have come under his observation, that labour is now cheaper than when it was compulsory, that more produce is got for a given amount of outlay, and that the value of property is rising.

One of the first places he visited in Antigua was the estate of "Gilberts," the property of his friend Nathaniel Gilbert. "Nothing could be more satisfactory than the state of the property. His molasses alone, last year, paid the whole expenses of the estate, including labour; the large produce of sugar, which had met with a high price in the British market, was therefore clear gain. Our friend is too consistent a Christian to manufacture rum. We understood that he received 25,000 dollars as a compensation for his slaves. He assured us that this sum was a mere present put into his pocket—a gratuity on which he had no reasonable claim. Since his land, without the slaves, is at least of the same value as it was with the slaves, before emancipation, and since his profits are increased rather than diminished, this consequence follows of course; but what figures can represent the relief which he experiences in his own emancipation from the trammels of slave-holding? Our friend has fitted up a neat chapel on his estate, in which we held a religious meeting in the evening, with his black peasantry.

Sir Bethel Codrington, an absentee proprietor, whose land borders on 'Gilberts,' is said to be deriving L.20,000 sterling per annum, from his sugar estates in Antigua. Whether this statement is exaggerated or not, I cannot say, but there can be no question that his revenues from this source are large. He was a noted advocate, during the late conflict for freedom in our country, for the continuance of slavery. Circumstances have now proved that emancipation to him has been any thing rather than the road to ruin. Nearly the same remark applies to a respectable member of Parliament, whose property in Antigua, during slavery, was in decay—unprofitable, and, by all accounts, almost ruinous. Now it produces an excellent income. I had the pleasure of viewing his cane-fields; they were in fine order, full of pecuniary promise.

A subsequent and somewhat extensive inquiry has led us to the conviction, that on most of the properties of Antigua, and in general throughout the West Indies, one-third only of the slaves were operative. What with childhood, age, infirmity, sickness, slave sickness, and other causes, full two-thirds of the negro population might be regarded as dead weight. And, farther, the number of free labourers employed for the same quantity of work, is now decidedly less than this third. We may therefore fairly reckon that the pecuniary saving on many of the estates in Antigua, by the change of slave for free labour, is at least *thirty per cent.* If the interest of money on the investment in slaves is added to the debit amount under slavery, the comparison becomes much more favourable on the side of freedom. Besides this affair of arithmetic, however, there is the general consideration that slavery and waste are twin sisters, whereas freedom is married to economy. Under the generous stimulus of equal liberty, short methods of labour are invented, machinery is introduced, every man, black and white, is thrown upon his own exertions, and into the whole community *co-operation* infuses *wealth*."

After narrating a number of other particulars respecting Antigua, Mr Gurney states that the average amount of sugar raised annually during the last five years of slavery was 12,189 hogsheads; the average raised annually during the first five years of freedom was 13,345 hogsheads; and the amount raised during

* A Winter in the West Indies, by Joseph John Gurney. London: Murray. 1840.

Digitized by Google

1839 was 22,383, other articles of produce being in proportion. "That," says he, "in the sixth year of freedom, after the fair trial of five years, the exports of sugar from Antigua almost doubled the average of the last five years of slavery, is a fact which precludes the necessity of all other evidence. By what hands was that vast crop raised and realised? By the hands of that lazy and impracticable race (as they have often been described)—the negroes. And under what stimulus has the work been effected? Solely under that of moderate wages."

Friend Gurney occasionally affords us a pleasing glimpse of the desire of the negro population for education: they are most anxious to be instructed; and, indeed, they appear in some places to devote a share of their earnings to the support of schools—a thing that scarcely can be said of the English peasantry. One day, at Dominica, says Mr Gurney, "the people gathered around us, and a woman came forward on behalf of the company, to beg for a school. 'We are hungry for a school,' said she, 'we are tired of waiting for it.' Nor were these idle words; for the people on this and a neighbouring property had agreed to subscribe eight dollars per month in part payment of a teacher. Nothing, indeed, can be more eager than the desire of the negroes of Dominica for education—they seem determined to obtain it; and it is gratifying to know that the efforts now making for the purpose are at once considerable and successful. There are nearly 700 scholars in the four Mico schools, which are ably conducted, and being quite clear of any peculiar religious bias, are acceptable to the whole population." This forms an agreeable piece of information. In Dominica, a majority of the lower house in the legislature is composed of coloured persons, and the same class of persons are now eligible as jurors, both in this and other islands; it becomes absolutely necessary that the people should, by means of instruction, be prepared for performing these functions with propriety.

Another circumstance which fell under Mr Gurney's notice at Dominica deserves to be made widely known. During slavery, it was below the dignity of any free person to labour in the fields; and all who could do so preferred to live in idleness rather than work. The abolition of slavery has removed this detestable plea for living in a state of slothful indulgence. *It is now quite respectable to work*—labour in the fields is not discreditable. This change of sentiment accounts for the comparative abundance of labour in the West Indies: emancipation has brought a host of idlers and those who shammed illness into the labour market; and though, of course, this has reduced the amount of wages to individuals, still such is the demand for hands, that all meet with remunerative employment.

In Antigua and a few other islands, the mode of management, taken all in all, seems to be better than in Jamaica; for in this latter island the practice is far too common of leaving estates to be managed by local attorneys and overseers, the actual proprietors living in England, and caring nothing more about their estates than receiving a certain annual return from them in produce; in other words, there is a deficiency of that moral supervision, which the eye of a master alone can give. In consequence of this or some other defect, a number of the estates present a spectacle of strife and distrust between overseers and labourers—the grand cause of dispute being the exaction of labour for rents of cottages and provision-grounds. In those districts in which rent and wages have been arranged independently of each other, every thing has gone on prosperously.

At the distance of a forenoon's ride from Kingston, among the Port Royal mountains, lies Halberstadt, a coffee plantation, belonging to a coloured gentleman, John Casper Weiss. Mr Gurney visited this coffee-planter, and received from him the following information, which we quote in his own words. "One hundred and seventy slaves, or apprentices, used to be supported on this estate. Now, our friend employs fifty-four free labourers, who work for him four days in the week, taking one day for their provision-grounds and another for market. This is all the labour that he requires, in order to keep up his former extent of cultivation. And willingly did he acknowledge the superior advantage which attends the present system. The saving of expense is obvious.

I understood our friend to allow that the average cost of supporting a slave was L.5 sterling per annum.

170 slaves, at L.5 per annum, is	L.850	0	0
Now, he pays 54 free labourers 4s. 6d. per week, one day's labour being set off against rent, for 50 weeks, two weeks being allowed for holy-days,	607	10	0
Saving under freedom,	L.242	10	0"

In the course of another journey, Mr Gurney offers the following useful fact. "'Do you see that excellent new stone wall round the field below us?' said the young physician to me, as we stood at A B's front door, surveying the delightful scenery. 'That wall could scarcely have been built at all under slavery or the apprenticeship; the necessary labour could not then have been hired at less than L.5 currency, or 15 dollars per chain. Under freedom, it cost only from 3½ dollars to 4 dollars per chain—not one-third of the amount. Still more remarkable is the fact, that the whole of it was built under the stimulus of job-work, by an invalid negro, who during slavery had been given up to total inaction.' This was the substance of our conversation; the information was afterwards fully confirmed by the proprietor. Such was the fresh blood infused into the veins of this decrepid person by the genial hand of freedom, that he had been redeemed from absolute uselessness—had executed a noble work—had greatly improved his master's property—and, finally, had realised for himself a handsome sum of money. This single fact is admirably and undeniably illustrative of the principles of the case, and for that purpose is as good as a thousand."

Towards the conclusion of the author's observations on Jamaica, he sums up the state of affairs in a few brief sentences:—"The imports of the island are rapidly increasing; trade improving; the towns thriving; new villages rising in every direction; property much enhanced in value; well-managed estates, productive and profitable; expenses of management diminished; short methods of labour adopted; provisions cultivated on a larger scale than ever; and the people, wherever they are properly treated, industrious, contented, and gradually accumulating wealth. Above all, education is rapidly spreading; the morals of the community improving; crime in many districts disappearing; and Christianity asserting her sway, with vastly augmented force, over the mass of the population. Cease from all attempts to oppose the current of justice and mercy—remove every obstruction to the fair and full working of freedom—and the bud of Jamaica's prosperity, already fragrant and vigorous, will soon burst into a glorious flower."

Having now finished the account of all that had come under his notice in the West Indies, Friend Gurney very properly takes the liberty of contrasting the whole with what he had seen in the slave states of America.

First—In the West Indies, the emancipated negroes are working well and diligently for wages on the estates of their old masters. In Virginia and the Carolinas, about two-thirds of the slave population do nothing, and the workers idle away their time as much as possible. "There are the old, the infirm, the sick, the shammers of sickness, the mothers of young infants, the numerous children, &c. &c. All these belong to the dead weight, and they leave about *one-third* of the black population in actual operation. Now, this operative class has no stimulus to labour, except compulsion—that is, the whip; and people neither *will* nor *can* perform by compulsion an average quantity of *continuous* work. That they should do so, is contrary to the laws of nature—to the constitution, not only of the negro, but of mankind in general. The result is, that many of the cotton and rice planters of Georgia and South Carolina are contenting themselves with half a day's work from their negroes. Their task is finished by twelve, one, or two o'clock; and for the rest of the day they are left to themselves. It appears, then, that the work obtained from a body of three hundred slaves in the southern states, cannot, in many cases, be estimated as more in quantity than the fair day's labour, on wages, of one-sixth of the number, that is, of *fifty freemen*."

Second—It follows, that the cost of slave labour is greater than that of freemen. Three hundred slaves, reckoning men, women, and children, at a value of 500 dollars each, represent a capital of 150,000 dollars, or an interest at 6 per cent. of 9000 dollars. Adding other 9000 dollars for their support, it is found that 300 slaves cost annually 18,000 dollars. Now, reckon the weekly wages of 50 free labourers at 3¼ dollars each, we have an annual expense of 5000 dollars. Thus, it will be seen, that American planters are voluntarily paying 18,000 dollars yearly for labour that could be performed for 5000 dollars. Or, to put the comparison in a different form, the Americans incur a vast outlay of capital, in name of value or cost price of negroes, whereas the West Indians allow every negro to be his own owner, and pay him only for his labour. How absurd would it be, were farmers in England obliged to *buy* all the ploughmen they required, and give them food, clothing, and lodging for life into the bargain!—yet the practice of buying black labourers in America, instead of simply hiring them, is a piece of equal absurdity, and, laying all moral considerations aside, is warranted by no principle in commercial policy.

Third—The value of landed property is rapidly rising in the West Indies: in the slave states of America it is falling, and many properties are entirely neglected. This is "forced on the view even of the most superficial observer, who travels through Maryland, Virginia, North and South Carolina, and Georgia. Thousands and tens of thousands of acres, which were once cultivated and productive, have fallen back, under the blight of slave labour, into a wilderness; not, indeed, the wilderness of olden times, which teemed with the luxuriance of nature, but one without fertility and without hope. The properties to which I allude, the appearance of which cannot fail to be familiar to many, were once, doubtless, of considerable value; now (notwithstanding the general rule that land rises in value as a nation rises) they are worth little or nothing. A change for the worse in the appearance of the country is conspicuous enough, even when one passes the line between Pennsylvania and Maryland; but I am told that it is still more striking to the traveller who crosses the river from the state of Ohio into Kentucky. The soil on either side of the magnificent stream being of equal fertility, the *free bank* (it is said) blooms with prosperity, while the *slave bank* presents the evident symptoms of neglect and decay."

Fourth—The comforts and happiness of the free negroes are immeasurably greater than those of the slaves in the southern states. True, some slaveholders, particularly those in easy circumstances, are kind to their human live-stock, the same as a gentleman will be kind to his dogs. But take the whole. Look at the scenes in the slave-market in Charleston. "In the breaking up and disposal of estates, husbands and wives, parents and children, are often sold—irrespectively of each other—each to the highest bidder. With such liabilities at hand, where can be the solid happiness of the slave of North America? A pro-slavery Methodist minister was, one day, questioning a well-educated negro, much respected by his master, and amply supplied with the conveniences of life. 'You have your wife and family about you,' said the minister; 'you have a good house; you and your children are well clad; you sit down, day by day, to a well-provided table; you are even engaged as a preacher to your brethren—why, then, are you anxious to be free? what can you wish for more?' 'Sir,' replied the negro, 'I wish to lay my hand on my heart, and say, My flesh is MY OWN.'"

Fifth—Compare the rapid moral improvement, desire for instruction, increase in the number of marriages, and the disappearance of irregularities, in the West Indies, with the dreadful moral degradation and compulsory ignorance in the southern states of America. "Evil in its root—incurably evil—opposed to the will of an intelligent and benevolent Creator, and deadly in its moral tendency, must be a system which shuts out half or two-thirds of the population of a state from even sipping at the fountain of knowledge—which proclaims to a multitudinous rising generation the stern decree, 'You shall *never* be taught to read the Bible!'

I have now," concludes Mr Gurney, "drawn a contrast between freedom in the West Indies and slavery in North America, on five distinct points—the quantity of labour, the expense of cultivation, the value of real property, the comforts of the negro, and lastly, morals and religion. I have endeavoured to avoid exaggeration in the statement of either side; but who shall deny that the scale preponderates with immense weight and power on the side of freedom? Who can doubt that the American statesman is bound, by every principle of philosophy as well as philanthropy, of policy as well as justice, to desist from the support of slavery, and henceforth to labour in the good old cause of *emancipation*?"

We cannot lay aside the work of this benevolent member of the Society of Friends, without warmly recommending it to the perusal of all who feel interested in the joint cause of negro emancipation and social improvement.

JAMES SMALL, THE IMPROVER OF THE PLOUGH.

On a former occasion we mentioned that there was not perhaps a village of a tolerable size in Scotland which did not boast of its *genius*—a man possessing acquirements superior to his neighbours, and who, simply from the influence of untoward circumstances, is prevented from attaining a wide and well-deserved distinction. Occasionally, however, these geniuses, as they are called by their less skilful neighbours, strike out an idea which, being really valuable, overcomes all obstacles, brings their name into notice, and probably raises them in worldly rank. James Small, the improver of the plough, was a person who in this manner raised himself into notice from a humble and obscure condition of life, and a sketch of his biography, therefore, may be of service to our young readers.

James Small was born at Upsettlington, in the parish of Ladykirk, and county of Berwick, about the year 1740. His father's only profession was that of a farmer. Under his superintendance his son, the late James Small, was instructed in all the various branches of agricultural labour—a knowledge of which he afterwards experienced the advantages.

Young Small was first bound as an apprentice to a country carpenter and ploughmaker, at Hutton, in Berwickshire. He remained in Scotland for some time after his apprenticeship was over; but about the year 1758, he went to England, where he worked with a Mr Robertson at Doncaster, in the making of waggons and other wheel-carriages.

It was in the year 1763 that he settled at Blackadder Mount, in Berwickshire, under the patronage of John Renton, Esq. of Blackadder. He there set up a manufactory of ploughs and other agricultural implements; and as he at the same time occupied a farm of considerable extent, he had an opportunity of trying many experiments, which he might not otherwise have been enabled to attempt. He thereby contrived a device for ascertaining the best shape of the mould-board, by making it of *soft wood*; by means of which it soon appeared where the pressure was the most severe, and where there was the greatest friction.

When he first settled at Blackadder Mount, the old Scotch plough was almost solely in use throughout Berwickshire. It was drawn by a pair of horses, with the addition of four, and sometimes of six oxen; the smallest number was a pair of horses and a pair of oxen, attended by a driver.

Digitized by Google

He began with trying experiments on his own farm, with ploughs of smaller sizes and of different forms, proving, by a steelyard with a stronger spring than usual, which of them performed the best work with the least force of draught. In devising the improvements which afterwards obtained such celebrity, he seems to have had the old Scotch plough, as respects general shape, chiefly in view; and the merit of his invention consisted in making an instrument which combined the qualities of strength, lightness, and easiness of draught. His exertions were crowned with remarkable success. A plough was constructed and brought into use which astonished all who had formerly used the heavy and clumsy ploughs of the country. With respect to the precise merits of Mr Small's plough, they arise from this, that the sock and the mouldboard are formed according to strict mechanical principles; and that those parts which enter the earth, and cut up the furrow, have that equal tapering, or sharpened wedge-like form, which occasions the least resistance in raising the furrow-slice. The mouldboard, in particular, has that regular curve or twist, which not only lessens friction, in elevating and turning over the furrow-slice, but it also places and leaves that slice in the most proper position for the beneficial effects of the atmosphere and the operations of the harrow. Small has also the sole merit of inventing and modelling the mouldboard, and other parts of the plough, in cast metal, which contributed so much to the speedy extension of that valuable instrument.

It is a striking proof of the excellence of his plough, that many ploughmen in Berwickshire, for their own ease and satisfaction, offered to be at the sole expense of the wood-work, if their masters would supply them with Small's plough, and would defray the other charges of the implement.

Having established his plough in Berwickshire, Small wished to introduce it into Mid-Lothian, where it had met with much opposition; but being confident of the superiority of his invention, he offered to make a comparative trial. In consequence of that challenge, a competition of ploughs took place in a field near Dalkeith, in presence of many gentlemen and farmers from Berwickshire, Mid-Lothian, East-Lothian, &c. A number of ploughs were brought forward; as, the old Scotch plough, several English ploughs, a plough by Mr Hutchison, with an iron wheel, &c.; but Small's was successful—the judges having decided that it did the best work, and was considerably lighter in the draught than any of the others. In consequence of the success of his plough at this public trial, it spread rapidly over all the different counties in Scotland, and has since been adopted in many parts of England, Wales, and Ireland, and in many foreign countries.

It was a rule with James Small, that whatever piece of work he undertook, whether the making of a cart or plough, or any other implement, it should be made complete; and so anxious was he that his implements should give perfect satisfaction, that rather than suffer any insufficient work to be sent from his manufactory, he would break it to pieces, whatever loss he might thereby sustain.

There was nothing, however, by which he was more distinguished than by his zeal to promote useful improvements in the department of agriculture; and for this, it has been stated, "he sacrificed his ease, his health, his strength, and his substance." This enterprising and ingenious man died in the year 1793, about the fifty-third year of his age.

Since the era of Small's improvements, many additional alterations have been made in the construction of ploughs to suit the tillage of particular soils, and also of mossy lands, and of these none are more deserving of commendation than the rid or self-cleansing plough of the Finlaysons—farmers in Ayrshire, who encountered innumerable difficulties in bringing their plough into general operation.

It is remarkable that, notwithstanding all these improvements, ploughs of an old clumsy construction continue in use in many parts of England, greatly to the loss of power. Independently of the injury from this cause, the plan usually followed of yoking horses to ploughs in England is highly objectionable. It is, for instance, customary to yoke four or six horses in a line, one before the other, the line of draught being by a rope or chain, which passes along the sides of the animals to the muzzle of the plough. In passing along, the rope is upheld to a certain extent by each horse, so that the front horses exert a power of draught on those behind them, or, in plain terms, a certain quantity of power is lost. It is proper to state what is the true principle of draught. According to a well-known law in mechanics, power is always most advantageously exerted in a *straight line*. Let the drawing power always proceed in a direct line from the shoulders of the animal to the object of resistance. If there be the slightest misdirection of the line, power is fruitlessly destroyed. With respect to ploughs, the power of each horse should go at once in an even line, sloping from its shoulders to the muzzle of the instrument. When power from several horses requires to be united, yoke a pair abreast, and, if need be, a pair in front; but let the power of each pair go individually to the seat of resistance, or the intervening swingle trees. If the draught of the front horses in any form touches the hind pair in its passage to the plough, power is lost. Attention to these simple principles of mechanical science might save many thousands of pounds annually in England.

MENDICITY IN IRELAND.

As we drove into Drogheda, we entered a crowd, which I can only describe as suggesting the idea of a miraculous advent of rags. It was market day, and the streets were so thronged that you could scarce see the pavement, except under the feet of the horses; and the public square was a sea of tatters. Here, and all over Ireland, I could not but wonder where and how these rent and frittered habiliments had gone through the preparatory stages of tear and wear. There were no degrees—nothing above rags to be seen in coat or petticoat, waistcoat or breeches, cloak or shirt. Even the hats and shoes were in rags; not a whole covering, even of the coarsest material, was to be detected on the thousand backs about us; nothing shabby, nothing threadbare, nothing mended, except here and there a hole in a beggar's coat stuffed with straw. Who can give me the genealogy of Irish rags? Who took the gloss from these coats, once broadcloth? Who wore them? Who tore them? Who sold them to the Jews? (for, by the way, Irish rags are fine rags, seldom frieze or fustian.) How came the tatters of the entire world, in short, to assemble in Ireland?—for if, as it would seem, they have all descended from the backs of gentlemen, the entire world must contribute to maintain the supply. I had been rather surprised at the scarcity of beggars in Belfast; but the beggary of Drogheda came up to the traveller's description. They were of every possible variety. At the first turn the coach made in the town, we were very near running over a blind man, who knelt in the liquid mud in the gutter (the calves of his legs quite covered by the pool, and only his heels appearing above), and held up in his hands the naked and footless stumps of a boy's legs. The child sat in a wooden box, with his back against the man's breast, and ate away, very unconcernedly, at a loaf of bread; while the blind exhibitor turned his face up to the sky, and, waving the stumps slightly from side to side, kept up a vociferation for charity, that was heard above all the turmoil of the market-place. When we stopped to change horses, the entire population, as deep as they could stand—at least with any chance of being heard—held out their hands, and, in every conceivable tone and mode of arresting the attention, implored charity. The sight was awful: old age in shapes so hideous, I should think the most horrible nightmare never had conceived. The rain poured down upon their tangled and uncovered heads, seaming, with its cleansing torrents, faces so hollow, so degraded in expression, and withal so clotted with filth and neglect, that they seemed like features of which the very owners had long lost not only care, but consciousness and remembrance; as if, in the horrors of want and idiotcy, they had anticipated the corrupting apathy of the grave, and abandoned every thing except the hunger which gnawed them into the memory of existence. I thought I should be able to recall many quick witticisms I had heard at Drogheda and elsewhere; but it is a kind of memory that floats away in the cloud of unimportant events occurring in so busy a life as travel: and I remember but one, and that more from the hideousness of the speaker than the excellence of her wit. I thought I had given away all my pence, when this woman, quite the weakest looking and sickliest I had observed, caught my eye. Another dive into my pocket brought forth a sovereign, a shilling, and a penny. "I won't trouble you for the gowld," said she, watching me as I turned over the pieces in my hand; "I don't like the colour of it." I laid my finger on the penny: "Ooh! that's too black entirely," she cried again; "something *betwane*; now there's a *dilikit* white shillin', *the colour o' your honour's white hand*, plases me more!" I was amused with their efforts, often successful, to penetrate and remove, by some apposite suggestion, any hesitation in the giver's generosity. "I'll change it for your honour, and divide it among 'em," said a cripple to a young man beside me, who had drawn sixpence from his pocket, and held it doubtfully in his hand. The sixpence was thrown into the beggar's hat, who had well foreseen that the giver would not have the courage to falsify a creditable reputation before strangers. I am sorry to add that the "division" was but a figure of speech; and the sixpence was clutched with a flourish of the cripple's crutch, which promised to show fight for the lion's share.—*Willis's Ireland Illustrated.*

THE PEEL FAMILY.

The introduction of calico-printing into Lancashire is ascribed to the Messrs Clayton of Bamberbridge, near Preston, who began the business on a small scale as early as the year 1764. They were followed, and with great vigour, by Mr Robert Peel, the grandfather of the present Right Honourable Sir Robert Peel, Bart., late Secretary of State. Mr Peel was originally a yeoman farming his own estate, and lived at Cross, afterwards called Peelfold, near Blackburn. Being of an active and enterprising disposition, he began the manufacture of cotton, and he is mentioned as one of the first persons who tried the carding cylinder. He also took up the printing business; and he made his first experiments secretly in his own house; and the cloth, instead of being calendered, was ironed by a female of the family, the pattern adopted being a parsley leaf. Stimulated by the success of his experiments, he embarked in the printing business with small means and convenience, and shortly after removed to Brookside, a village two miles from Blackburn. Here he carried on the business for some years with the aid of his sons; and by great application, skill, and enterprise, the concern was made eminently prosperous. His eldest son, Robert, afterwards created a baronet, possessed strong talents, which he devoted assiduously to business from an early age, and thus contributed much to the success of the printing, spinning, and manufacturing businesses; and in each of these branches the Peels soon took a lead in Lancashire. They eagerly adopted every improvement suggested by others, and many improvements originated in their own extensive establishments. As the elder Mr Peel had several sons, Robert quitted his father's concern about 1773, and established himself with his uncle, Mr Haworth, and his future father-in-law, Mr William Yates, at Bury, where the cotton-spinning and printing trades were carried on for many years with pre-eminent success, and on a most extensive scale, and are, indeed, continued, though in other hands, to the present day. Mr Peel, the father, with his other sons, and another Mr Yates, established the print-works at Church, and had also large works at Burnley, Salley Abbey, and Foxhillbank, and spinning-mills at Altham, and afterwards at Burton-upon-Trent, in Staffordshire. So widely did these concerns branch out, and so liberally and skilfully were they conducted, that they not only brought immense wealth to the proprietors, but set an example to the whole cotton trade, and trained up many of the most successful printers and manufacturers in Lancashire.—*Baines' History of the Cotton Manufacture.*

ANECDOTE OF A DOUBLE-BEDDED ROOM.

Chance and the stage-coach put me lately in the town of Stirling at nightfall. A few shops were still open, but the streets, in general, were dark and dull, and such as to impress a stranger with a feeling of loneliness. On proceeding to the inn, I learned that I could only obtain a share of a double-bedded room, the Falkirk Tryst having caused an unusual influx of strangers. This was far from pleasant, but, as there was no alternative, I at length stole with as little noise as possible to my moiety of a chamber. Scarcely had I entered, when a sepulchral voice from the other bed said, "Bolt the door!" I did so, but, at the same time, thought the circumstance rather suspicious. Why this precaution? What was to be done that interruption should be dreaded? On creeping underneath the blankets, I in vain attempted to sleep. Sometimes a heavy sonorous snore resounded through the apartment; anon, the heaving of a pair of huge lungs startled my slumbers. Then there was a tossing from one side of the bed to the other—a noise as if the pillows and bolsters had risen in insurrection—and then a yawning and stretching, or low, half-stifled, gurgling sound, as of a person in the last stage of drowning. In sooth, he was a tempestuous sleeper. I listened, and began to reflect on my situation. I was here shut in with an entire stranger—a person whom I had not even seen, and who, for aught I knew, might only be waiting till I had resigned myself to sleep, to get up and empty my pockets, or commit some desperate outrage. All the terrific stories I had ever read of double-bedded rooms, crowded upon my brain. Weariness, however, is seldom long wakeful even in the midst of danger, and my mind at length settled into repose amid visions of midnight robberies and Ludlow assassinations. What length of time elapsed I know not, but I seemed hardly to have fallen asleep when I was awakened by a rustling noise. It was still dark, and I instinctively drew the bed-clothes closer about my head. The noise continued, and edging one eye over the blankets, I saw distinctly a figure of gigantic proportions striding stealthily across the room, and relieved against the uncertain light of the window opposite. It passed, and became invisible in the darkness. I then heard a rummaging among clothes, and anon the creaking of some small instrument upon its hinges. A clasp-knife perhaps! I shuddered. At this moment, however, the stranger having regaled his nostrils with an enormous pinch of snuff, stole back to bed! It would be hard to say which of us enjoyed that pinch of snuff most.—*Scotsman newspaper.*

LITERARY RELIC.

In the library of Mr Rogers, the poet, at his house in St James's Place, London, is the original agreement between Milton and his publisher, Samuel Symons, in 1666, for the copyright of "Paradise Lost." It is written on one page of foolscap, signed by the contracting parties, and witnessed by "John Fisher" and "Benjamin Greene, servant to Mr Milton." The autograph of the great poet, notwithstanding his blindness, is remarkably regular and distinct. This interesting relic, we need hardly say, is carefully preserved by its distinguished owner: it is framed and glazed, and occupies a prominent place on the walls of the classical and hospitable mansion of the Poet of Memory. Mr Rogers, we believe, gave seventy guineas for this relic! For the poem itself Milton received ten pounds, five being paid in advance, and other five at the expiration of two years, when 1300 copies had been sold. For each edition, not exceeding 1500 copies, five pounds were to be paid; but in seven years the poet died, and the widow disposed of all her "right, title, and interest" in the work for an additional sum of seven pounds. Thus the whole copyright of "Paradise Lost" brought to the author and his family seventeen pounds, and the bit of paper on which the agreement was written was sold and eagerly purchased for seventy guineas! Milton was more than fifty years of age, blind, infirm, and solitary, when he began the composition of his great epic. At a similar advanced period of life, Sir Walter Scott, struck with misfortune, entered into an engagement to liquidate, by his literary exertions, a debt of one hundred and twenty thousand pounds. Milton rested his long-cherished hopes of lasting fame upon the work thus late begun; Scott staked his character and reputation upon the fulfilment of his vast engagement. Both entered with characteristic ardour upon their tasks, and amidst the pressure of increasing age and infirmity, never lost sight of their anticipated reward. In seven years Milton had completed his divine poem, and held in his hand his passport to immortality. In seven years Scott had paid all but one-sixth of his enormous load of debt. The prize was within view, independence seemed almost in his grasp, but he had overtasked his strength, and disease, soon to be followed by death, came like an armed man, and closed the superhuman struggle. When will the annals of literature record again two such instances of heroic determination, under such adverse circumstances, united to the highest creative genius, and crowned with such marvellous results?—*Inverness Courier.*

A FEW WEEKS FROM HOME.

LONDON CEMETERIES.

WHEREVER one goes in England, he finds the most amusingly absurd old usages, forms, and institutions. In an old baronial castle near Canterbury, the curfew bell has been rung nightly since the reign of William the Conqueror, and the practice is kept up with the most reverential care. In a certain borough, every candidate for the honour of citizenship must dress himself in a white sheet and wade through a dirty horse-pond. In London, one has only to go into the inns of court, or the endowed schools, in order to see a sufficiency of examples of ancient and now aimless and useless practices. The yellow hue of slavery comes down to us from the middle ages on the legs of the children of King Edward's School; and because a small cap unfit for the head was the fashion of the year 1550, these young persons have had to walk bareheaded for three centuries, and will probably do so for three centuries to come. We have already adverted to the square platters of the Winchester boys, so conservative of endowment rules, but so destructive of gravy. We have been told that, at a similar collegiate school, potatoes were recognised as canonical only about twenty years ago, and not even then without great hesitation and many deep and anxious consultations. These things may be considered as results of the rigidly literal character of English law. In Scotland, where law is less exact in her behests, most such matters have been modified according to the spirit of advancing ages. We have accordingly, in our northern region, few things which bring the very form and pressure of long-past centuries before us. The past is seen only in its wrecks — ruined castles, ruined abbeys, ruined every thing. It is scarcely possible for an Englishman, reared in familiarity with so many antiquated institutions and usages, to conceive the impression which these make upon the mind of a stranger, coming, as we do, from a land where there is a greater conformity between the things which are and the things which common sense points out to be needful and proper.

In my late sojourn in the south, these considerations were forcibly brought before me, when, after an excursion into Kent, I took a ramble amongst the metropolitan cemeteries. A churchyard in London is a very different thing from a churchyard in the country, where breezes blow, cowslips and daisies bloom, grass grows green, and where even the mournful graves have a pleasant summer look about them, that gives you the idea that the poor inhabitant below lies snug and comfortable, and is cheered in his solitude by the singing of the birds and the shining of the sun all day long. How different one of the London churchyards! Conceive a Sir-Christopher-Wren church, in the centre of a small quadrangular opening, in the midst of hosts of dingy brick houses, which seem crushing in upon the little court, as if desirous to overrun it with buildings, and leaving only a narrow waggon way around. As for the ground, or place of tombs, ten to one it is garnished with one or two trees, which find great difficulty in growing up through the smoky atmosphere, and perhaps loll a branch over the rusty iron railing beneath. The graves, except when flagged over with flat stones, are so many rows of oblong mud heaps—masses of dark mould, saturated with the decaying elements of humanity, and revolting to every feeling of delicacy and propriety. In Tooley Street, there is a bloated churchyard of this description; and wending our way through the city by Aldgate, Great St Thomas the Apostle, Holborn, and Oxford Street, we see one every here and there, equally choked, black, and hideous.

So limited is the space for interment in these metropolitan Golgothas, in comparison with the quantity of deaths, that it is not unusual for a number of coffins to be deposited in the same grave; commencing at a depth of twelve or fifteen feet, the member of the family who dies first gets the lowest place, and so on, one a-top of another; the grave being in time packed to within a foot or two of the surface. In one of the churchyards lying between Holborn and the Strand, and in which I had an opportunity of seeing an open grave, the scene of mortal relics around was of the most unpleasing nature, and certainly far from being in accordance with that decent ceremonial with which the dead are consigned to the tomb.

In most of the churchyards are found vaults or subterranean cells, which are employed as receptacles for the dead, and frequently these are situated beneath the floors of the churches—a practice dangerous above all for the public health, for, with every precaution, not excepting that of leaden coffins, it is well known that noxious gases escape from such depositories, and prove highly detrimental to all who are exposed to them, acting, indeed, exactly as a poison upon the living fibre. We have here a result of the superstitious spirit of the middle ages, which regarded burial within the church as favourable to the most important interests, as is the case in Italy at this day. The original motive may now be said scarcely to exist in England; but still the custom is maintained, in spite of all that reason and the most simple regard to prudence can say to the contrary.

The general evil of crowded churchyards and church vaults has been repeatedly pointed out by medical men; and there is perhaps some vague notion in the public mind that it is not right. Nevertheless, the obstacles against its reformation have hitherto been too much for a people, who may literally be said to be too busy in attending to the affairs of the living, to have much time to devote to those of the dead. The main obstacle lies in the connexion which has been established between sepulture and church rites. The working clergy look for an important part of their incomes to the fees exigible on account of burials. The people might no doubt have themselves buried where they choose; but religious feeling makes most of them regard the consecration of the ground and the performance of the burial service as indispensable; and these advantages are not to be obtained in new cemeteries, unless the clergy shall have been compensated for the unavoidable diminution of the burial fees at the old churchyards. The error here is in making the incomes of the clergy depend on such paltry particulars. If provision were made for them by other means, it might be expected that burial-grounds would then only be found in proper situations.

Even under all the difficulties arising from this cause, several new cemeteries have of late years been established apart from churches and the crowded parts of the city. In 1833, an act was obtained for one at Kensal Green, under the proprietorship and regulation of a joint-stock company. Within a few years afterwards, other companies were able to procure acts, for the establishment of cemeteries at Norwood, Highgate, and Kensington. More lately, a company has opened a cemetery on a similar scale at Abney Park, Stoke Newington. A visit to some of these occupied a couple of days during my stay in London. Let me first speak of that at Kensal Green. The situation of this ornamental and airy burying-ground has been remarkably well chosen. Leaving Oxford Street in a north-west direction, we proceed a distance of three miles on the road to Harrow, passing on our left the station of the Great Western Railway at Paddington, and wending our way by a country road environed with green fields and hedgerows. We, in short, get out of town—no easy matter to a pedestrian in London—and the last bit of street is left behind. Having attained the summit of a broad swelling eminence, we find on the left a façade and gateway, of elegant architectural proportions, fronting the burying-ground we are in quest of, and from which, on casting our eyes back, we are presented with a most extensive prospect across the country as far as the hills of Surrey, and also of the western environs of the metropolis. We are now within this beautifully laid out Père la Chaise, as I may call it—a gently sloping field with a southern exposure, measuring forty-six acres, and calculated to afford an almost inexhaustible amount of accommodation for interments. As yet, the ground is rather bare of trees, but this is in the course of remedy, and in a few years it will exhibit a variety of shady recesses. Several walks, laid with yellow gravel, and broad enough to allow the driving of carriages, are spread in different directions through the cemetery, permitting the visiter to observe the long rows of graves and monumental erections which line their sides and exterior boundaries. A cloister or species of arcade of Grecian architecture, which crowns the highest part of the ground on the north, affords a covering to the family vaults, in which is accommodation for 5000 bodies, and along the face of the inner wall there is room for monumental tablets of marble in different devices. In the middle of the ground, a short way from this, stands a chapel with environing porticoes, the whole built of stone, and in excellent taste. Along the broad path leading down the centre of the ground, we find the greatest number of the more elegant, and, as we should call them, sentimental cenotaphs and monuments. The most conspicuous in the series is a covered building, embellished with exterior railing, vases, and flower-borders, forming, as we learn from the inscription, what is to be the burial place of Mr Ducrow, the famed equestrian.

All that portion of the ground which we have described, lying towards the right of the entrance, and forming perhaps three-fourths of the entire cemetery, has been consecrated, and is devoted exclusively to the sepulture of members of the Established Church, or at least to burials at which the church service is used. A considerably smaller portion, separated from the other by an artificial ditch and railing, and situated on the left of the gateway, has been reserved unconsecrated, for the interment of all who belong to other denominations of religionists. This portion has also its chapel, and, on perambulating the walks, I observed that the tombstones are generally commemorative of foreigners, members of the Roman Catholic body, Presbyterians, and others out of the pale of the church. On thus finding religious distinctions carried beyond, or, I may say, into the grave, and the different feelings of mankind on a point of ritual presented in so tangible a form, the mind of an individual whose country's faith overlooks all such matters, and whose feelings accordingly have never run in such channels, is impressed in a way which serves much to spoil, as far as he is concerned, the effect of what is otherwise a solemn and tastefully disposed scene.

Norwood Cemetery, belonging to the South Metropolitan Cemetery Company, and situated at the distance of six miles from town, in the county of Surrey and diocese of Winchester, ranks next in point of size to that at Kensal Green. It consists of about forty acres, occupying the top and two sloping sides of a beautiful hill—properly a knoll—and is laid out with

Digitized by Google

walks, embellished with shrubs, and studded over with monumental erections, in a style of good taste. It also contains two chapels for the accommodation of funeral parties belonging to the Established Church and dissenting bodies. Placed in the midst of a picturesque and well-wooded piece of country, with many handsome villas scattered about the scene, Norwood Cemetery may be described as occupying a favourable locality, while its distance from town, though somewhat inconvenient, is in one important point of view a recommendation.

Highgate Cemetery, which is only half the size of that of Norwood, or somewhat more than twenty acres, is situated on the summit of Highgate Hill, in a direction north from the more densely peopled part of London. In many respects it is inferior in appearance to the two great burying-grounds already noticed, but is thriving as a place of sepulture, and promises to be of great use in relieving the over-crowded metropolitan churchyards. Neither in this nor in Norwood Cemetery are there any visible distinctions between the consecrated and unconsecrated portions. The company to whom the Highgate grounds belong is empowered by act of parliament to establish cemeteries in other parts of the environs of the metropolis, and in virtue of which it has lately opened a cemetery at Nunhead, between Peckham and New Cross—a beautiful spot of ground within about two miles of the Norwood cemetery.

We now come to a cemetery which has been established on a much broader principle than any other in the neighbourhood of London. I allude to that lately opened in the environs of Stoke Newington, about three miles from the city in a north-easterly direction. The Abney Park Cemetery, as it is called, was established by a company of shareholders who were anxious to see a burial-ground open to all classes of the community and to all denominations of Christians, without restraint in forms. To accomplish this object, they did not encumber themselves by an act of Parliament, nor consecrate the ground according to the usual ceremony, but proceeded as a private association possessing the ground in freehold. Their capital is small, being only L.35,000, divided into 3500 shares of L.10 each. When I visited the cemetery in October, it was only newly opened, and a handsome chapel, in the Gothic style, situated in the centre of the ground, remained unfinished. The locality, though environed by straggling lines of streets and villas, is yet sufficiently in the country, and freely enough exposed, to give assurance against the evils arising from the crowded city churchyards. The ground is flat, and of an irregular shape, measuring about thirty acres; and as there remain some fine tall trees, which embellished it while a private garden, the place is not without an air of sylvan beauty. On one side of the ground, but fronting to the main street of Stoke Newington, still stands an old red brick mansion, possessing a certain aristocratic air, which, at the beginning of last century, was the residence of Sir Thomas Abney, Lord Mayor of London, with whom, as afterwards with his widow, Lady Abney, lived for many years the venerable Isaac Watts, who here wrote several of his beautiful hymns and divine songs. At the same period Daniel Defoe occupied a house on the opposite side of the way, which also remains in existence, though in a modernised form. Thomas Day (the author of Sandford and Merton), John Howard, the philanthropist, and, in later times, Dr Aiken and Mrs Barbauld, were also numbered among the inhabitants of the village. At a previous era, during the Protectorate, Stoke Newington contained the residence of General Fleetwood, who married Ireton's widow, the eldest daughter of Oliver Cromwell; and the house which they occupied still remains. The cemetery comprehends the greater part of the grounds formerly attached to Abney House, as well as those connected with the mansion of General Fleetwood, who is said to have planted some of the trees now ornamenting the burial-ground with his own hands. Towards the side of the cemetery verging on the village, there is a magnificent cedar of Lebanon, one of the finest I have ever seen, and believed to have been one among a number with which Fleetwood embellished the ground; if such be the case, it is now nearly two hundred years old. The authority to which I am indebted for some of these particulars,* mentions that some years ago a mower's scythe was suspended by the point in the trunk of this cedar, and being forgotten or concealed from view by the surrounding underwood and shrubs, the tree in its growth has completely covered the blade, and now no more is seen than a small portion of the iron heel to which the handle of the scythe is usually fastened, all the rest being absorbed in the breadth of the tree. In another portion of the cemetery is a spot, once forming a secluded corner of Fleetwood's domain, in which, according to a tradition of the village, the body of Cromwell was privately buried, its interment in Westminster Abbey being merely a pretence. This, however, appears scarcely consistent with various historical circumstances.

Since the dedication of the cemetery in May 1840, there have been a number of burials, and the ground, at the time of my visit, already contained several handsome monuments, besides graves of the common order. Around the outskirts is planted an extensive collection of trees and shrubs, the whole arranged botanically according to their genera and species. This arboretum, which contains, as I am informed, 2500 varieties, will, a few years hence, add greatly to the beauty of the scene, independently of any other merit which it may possess. In walking through the ground I had an opportunity of inspecting a table of fees, which are chargeable for interments by the company. Here, as in the similar documents connected with the other new cemeteries, I observed a number of exactions of a most unexpected nature; for example, there are fees for different hours of the day, as if it were of the least consequence when an interment took place; and, if I recollect rightly, there is a certain fee exigible for the use of a temporary cover from the weather for the funeral company.* Altogether, there is an elaborate minuteness in this and other cemetery tariffs, which, though perfectly conformable to the cut-and-dried system of petty charging for civility which one meets with almost every where in England, is any thing but creditable to respectable associations.

Not being consecrated, Abney Park is exempted from all interference of parochial authorities, in which respect it occupies a very different standing from all other cemeteries in and about London. One of the advantages to which it lays claim is, that any clergyman, of whatever denomination, is allowed to perform a funeral service within it, according to the wish of the parties concerned—a thing not at all permissible in consecrated ground, which falls within the jurisdiction exclusively of clergymen of the established church. Before the other cemeteries could obtain the benefit of consecration, the parties concerned had to come under an agreement, sanctioned by act of Parliament, for the payment of fees to the parochial clergy. The Kensal Green company, for example, "is bound," says Mr Collison, "to pay a fee to the incumbent of the parish from which any body is brought for interment within the consecrated portion of the cemetery, provided the parish be within the weekly bills of mortality and in the diocese of London. The amount of this fee corresponds with the species of interment, and is regulated by a scale: a *fee of five shillings* is payable with respect to a corpse interred in the consecrated catacombs, vaults, or brick graves (which, by the bye, have never been consecrated, seeing that they were built after the ground had undergone that ceremony), and a *fee of one shilling and sixpence* for a corpse interred in the open ground." In the case of bodies brought from the parish of Marylebone, for interment within the consecrated part, an extra tax of *two shillings and sixpence* is levied for the incumbent of Marylebone, who thus, as we understand it, gets 7s. 6d. instead of 5s. per body. The Highgate Cemetery Company are obliged also to pay a fee to the incumbent of any parish whence a body is taken, situated within five miles of the ground. The Westminster Cemetery Company is much worse off, being, says the same authority, "compelled to pay to the incumbent of any parish, within *ten miles* of the cemetery, from which any body shall be brought for interment within the consecrated portion—no matter whether in vault, catacomb, or open ground, or whether it be the corpse of a child or an adult—the sum of *ten shillings for each body!* and to the parish clerk of the parish (if he was in office at the time of passing the act) the sum of one shilling!" A cemetery company at Gravesend has been more leniently dealt with, a fee of two shillings per body only being payable to the incumbents of either of two parishes. As, in all cases, the cemetery companies employ and pay clergymen who perform the actual duty, these various fees fall as a downright tax on families who choose to send the bodies of their relations to be interred in the out-of-town cemeteries, and, in point of fact, tend to perpetuate the odious practice of interring in the small burying-grounds of the city.

* Cemetery Interment. By George Collison, solicitor. 1 vol. London: 1840.

* For a whimsical account of the London cemeterial charges, we beg to refer to an article in No. 415 of the Journal, extracted from a clever metropolitan print.

THE CONSCRIPTION.

A FRENCH STORY.

In one of the later years of the empire in France, at a time when the conscription laid its terrible hands on the flower of the youth of the country, and sent them off, reluctantly or unreluctantly, to the field of battle, the society of a certain small town in one of the central departments received a notable addition in the person of the Baron de Valville, a returned emigrant. He was a man apparently about fifty years of age, yet his figure retained all the erectness and elegance of early manhood. He was understood to be of one of the principal families of Normandy, and had come, it was said, to a country residence, in order to recover from the harassing effects of exile on body and mind. The little circle into which he stept, was delighted with the refined polish of his manners, and the intellectual charms of his conversation. Young men, of any rank, were scarce in those days, and the baron had few competitors in his course to popularity, and to the favour, in particular, of the ladies. His fifty years were almost forgotten, and might have been wholly so, had not his temples been undeniably whitened a little by time. The only rival, almost, of the baron was a young man, named Florestan de Blavaux. At the first appearance of the baron, this youth had cast upon him a doubtful eye, as if afraid that the hour of M. de Valville's captivations had not yet past by. Indeed, there was a more special and precise reason for the alarm of Blavaux. He was in love.

Some time after the baron had settled down in his new scene, Blavaux and he met in a spot where they were almost obliged to converse. The baron could not help smiling at the appearance of the other. Though young, tall, and well formed, Blavaux wore immense blue spectacles, and leant over his cane, as if bent down by years. He saw the baron's scanning glance, and said, half seriously, half smilingly, "You see before you, sir, a victim of war." "What!" said de Valville; "you have served, then?—you have been wounded?" "Wounded! yes, ruined by the enemy that wounds us all," replied Blavaux. "Your property has been ravaged by the enemy, perhaps?" said the baron, inquiringly. "Yes, the enemy called the conscription," was the answer: "for ten years I have struggled with it, and, unequal as was the contest, as yet I have triumphed. But at what a cost! dear have been my victories! Sir, I have given *eight* defenders to my country—I have eight representatives under our banners. You know how costly substitutes always are. Mine have cost me ten thousand francs a-piece."

"That makes, in all, eighty thousand francs," said the baron; "a goodly sum!"

"Yes," continued Blavaux, in a rueful tone, "to defray the expenses, I was obliged to sell my property. I had fifteen thousand livres of income, and now I have but three. One or two new conscriptions, and I am a beggar. Our fighting government won't hear reason. It is in vain for me to tell them that I am already a soldier—in fact, that I am eight soldiers at once; that I am serving in three armies, fighting in three places, north, east, and south; that I have received more than thirty wounds, and have lost three legs and five arms; and that I have even been twice killed on the field of battle. It is needless for me to tell them all this, true as it is. The government simply say, 'We have need of men, and we take you.' Never was there such a system! Being no longer able to pay with my purse, I am growing ill to avoid new and worse evils. I have certificates of rheumatism, and can prove that my sight is weakening daily."

The baron smiled at this tirade. "Excellent pretexts for escaping being a hero!"

"Yes, baron," said Blavaux, "that is all very well. But my sufferings are not without some alloy of good. I have made great sacrifices for my country, and enjoy an advantage in being left almost alone—the only young man in the place. I may marry well."

"And have you fixed on an object?" replied the baron. "I have," said Blavaux, after a short pause; "I have fixed my affections—yes, affections—on a certain object, and I am not sorry to have an opportunity of speaking to you on the subject. Bow, and smile, and flirt, baron, with all the world but one person." "And who may that be?" said De Valville. "Madame de Nercy," returned the young man; "I have given my heart to the young and charming widow. I know that she will not give away her hand but to one of her own age, so that you need not come in my path with serious intentions. Pray, be warned! I will not bear interference in that quarter. Flirt with all else whom you please."

The baron only laughed at Blavaux's injunctions; nor did he afterwards alter his conduct in the slightest degree towards Madame de Nercy. On the contrary, he was continually by her side, and seemed ever to call up his whole powers of pleasing when in her presence. He was in some measure not unsuccessful. The lady seemed to listen to him with delight, but Blavaux had not misrepresented her, in ascribing to

Digitized by Google

her a dislike to matches, where the age was unequal. She had, in truth, suffered too much in her former wedded state, from the disparity of tastes caused by disparity of years, not to feel strongly on the subject. Thus it chanced that, when she had listened long to the attractive converse of the baron, she used to cast a glance at his grey locks, and think to herself, "What a pity that he is fifty!" Widows are famed for telling their mind with freedom, and the baron was not long in catching up some expressions from her lips, which revealed the state of her thoughts. "Then you will only wed with one of your own age, lady?" said the baron. "I confess to that weakness," returned Madame de Nercy with a smile. "You are in error," said the baron; "men of mature years"—— "Oh, pray do not trouble yourself to praise them," interrupted the lady; "my poor dead husband was of your years, and though he was as good a soul as ever lived, I learnt from him that age and youth cannot assort together." "Then why not marry your admirer Blavaux?" said the baron. "Pshaw, Blavaux," replied the lady; "he is young, to be sure, but I will never wed a man who would hide in a closet or a tub to avoid the conscription. No, no," continued Madame de Nercy, "I am in no hurry; I will wait for the *peace*. And, in the mean time, baron, do you try with all your might to grow young again. If you were twenty years younger—we should see, we should see, baron!"

M. de Valville was silent for some time. He then said, "Madame de Nercy, you encourage me to give utterance to a secret. I am a man of fifty, and young again I shall never be; but I have a son, the very image of myself in person, and fully twenty years younger. In him I see my very self, as I was at his age. Madame, my son loves you. He saw you but once, at a ball in Paris, during your last visit. He learnt who you were; but, alas! he is so unfortunately circumstanced as to be unable to appear and own his love. Our family have ever been royalists, and my ill-fated son was mad enough to join in a conspiracy against those in power. The plot was discovered, and he became a proscribed fugitive. For some time he has been concealed in my own house, not in this town, but at the little country villa which I purchased near to yours. From that concealment he would ere now have burst to throw himself at your feet, but for my entreaties. I promised to plead his cause with you, that he might not risk his life by exposing himself to the chance of seizure by the police. You have now given me an opportunity to fulfil my word. Ah! madame, take pity upon him—take pity upon me! Consent to see him, and hear him plead his own cause!"

This strange revelation made a strong impression on the fair widow. A beautiful young man, deeply in love, and a proscribed fugitive, presented a most charmingly romantic picture to her fancy. "I go to the country to-morrow," said she, after some moments of blushing yet not unpleasing confusion, "and you may come to me at eight in the morning. We will go together." "Ah, madame," replied M. de Valville, "that is a pleasure which prudence forbids me to enjoy. Beyond a doubt, my movements are secretly watched. My son will be left to greater freedom and safety by my remaining here. In truth, it would be well for me to avert suspicion by going to some other place." The widow was somewhat averse to go alone, but the difficulty was got over by her resolving to take a confidential friend with her. To the country, accordingly, she went on the following day. Soon after her arrival, she received a visit from a young man, whom she could not look upon without surprise. He was the very image of his father. It was the same figure twenty years younger; eyes, look, and tone of voice, being the same. The step of the son was more elastic, and, in place of the grey locks of the baron, short and beautiful chestnut tresses adorned the head of the son. As to the rest, the son proved to have the very spirit of the father—intelligent, polished, and tender. The poor widow's heart was soon in chains. At the end of a fortnight or so, she returned to town, and was soon after waited on by the baron, who, she understood, had fulfilled his intention of averting suspicion by a short tour.

"Ah, well!" said he, taking the hand of Madame de Nercy respectfully, "what have you made of my poor boy? Does he consent to take care of his safety? Is he gone?"

The widow looked down and blushed. "No, he is not gone yet. Before he goes, we wish to go through a little ceremony, and I now have to ask your consent to it." "You have it," replied the baron with emotion, "and no one can pray more sincerely for your happiness. But the marriage!—it must be so far public, and I see in it new perils for my son!" "Oh, fear nothing," exclaimed the lady; "we have arranged all that. The mayor, in whose presence it shall take place, is devoted to me, and will be silent, particularly as I mean to give him a piece of ground of mine, which he has long coveted. Then the publication will seem to be in your name, Adrien de Valville, which is the same as your son's. It will be believed that I espouse you, and this we will countenance. Fear nothing, dear baron. All will be done safely, though prudence may require you to be absent."

The report accordingly went abroad of the approaching marriage of the baron with Madame de Nercy. One person was, or seemed to be, greatly annoyed thereat. This was M. Florestan Blavaux. He visited the baron, and spoke of duels and death. The baron only smiled, and begged him in courtesy to allow the ceremony first to pass, to which request M. Florestan, being an anti-conscription man, gave his consent.

The ceremony passed over, and Madame Adrien de Valville returned alone from her country seat, shedding many regretful tears, not on account of the ceremony, certainly, but because she had seen her young and handsome husband quit her side to seek a safer retreat, there to wait for more fortunate days. She came to her house, expecting there to meet, and to receive consolation from, her father-in-law. To her surprise, she saw there not the grey-haired baron, but her own husband.

"You here, Adrien!" exclaimed she, in terror; "what imprudence! yet I embrace you again. Ah! I know what brought you here. You could not depart without seeing your dear father!"

The young husband knelt down before her. "Pardon me!" cried he; "I and my father are one! Beloved wife, forgive me. When you saw me first as a man of fifty years, I was in disguise, and—can you bear to hear it?—on account of the conscription! But not because I would not be a soldier. No, I would have served my country cheerfully. But an eccentric relation bound me by his will to marry under a certain age. I saw you in Paris, and would have addressed you without disguise; but I was just then drawn for the army, and Napoleon himself, knowing our family's former principles, gave me positive orders to serve in person. My fortune and my love were both at stake. I disguised myself, and fled—fled to the spot where you were. This is my whole story. You will forgive me—I trust, you will forgive me—the deception I have practised. Now when we are united, I will, if you permit me, serve my country wherever she has need of me. To you I would have revealed all before now, had not your declaration, that you would never wed one who fled from the conscription, terrified me into silence; and then I thought of the scheme which has been followed. Pardon me, dearest wife!"

The lady's pardon was not difficult to obtain. Soon after the disclosure which has been related, M. de Valville went to visit M. Blavaux. He found that gentleman too much absorbed in other matters to think of duelling. The unfortunate Blavaux had just been drawn for the conscription for the *ninth* time.

SKETCHES OF SUPERSTITIONS.

SECOND-SIGHT.

SECOND-SIGHT, taking the word in its common acceptation of supernatural sight-seeing, is one of the varieties of spectral illusion. Certain mental functions becoming diseased, the sense of sight is imposed upon by the appearance of things which are purely imaginary, but nevertheless supposed to be prophetic of future events. Idleness, solitude, insufficient diet, and an imagination led astray by ruminating too intensely on the causes of human weal and wo, may be assigned as the prevailing causes of the disease. Our Lowland ancestors used occasionally to see *wraiths*, or spectral appearances of persons who were soon to quit this mortal scene; the Irish were also accustomed to the spectacle of *fetches*; and the Highlanders had their *second-sight*—the whole, be it observed, being but a variety of the same mental disease and delusion.

Second-sight, however, has formed the subject of a more regular profession than any other species of spectral frenzy. There were persons, who, possessing from infancy a defective mental constitution, or having a taste for imposture, gave themselves out as habitual sight-seers, and were reverenced accordingly by their unsophisticated neighbours. Martin, in his account of the Western Islands, a work written upwards of a century ago, when any sort of nonsense met with popular belief, enters pretty largely into a definition of the faculty of second-sight, and we shall take the liberty of offering a few of his explanations.

When the seer is visited by a sight, he is deeply affected by it, and, for the time, it absorbs his whole faculties, to the exclusion of all things else. The power of the seer is a natural endowment, and cannot be acquired by communication, or in any other way. It is usually talked of by its possessors as a painful and troublesome gift, and one which they would gladly be rid of, if they could. Its vaticinations relate only to things to come, and not to past events. Young and old may alike possess the second-sight, and it is common, also, to men and women. The visions are sometimes predicative of good, and sometimes of evil. Occasionally, the vision simply gives indifferent tidings.

These are a few of the most common peculiarities attendant on this faculty. There are likewise numberless rules affecting its exercise, and the interpretation of its visions. If a vision occur by day, for example, the accomplishment of what it is supposed to predict, will be speedy; if by night, less so. An exact proportion, indeed, is maintained in this respect—the morning vision being sooner fulfilled than that of noon; the latter more quickly than that of the afternoon; and so on. If the seer beholds a figure in a shroud, it is considered a sure sign of death to the party represented by the figure; and, according to the extent to which the shroud covers the body, the end will be quicker or slower. If a woman be seen at a man's left hand, it is a presage that she will be his wife, and this will be the case (say the true believers) though even both should then be married. If more than one woman be seen standing at a man's left hand, they will be married to him in rotation, as they stand nearer or farther from his arm. A seer often announces that such and such a guest will arrive at a certain hour, and, though a hundred miles away, the guest, it is said, will appear at the stated time. If a seer observe a vision of trees and crops in some spot or another, though perfectly barren and bare at the moment, wood and grain will, it is believed, there be seen in due time. A visionary house is beheld by the gifted eye, in a place where stone and lime were never laid, or expected to be laid. Yet there will the real house forthwith be seen. To see a seat as if vacant, when one is sitting in it, is a presage of the party's death. The seer may behold crowds of people, or single individuals, and very frequently he meets imaginary funeral parties, and determines the coming decease by the apparent mourners.

These rules of vaticination are *said to be* unvarying. No ordinary person sees the vision while it is present to the seer, but the same vision often appears to two or more of the gifted, either while they are together or apart. The Highlanders believe that children and the lower animals, such as cows and horses, behold the appearances while they are before the seer. This is made plain, they say, in the case of the animals, by the trembling which seizes them at the moment; and frequently the children will cry, and, if asked the reason, will tell what unusual thing they beheld or have beheld. "I was present," says the author previously quoted, "in a house where a child cried out of a sudden; and being asked the reason, he answered that he had seen a great white thing lying on the board which was in the corner: but he was not believed, until a seer, who was present, said that the boy was right, and that the board would be made into a coffin; and, soon after, it was made into one accordingly," says the believing Martin. As for horses, it is averred that they will not move forward when a seer beholds a vision, and that they sometimes run about wildly, without any cause being discovered, till a seer comes forward and explains the matter. "A horse fastened by the common road on the side of Loch Skeriness in Skye, did break his rope at noon-day, and ran up and down without the least visible cause. But two of the neighbourhood that happened to be at a little distance, and in view of the horse, did at the same time see a number of men about a corpse." Somebody, who lived thirteen miles off, died soon after, and, "*accordingly*, the prophecy was accomplished," says Martin.

In Mr Martin's book, we find numerous instances of the exercise of the faculty now described; and in a distinct treatise on the subject by "Theophilus Insulanus," included in the Miscellanea Scotica, we are presented with not less than seventy or eighty cases. The greater part of these relate to persons in an inferior rank of life, but some, also, to people in a higher grade; and all the cases consist of visions seen, and fulfilled, in accordance, nearly, with the rules already stated. We select a few of the most authentic-looking and remarkable.

The following case is from the communication of a man of unquestionable veracity, Angus Campbell of Eansay, who "related, that, in a fair sun-shining day, he saw a little fleet, consisting of nine vessels, with an easy leading gale, coming under sail to a place called Corminish, opposite to his house, where they dropt their anchors, having their long boats after them, and the crew of each walking the decks; and that his children and several of his domestics took particular notice of a large sloop among them. As the place where they moored in was not a safe harbour, nor that sound a frequented passage to the Western Ocean, he dispatched an express to his servants, who were at a good distance about their labouring, with a view to send a boat to those ships, either to bring them to a safe harbour, or to pilot them out to sea, as they choosed; and, after his servants came up, all of them saw the vessels, as formerly described; but, while they were deliberating what to do, the scene disappeared gradually. In two years thereafter, the same number of ships, the remarkable sloop being among them, came and dropt anchor at Corminish, which was attended with all the circumstances above related, according as Eansay told the whole to Mr Kenneth Macaulay, present minister of the Harries, from whom I had this relation; and who says there are several still living witnesses of the above representation and its accomplishment."

"Mr John Maclean," says another case, "late minister in Mull, as he was walking in the fields, saw his daughter (who was then absent at Turloisg) entering his house, her head muffled with linen; he followed at her heels (as he thought), and asking his domestics if they had on a good fire, as he was sure his daughter wanted much to be warmed. They all denied to have seen her; which passed for that time: but, in eight days thereafter, the girl returned muffled, as seen by her father, and in a few days fevered, of which she died."

"A noble peer of this nation being one morning in his bed-chamber, and attended by several persons, when his servant had put a new coat upon his lord, a gentleman standing by presently cried out, 'For God's sake, my lord, put off that coat!' And being asked the reason, he replied, that he saw a whinger or poniard stick in the breast of it. The noble peer,

Digitized by Google

esteeming this as a mere fancy, replied, 'This coat is honestly come by, and I see no reason why I may not wear it.' The gentleman still entreated, and earnestly craved that it might be put off; upon which debate, the noble peer's lady, not being far off, came in, and, being informed of the whole affair, entreated her lord to comply with the gentleman's desire, which he did. Meantime one of the servants standing by desired the lady to give it him, and he would wear it; she granted his request; he put it on, and ere night he was stabbed by a poniard, in that very place which the gentleman had pointed to in the morning. This relation I had from a very ingenious and understanding gentleman, who was grandchild to the said noble peer."

A fourth instance is given in the work of Theophilus Insulanus in these terms. "Roderick Macleod, a plain, good-natured young man, informed me, that, when he served the deceased Reverend Mr John Macleod, some time minister of Diurinish, in the station of an overseer, as he was going into the principal house in the dusk of the evening, he met the said Mr John coming out, who came so close to him as to touch the declarant's clothes, as he imagined; but having entered the house, he saw the same Mr John sitting in a chair at his fire-side; and, being astonished to find him there, told what he had seen, of which the minister did not seem to take much notice; but thereafter, in three or four days, desired to know of him the circumstances of what he had seen; and the young man insisting that he saw him come out of the house the moment he entered, he said, the scene appears to be intended for a warning, but enjoined my informer to conceal it from his spouse. He died the same year, according to this and other presages of his approaching end."

These are fair specimens of the sort of stories which pass current with Mr Martin and many Celts, as presenting true instances of the exercise of a supernatural faculty. It will probably appear to the majority of readers that a much more reasonable explanation may be given of them. With regard to the seeing of the fleet of nine ships, the whole was undoubtedly an atmospherical illusion. Various circumstances prove it. All the servants and children—every one, in short, who looked—beheld the scene; it was the vision of no seer or seers, but of common-sighted persons. It is possible, indeed, that the ships were real ships after all; for, though the narrator says that the mooring place was unsafe, it was probably just as safe *at first* as at the end of two years, when ships really came to the same spot. But, considering it to be an atmospheric phenomenon, is such a thing at all miraculous? The Spectre of the Brocken, the famous apparition of soldiery on Souter Hill, the Fata Morgana of Sicily, the Flying-Dutchman legends, and many other recorded phenomena, show it to be perfectly natural and possible. In an early paper on Atmospherical Illusions, the most of these phenomena were mentioned in detail, but the facts of the Souter (or Soutra) Fell case may be briefly re-stated. A gentleman and his servant, in the year 1744, beheld a troop of cavalry riding and performing various military evolutions on the side of the hill mentioned, in a spot so precipitous as to render it absolutely impossible for man or beast to maintain a footing. The servant had in the previous year observed a single horseman hunting in nearly the same place, and had then come to the conclusion that the sight was illusory, it being impossible for a rider to cross a perpendicular precipice at speed. The troop of cavalry, therefore, was at once set down as an atmospheric deception, and numbers of persons of the district came to look on the extraordinary scene, which continued visible till nightfall. An explanation of the circumstance was afforded by the rebellion of the following year. Some party of rebels were most probably exercising in secret, in a spot where the evening sun so caught their figures as to reflect them on the acclivity of Souter Hill. The legend of the spectre of the Brocken in like manner arose from the fact of the ground being favourable to the reflection of a visiter's figure against the evening sky. The figure appeared gigantic. A similar phenomenon has been several times witnessed on Ben Nevis; and, if our memory serves us, the Ettrick Shepherd has related, in the pages of this periodical, an instance in which the same thing once occurred to himself during his early career on his native hills.

It will be obvious in what manner these cases apply to the present subject. Wherever, among the seventy or eighty cases of Theophilus-of-the-Islands, or those of Mr Martin, a real instance occurs of a scene consisting of human figures, ships, or any objects whatever, having been presented to a spectator's eye, the matter may be referred to atmospherical refraction or reflection. In the case of ships the matter is peculiarly clear, so many authentic instances being on record of vessels having been displayed to observers at a great distance through atmospherical refraction. One ship, when far below the horizon, has often been thus shown to another at sea. We may even wonder that such phenomena are not more common, seeing that M. Bottineau of Mauritius, whose discoveries in nautical second-sight excited much attention some years ago, declared that a meteoric appearance of one kind or another regularly attended the movements of every vessel at sea. He proved this in a remarkable manner, by foretelling, time after time, and with wonderful accuracy, the approach of ships to the Isle of France. What the precise atmospheric appearance which guided him was, he kept secret, in the hope of reward.

Both by land and sea, therefore, objects may frequently be made visible by atmospheric refraction, without any *new* or *second-sight* being concerned in the matter. Those cases of second-sight, again, where apparitional figures were really presented to the eyes of any party or parties, may be naturally accounted for on the principles laid down in our papers on Spectral Illusions. These it is needless to recapitulate. As to the fulfilment of prophecies made in this way, any one who looks seriously at the cases recorded will be in little doubt on the subject. In the first place, the comparatively few cases where fulfilment seemed to take place, are those we are told of; the millions which failed remain unrecorded. Again, what sort of fulfilment does take place? If the *fixed* rules which the seers speak of were really obeyed, there might be some marvel, but the very opposite is the case. Ships came to Corminish at the end of *two* years. If they had come at the end of three, four, five, or even ten, the fulfilment would, we suppose, have been equally perfect, or at least esteemed so. With regard to the other two cases quoted, those of Maclean and the noble lord, it is unnecessary to say more than that similar presentiments are very frequent among people of superstitious temperament, and come to nothing in ninety-nine cases in the hundred.

As little regard to parties as to time is usually preserved in the accomplishment of the vaticinations. A silly man or woman says that something like a shroud appeared to their sight. Somebody dies within one day afterwards, or within half a year afterwards, either at the spot, or at a distance from it, and the vision is held to be fulfilled. This is really a fair account of the majority of the recorded cases. "Christian Macdonald relates, that while she lived with her aunt, she saw once at the door a gathering of people about a coffin. About a *quarter of a year* thereafter her aunt sickened, of which she died, and then the declarant had the opportunity really to see the scene which had before put her into so much fright and confusion." Had she herself, or any member of the family, sickened within the quarter of a year, or within *any* other time, the prophecy would have been equally perfect. A sight-seeing old woman having once seen Major Donald Macleod, an officer in the Dutch service, and then recruiting in Scotland, told those who were with him that she "saw him shrouded up in his winding-sheet to the crown of his head, which, she said, was a sure sign of his approaching end. The major *soon thereafter* went south, and, waiting for a ship at Leith to transport himself and recruits to Holland, was seized with a fever, of which he died." This was told by M'Leod of Waterstein, a "pious man." An old woman, seeing an officer rather sickly-looking, and learning (which she took care to do) that he was actively engaged in foreign wars, ventures to prognosticate his coming end. If he had died on the battle-field a year or two later, the case would have been quite the same, and quoted as one of second-sight. This is just about as safe a mode of prophesying as may be. Tell a man that he is to die, mentioning no time, and you may be pretty sure of being correct in your vaticination.

"The Lady Coll, happy in a pious education, informed me that she heard at different times, in a closet adjoining her bed-chamber, a great noise. In a few days, a person died in that neighbourhood, and some articles for his *sowe* and *coffin* were taken out of that closet; after which no more noise was heard therein. It is very frequently observed, that the articles employed for a sowe and coffin are so haunted, according to many attestations." In the Lady Coll's closet, seemingly, lay a quantity of wood or old lumber. The rats made a clatter amongst it. It was taken away, and the rats could clatter amongst it no more. This seems a very feasible explanation of the miracle; and so, we believe, will our readers determine.

It may be imagined that we are here selecting cases easier of explanation than others; but the truth is, that we are taking those very instances chiefly rested upon by the believers. "Those I point out to you (as main authorities) are (says Theophilus Insulanus) Messrs Maclean and Macleod, ministers, the Lady Coll, Angus Campbell of Eansay, Norman Macleod of Waterstein, and Rory Macleod." We have noticed the cases in which the most of these parties were concerned.

Perhaps the reader may be disposed to think that we have remarked too seriously on this subject; but the belief in second-sight is far from being yet extinct among a large section of our fellow-countrymen, and it is our object, in these papers, to sap and clear away the foundations of superstition among the less educated classes whom we address. We may therefore proceed by remarking, that, if second-sight were a real and existent faculty—an endowment of a supernatural order—we might anticipate some great end to be served by it. The reverse is the case, to a ridiculous extent, if a judgment may be formed from the usual recorded cases. What purpose could be served by visions being presented to the horse that "did break his rope, and ran up and down?" Or by the exhibition of nine ships to Campbell of Eansay, and all his man-servants and maid-servants, his sons and his daughters? Or by the rumble-tumbling in Lady Coll's closet? In almost every instance, in short, the faculty seems to have had not a shadow of use or purpose. It is adverse to all rational ideas of the system of the universe, to imagine that communications of a supernatural order can ever be made without some cause, not to say a great cause—or that freakish spirits are permitted to rove at will through the aërial world, and startle horses and cows with imaginary funerals and pictures of death-shrouds. Besides these abstract reasons for disbelief in this absurd superstition, we are assured by an enlightened philosophy that every description of spectral illusion (not included in atmospheric phenomena) is a result of constitutional disorder, arising from those causes which have been already stated, and therefore, like every other disease, falls within the province of the physician.

ANECDOTES OF IRISH LABOURERS.

It appears that, both in Sweden and Norway, the poor are obliged sometimes to eat the inner bark of the fir-tree, mixed with bad bread. In the south of Europe, the labourers also fare badly. Maize-bread, milk, and chestnuts, are their principal food. In Denmark, the labourers live upon rye-bread, bad milk, cheese, and coffee. What would an English labourer, whose family often consume from three to four shillings' worth of the best wheaten bread per week, say to this?

The English labourer is the best fed in Europe, because he has established his taste at a high standard—he must have good solid food, and, particularly, good wheaten bread. All depends on choosing and adhering to a certain standard of living. The Scottish labourer's standard is comparatively low. He is contented with oatmeal porridge, and a sloppy kind of broth, which is little better than water and vegetable extract. Attaining this standard, he marries, and so perpetuates this low degree of taste. The Irishman chooses a much lower standard than either. He is satisfied with potatoes, and on the same principle brings other beings into the world who care for nothing better. Money wages arrange themselves according to these respective standards—the Englishman is paid at a rate which enables him to purchase bread, tea, and bacon; the Scotchman gets enough to buy porridge and the aforesaid vegetable extract; and the Irishman receives a poor pittance barely sufficient to keep him in potatoes. Some persons imagine that the Englishman receives high wages because he lives in a rich country; but this is a complete delusion. If the Englishman were to marry when he could get potatoes only, the wages of labourers would soon be as low as they are in Ireland, for there would soon be as great redundancy of population, and, in the competition for employment, wages would necessarily fall. The rate of wages has no reference to the richness or poorness of a country, but exclusively depends on the supply of labourers and the demand for them.

We shall now see in what an unhappy condition the Irishman places himself by adopting a low standard of living. The weekly wages paid in Ireland to field labourers are only sufficient in ordinary seasons. There are times when potatoes rise to a very high price; and as wages are not regulated by dearths, the misery sustained by a failure of potato crops is extreme. This was the case in the south-eastern counties of Ireland during the last summer. The following statement of *facts* will show how the matter usually operates.

Philip Brown (or, as he is more generally termed, Phil) may have seen fifty summers, and many of them very "hard ones;" but he is yet perfectly well able to handle a crow-bar or sledge. When a young man, Phil was good looking, good tempered, and good natured, and, consequently, a great favourite with the girls, and of course married before his beard was well grown; he made choice of one of the plainest of her sex, and as poor and improvident as himself, but fortunately gifted with the same cheerfulness of disposition.

Having at once made up his mind to marry, and perpetrated the act forthwith, he looked out for a house and potato garden, and considered himself fortunate in obtaining an acre in the very worst angle of a very bad farm, remote from a market town, at double the rent paid by the former occupant—which by the way was a rack one—with the condition annexed of building, at his own cost, a cabin, and working for this farmer at sixpence per day, and diet.

To these terms Phil, of course, assented—what could he do?—and got possession accordingly, making himself comfortable with the reflection that the potatoes and oats—Phil's intended crops—would keep his wife and children (who were to follow as a matter of course), while his labour would pay the rent.

Phil's condition, for many years, was any thing but enviable under such financial circumstances. The farmer with whom he worked was one of the worst imaginable, always late in getting in his crops, and therefore keeping Phil so long from the poor fellow's own "season," that he was behind hand in setting his half acre of potatoes and sowing his patch of oats, and, consequently, had always particularly bad crops; yet he continued to be one of the most cheerful and industrious men in the parish. If *lively* work was to be done, you need only have praised Phil, and he would grasp his spade with redoubled energy, and drive it into the earth to the very stop.

Digitized by Google

Years passed over the head of the hard working agriculturist; his children multiplied, while his means of maintaining them diminished.

As usual, he was late last year in setting his potatoes, which having been in low, ill-drained ground, like the crops of many of his neighbours similarly circumstanced, "went with the wet;" and this calamity obliged him to purchase food, as long as he could obtain any for money or credit.

For some time he found no great difficulty in "filling the pot;" but when potatoes became scarce in his neighbourhood, Phil's case became alarming, and grew worse and worse. At last necessity compelled Kitty to "take the bag," and trudge about among the farmers, day after day, for a handful of potatoes, for "God's sake," until she wore the soles off her shoes, and then went barefoot. Still neither Phil nor his wife complained; but if any change was perceptible, it was, if possible, a more strict attention to his work, with a lengthening of the chin from the emaciation of his face.

Matters in May last were very bad indeed. Phil was sorely puzzled to make the "livin stritch;" at last the best scheme he could devise was to put the children to bed very early, without their suppers, "that they might sleep off the hunger." This most heart-rending course of systematic privation was followed for some time by the entire family; but then came the difficulty to procure the *breakfast* and *dinner*. Potatoes were then a halfpenny a pound. To add to his distress, his eldest daughter, who had obtained a "sarvice" in a farmer's house, had some short time previously become unable to work, and was obliged to return home, a dead weight on the family establishment, which now consisted of nine individuals, requiring nearly three times the quantity of potatoes which the father's earnings could possibly supply.

He was ashamed to beg, reluctant to ask relief, from a mistaken sense of pride, and too honest to steal, even when in the greatest extremity. One morning he left his house, telling Kitty "to try and keep a bit to the childher any how, and not to heed him," and off he trudged to his work, enjoying, or appearing to enjoy, the passing joke as usual with his fellow-workmen, who could perceive nothing unusual in his deportment; there was the same cheerfulness, the same placidity of countenance, except, if possible, a greater elongation of jaw.

The work went on, the day advanced, and Phil had fasted from the preceding noon. He had occasion to go with a message to an adjoining house, and in trying to cross a fence, fell exhausted from inanition and hard labour. Fortunately for him, a gentleman saw the fall; but on asking Phil if any thing serious was the matter with him, was answered "Oh, nothing of any account," and might have remained in ignorance of the poor fellow's condition, if Kitty—who had borrowed a few potatoes, and was coming to her husband with a scanty pittance—had not explained that hunger was the sole cause of his exhaustion.

Phil's case was not a solitary one in that district; and until funds were raised with some liberality among the gentry and farmers, the distress, though partial where it did exist, was terrible, and yet endured with the elasticity of temperament which constitutes so distinguishing a feature in the character of the Irish.

Another instance of silent and uncomplaining suffering may be given. A party of men were engaged at work in a limestone quarry, and were generally in a state of urgent want, earning a bare sufficiency to keep soul and body together; some of them *frequently* worked without eating any breakfast whatever. One of the most hard-working and industrious men in the set was extremely poor, his family numerous and helpless, and his distresses pressing. On one occasion his employer, while superintending the sale of some limestone at the dinner hour, observed this man to walk off, and, in passing by, to make a cheerful observation to his companions, who began to dine. He did not return until the dinner hour had passed.

On that evening the men were paid their wages, and it then appeared that this poor fellow had eaten nothing that day, and was too proud to acknowledge his necessities. One of the workmen, who had usually toiled with him in taskwork, on finding out the melancholy fact, with a tear in his eye, went to his bag, drew out a piece of bread, and begged of his old companion not to be offended at his offer, but to take it. This was genuine feeling—the pride of the one, and warm-heartedness of the other.

But a singular fact remains to be told. A day or two after this, there happened to be a horse-race within a few miles, and to this these workmen, one and all—including the man whose starving state I have particularised—set off. Their employer remonstrated with them the next day on their loss of hire, consequent upon this frolic, at a time when they so much wanted every penny they could earn, and under circumstances in which men rarely seek amusement; but the only reply he could obtain was, "Plase yer honour, sure, we only wint to *divart* the *hunger*."

Though we may smile at this novel mode of satisfying the cravings of appetite, we must admire the patient endurance which these sufferers manifested, contrasting so strongly with the conduct of the thousands of workmen elsewhere, who, though not experiencing a tenth of the pressure under which Philip Brown and many of his countrymen struggled with fortitude—nay, in circumstances which an Irish labourer would generally consider *comfortable*—would have met and combined for a "strike," or forcibly obtained bread, and committed outrages upon property; or, at best, submitted with a sullen fortitude, instead of that light-heartedness which relieves calamity of half its bitterness.

Ireland is now fortunately in the course of improvement in many respects; elementary schools, the forerunners of a greater degree of intelligence, are every where coming into operation; an abandonment of intemperance is largely promoting a taste for rational comforts; and the poor law, just set on foot, will prevent the lowering of the standard of living below an endurable point, if not tend to elevate it to that which prevails in England. From all these circumstances, and supposing perfect tranquillity to be maintained, the condition of Irish labourers twenty years hence will bear no resemblance to what it is at present, but be prodigiously improved.

THE CITY OF THE MAGYAR.*

THE "City of the Magyar" is Pesth, in Hungary, so called with reference to the warlike and interesting people (Magyars) who compose the bulk of the inhabitants of that country. Miss Pardoe, after visiting the City of the Sultan, and describing it in a pleasant and popular volume, made a tour in Hungary, and the work, whose full title is quoted below, is the result. She is one of those dexterous artists of modern times, who, with tolerable materials, are sure to make a *readable* book—thus attaining one of the first ends of all literary exertion. Nor does she alone give a good and lively description of *remarkables* seen, but she can speak with tolerable skill and acumen on the more difficult subjects of political and social organisation, though these, we may remark, are judiciously treated only at such length, and in so scattered a manner, as not to be felt tiresome. Hungary is perhaps as interesting a country to the British public as any distant country with which we have no direct political relations can well be, for its people are a fine race, who, from mere natural energy apparently, keep up a free spirit under a government at once foreign, powerful, and despotic. Miss Pardoe's sketches of the Diet (the Parliament of Hungary) are amongst the most interesting parts of her book.

Amidst the various things touched upon—the cities, the hamlets, the country, the mines, prisons, universities, monasteries—it is difficult to decide upon the choice of a few extracts which may give any general notion of the character of this work. After some consideration, we have resolved for the mean time to content ourselves with abridging the account given of the awful catastrophe consequent upon the breaking of the frost in 1838.

"The city of Pesth is built along the left bank of the Danube, from which its riverward line is only separated by a quay of a few toises in width, and in many places the houses advance even yet nearer to the lip of the stream. The soil occupied by the town, and the whole stretch of country for miles about it, is one waste of light deep sand; while the houses are (or perhaps, I should rather say, were) nearly all built over cellars, magazines, stables, and drains.

At the beginning of January 1838, the Danube had already attained an unusual and somewhat alarming height, and the water flooded all the drains and subterraneans in its immediate neighbourhood, whence it was obliged to be drawn off; after which the *débouchures* of all these underground inlets were carefully closed.

I mention this circumstance, because it became ultimately evident that the stoppage of these subterraneans was one main agent in the destruction of property which afterwards ensued, and as it, moreover, proves that when the Danube received its first coat of frost it was unusually high; while at the same time at Soroksár, a couple of leagues below the city, a branch of the river having become choked with ice, caused the overflow to which I have alluded.

The Danube was entirely frozen over and firmly closed between the 5th and 6th of January; and a continuance of snow and extreme cold so severely operated upon it, that the ice gradually increased to upwards of three feet in thickness. During the 8th and 9th of March the stupendous mass began to yield, but after flooding the lower part of Buda, it again settled. It was considered, however, to wear so menacing an appearance, that a dyke six feet high was flung up the whole length of the city between the houses and the river; when the authorities and inhabitants of Pesth, satisfied with this precaution, and the stoppage of the drains where they communicated with the Danube, and remembering that during the inundation of 1775, the water had never risen to the height of their newly-erected barrier, abandoned themselves to the hope and belief that before the river had attained the level of the dyke, the ice would break up, and be carried away by the strength of the current.

Some few individuals there were, nevertheless, who looked upon the frost-chained giant with more anxious forebodings, and who asked themselves what, if this comfortable occurrence did not take place, was likely to be the fate of the devoted city! The answer of their own reason was by no means consolatory, and consequently a few, a very few, ventured to take precautions against the possibility of disaster. It is almost needless to explain that among these wise individuals was Count Stephen Széchenyi, who supplied the *bel-esprits* of Pesth for a time with food for mirth and sarcasm, by the apparition of a roomy barge just within the *porte cochère* of his residence. Little did those who scoffed imagine how soon they would become suitors for the loan of that same laughter-inspiring boat! The jests had not time to become stale upon the lips of those who uttered them, ere they were fearfully forgotten.

Late in the afternoon of the 13th the river appeared to become more threatening in its appearance, and it was considered necessary to use every precaution which might prevent its flooding the quays. Immediate orders were given to this effect, and the scene was described to me by an eye-witness as fearfully dramatic. In every direction were to be seen labourers toiling to fortify the dyke, and adding such other means of defence as the impulse of the moment suggested; but still no serious apprehensions were entertained, for it was believed that this was the last effort of the mighty river to free itself from its frozen load, and that, the feat accomplished, all peril would be past. And thus men moved about chatting, and speculating, and even jesting; excited into false, but nevertheless loud, spirits; giving advice when it was neither sought nor followed, and seeming rather to be actors in a wild dream than a peril-teeming reality. The greetings of acquaintance were heard among the crowd; the ribald jests of the thoughtless, and now and then even the laughter of women, who tried to trifle away their fears when they were chidden for them: but at eight in the evening the heavy peal of the alarm-bell boomed out, and doubt, and hope, and jest were at an end.

When its iron tongue first broke upon the air, the scene along the river bank was most extraordinary. Workmen and soldiers, lighted by torch-bearers, were still actively employed in strengthening the defences of the dyke; crowds of people from all quarters of the city thronged the quay, and impeded the passage of the waggons which were moving to and fro laden with sand, to fill the breaches; strong men were carrying timber to different points to increase the resistance of the temporary breakwater; and it is calculated that not less than sixty thousand persons must have been collected on the shore; when about ten o'clock the swollen river suddenly made a new and mightier effort than any which had preceded it, and burst the dyke in several places; and the wild waters, laden with jagged ice, rushed onward with resistless violence, driving before them the cowering crowd, who fled appalled and breathless before the swift pursuit of this strange and terrific enemy.

Down fell the night, as if to aggravate the terrors of the hour; and men hurried on they knew not whither, pursued by a danger against which the bravest could not contend. There was no laughter now upon the air! The shrieks of women, and the groans of men; mothers screaming for their children, and children wailing for their mothers: the quick sharp sound of flying footsteps upon the frozen earth; and over all the rushing, dashing, headlong voice of the emancipated waters, made up the frightful diapason.

By an hour past midnight, several quarters of the city were flooded to the height of twenty-seven feet, and in several streets large boats might be seen moving from house to house; while at each extremity of the suburbs the ice-laden river poured like a torrent upon the town; and in those suburbs themselves the poor inhabitants had barely time to escape with life, leaving their little possessions to the fury of the treacherous element to which they had so long fearlessly trusted.

On the morning of the 14th, whole streets, undermined by the body of pent-up water which filled the subterraneans beneath them, fell with successive and deafening crashes, burying alike men and animals amid their ruins; and perhaps this was the most awful moment to a spectator, of all that fatal time.

I remember being told by the Archduchess Palatine, when she was one day conversing with me on the subject of this frightful inundation, that as she stood at one of the windows of the Palace of Buda, and looked down upon the suffering city, seeing whole ranges of buildings sink and disappear in the watery waste about them, she felt her brain reel and her heart sicken, as a vague feeling grew upon her that the whole town would be ere long swept away!

From the 14th to the 15th, the water continued sullenly and steadily to increase, spreading wider and wider, sapping and overthrowing dwellings, and drowning their panic-stricken inhabitants. But the day of horror—the acmè of misery—was the 15th itself. Pesth will probably never number in her annals so dark a day again—she might perhaps not be enabled to survive such another;—the mad river, as that day dawned, rioted in ruin; and many looked upwards to the clear cold sky, and marvelled whether the Almighty promise was forgotten!

Thousands of men, women, and children, homeless, houseless, hopeless beings, clinging to life when they had lost nearly all that made life a blessing—parents, and children, and sisters, and lovers—the young, helpless in their first weakness, and the old, trembling in their last—the strong man, whose weapon was stricken from his hand by a Power against which the strongest contends in vain—the philosopher, who

* The City of the Magyar, or Hungary and its Institutions in 1839-40. By Miss Pardoe, author of "Traits and Traditions of Portugal," "the City of the Sultan," "the Beauties of the Bosphorus," &c. 3 vols. London: Virtue. 1840.

in all his abstraction had found no preparative for so hideous a death as this—the mother, whose hope had withered as her babe died upon her bosom, and who clung to life rather from instinct than from volition—the fond, the beautiful, the delicately nurtured—all were huddled together during that fearful day upon the narrow spaces scattered over the town and suburbs which the waters had not yet reached. And as it wore by, every half hour added to the devastation around them; houses and buildings which had survived the first shock, seemed to have been preserved only to add to the horrors of that day; many of them fell and perished from roof to base; others became rent by the heavy dashing of the waters, and through the yawning apertures the wasting tide poured in, and ruined all it touched; while to add to the confusion, in some quarters of the city the heavy barges which had been procured to remove the sufferers from their threatened houses, broke loose, and went driving onward through the streets on the crest of the foaming waters.

Many individuals declared that they felt the shock of an earthquake on the night of the 13th, an assertion which added to the terror of the people; but this fact has never been verified, and it is probable that the impression was originated by explosions of the fixed air which was pent up in the subterraneans, and which, as the impetuosity of the water broke in, rushed out at the other extremity of the drains with a sound like thunder. It may be imagined what an immense hydraulic pressure must have been exerted on these underground channels, when it is stated that in a thousand places in the middle of the streets, courts, and gardens, the water forced its way in small jets from the earth; and to that pressure may be attributed in a great degree the ruin of the city.

To attempt a description of the horrors of the 15th, would be a vain as well as an ungraceful task; but nothing tended so utterly to bring them to a climax as the fall of the extensive Derra Palace in the New Market-place. In vain did men murmur to each other that the building had been defective in its construction, and unsound in its foundations; their misery was deeper than the cheat which they sought to put upon themselves; and from that moment those who yet enjoyed the shelter of a roof looked on their temporary asylum with suspicion, and a general fear grew among the multitude that the whole city was crumbling about them.

Horror accumulated upon horror: the young and the fragile, unaccustomed to exposure, in drenched and clinging garments, to the bleak wind of that chilly season, began to droop and sicken. Even amid the terrors which surrounded them, fathers of families, who sat silently among their quailing children, remembered that they had suddenly become beggars; and they glanced from their wretched offspring to the leaping and foaming waters about them, and listened to the crash of the falling houses which burst at intervals upon their ears, till they began to smile vaguely and fearfully, and to muse the wild musings of madness.

One miserable man—a merchant in prosperous circumstances—was seen early in the morning of that memorable day, standing with folded arms and gloomy brow, gazing upon the wreck of what had so lately been his happy and comfortable home. The roof had fallen in, for the foundation had failed, and one of the side walls having given way beneath the pressure, a section of the house was laid bare, and the waters were rioting and brawling over his ruined property. The hour of noon arrived, and still there stood the sufferer, stern, and silent, and motionless: twilight fell, but he stirred not from his watch; nor was it until the increasing darkness hid from his view the spectacle of his worldly overthrow, that he started from his seeming reverie, and laughed, and shouted, and clapped his hands in wild and savage glee! Nero jested upon the flames which were consuming Rome, because they worked out his revenge—the maniac merchant gambolled, and mowed, and mocked the lashing waters that had beggared him—nor knew amid his frenzy that he was making merry over the ruins of his own reason!

The 15th of March was, however, sufficiently terrible to the most sane and collected; and it is questionable whether the poor victims of temporary hallucination, shocking as it was to contemplate their wretchedness, did not escape much real suffering. All was misery, desolation, and despair, and the firmest nerves must have quailed beneath the sights and sounds which every where assailed them.

It having been found necessary to extricate all who had lingered in the suburbs from their frail and failing houses, a number of boats were busily plying in every direction, and as there was no time to waste on forms or convenience, the terrified people were rapidly put on board and carried off to places of comparative safety. By eleven o'clock at night, throughout the whole city there was not a foot of dry ground, save in the New-Market-Platz, the Joseph-Platz, the Franciscan-Platz, and the courts of the Lutheran Church, the County-Hall, and the Invalid Hospital, and these were crowded both by men and horses, while many families of the highest rank were huddled together in the rude wooden booths erected in the Market-place, or sat in their carriages for days and nights, exposed like the rest of the population to the sufferings of cold and damp.

While yet the fury of the element was at its greatest height, and all was want, and anguish, and desolation throughout the city—while thousands of wretched beings were still without food or shelter—the Archduke Palatine sent his eldest son, the young Prince Stephen, to speak peace and comfort to the miserable citizens; and despite the danger of the mission, the high-hearted youth accepted it without hesitation.

Nor was it a light duty which this noble scion of the House of Hapsburg received as a boon at the hands of his imperial father; for the river was pouring down angrily, laden with masses of ice driven onward by the current, and threatening ruin to the unwary bark with which they might chance to come in contact. There were no attentive menials awaiting his disembarkation on the opposite shore, with ready services and obsequious words. He went to meet misery, famine, and madness; but as he stood erect in the boat, he cast not one look behind to the safe asylum which he had left—he waved his arm encouragingly towards the sinking city—he urged on his panting and trembling boatmen—and after a weary and perilous passage, his little bark began to thread the streets of Pesth.

No sooner had his appearance brought comfort to the sufferers—for there must have been comfort in the conviction that abandonment was not superadded to misery—than he vigorously applied himself to the task of mitigating the wretchedness by which he was surrounded. With his own hands, he distributed the bread with which his boat was laden; he had a kind and a hopeful word for all; and it is certain that the exertions and sympathy of the Palatinate family on the occasion of this dreadful calamity, will be as durably impressed upon the hearts of the inhabitants of Pesth, as though they had been graven upon marble."

Pesth has since been partly rebuilt in a style of great beauty, and on a plan more secure than formerly, and is now one of the most attractive places of residence in Europe.

COLONISATION OF NEW ZEALAND—FURTHER PROCEEDINGS.

In our number for September 12th of last year, we gave an account of the proceedings in and respecting New Zealand, down to the 7th of March last. We now propose to continue the narrative, as far as subsequent intelligence will allow.

By the 7th of March, eight vessels dispatched by the New Zealand Company had reached the harbour called Port Nicholson, in Cook's Straits. The first, the Tory, had arrived in August, with Colonel Wakefield, the company's chief agent, who employed himself during the four last months of 1839 in purchasing land from the natives. He acquired the southern portion of the northern island, and the northern portion of the southern island, or all the New Zealand territory between the 38th and 43d parallels of latitude. The second vessel, the Cuba, contained the surveying party; it had a long voyage, and only arrived in January, a few weeks before the other six vessels which contained emigrants. The lateness of the arrival of the Cuba has been a misfortune to the colony. This vessel should have preceded all emigrant ships by several months, in order to have had the land ready for occupation. For want of this preparation, the first year's procedure of many of the colonists must be provisional, or a life of squatting.

It was also stated in our first report that the British government, while refusing to countenance the proceedings of the New Zealand Company, had dispatched an officer, Captain Hobson, to represent it in that part of the world; and that Hobson, arriving on the 30th January at the Bay of Islands, immediately proclaimed that a commission would be appointed to inquire into the validity of all previous purchases of land, and that all future purchases would be null and void. It was stated that the captain thereafter made some inquiries with reference to the best site for the government capital of New Zealand, but had been interrupted in these and all other proceedings by a paralytic attack.

The later intelligence represents the colonisation of this fine country as proceeding briskly. Those who have not happened to pay attention to the newspaper notices of it, and have been out of the way of hearing the colony spoken of, will be surprised to learn, that already, though but eighteen months have elapsed since the commencement of proceedings, the number of persons sent out to it amounted, on the 20th October, to 2274. Eight vessels, it has been said, arrived before 7th March last. Several others arrived soon after. Six have been dispatched during this summer and autumn. Eighteen vessels in all were sent out by the New Zealand Land Company in the first eighteen months. Port Nicholson, which, on last New Year's day, was the solitude it had been in the days of Cook, in May contained a population of 2115 (including natives), and exhibited all the bustle which our mercantile nation practises at home, and must needs carry every where with it. Besides the emigration from the mother country, there is an extensive re-emigration from the Australian colonies. With this in addition to other means, the population must swell very fast. There are in all, perhaps, at this moment, fully five thousand Europeans in New Zealand, being probably not much short of the numbers of the natives in the same districts.

Port Nicholson is a bay of seven miles or upwards in extent every way, opening from Cook's Strait into the southern extremity of the north island. Into the head of this bay runs the Hutt river, through a valley several miles in breadth, and where the vegetation is of such luxuriance that it has not as yet been penetrated more than a few miles. On each side of the bay, there is a considerable piece of level land, either of which would suit for the site of a town. The ground at the mouth, or rather mouths, of the river (for it forms a delta), was at first considered by the surveyor-general as the proper place for the principal city. The landing of emigrants appears to have taken place near the mouth of the river, and most of the colonists first took up their abode on the low ground adjoining. This part, however, was found to be exposed to inundations; the mouth of the river required deepening; and the anchorage was exposed to the south winds. Colonel Wakefield, therefore, with the approval of the majority of the colonists, determined to shift the site of the first town to the level ground on the east side of the harbour. This spot is called Thorndon; it adjoins to Lambton Harbour, an inner basin of Port Nicholson, and has the advantage of deep water close up to the shore. The place is sheltered from all winds, and has a safe anchorage for ships of every size. There is at this place a level space of 500 or 600 acres, with gentle eminences on which residences may be erected; and a road along the beach may be made with little difficulty to the mouth of the river, which is five miles distant. No large stream of water flows through the ground, but the wells are supplied at a small depth from the surface. The change to this site was made early in April, in consequence of the almost universal wish of the emigrants, and it gave general satisfaction. In May last, the directors in London determined to name the first town *Wellington*, but recent letters mention that Captain Hobson had previously named it *Durham*, in compliment to the lamented nobleman who was the first governor of the Company. The probability seems, therefore, that *Durham* will be the name.

Owing to the indecision as to the site of the first town, and the want of a survey for the assignment of particular settlements, the first proceedings of the emigrants were of a desultory nature, but conducted with the greatest possible cheerfulness. So early as February 12, Colonel Wakefield describes the banks of the Hutt as already quite changed by the efforts of the individuals who had landed in the Oriental only a fortnight before. "Rows of native houses, single settlements, tents, and rick-covers, already afford shelter to the whole of the passengers. The Roxburgh emigrants [meaning the passengers by the Duke of Roxburgh, who had arrived only six days before] have also united themselves in forming an adjoining settlement on the river. Farthest north are the Scotch party, rather separated from their friends, and eyeing with satisfied looks the rich land, into which they are eager to thrust their spades." In a dispatch of the 22d March, he says, "A town has actually sprung up in temporary locations along the beach, where stores and residences will soon afford great accommodation to shipping and immigrants." Amongst the capitalists who went by the Oriental, were a son of Lord Petre, a son of Sir George Sinclair of Thurso Castle, a brother of Sir William Molesworth, and several other young men of family. It is a pleasant trait of the new colony to hear of the activity of these young men, whose compeers at home in too many instances misspend their time and misuse their best faculties. Mr E. J. Wakefield, in a diary-like communication to his father, says, under date February 23, "I went up the river as far as the surveyor's lines extend, and saw Molesworth, Petre, Hopper, Sinclair, and an old school-fellow at Bruce-Castle, Mantell. They are all working away in excellent spirits, at houses made of flax, bark, and rushes, chiefly by native architects, and at small clearings for potato gardens, &c. All this is being done on what will be the public quay or boulevard, extending 150 feet back from the west bank of the Hutt." Another trait of the cheerful spirit of the settlers—"Feb. 28. Heavy rain all day. The canny Scots in the Bengal Merchant are a capital set, landing every day and working away at clearings and houses during the rain, while no other complaint escapes them except the remark, in a good-humoured tone of voice, that the weather's 'rayther saft!'"

The settlement had only been a few weeks at Port Nicholson, when vessels began to arrive from Sydney with sheep, cattle, provisions, and miscellaneous goods, which were offered to the settlers, not always at the most reasonable prices, and therefore were not very readily bought. With regard to provisions, the settlers do not seem likely to be much at a loss, for, though the delay of the survey prevents a hearty or general application to husbandry operations, the land is so easily tilled and so productive, that considerable stores will certainly be raised in the course of even the first few months. We find it mentioned in a letter by the physician, Dr Dorset, that when Colonel Wakefield bought the land at Port Nicholson, in the latter part of 1839, the man whom he left in possession planted some English seed, the consequence of which was, that when the place began to be settled in the ensuing February, there was a large and well-stocked garden, from which all the principal families were supplied with excellent vegetables. "We are," says this gentleman (March 29), "extremely well off for provisions, and fish in abundance; among which are craw-fish, oysters, and fresh-water eels. We have also some mountain trout, of the existence of which, till within these few days, we had not the least knowledge; but the surveyors, in clearing the valley a few days ago,

Digitized by Google

discovered a stream, which, to their great delight, was stocked with trout, on which they made a hearty meal, besides bringing several home for the gratification of the colonists." The cattle brought by speculators from Sydney not meeting a ready market on account of the want of the survey, some of them were killed for provisions; and we find beef variously stated as being at 8d. and 1s. a-pound. Pigs being an abundant stock among the native population, pork was sixpence a-pound. It is spoken of as a delicious article, the animals being allowed to go about wild, feeding on fern-root, which makes even the fat by itself a rich treat. There was also abundance of native potatoes, of the finest quality, which we observe quoted at 12s. per hundred-weight. It must be remembered that there are two crops per annum in New Zealand. February is there analogous to our August. Nevertheless, the vegetables sown there by the settlers are described only a fortnight after as getting on amazingly fast, and likely to afford an abundant crop before winter, which would commence in May. Cabbages of all sorts, cauliflowers, broccoli, peas, mustard, cress, and pumpkins, are enumerated as amongst the vegetables sown. The soil at Port Nicholson gives high satisfaction to all: scientific agriculturists declare it to be superior to West Hoo, one of the most fertile spots in Kent. The climate is also described as mild and equable, even when winter was approaching.

Our government, it is well known, was at first doubtful of its right of sovereignty over New Zealand, and would give no sanction to any measures for preserving order amongst the company's settlers. The company acted under this inconvenience with remarkable patience and submission. The settlers themselves hit upon an expedient of an ingenious nature for supplying the want. Assuming that the sovereignty lay in the native chiefs (though in fact these men had no practical sovereignty), they determined to accept a *constitution* from them, and to act under it. A deed was accordingly drawn out, and signed by Warreporee and Eponee, chiefs of the Port Nicholson district, and a council was appointed to exercise the legislative and executive powers thus conferred. This provisional constitution was proclaimed with due formalities, and an address upon the subject was published, April 18, in the *New Zealand Gazette*, a sheet printed in a small tent hastily erected on the beach, and destined to be the *Moniteur* of the colony. It was now clear that the colonists were in the fair way of setting up an independent republic, and Captain Hobson took the resolution of proclaiming the sovereignty of Great Britain over the whole of the islands. This at once altered the face of affairs, and replaced the colony under British protection. The proclamation has been sanctioned at home by its being inserted in the *London Gazette*, and at the end of October it was announced that the Colonial Office had come to a good understanding with the company. We are now, then, to regard all difficulties on this score at an end. New Zealand, including the settlement at Port Nicholson, will be henceforth ranked as a separate colony, and will probably ere long have a governor appointed to it, who will be wholly independent of New South Wales.

Amongst the population at Port Nicholson, up to April last, were about 500 natives. Most accounts speak favourably of these individuals, and prognosticate that they will be useful as labourers. They had already been active in clearing land and building houses for the settlers. "We give them," says a colonist (Mr Partridge), "blankets, muskets, powder, tobacco, and shirts, in exchange for pigs, potatoes, house-building, and thatching, and things of that sort." Speaking of the chiefs, the same gentleman says (March 18), "Warreporee drank tea with me to-night, and drank wine like a good Christian; but his appetite is of the largest. He is a great warrior, six feet high, and a restless fighting devil. Eponee is an orator, and a sensible fellow." Though irritable when thwarted in their prejudices and customs, they are, if civilly treated, obliging, attentive, and well-behaved. To an active European they appear indolent; but it must be readily seen that a barbarian cannot all at once be broken into habits of diligent application. This must be a matter of time, and perhaps the existing generation will never be very serviceable. It is by taking the young into training, that the services of the aboriginal race will be most speedily and efficiently secured. A lady (Miss Hunter) says, April 7—"We are very much pleased with the natives, who seem to be intelligent and obliging, but very indolent. They take a great deal of interest in the children, and bring them presents of Indian corn and pumpkins, of which they have abundance. We are learning the language by degrees, and, with the assistance of signs, we understand each other pretty well." Another writer (Mr Marjoribanks) speaks of the natives as extremely filthy, and more disposed to thrust themselves upon the hospitality of the settlers, than to work for an independent subsistence. He adverts to two princesses who live in a pig-sty, cover themselves by day with a mat of native flax, and eat vermin. But even he allows that he, by and bye, saw one of these ladies appear on a Sunday in a nice new gown that would not have disgraced a London or Parisian milliner. If once the people in general get a taste for smart dresses and superior accommodations, their barbarism and inactivity will disappear together. It is a noble and humane arrangement, which this company has been the first to make with respect to any aborigines, that a tenth part of the land is reserved for their use as free property. The reserves made for them at Port Nicholson were estimated, a few weeks after the first settlement, as worth L.35,000. This appears like acting upon high principle, and forms a striking contrast with the conduct of the missionaries of the Church Missionary Society, who have possessed themselves of a great deal of land in the most unscrupulous way, and, now that their arts are exposed and stopped, do all they can to incense the natives against the company's settlers. It may here be observed, that the company has also acted with great liberality with respect to the religious interests of the colony. To a body entitled the Church Society of New Zealand, they offered a free grant of 2000 acres, and to devote L.1500 to the carrying out of labourers to cultivate it, provided the society would become purchasers in the ordinary way for other 2000 acres. This offer has been accepted, and arrangements are consequently in progress for erecting a bishopric in New Zealand. The company also give a free passage to any clergyman of whatever denomination, who can make it appear that there is a congregation desiring his services.

A few miscellaneous excerpts from the letters of settlers, may here be appropriate.* Dr Dorset, in a journal-shaped letter to his brother, after mentioning his arrival at Port Nicholson, on the 21st February, says, "I cannot describe my sensations when I saw lying there five large ships, and another, the Bengal Merchant, coming into the harbour astern of us, and several small vessels from Sydney and the coast of New Zealand at anchor also; and the beach covered with tents and houses, and packages of goods strewed every where. * * I was particularly struck with the cheerfulness pourtrayed in all the emigrants' countenances, and the universal content and satisfaction that reigned among them with regard to the soil, climate, and appearance of the country; also the usefulness of the natives, with whom the emigrants are on the best terms. * * Several merchants from Sydney have opened large storehouses here, and things are very moderate." He describes himself as having laboured in England under permanent weakness of the chest, but as being quite restored by the New Zealand climate. "I am," he adds, "in full swing as surgeon of the colony, with lots to do—not in the way of sickness, but in bringing young ones into the world."

E. J. Wakefield, a nephew of the Company's agent, says, "In hilly situations, the vine might be grown to great advantage: at Hokianga, in the north island, I have seen 360 odd species of vines, which had produced a crop last year." Mr Revans, the publisher of the Gazette, says (April 6), "We have a most magnificent harbour; most fertile land; such foliage and verdure as I have never before witnessed; and the climate agreeable, and, I think, admirably suited to the English constitution. * * The bank is in operation, and I believe a local bank will soon be started. It is a very promising place, and I have no doubt that a large business will soon be done at immense profits, with the people, and the whaling parties on these islands. * * I am in rude health. I rise at five, and go to bed at eight, and work, and talk, and walk incessantly. We have no time to open books—that will be for the future. I like Colonel Wakefield much; I think him admirably qualified for the post he occupies, and I do not believe he has an enemy in the place." Miss Hunter writes to a female friend (April 7), "The scenery is very romantic, and mamma says that in some places it reminds her of Scotland. * * We have six visiters for every one we had at home. * * Baby is quite well, and likes every thing except the cooking, which we are obliged to do in the open air, over wood fires, laid upon the ground. * * Papa is post-master for the colony, and has between two and three hundred letters for Sydney and England; this will give you some idea of the population." Mr Partridge writes (March 18), "Labour is high; mechanics 45s. to 50s. per week; labourers 30s. per week. I am now living in a tent which I have bought, for the house is not yet landed; and I am very well contented that I have not yet been obliged to sleep with an umbrella over my head, as most others have done. The climate is so fine that every body laughs at such things. * * Molesworth, Sinclair, and Petre, and the aristocracy, are setting a good example by working away. Fustian coats and thick shoes are very fashionable, and you would laugh to see officers, doctors, and dandies—digging, thatching, and chopping with great frenzy. * * My living here, I think, will cost me a mere trifle. Economy is the order of the day; and I carpenterise, carry logs, and cook, and go to council, without detriment to my gentility."

Mr Charles M'Gurk represents himself (March 16) as a contractor for clearing lines for streets in the place originally designed for the settlement. "It is very hard work, and I am generally wet all day, as we have to cross over swamps; yet I have not felt the least ill effects from it, and I like this sort of life amazingly. * * We came to a tree yesterday forty feet in circumference; it is, I think, of the pine genus, of a red colour, and as hard as iron. There is no doubt that the wood will pay well when oxen are at work, and some kind of roads made." Mr E. B. Hopper (April 12) says—"At present, persons who brought out from L.100 to L.300 with them, are all doing well; mechanics and labourers are also doing well. Common labourers are getting 30s. a-week; carpenters from 6s. to 7s. per day; and, from the great demand for labour, wages will be much higher. Considerable premiums have already been given for town and country sections. One quarter of the town acre of No. 27 choice, was sold the other day for L.100; two or three whole sections of higher numbers have been sold for L.250 the section of 101 acres. Numbers of capitalists are flocking here from Sydney and Van Diemen's Land. * * Companies of several descriptions are forming at Sydney to establish themselves here; so that I am fully in hopes that, by this time two years, the colony will begin to take the lead of the southern colonies, on account of its resources in three fixed commodities, viz. flax, timber, and oil. With the first we have tied together all the materials, including the roofs and walls, of our first houses, and very strong they are; and the fine broad leaves, from six to ten feet long, make excellent side-walls. Some of the trees are large enough to scoop out bed-rooms, although this is by no means considered a fine timber district. * * For the present we are located on the banks of the river Hutt, and a most delightful place it is; the soil is of the richest quality. We are already enjoying fine radishes, the seed of which was sown five weeks since; wild pigeons and ducks are very plentiful; the rivers supply quantities of fine salmon, snappers, eels, and other fish, which we catch in front of our doors. The natives are very much attached to us, and pride themselves in evincing their readiness to preserve and protect us from being molested by their enemies. We allow them to come in and out of our dwellings as they please; and you will probably be surprised when I tell you we have neither locks, bolts, nor bars, in use for the security of any of our property—it is lying about exposed in every direction. My boxes and chests have been for weeks out in the open air, night and day, and not a single article has been stolen."

Since this article was written, intelligence from New Zealand to the 9th July reached this country. It was of the same satisfactory kind as all that had preceded it. British law had been established in full efficiency by Governor Hobson. Two additional vessels from London had arrived with emigrants, and the immigration from Australia was continuing on a large scale. The surveys were proceeding vigorously, and, meanwhile, a considerable traffic was carried on with Sydney, the emigrants purchasing flax and potatoes from the natives for exportation to that port, whence they received miscellaneous supplies in exchange. The New Zealand Company have now declared a dividend; they have raised the price of land; and are henceforth to cease allowing a drawback to purchasers to assist in paying their passage, the whole emigration funds being now to be reserved for passengers of the labouring class.

So far, then, all appears to be going on well in this new settlement. We would hope that the settlers will soon be able, and be found willing, to set about agricultural and pastoral business on a proper scale, and not devote more than enough of attention to those speculations in land which, leading to no actual production, only enrich one at the expense of another, and tend to repress every thing like real progress. In concluding, we would beg our readers to observe, that our purpose here strictly is, to communicate intelligence respecting a very remarkable movement at present in progress, not to recommend individuals to become emigrants, or to emigrate to this part of the world in particular. Individual adventures of so important a kind should be made upon grounds more solid than any we can hope to present; but we may at the same time, with perfect sincerity, express our gratification at the agreeable intelligence which has been as yet returned from New Zealand, and our confident expectation that, if no unexpected circumstances of an unfavourable nature shall arise, this must speedily become one of the most prosperous of our colonies.

* We derive them from a London fortnightly newspaper, the *New Zealand Journal*.

ORIGINALS OF "THE BRIDE OF LAMMERMOOR."

"Truth is strange—stranger than fiction."—BYRON.

OUR readers, we feel assured (says the editor of the Inverness Courier), will peruse with deep interest the following excellent account of the originals of the principal characters who figure in, perhaps, the most touchingly beautiful fiction which proceeded from the genius of the author of Waverley. The letter is written by a gentleman who, as will appear, has had the best means of ascertaining the real circumstances on which the romance was founded, as well as the true characters of the persons introduced in this tragical tale. The light thrown upon the point as to the author of the homicide, is curious and striking:—

"*L*—— *E*——, *September* 5, 1823.

My dear Sir J——,—Various circumstances have occurred which have unavoidably prevented my returning an earlier answer to your queries regarding our unfortunate relative, 'The Bride of Lammermoor.' I shall now have much pleasure in complying with your wishes, in as far as an indifferent memory will enable me to do so.

'The Bride of *Baldoon*' (for such has always been her designation in our family) was the Honourable Janet Dalrymple, eldest daughter of our great-great-grandfather, James *Viscount Stair*, Lord President of the Court of Session in the reign of William and

Digitized by Google

Mary; sister to the first Earl of *that name*, and to our great-grandfather the Lord President, Sir Hugh Dalrymple of North Berwick, and consequently our *great-grandaunt*.

She was secretly attached, and had plighted her faith to the Lord Rutherford, when, under the auspices of her mother, a less amiable, but much more opulent, suitor appeared in the person of David Dunbar, eldest son of Sir David Dunbar of Baldoon (an ancestor of the Selkirk family), whose addresses were, as may be supposed, submitted to with the greatest aversion, from their being ungenerously persisted in after his being informed of her early attachment and solemn engagement. To this man, however, she was ultimately *forced* to give her hand.

The result of this cruel and unnatural sacrifice was nearly, if not exactly, as related by Sir Walter Scott. On the marriage night, soon after the young couple were left alone, violent and continued screams were heard to proceed from the bridal chamber, and on the door (which was found locked) being forced open, the bridegroom was found extended on the floor, stabbed, and weltering in his blood, while the bride sat in the corner of the large fire-place in a state of the most deplorable frenzy, which continued without any lucid interval until the period of her death. She survived but a short time, during which (with the exception of the few words mentioned by Sir Walter Scott—'Ye ha'e ta'en up your bonny bridegroom') she never spoke, and refused all sustenance.

The conclusion drawn from these extraordinary circumstances, and which seems to have been assumed by Sir Walter as the fact, was, that the forlorn and distracted victim, seeing no other means of escaping from a fate which she beheld with disgust and abhorrence, had, in a fit of desperation, inflicted the fatal wound upon her selfish and unfeeling husband. But, in justice to the memory of our unhappy relative, we may be permitted to regret Sir Walter's not having been made acquainted with the tradition long current in the part of the country where the tragical event took place—namely, that from the window having been found open, it was conjectured that the lover had, during the bustle and confusion occasioned by the preparations for the marriage feast, and perhaps by the connivance of some servant of the family, contrived to gain admission and secrete himself in the bridal chamber, from whence he had made his escape into the garden after having fought with and severely wounded his successful rival—a conclusion strengthened by other concurring circumstances, and rendered more probable by the fact of young Baldoon having, to his latest breath, obstinately refused to give any explanation on the subject, and which might well justify a belief that he was actuated by a desire of concealing the particulars of a rencontre, the cause and consequence of which he might justly consider as equally discreditable to himself. The unfortunate lover was said to have disappeared immediately after the catastrophe, in a manner somewhat mysterious; but this part of the story has escaped my recollection.

While on the subject of this calamitous event, I cannot help offering some observations on the principal personages introduced in Sir Walter Scott's narrative, all of whom are more or less interesting both to you and me.

The character of Sir William Ashton certainly cannot be considered as a fair representation of our eminent and respectable ancestor, Lord Stair, to whom he bears little resemblance either as a politician or a gentleman; and Sir Walter would seem wishful to avoid the application, when he says that, on acquiring the ancient seat of the Lords of Ravenswood, Sir William had removed certain old family portraits, and replaced them by "those of King William and Queen Mary, and of Sir Thomas Hope and *Lord Stair*, two distinguished Scotch lawyers;" but on this point some less ambiguous intimation would have been very desirable; and having, in the character of Lucy Ashton, stuck so closely to the character of *the daughter*, the author should, in fairness, have been at more pains to prevent that of the Lord Keeper from being considered as an equally fair representation of *the father*; an omission of which the descendants of Lord Stair have, I think, reason to complain.

In Lady Ashton, the character of our great-great-grandmother seems in many respects more faithfully delineated, or at least less misrepresented. She was an ambitious and interested woman, of a masculine character and understanding; and the transaction regarding her daughter's marriage was believed to have been hers, and not her husband's, who, from his numerous important avocations as Lord President, Privy Councillor, and active assistant in the management of Scottish affairs, had probably neither time nor inclination to take much personal concern in family arrangements.

The situation of young Ravenswood bears a sufficiently strong resemblance to that of the Lord Rutherford, who was an amiable and high-spirited young man, nobly born, but destitute of fortune, and who, if the above account is to be credited as to the manner and *place* in which he thought proper to chastise his successful rival, seems to have been not ill cut out for a hero of romance. And as to young Baldoon, of whom little is known beyond what has been related above, he seems to have a more respectable representation than he deserved in the person of *Bucklaw*.

The story was, I have understood, communicated to Sir Walter Scott by our worthy friend the late Mrs A—— M—— K——, who seems to have been well acquainted with all the particulars, excepting those to which I have more especially alluded, which, as a friend and connexion of the family, had she known, she would not have failed to mention; and, in as far as his information went (with the exception of his having changed the scene of action from the *west coast to the east*), Sir Walter seems to have adhered to facts as closely as he could well be expected to do in a work bearing the general stamp of fiction. But if the memory of so disastrous and distressing a family anecdote was to be preserved and handed down to posterity in a story so singularly affecting, and by an author the most popular of our own or any other age, while it was surely of importance to avoid any such offensive misrepresentation of character as that to which I have alluded, it was at the same time much to be lamented that the author of the Bride of Lammermoor should have been ignorant of a tradition so truly worthy of credit, throwing so much satisfactory light on an event equally tragical and mysterious, and which, while a judicious management of the circumstances might have increased rather than diminished the interest of the narrative, would have left a less painful impression regarding our unhappy and unfortunate relative, 'the Bride of Baldoon.'

With best regards from all here, to you and Lady S——, I remain, my dear Sir J——, ever most truly yours, (Signed) R. D—— H—— E——."

FAREWELL, OLD YEAR!

Farewell, Old Year!—when other friends depart,
Fond hope still lingers in the sad adieu,
And e'en in absence tells the sorrowing heart
That after Fare-thee-well comes How-d'ye-do!

But thou, Old Year, art passing from my sight;
Thy cheerful days, thy happy hours, are o'er;
To memory's dim domain they take their flight,
And from her shades they shall return no more!

The summer birds that, with their truant wings,
Cleave the far ether of a southern sky,
Anon return, by bowers and gushing springs,
To glad the wild woods with their melody.

But they return not—hours of bliss swift stealing
Away, away, on pinions bright and pure,
E'en in their flight the matchless joys revealing—
Too fair to last, too lovely to endure!

In vain, with beating hearts and arms extended,
We court their stay, and pray that they may last;
They glide away, too soon with memories blended,
That crowd the precincts of the insatiate past.

Thus years roll by, and each and every one
Snatches some treasured happiness away.
Ah, graceless heart! reflect—and are there none
That bear griefs with them on their backward way?

Neither shall these return to mar thy rest.
If joys depart, so care's dark hours go by;
And time hath power to heal the bleeding breast,
To dry the falling tear, and hush the sigh.

Or if a sting remain, the honey dew
Of sweet remembrance shall allay the smart,
And soothe regrets, and kindle hope anew—
Blest antidote to care!—oh! thankless heart!

Yes! years roll on. Yet wherefore send them forth
With records dark and sad to bear on high?
Oh! give them noble thoughts and deeds of worth,
To swell the annals of eternity!

—*Knickerbocker, or New York Monthly Magazine.*

KINDNESS OF THE POOR TO THE POOR.

Whoever has studied, with a mind free from prejudice, the manners of the working classes, cannot fail to have observed that these classes very generally present numerous examples of virtue. The working man is, for the most part, free-hearted, kind, and anxious to assist his comrades, and capable of the truest devotion towards his employer. In those quarters the population of which is chiefly engaged in the industrious arts, it is notorious that artisans, whose circumstances are tolerably easy, succour, with a ready and active charity, not only those of their comrades who are prevented from labouring by sickness, but all who occupy the same house with themselves, or with whom they maintain habits of neighbourhood. Out of their wages they keep back a portion for these purposes; and even perform the sick man's task in addition to their own, to preserve his salary to him during the continuance of his illness. If he is compelled to seek the hospital, on the day of his removal his bedside is visited by a deputation of his companions, with offers of money and words of consolation. When his strength returns, they make it their business to seek work for him, and subscribe towards his maintenance for the first fortnight. Should some unforeseen accident have reduced him to distress, they relieve him by an advance of money, a meal, a bed; and these succours, freely offered, constitute a debt which the recipient could not, without dishonour, fail to discharge. Nay, their solicitude follows him even amid his follies, and does not abandon him in his crimes. In the former case they try to counsel him back to respectability, with friendly and indulgent words; in the latter, they still visit him in prison, and hold out to him a helping hand.—*On the Dangerous Classes in Large Towns.*

IMPORTANCE OF TRIFLES.

Why was the refusal of a "private gentleman to pay twenty or thirty shillings to the king's service argued," says Clarendon, "before all the judges of England?" Because, in those twenty shillings one party saw the germ of a tyranny, and the other of a rebellion. Why will a lawyer warn you against permitting a neighbour to claim the gathering of even a leaf upon your estate, without contesting his right? Because the gathering of the leaf may invalidate your title to the whole estate. Why will a wise politician contest so earnestly for the form of a word, or the wearing of a hat, or the title of a writ? Because each of these will become a precedent; and in precedent is involved principle. Why will an engineer be alarmed at the first drop of water oozing through a dam? Because the rest, he knows, will follow it. Why is the discovery of one little bone in a stratum of a rock enough to overturn a whole theory of geology? Because the little bone, like a pack-thread, will draw after it the whole skeleton, like a coil of rope, and the skeleton will imply the power which brought it to its site; and that power will be vast and pregnant with other influences: and thus the whole system of the science will be dragged into peril, as many other systems have been perilled, and have been upset by the merest trifle, by one little fact. Why will a spot of blood betray murder? Why will the print of a nail discover a thief? Why will a whole neighbourhood take flight at the sight of a little boy, with only a little spark of fire, going into a magazine of powder? or a crowd disperse upon the ice at the sound of the slightest crack? Because nature, as well as theology, has her Athanasian creed, and her damnatory clauses for those who neglect iotas; because nature, as well as theology, does not know what a trifle is.—*Sewell's Christian Morals.*

THE UPRIGHT MAN OF BUSINESS.

There is no being in the world (says Dr Dewey) for whom I feel a higher moral respect and admiration, than for the upright man of business; no, not for the philanthropist, the missionary, or the martyr. I feel that I could more easily be a martyr than a man of that lofty moral uprightness. And let me say, yet more distinctly, that it is not for the generous man that I feel this kind of respect—generosity seems to me a lower quality, a mere impulse, compared with the lofty virtue I speak of. It is not for the man who distributes extensive charities, who bestows magnificent donations. That may be all very well—I speak not to disparage it—I wish there was more of it; and yet it may all consist with a want of the true lofty unbending uprightness. That is not the man, then, of whom I speak; but it is he who stands, amidst all the swaying interests and perilous exigencies of trade, firm, calm, disinterested, and upright. It is the man who can see another man's interests just as well as his own; it is the man whose mind his own advantage does not blind nor cloud for an instant; who could sit a judge upon a question between himself and his neighbour, just as safely as the purest magistrate upon the bench of justice. Ah! how much richer than ermine—how far nobler than the train of magisterial authority—how more awful than the guarded bench of majesty—is that simple, magnanimous, and majestic truth! Yes, it is the man who is true—true to himself, his neighbour, and his God—true to the right—true to his conscience—and who feels that the slightest suggestion of that conscience is more to him than the chance of acquiring a hundred estates.

CURIOUS PRINTING ESTABLISHMENT.

A curious account is given, from Tubingen, in Wurtemburg, of a new printing establishment, lately opened by M. Theodore Helgerad. All the compositors and pressmen, one hundred and ninety-six in number, eleven of the former being women, are deaf and dumb, and have been educated at his cost for the employment in which they are now engaged. The king has conferred on M. Helgerad the large gold medal, of the order of civil merit, for this great reclamation from the social and moral waste: but M. Helgerad has a higher recompense for this remarkable labour of love than medals can mark, or monarchs bestow.—*Newspaper paragraph.*

"INTERESTING ANECDOTE OF EMANCIPATED NEGROES."

An Occasional Note, which appeared under the above title in No. 441 of the Journal, contains a statement to a certain extent erroneous, in consequence of a confusing of two sets of circumstances on the part of our informant. The truth, as communicated to us by Mr Finlay, the gentleman referred to in the anecdote, is as follows:—A *penn* (that is to say, a pastoral) *estate* in Jamaica, was formerly managed by Mr Finlay, under the immediate care of a white overseer, at an expense of several hundred pounds. Since the emancipation, the principal business on this estate, the hiring out of negroes, has ceased, and the overseer, being no longer required, was discharged, and the estate was then put under the charge of an intelligent negro and an assistant, whose united salary is only L.50 per annum; "the people keeping the pastures in order, in consideration of their having their houses and provision-farms rent free." The wonder in the case is simply limited to the fact of an estate of 1200 acres, with 250 cattle, and 100 small tenants, being kept in order by one negro, and that even while Mr Finlay was absent in England. The whole management reflects credit; says Mr Finlay, both on the industry and the dispositions of the negroes, and is an earnest of the rapid progress they are making in the duties of citizenship.

This gentleman adds what will at the present time be read with interest, as the testimony of a most intelligent and respectable individual:—"I can solemnly assure all those who are interested in the welfare of the blacks, that, after a panoramic survey I have made during the last eighteen months, of the state of the wretched slaves of Cuba and America, and the cheated, nominally free blacks of the northern states—the stout independent English—the light-hearted Irish—the sagacious Scotch—the plodding Fleming—the gay Frenchman, and the brutalised indolent Haitien—I have returned here perfectly convinced that none of them have the physical comforts of the freedman of the British West Indies. His moral condition also is advancing with giant strides: churches, chapels, and schools, are rising on every side, and in ten years more, even in this respect, we will challenge comparison with most of the above.—*Kingston, October* 19, 1840."

CHAMBERS'
EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 467. SATURDAY, JANUARY 9, 1841. PRICE THREE HALFPENCE.

DRAWBACKS.

BOTH individuals and communities will generally find, when they make advances in some presumed good, that the good is not altogether unmixed: there is always some drawback from the benefits contemplated, as if it were not possible in nature that human aims should be entirely accomplished, or human desires perfectly gratified. Proverbial wisdom recognises, and has at all times recognised, many of these drawbacks from attained good. For example, wealth brings with it cares, and though most people, like Charles Lamb, contrive to put up with it, yet it is from this cause not an unmixed good. Merit, again, may be proved, and the honours due to high public service may be conceded; but envy is the shade of merit, and the triumph is embittered to a generous nature by finding that from many it only provokes sneers and detraction.

"The moir I stand on opin nicht,
My faults moir subiect ar to sicht,"

says very truly the Regent Marr, on the front of his house at Stirling. The lowly and the unfortunate little think of the distress of mind which the prosperous man experiences when he finds that the sympathy and friendly kindness which he enjoyed in his humbler days, and the general satisfaction which he gave by the simple performance of the duties assigned to him, are exchanged for a disposition to take offence at the smallest oversight, a suspicion that he is proud and altered, and such a general jealousy of all he does and does not do, and all he says and does not say, that he feels as if he could not, though he were to give his whole time and fortune to it, please even that one half of the world to which Æsop counsels him to limit exertions of that nature. So also, when some of the virtues have been to all appearance attained, how often do we find some opposite vice appearing! Here no degree of vigilance of which man is capable will avail to keep all right. Dam up error in one place, and presently you will see it oozing out at another. Let the right wing be victorious, and chase all opposed to it from the field, and straight you will find, as the royalists did at Marston Moor, that the left has been disgracefully beaten, and fled twenty miles to the rear. One of the most common drawbacks from the merit of a correct life, is a pride therein which renders it wholly unamiable. Indulgences of almost all kinds may be dispensed with, but, lo! in their place has come a spirit of puritanism so unnatural, that medium characters, in contemplating it, are not so much inclined to go in the self-denying as in the contrary direction. We have been told by rural observers, and we hope we may state the fact without injury to the cause of the virtues brought into question, that the votaries of temperance amongst the rustic classes are occasionally found somewhat morose, and to have lost a little of their hearty good will as workmen; and that sometimes a young servant who puts money in the savings' bank, seems less willing than before to go to the succour of an infirm parent, as fearing to have to dissipate her little store. These circumstances, as far as they can be presumed to exist, must be held as simply drawbacks, unavoidable in certain instances, from what is upon the whole meritorious conduct. Again, great pains may have been taken to avoid every sort of reproach; but the state attained is only negatively good; ungraced by a single active virtue, or the slightest effort to communicate happiness, it has only reached the distance-post of the race of goodness, and the better half of the task remains undone, unattempted. Gray, the poet, is said to have been a good man of this kind: he was nearly irreproachable, but he never exerted himself to do any positive good. He allowed his life to pass away in the delusion that he was all that he could be expected to be; while, in reality, many of the world's equivocal characters were better in an active sense than he with all his high reputation. Even the religious sentiment, in its most exalted moods, is often found attended by dismal drawbacks, as fanaticism, bigotry, intolerance, superstition—showing in a peculiarly striking light that very frailty and imperfection which, as an inherent feature of human nature, forms one of the fundamental doctrines of religion. That justice and wisdom carried to an extreme become cruel and absurd, we have high authority for saying;* and it is found to be the case in every-day life. Who do such foolish things as the wise, or who ever act so detestably as those who lay down to themselves certain rules from which they are too conscientious ever to swerve? The truth is, the general condition of things does not admit of any one principle being invariably followed; and perhaps there is even a law rendering folly and nonsense to a certain extent necessary elements in our condition, so that their utter extinction, were it possible, might be attended with effects not less disastrous than if light, heat, electricity, or some other important physical principle, were abstracted.

The progress of a community towards civilisation, is very much analogous to that of an individual in his efforts to perfect his condition and his moral nature. We must not expect to find any one supposable condition which a nation may attain, to be altogether without its drawbacks. European nations have for ages made civilisation one of their chief aims, and great advances have certainly been made in that respect. But civilisation, whatever blessings it may bring upon the whole, is also attended by evils which do not very clearly appear separable from it. This is only too certain a truth, and the sole consolation which attends it is, that no other state is attended by evils of less number or magnitude.

The romantic ideas entertained in the last century respecting the savage condition, are now pretty nearly abandoned. It is now seen that that state of society is no more without its pains and sorrows than any other which has been as yet experienced by the human family. The once alleged absence of indigence and disease amongst primitive tribes, is thus summarily treated in a late work:†—"It is generally agreed that indigence consists in the want of some things absolutely necessary to existence. Such a state cannot exist in barbarous life; the savage either lives or dies; he is never precisely rich or poor: whilst the means of subsistence are afforded, he exists from hand to mouth; when they fail, there is no one from whom he can beg or borrow, and few whom he can plunder. With him destitution is death. It is true that he can support hunger, thirst, pain, to a degree which we cannot approach; that he will feed on substances from which we shrink with horror. But there are limits to his powers of endurance: when these are passed, he sinks unnoticed and unknown; there is no one to record that a unit has been subtracted from the amount of human existence. The uniformity which travellers and voyagers have discovered in savage life, is a condition but one degree higher than absolute starvation. Those who sink below it disappear instantaneously, and are as if they had never been. For a similar reason, severe diseases are rarely seen by the casual visiters of savage tribes. Death is their doctor, and the grave their hospital. Those who have resided amongst them, testify that diseases are produced by the privations endured at one period, and the repletion in which they indulge when a time of plenty arrives. But unless the cure is rapid, the termination of the disease must be fatal. When patients are left entirely to nature, it is found that nature presses very hard for an immediate payment of her debt."

A still more conclusive fact against savage life is, that it admits of so few to its supposed benefits. In countries possessed by such tribes, the population is not believed to be in general above one to a square mile at an average; while, in many industrious countries, it is upwards of two hundred.

It may be concluded, then, that it is not to the state in which civilisation is *nil*, that we are to look for the blessings which we deem at present wanting. We may now pass forward to the state of things in which there is some civilisation, but only some, the great mass being slaves, and in a condition of brutish ignorance. Of the condition of an European feudal slave, we have a very striking picture in a late work of Dr Bowring:—"I went once into the hut of a Russian serf. It was made of logs of wood, and though the winter was bitterly cold, the only windows were small square holes, through which the snow was driven by the sharp winds, and when the door was opened, there rushed in showers of sleet and hoar-frost. Within was a smoky suffocating heat, produced by the burning of damp wood in a stove. The inhabitants were a boor, his wife, and three children, covered with dirt and vermin; and the whole family were the vassals of a neighbouring nobleman. They were attached to the soil according to the feudal usages—had no will of their own, they could possess no property, and were almost without any legal right. All they could gain was claimed by and paid to their master; and of the produce of the fields they cultivated, no part came to their share but such a portion as enabled them to support existence. I was curious to hear what notions a Russian boor had of freedom, and of his own condition. Peter Petrovich was sitting in his ragged sheep-skin garment on a block of wood, carving ornaments out of the thigh-bone of an ox. I sat down by him, and asked how far he had ever travelled. 'Never ten versts from where I was born,' said he. 'Should you not like to see a great city?' 'I have heard of one, I don't know what was its name, from Ivan Carlovich, and that's enough for me.' 'Can you read or write?' 'Not I! What would be the use of reading or writing? The priest reads to me, and saves me the trouble; and I have nobody to write to, and nobody to write about.' 'Should you not like a better house?' 'I do not know what I should do with it; it would only add to my trouble.' The love of independence is often said to be an instinct of man, a natural irrepressible feeling; but when I asked Peter Petrovich if he ever thought of buying his freedom, of endeavouring to become his own master, he looked surprised, and said—'Am I a fool? Do not I know when I am well off? Must not my lord provide for me? How could I provide for myself.' It was in vain I sought to touch a chord which is said to vibrate in all minds—the love of liberty. Liberty to him was to take no care of himself. * * 'But surely if you were to labour for yourself, and keep all the money you gain, you might have better food and garments, and a more comfortable house.' It was in vain to talk to Peter Petrovich. 'My master must provide for me,' was the burden of his story."*

There is here, it is true, contentment, but a con-

Digitized by Google

tentment rather to be condemned than approved of, seeing that, from mere ignorance, it kept a human being at a point of enjoyment far below what his nature was capable of, and what he might have easily obtained by a little knowledge and a little exertion. Dr Johnson says very justly—"Happiness consists in the multiplicity of agreeable consciousness. A peasant has not a capacity for having *equal* happiness with a philosopher: they may be equally *satisfied*, but not equally *happy*. A small drinking glass and a large one may be equally full, but the larger one holds more than the smaller." Obviously, in the case of Peter Petrovich, and of all in his circumstances, there was an immense waste of capability of enjoyment, as well as a submission to many positive evils which only could be tolerable under an obtuseness of feeling, as artificial in the manner of its production as are the most refined tastes and appetites.

The ages of slavery in England were succeeded by a period during which there was still great though somewhat less ignorance, perhaps a good deal of the substantial comforts of life, and withal such a sufficiency of popular amusement, as to make the term "merry" applicable to the country. At this time, however, the people must have often suffered tremendously. Every now and then, the plague came to sweep off some large portion of the population. In the reign of Edward IV. alone, it is believed to have destroyed as many as the wars of the Roses. Here were evils surely more than enough to make dear that ignorance under which men are believed to have been contented and happy.

In our own age, the social system is almost entirely changed. Population is vastly increased; and great masses of it are assembled in particular districts, to prosecute industrious courses depending in great measure on demand out of the country. The middle classes, who formerly followed their trades and other occupations in a comparatively leisurely way, are now involved in a struggle so severe as to absorb nearly every man's entire faculties. All, we verily believe, enjoy more substantial comfort, and are more exempt from sharp hardships of various kinds, than they formerly were; but, nevertheless, the remuneration of labour is complained of in many cases as too low, and the middle classes feel that, to procure a decent maintenance, demands much more exertion than any man ought to be expected to give, and more ingenuity than many possess. Hence, in the one class, there are vast numbers under-fed and under-provided in all respects, and in the other a considerable number who, though they could do well in a common state of things, are found quite unfit for one in which so excessive a perseverance and such active faculties are required to attain any fair degree of success. When the working classes were totally ignorant, they could submit to worse evils with patience; but now, being partially enlightened, they manifest violent discontents, and form confessedly a threatening element in the state. And, assuredly, while the productive resources and industry of the country were never greater than at present, while science advances with unexampled strides, while the first literary names of the country are of unequalled lustre, and while Britain is extending her power and population over every quarter of the globe, it is a sad drawback from all her glory, that life to so great a proportion of her sons is not supplied with a sufficiency to cheer and support it, but is a scene of incessant toil, not even enlivened by those holidays and sports which made our ruder ancestors merry. Diseases do not now carry off hundreds of thousands at a sweep, but a general lowness of condition may still show itself unfavourable to healthy development, and inconsistent with the enjoyment of existence.

On the other hand, the middle classes do not secure their superior comforts without encountering disadvantages of a most serious nature. The incessant tasking of the brain, in which their active life may be said chiefly to consist, produces a stimulation of that organ, which, being generally accompanied by deficient bodily exercise, and often by exposure to vitiated air, tends to induce a class of diseases of which the rude natural man of the backwoods has no experience. Why are paralysis, dyspepsia, diseases of the heart, and nervous maladies in general, now so prevalent? Simply because the life of business which Englishmen of the middle ranks now regard as their natural and proper element, cannot be prosecuted without an exclusive and excessive use of the nervous system, leading to such derangements. There is a well-known anecdote of an old duchess, who said "she was born before nerves came into fashion." There is more serious earnest in this expression than is generally thought of. The exigencies of recent times have certainly brought the nervous system into a degree of exercise and excitement formerly unknown, and which may almost be said to have for the first time made the world aware of there being such things as nerves. These are the *drawbacks* from a system which, taken in another point of view, must be admired for the energy, perseverance, and integrity, with which it is followed out, and its vast results in the production and diffusion of wealth.

It seems to be almost inseparable from an advanced state of things, that great evils of the opposite nature should exist. Nowhere on earth is there so much poverty as amongst those very communities most noted for wealth. Nowhere is there so much drunkenness and vice as in nations noted generally for their high moral character. There would almost appear to be a positive and negative pole in artificial society, and, the more artificial society may be, so much the more decided seems its tendency to polarise.

Is it to be understood, then, that the civilisation which nations strive for were better wanting, since it is attended by such evils? We should be loath to come to this conclusion. We cannot doubt that, though each state has its own peculiar evils, those of the advanced state are, upon the whole, the least. After all, the present evils are evils of partial civilisation. The great body of the people are uninstructed: even the leading and so-called enlightened classes, are under the influence of many false maxims which must in time be dispelled. It is very likely that, as civilisation in these respects advances, many of the present evils will be lessened. We are not to expect that a civilisation of so perfect a nature will ever be attained, as to extinguish all social evils. Human nature evidently does not admit of any such result. But, in believing that happiness will in time be more generally diffused throughout communities, and positive evil greatly reduced in amount, we are justified by all that has yet been observable of human progress.

STORY OF INEZ DE CASTRO.

The lengthened and varied annals of the Peninsula contain no episode more deeply interesting than that which the reader will find laid before him in the following brief and unvarnished narrative. The scene of the story was Portugal, and the time the middle of the fourteenth century, when Alfonso IV. sat upon the throne of that country. This prince had been distinguished in his youth for the display of almost every bad quality, having rebelled more than once against his father, and so embroiled the kingdom in repeated civil discords. When he ascended the throne, he exhibited that total disregard for his new duties which might have been expected from his previous conduct, until a solemn and bold warning from one of his chief nobles effected a compulsory reformation, rendered comparatively durable by fears for his personal safety. The caution referred to was thus given. The council of state had long waited for him one day, having affairs of consequence to transact. Alfonso had gone a-hunting, and when he appeared at length in council, it was only to entertain the grave statesmen and nobles there assembled, with an account of his day's sport. "Sire," said one of the councillors, "we did not come here to listen to things fitted for the ears of huntsmen. If your highness will attend to the necessities of your subjects, you will have humble and faithful vassals; if not"—— "What then?" cried the angry king. The minister calmly proceeded—"If not, they will *seek another king!*" Alfonso broke forth into a torrent of invectives; but something in the manner of those around him compelled him ultimately to moderate his passion, and to promise that, from that time forward, they would find in him "not Alfonso the hunter, but Alfonso the king."

To this seasonable warning, history tells us, the Portuguese people owed many public benefits during the remainder of Alfonso's reign; but the reformation did not extend to the king's private conduct. His son and heir, Dom Pedro, was united in marriage to Constance, daughter of a powerful Castilian prince. The affections of the Infante, as the heir-apparent was called, were not consulted or engaged in this match. He was strongly attached, in fact, to another lady, named Inez de Castro, the daughter of a noble Castilian who had sought refuge in Portugal from perils incurred in his native province. This attachment was mutual, yet Pedro remained constant to his vows to Constance, and lived in unbroken harmony with her. It is admitted by all annalists that the virtuous fidelity and self-command exhibited by the Portuguese prince were as commendable as they were rare, in stations like his, at that period of the world's history. However, King Alfonso was aware of his son's passion for Inez de Castro; and from the fear that circumstances might yet occur to bring about a match between them, which he regarded as one unworthy of the royal house of Portugal, the king caused Donna Inez to stand godmother to one of the Infante's children by Constance, thus creating a spiritual bar to the possibility of future wedlock between the two parties. The Church of Rome forbade the union of the sponsor of an infant with its real parent.

Nevertheless, when Constance died, as she did after being married but a few years, Dom Pedro's attachment set all such obstacles at defiance. He obtained a papal dispensation, and married Inez de Castro. At the same time, he concealed his marriage from his father and the public, the lady consenting rather to bear the imputation of an illegal connexion, than to subject the Infante to the risk of Alfonso's anger. For some years, Inez lived in great seclusion at Coimbra, where she bore four children to her husband, namely, Alfonso, John, Dennis, and Beatrice. Unacknowledged as this union was, the court, nevertheless, suspected something of the kind. In his private conduct, Pedro not only exhibited all the affection and constancy of a husband as regarded Inez, but peremptorily declined entering into any of the new matrimonial engagements which his father was perpetually proposing to him. Inez de Castro, therefore, could not but be an object of suspicion to Alfonso and his confidants, and she unfortunately incurred, through other circumstances, a degree of additional odium, which brought on the crisis of her fate. The despotism of the reigning sovereign of Castile caused many of her countrymen to fly to Portugal for protection; and by gaining for them the favour of her husband, the Infante, she was able to place them in a position that excited the envy of the native courtiers. A strong party was by degrees formed against Inez, and to these persons it became an object of importance to dispose of the unfortunate lady, ere the demise of Alfonso called his son to the throne, and consolidated her power beyond all possibility of overthrow.

This inimical party commenced operations by working on the fears of the old king, and persuading him that the life and rights of Ferdinand, his grandson by Constance, were endangered by the influence of Inez de Castro. They brought Alfonso to the belief that the death of that unfortunate lady was indispensable to the security of the royal line, and the general peace of the country; and at length the king consented to the execution of the cruel purpose to which his mind had thus been made familiar. Pedro was absent on a lengthened hunting excursion, and, during that absence, Alfonso betook himself to Coimbra, accompanied by Gonsalves, Pacheco, and Coelho, those of his courtiers most hostile to Inez de Castro. He entered the dwelling where she had lived so many years in peace with her family. Alone, with her protector and husband far away, the unhappy woman beheld this intrusion with mortal alarm. She gathered her children about her, as if her feeble arms could save them from peril, and prostrated herself along with them at the feet of the old king. She implored him to have pity on his innocent grandchildren, and on herself, their mother. The king was not without natural feelings, and these were touched by the appeal made to him, and by the sight of his son's lovely offspring, and their still beauteous mother. He left her uninjured, and rejoined the three courtiers, who eagerly waited outside, expectant of a summons to complete the bloody act in contemplation. Their arguments speedily cured the king of his humane relentings, and he gave them authority to return to the chamber of Inez, and dispatch her with their daggers. The three courtiers waited for no second orders, but in a few minutes had dyed their weapons in the blood of the defenceless wife of the Infante. They then hurried with the king from the scene of their barbarous crime.

Dom Pedro's rage and grief were violent in proportion to his affection for Inez, and to the happiness he had enjoyed with her during their wedded life. From the hour of her death, his very nature seemed to be changed, and one absorbing, overwhelming passion, the desire of revenge, took possession of his soul. In the first burst of his resentment he took arms against his father, and commenced a bloody civil war. The contest was terminated, however, by the interposition of the aged queen, who represented to her son the injustice of continuing to punish the whole country for the crime of one or a few. Pedro was alive to the justice of this appeal, and laid down his arms, to save the nation from further calamities. He submitted even to a reconciliation with his father, who thenceforth employed all possible means to appease his son, and divert his thoughts from the murdered Inez. However, Alfonso allowed the actual assassins to quit the country, and take refuge in Castile. Whether or not the old monarch succeeded in banishing the remembrance of Inez from the breast of the Infante, was made apparent soon afterwards, when the latter, by the demise of his father, was called to the throne.

The first act of the new king was to conclude a treaty with the reigning sovereign of Castile, by which all fugitives were to be given up on both sides. Pedro of Portugal shewed a desire to effect this compact at any cost. He betrothed his three sons to the daughters of the Castilian sovereign, though these daughters were illegitimate, being the offspring of Maria de Padilla, a lady for whose sake the King of Castile had cruelly misused his wedded queen. By giving his assent to this arrangement, and any others stipulated for by the other contracting party, Pedro accomplished the grand object of his wishes—the gratification of what had become the ruling passion of his life. He got into his hands the murderers of Inez de Castro. From these men Pedro had certainly received a mortal injury, and one that deserved the punishment of death. They had cruelly and treacherously violated the privacy of his home, and for ever ruined its happiness, by dipping their hands in the blood of an unoffending woman, the wife of his bosom, and the mother of his infants. But the death which Pedro inflicted on these men was one not to be excused even by the greatness of their crime. Gonsalves and Coelho (for Pacheco escaped seizure) perished by tortures too painful to describe. Naturally a man of no ungentle nature, and even admittedly possessed of many virtues, Pedro is said to have glutted his eyes with the sufferings of his victims, all other feelings being lost in the gratification of the one great passion of revenge.

Nor was the monarch satisfied with this offering to the manes of his wife. After the execution of her slayers, he assembled the cortes, and solemnly took oath that he had obtained a papal dispensation for his marriage with Inez de Castro, and that that marriage had taken place in presence of the Bishop Guarda and the equerry of his own household. These individuals confirmed by their oaths the statement of the king. This ceremony ended, a new scene took place, of a character almost unexampled in history; a scene so strange, so solemn, so fearfully impressive in its

Digitized by Google

nature, that it is little marvel that the name and fate of Inez de Castro should have afforded a theme for the poet and the painter in all lands, and throughout all succeeding times. In presence of the whole assembled court, the body of Inez de Castro, raised from the quietude of the tomb after a sleep of several years, was placed on the throne beside her husband, and there, gorgeously attired as became the consort of a powerful monarch, was crowned with the queenly diadem of Portugal. The heir-apparent of the sceptre, Prince Ferdinand, son of Constance, knelt in homage before the corpse, and kissed her cold hand, as the first of her subjects. The whole Portuguese nobility, lords and ladies, followed the example of the prince; and, in short, every customary rite was performed which might have accompanied the coronation of the most powerful and popular of living princesses. Pedro, meanwhile, looked on in stern enjoyment of the honours paid to the remains of his beloved wife. The body of Inez was conveyed, immediately after this ceremony, to the royal burial-place at Alcobaca, and there magnificently re-interred. Pedro closed the scene by formally establishing the legitimacy of the children of Inez, and by profusely rewarding all who had ever served her, or had any claims upon her gratitude.

Thus closes the extraordinary history of Inez de Castro. It is but fair to the memory of Pedro to state, that when he had avenged the murder of his consort, and done all in his power to clear her memory from stain, he became to Portugal a just and even popular ruler. To the last, he administered the laws with severity, but at the same time with undeviating impartiality. These qualities perhaps rendered him a ruler more fit for such times than one of milder and more merciful sentiments. He showed, also, that a sovereign austerely just could also be habitually generous, and even munificent. Up till the hour of his death, Pedro retained his affection for the memory of Inez de Castro unchanged and undiminished, and it was his frequent custom to retire to her tomb, and there indulge in meditation upon her virtues and her fate.

ENGLISH NATIONAL AIRS—MR CHAPPELL'S COLLECTION.

MR CHAPPELL is entitled to universal thanks for this collection of the national music of England;* which appears in two thin quartos, one of them containing two hundred and forty-eight tunes, with piano-forte accompaniments, while the other presents notes, stating the history of each of the airs, and including the songs, where recoverable or fit to appear before eyes polite; the whole being prefaced by an essay on the minstrels who, till about the time of Henry VIII., made it a business to sing and play before popular assemblies in England.

The English populace appear to have had romantic ballads, and merry and sentimental songs, at as early a period as the Scotch; and the airs to which these were sung, were probably as much the composition of the common people themselves, as the Scottish airs appear to have been. It is essential to observe the probability of these tunes having been produced by the uninstructed populace, and not by men skilled in music, as it seems to require this circumstance to entitle any body of music to the term *national*. Such tunes grow, as it were, out of the national mind, partaking of whatever is peculiar in it, and partly fashioned by the circumstances in which it exists, just as a peculiar set of flowering plants grow in a particular region, in accordance with the nature of the soil, the climate, and other conditions. The beautiful madrigals of the sixteenth and seventeenth centuries, the great variety of fine church music, and the works of her Purcells, Arnes, Calcotts, Shields, and Bishops, albeit the subject of a not less just national pride, must be regarded as standing quite apart from the expressly national music of England, because these fine compositions were the work of accomplished musicians. Things so produced, in the light of day, and with all advantages of culture, are altogether different in character, as in their history, from those simple melodies which rise, like Burns's mountain daisy,

> "Unseen, alane,"

and remain noteless till their modest beauty chances to meet the eyes and steal into the heart of some one possessed of competent taste.

Mr Chappell does not pretend to limit his collection to national airs of the kind we have thus endeavoured to define; had he done so, a smaller book would have served his purpose, for, either England has never produced many truly national airs, or, after a long period of neglect, but a small number of them are recoverable. After all, those which he has recovered have not been, in any but a very few instances, noted down from the singing of ordinary persons, but are chiefly extracted from old musical collections, into which they had been transferred at an early period, possibly not without some improvements from hands of skill. In these airs he sees some general characteristics, such as may be considered as distinguishing them from the music of other nations. The peculiar features of the narrative tunes are, he says, "the long intervals between each phrase, so well calculated for recovering breath in the long ballads to which they are attached. They are invariably of simple construction, usually plaintive, and the last three notes of the melody of by far the greater number of them, unlike most of the other tunes, fall gradually to the key-note at the end." The fine ballad air of Chevy Chase is a specimen of these peculiarities. A great majority of the old English tunes are in minor keys; and in some instances, as in the Jolly Miller, Greensleeves, Old King Cowl, and others, there is a bold and jovial character, very unusual in airs upon minor keys. Other peculiarities, he says, not to be found in the national music of any other country, are—the accent upon the second, instead of the first of the bar, and the frequency of the passing at the termination to a semitone below, and then rising to the key-note. These matters, technical as they are, seem to us worthy of being quoted, for we never before knew of any attempt being made to establish distinguishing peculiarities in the national English airs. We cannot, however, remark without surprise Mr Chappell's allegation that, in being so often upon minor keys, the English airs resemble those of Russia and Norway, and *differ* from those of Ireland and Scotland. The Irish and Scottish national airs are for nothing so remarkable as for their being often on minor keys; hence much of their plaintiveness. It seems to be a peculiarity of national music in all countries.

A somewhat greater antiquity can be established for a considerable number of the English airs than for any of the Scotch or Irish. This is very much owing to the lucky accident of the preservation of two old manuscript collections, namely, *Queen Elizabeth's Virginal Book*, or collection of tunes for the virginal, and *William Ballet's Lute-Book*, the latter of which is considered as the older of the two. To these Mr Chappell has been indebted for many popular tunes. Overlooking a collection of English airs printed at Haerlem in 1626, the book to which Mr Chappell has been indebted in the next degree is Playford's *Dancing-Master*, of which the first edition appeared in 1650, and which likewise contains many popular airs. The remainder of the airs in Mr Chappell's collection may be said to have been chiefly derived from the collections of D'Urfey and a few others, the English operas of the eighteenth century, and the works of the respective composers.

It is curious to learn what tunes, still popular, were so in the time of Elizabeth. *Greensleeves*, the characteristically bold air to which Macbeath sings "Since laws were made for every degree," is one of these. It is quite a tune with a history. The earliest trace of it is in 1580, when a *Reprehension against Green Sleeves* was licensed by the Stationers' Company, for Elderton, a ballad-maker. In the same year was licensed *A New Courtly Sonnet of the Lady Green Sleeves, to the new tune of Green Sleeves*, of which here is a specimen—

> Alas, my love, ye do me wrong,
> To cast me off discourteously,
> And I have loved you so long,
> Delighting in your company.
> Greensleeves was all my joy,
> Greensleeves was my delight,
> Greensleeves was my heart of gold,
> And who but Ladie Greensleeves?

This second piece was probably an attempt to supplant, by verses of pure sentiment, the original wanton verses. After this we see lively proofs of the enduring popularity of the tune. Mrs Ford speaks of the words and dispositions of Falstaff as not less incongruous than would be "the hundredth psalm to the tune of Greensleeves." Falstaff himself, in the park, cries, "Let it thunder to the tune of Greensleeves." In the *Loyal Subject*, by Beaumont and Fletcher, we have a character saying, "And sets our credits to the tune of Greensleeves." By and bye, we have the Cavaliers writing songs against the Roundheads and the Rump Parliament to this still favourite air: in one collection there are no fewer than fourteen such songs to it. There are fourteen other songs to it in D'Urfey's *Pills to Purge Melancholy*. One of these is in the following form:—

> The times are so ticklish, I vow and profess,
> I know not which party or cause to embrace;
> I want to join those who are least in distress;
> Which nobody can deny.
> Each party, I see, is thus full of hope;
> There are some for the devil and some for the pope;
> And I am for any thing else but a *rope*,
> Which nobody can deny.

It seems to have been appropriated by the Jacobite party: we learn in Boswell's Tour to the Hebrides, that old Macdonald of Kingsburgh, who saved Prince Charles in his wanderings, had but one song, namely,

> Green sleeves and pudding pies,
> Tell me where my mistress lies,
> * * *
> To all our injured friends in need,
> This side and beyond the Tweed!—
> Let all pretenders shake for dread,
> And let *his* health go round.

When this veteran was under examination respecting the dress of the Irish serving-girl whom he had entertained (the Prince in disguise), Macleod of Taliaker slyly asked, in allusion to his only song, "Had she green sleeves?" An air which has thus delighted the people for nearly three centuries—which has been alluded to by Shakspeare, Nash, Beaumont and Fletcher, and Prior—which gave modulation to the sentiments of exasperated loyalty throughout all its various phases between 1640 and 1746—and to which perhaps threescore sets of verses have in all been set—must be considered as something not unworthy of note in a nation's history. In our opinion, indeed, the tune of Greensleeves is as historical as the battle of Edgehill or the Peace of Ryswick.

Packington's Pound is another of those old airs of which a long tale could be told. Mr Chappell thinks it was probably a dance composed by Thomas Pagington, one of the musicians in the service of the Protector Somerset. The name might be from the form of the dance, some of the performers being perhaps enclosed or placed in pound by the rest. The air is in Elisabeth's Virginal Book, and in many printed collections from 1634 downwards. It is alluded to in Ben Jonson's comedy of *Bartholomew Fair*. A vast number of political and other songs have been written to it, which is not surprising, when we consider its peculiar smartness and alacrity, so well fitting it to be a vehicle of satiric sentiment. We remember an uncommonly clever political pasquinade written to it so lately as 1823, to burlesque the sudden rush of young states which was then taking place in South America, and the contemporaneous Poyais bubble:—

> A prince or cazique
> Springs up like a leak;
> Protectors and presidents sprout every week
> Then a fig for King George and his old-fashion'd sway,
> And huzza for Macgregor, cazique of Poyais!

Old Simon the King, the favourite tune, it will be remembered, of Squire Western in Tom Jones, and that by which his daughter Sophy practised upon his good nature when she wished any particular favour, is a tune of the time of Charles I., if not earlier. The Cavaliers had songs to it against the Parliamentarians in 1641. We now learn that old Simon the King was a living man of that age, namely, Simon Wadloe, who kept the Devil Tavern at Temple-Bar, at the time when Ben Jonson's club, called the Apollo Club, met there. He seems to have got his peculiar appellation, as being the king of *skinkers*, that is, servers of liquor; and the wits who met at his house have many jocular verses upon him under that title. The original song is the very perfection of reckless bacchanalianism, but at the same time so full of the spirit of harum-scarum humour, that the veriest teetotaller must needs smile at it, however much, like ourselves, he may condemn the practices it refers to:—

> If a man should be drunk to-night,
> And laid in his grave to-morrow,
> Will you or any man say
> That he died of care or sorrow?
> Then hang up all sorrow and care,
> * * *
> For drinking will make a man quaff,
> And quaffing will make a man sing,
> And singing will make a man laugh,
> And laughing long life doth bring,
> Says old Simon the King.

The inconsequentiality of all this is so perfectly characteristic of a maudlin brain, that nothing, in our opinion, could be more amusing in its way.

The thirty-second tune in Mr Chappell's collection is one fully as old as the above, being that to which the song of *Dulcina* was sung, referred to by the shepherdess in Izaak Walton's Angler. To the same air Ben Jonson wrote his song of *Robin Goodfellow*, so charming as a sketch of that small mischief-loving spirite—

> When lads and lasses merry be,
> With possets and with juncates fine;
> Unseen of all the company,
> I eat their cakes and sip their wine;
> And to make sport,
> I start and snort,
> And out the candles I do blow;
> The maids I kiss;
> They shriek—Who's this?
> I answer nought but ho, ho, ho!
>
> By wells and rills in meadows green,
> We nightly dance our hey-day guise;
> And to our fairy king and queen
> We chant our moonlight minstrelsies.
> When larks 'gin sing,
> Away we fling,
> And babes new born steal as we go;
> And elf in bed
> We leave instead,
> And wend us laughing, ho, ho, ho!

Some tunes are curiously connected with historical persons and events. *Joan's Placket*, which will readily occur to the minds of many of our readers when we tell them that it is the air of Justice Woodcock's song, "Such were the joys of our dancing days," is said by tradition to have been played as a slow march by the band at the execution of Mary Queen of Scots in Fotheringay Castle. Mr Chappell doubts this, but without stating any reasons. The Highland army entered Edinburgh to the tune of *We'll awa to Sherramuir to haud the Whigs in order*—and Carlisle, to that of *Sandie o'er the lee*. We find it stated in Mr Chappell's work, that, on leaving Manchester, on their march for London, they played *Felton's Gavot*, a lively air then popular, the composition of the Rev. William Felton, prebendary of Hereford, and the same which Sir John Stevenson has latterly modified, with words by Mr Haynes Bayley, beginning "Give that wreath to me." It stands No. 64 in Mr Chappell's collection. King Charles II. was so delighted with the tune of *My lodging is on the cold ground*, as sung by Mrs Davis in the character of Celania, the shepherdess mad for love, that he took that lady off the stage. She was the mother of his daughter Mary Tudor, who in her turn was the mother of the unfortunate Earl of Derwentwater. Purcell's tune of *Lillibullero*, being adapted to a song against the Irish Catholics, and

* A Collection of National English Airs, consisting of Ancient Song, Ballad, and Dance Tunes, &c. Edited by W. Chappell, F.S.A. London: published by Chappell, New Bond Street. 1840.

Digitized by Google

becoming popular beyond example amongst the Protestant party, is believed to have had a powerful effect in settling Ireland under the government of William and Mary. While touching upon historical tunes, we may remark that Mr Chappell enters into a keen and searching inquiry into the authorship of *the King's Anthem*, the result of which is, that most probably the air was composed by Henry Carey, on the eve of the insurrection of 1715, and with the name of James, the so-called Pretender, instead of that of King George, the author being a Jacobite. The insurrection being unsuccessful, the tune and words lay neglected till 1740, when the author prudently substituted George for James, and sang it at a tavern meeting to celebrate Admiral Vernon's victory. A year or two afterwards, Carey put an end to his life at the advanced age of eighty, when only one halfpenny was found in his pocket. The song and air still remained in obscurity, till, in 1745, Dr Arne harmonised it, and brought it out at Drury Lane, as a popular expression of loyalty against that very party in behalf of whose political idol it had been written thirty years before! Such is the strange turncoat history of this magnificent anthem, admitted to be the finest thing of its kind in the civilised world. The presumed mother of the late Edmund Kean was a grand-daughter of Henry Carey, who, it may be remarked, was also the author of *Sally in our alley*.

Mr Chappell's collection contains some very old dance tunes. There is one which he considers as of the fourteenth century, remarkable for the number of appoggiaturas, and of bars in the phrases. We have *Sellenger's Round*, which may be found spoken of from the days of Elizabeth to those of Anne. Also *Roger of Coverley*, an old country dance of peculiar figure, the name of which Addison appropriated for one of the most delightful characters in English literature. Coverley is the place now called Cowley, near Oxford. There is a *Morris Dance*, from the Haerlem collection formerly spoken of; also a strange dance called the *Shaking of the Sheet, or the Dance of Death*, which is found to be as old as 1560, and to be accompanied by an impressive set of moral verses. Mr Chappell presents a Cornish dancing tune connected with a curious custom. At the beginning of May, the people of Cornwall were accustomed to mimic the circumstances of a foray—a group proceeding into the country, where they gather flowers, and sport about all day. They assumed the privilege of entering houses, dancing in at one door and out at another; after which they returned dancing merrily, with the flowers they had gathered. This appears to have been a very ancient custom, designed for welcoming in the summer. The tune is that to which the parties danced on their return. Mr Chappell also presents us with the *Cushion Dance*, well known to be one of great antiquity in England, and indeed rather an ancient custom than a dance.

It is in thus bringing before us the very notes connected with ancient national customs, or which the poets of old times had in their mind when they wrote some of their sweetest verses, that the great charm of Mr Chappell's collection consists. How delightful, for instance, to be able to finger over the identical tune to which Walton's shepherdess sung "Come live with me and be my love" (No. 180), and which Shakspeare must have meant Sir Hugh Evans to hum when he caused him to quote a snatch of that pretty pastoral ditty! How interesting to hear the very music to which our simple ancestors, in early Catholic times, sung their Christmas carols (Nos. 192, 193, 194, 195)—those sacred serenades which breathe so much of the earnest and affectionate spirit of our religion, without any foreign or unpleasing admixture—

> God rest you merry, gentlemen,
> Let nothing you dismay,
> For Jesus Christ, our saviour,
> Was born upon this day, &c.

It is very remarkable, by the way, what a tone of solemn and earnest feeling is conveyed in some of the old English airs. There is one of much impressiveness (No. 188), connected with the strange old poem which represents death calling away a fine lady in the midst of her gaieties: the same air is said by Ritson to be that to which all the metrical lamentations of noted criminals were chanted for upwards of two hundred years. The same character belongs to one (No. 5) which was the air of a fervent political or rather religious ballad two hundred years ago—a burst of solemn joy at the prospects which opened to the puritan party in 1641:—

> Know, then, my brethren, heaven is clear,
> And all the clouds are gone;
> The righteous men shall flourish now;
> Good days are coming on.

To us this appears an opening in the highest strain of poetry; and the air is perfectly appropriate to it.

We must now draw to a close. We would, in conclusion, repeat our thanks to Mr Chappell for his elegant and most interesting collection; interesting, we are sure, not only to all who have any taste for good music, but to every one who has the slightest feeling respecting the past enjoyments of the people whose name he is proud to bear. Absorbed in the pleasure which the perusal of this work has been to us, we are loath to remark on some traits of jealous feeling which the editor allows to escape him respecting a subject to which we fear he has given too little study—the national music of Ireland and Scotland. What does it matter, we would ask him, on which side of the Tweed or of the Irish Channel some particular air has been composed; or that a few which had made their way thither were at length looked upon, not as strangers, but as kindly natives, and by mistake so designated? A quiet correction of such errors is surely all that the case justly calls for. It may be true, as he says, that no Irish or Scottish airs can be proved older than the reign of Charles I.; but neither are there many English airs certainly older than that period, and, but for the existence of the MSS. of Queen Elizabeth and William Ballet, he would not have been able to prove even those few to be older. This is a matter ruled entirely by the accident of the existence or discovery of a book. Rivalry on such topics is to us incomprehensible. We can take as great pleasure in the fine old airs of England and Ireland as in those of our own country; and though the former were established to-morrow as being of twice the antiquity, the number, and the beauty of our own, we should not be able to see the least ground for lamentation, much less for anger.

CURE OF SQUINTING.

The remarkable operation for the cure of squinting, which has been already adverted to in the Journal, may now be said to be in general practice throughout the empire. It has been performed upon hundreds of patients in various cities, and almost invariably with good effect. Having lately witnessed the operation in several instances, we are anxious to give a more minute account of it than we were formerly able to present. It may, in the first place, be remarked, that squinting, or *strabismus*, as it is medically termed, is of different kinds. Sometimes both eyes squint, but more frequently only one: if the eye be turned outwards, it is *divergent*, and if inwards, it is *convergent*, squint. Convergent squinting, in which the pupil of the eye is turned towards the nose, is by far the most common. Whether divergent or convergent, the squint can be cured by a simple surgical operation, the principle of which is the cutting of a muscle to allow the eye to assume a straightforward vision. We are here to describe the operation which we saw performed upon a boy who had a convergent squint in his left eye.

The patient being seated on a chair in front of a window, his right eye was covered with a bandage, so as to render the affected eye steadier during the operation. He was now told to look outwards, or towards his left, as far as possible, in order to bring the white of the eye at the inner corner into view. This being done, an assistant, who stood behind, lifted the upper eyelid with a crooked silver wire, called a speculum. This speculum only holds up the eyelid as with a blunt hook, and does not make any wound. Another assistant, standing on the left, now fixes the ball of the eye, by holding it down with a small instrument, with an exceedingly small crooked point; the crooked point goes into the white, and, scarcely giving any pain, keeps the eye from moving. If the patient can be intrusted to hold his eye steady, this hooking process may be dispensed with. All is now ready for the operation of cutting. The surgeon, standing in front, and depressing the lower eyelid with his left thumb, "pierces the *conjunctiva* with a small knife, about midway between the hook and the *caruncula lacrymalis*"—that is, he makes a very small cut crosswise, up the white part of the ball, between the pupil and corner of the eye. This cut, which resembles a kind of scratch, discloses the tendon or muscle beneath which is to be divided. Into the lower end of the incision he passes a curved director—a thin instrument, with a groove along its surface to guide the knife. This director is insinuated between the muscle and sclerotic, until he sees the point emerging above. He then divides the tendon, by running the knife along the groove of the director. Provided due care has been taken to elevate the whole tendon on the director, the operation will now be found complete; and the eye, being disengaged from all its fastenings, is seen to be straight. In the case of the boy, above mentioned, the operation did not occupy above a minute, or so much. A little blood flows from the wound, which is wiped off with a sponge, and a bandage of linen, dipped in cold water, is applied. In a week or ten days, all appearance of wound is gone, and a slight inflammation at the part afterwards disappears. Besides effecting an improvement in personal appearance, the cure greatly increases the power of vision.

It may be observed, that we are assisted in preparing this account of what we saw by a pamphlet published by the operator, Mr Alexander Miller, of Edinburgh.* From our own observation, and the statements published by this and other practitioners, we consider the operation as a simple and easy one, quite certain of success, if rightly performed. The chief advice we have to offer to those desirous of having the operation performed, is to select a practitioner who is well acquainted with the process—not a person merely who has a great name for surgery, for the most eminent surgeons have occasionally failed in performing the operation rightly.

Besides the small work of Mr Miller, we have seen one of larger dimensions on the same subject, by P. Bennet Lucas, member of the Royal College of Surgeons in London.* The following are a few cases mentioned by Mr Lucas:—

"*Double Convergent Strabismus.*—Mr Mills, *etat.* 21, has had strabismus since he was three years old. When he looks directly forward with either eye, the other turns inwards and slightly upwards, so as to conceal about one-third of the cornea; but the right eye more. The pupil of the turned-in eye dilates to double the extent of the other. Until he was three years old, the movements of his eye were perfect. At that period one of the eyes became slightly inverted, and the deformity was endeavoured to be removed by keeping the sound eye covered with a bandage, but without any happy result, and the eyes soon acquired their present movements. By some of Mr Mills' relatives the strabismus was attributed to cold, and by others to a fall.

June 12, 1840.—In the presence of Mr Pilcher, Mr Chaldecott, and Drs Wild, Pettigrew, and Walsh, I divided the internal rectus muscle of the right eye, which immediately rendered it straight, and visibly more prominent than its fellow. The left eye, as was anticipated, turned in, which the patient was told to expect before the operation was performed. From there being not the slightest hæmorrhage, and the patient being completely under control, from his temporary debility, the operation occupied less than two minutes.

June 16th.—Proceeding favourably. No pain or uneasiness since the operation. There is considerable vascularity of the conjunctival vessels in the vicinity of the incision, and a vertical layer of lymph, about a line thick, between the divided conjunctiva, the edges of which membrane are slightly swollen. The left eye is turned in more permanently than before; he can, by an effort, direct both eyes to the same object, but can retain them so only for a few minutes.

June 21st.—At the first operation it was determined that the left eye should be operated upon after a few days; and this day, with the kind assistance of Mr Pilcher and Mr Chaldecott, I divided its inner rectus muscle. The eye immediately became straight, and equally prominent with its fellow, and both eyes moved naturally.

June 10th, 1840.—Mary Anne Davis, *etat.* 17, has been affected with double convergent strabismus since she was two years old, which was caused by a fall off a high bedstead, upon her head. Her irides are of a dark brown colour. When she looks at an object with either eye, the other turns upwards and inwards, so as fully to conceal two-thirds of the cornea. The strabismus is even more intense in the right eye. Her education has been entirely neglected in consequence of the state of her vision. She cannot work at her needle for longer than ten minutes at a time, in consequence of the objects appearing dull and confused. She is an intelligent girl, and gives an account of the distressing state of her eyes. I divided the internal rectus muscle of the right eye, when it immediately occupied the centre of the orbital axis, and became more prominent than the other. The left eye remained turned upwards and inwards. I operated on the second eye three weeks after, when both organs became perfectly straight, and equally prominent.

August 13th.—Her eyes are perfectly straight, and follow each other's movements harmoniously. Her vision is remarkably benefited. Before the operation she suffered the greatest inconvenience in pursuing her ordinary avocations; even in walking, objects appeared confused to her, and she could not judge of their distance. She can now work at her needle without any inconvenience.

Mr Henry Mills, *etat.* 22, has had convergent strabismus of his right eye since he was four years old. His irides are of a dark brown colour, and the eyes are small and sunken. When the hand is placed over the left eye, he is able to bring the right one to the centre of the orbit. The left eye is unaffected.

On July the 28th, 1840, I divided the right inner rectus muscle, when the eye immediately became straight, but more prominent than its fellow.

August 7th.—The effect of the operation was this day as follows:—Scarcely a mark of the incision was present. Both eyes were straight, but at times the left eye appeared to have a slight inclination inwards. I mention this, although it appeared to some of those present that both eyes were perfectly straight. The right eye is much more prominent than its fellow, and forms a striking contrast to it in this respect. In the presence of Mr Kraus, Mr Cameron, and Mr Earle, I divided the inner rectus muscle of the sunken eye, which at once made it equally prominent with its fellow, without producing the least deformity of it.

The difference in the appearance of the patient was most remarkable. August 26th.—Saw Mr Mills this day; the incisions of the conjunctiva are scarcely perceptible; both eyes are equally prominent, and follow each other's movements with regularity. The division in this case of the inner rectus muscle of the eye *which did not squint* has been attended with the most satisfactory results, and practically illustrates in the living subject some of the physiological views which have been advanced in the preceding part of this essay, regarding the actions of the oblique muscles."

From personal observation, we are enabled to confirm the general conclusions at which Mr Lucas arrives in his narration of these and other cases. We have seen several persons, male and female, who have

* A Description of the Method of Operating for the Cure of Strabismus or Squinting; by Alexander Miller, F.R.S.C.E. Rickard: Edinburgh. 1840.

* Practical Treatise on the cure of Strabismus or Squint. 1 vol. Samuel Highley, Fleet Street, London. 1840.

been operated on in Edinburgh; and, while all appearance of squint was removed, every individual declared that they now saw as well with the formerly bad eye as with the good one, and all seemed to possess the power of moving either eye in any direction required of them.

RAILWAY ACCIDENTS.

RAILWAYS, as bringing the exactness of science to bear upon personal locomotion, and as productive of unexampled speed in travelling, must command the good wishes of every enlightened person. But, like other things of fine mechanical arrangement, they require careful handling. Accidents upon them, productive of damage and loss of life, have for some time been of alarming frequency, and have gone so far to shake the confidence of the public in this new mode of conveyance, that, on one road at least, the old stage-coaches have been resumed. We find some light thrown upon the causes of these accidents by an inquest held at Harrow, upon the bodies of two engine-drivers killed by a collision on the London and Birmingham line. It was shown in evidence, that the engineer who was the cause of the accident, and whom it cost his own life, was quite illiterate, and that many of the other officials on the line were so much so, as to be unable to read the printed regulations put into their hands. The jury passed resolutions, from which the following is an instructive extract:—

"The Jury cannot conclude their labours without expressing their surprise and regret at the manifest inefficiency of the executive of the company, as connected with matters that have come before them in this inquiry. The directors seem to have passed and printed many excellent rules and resolutions, which have been neglected to be carried out and enforced; while, in some instances, printed instructions have been given to a class of men unable, from want of education, to read them; and in some cases persons appear to have been put on as drivers of engines, having the whole conduct of the trains, without being duly qualified for the purpose. Considering the immense importance to the public of safe conduct in a mode of conveyance over which they are deprived of all control, or, when in motion, even of the power of remonstrance or complaint, and are entirely at the mercy of the engine-driver, the jury feel the public have a right to expect that some person of superior education and attainments as an engineer should be appointed as a captain of each train, to proceed with it and conduct it to its final destination. The night-signals are evidently insufficient, and yet no efficient means seem to have been adopted to improve them; while it is evident that no security can be attained until a means of communication between the guards and the engine-drivers is established. To all which matters the jury feel it is the bounden duty of the directors to turn their immediate and earnest attention."

When we thus learn that men of so low a grade as to be unable to read, are appointed to important situations on the railway, we cannot wonder at the late numerous accidents. Let us suppose the nearly parallel case of the great steamers being intrusted to men destitute of education and nautical skill, and at the same time a want of all the signals established for mutual understanding between vessels at sea, and no lights by night; and could we expect that tremendous accidents would not be constantly taking place! The management of a great train of carriages upon a railway, so as to avoid all the mechanical dangers of the case, is not a much less nice affair than that of a steamer at sea: in some respects, it is even more so. It would be therefore proper to have men of a respectable and instructed class to guide them, instead of such men as those described by the Harrow inquest. It is to be observed, that the risk which the engine-drivers participate with the persons in the carriages, is no guarantee against danger. Seamen are found to man any vessel, however unseaworthy. Human beings will be found to undertake every degree of hazard to life, short of certain destruction, for a consideration. In the uninstructed mind, cautiousness and conscientiousness are often alike so feeble, as scarcely to have any control over conduct. If, then, inferior persons are selected for the responsible situations on railways, the danger to their own lives, and the consideration of danger to the lives of others, will have in general no perceptible effect in causing the train to be guided safely.

It is remarkable that accidents by railways have not been much heard of, and, in fact, have been of very rare occurrence, till last year. When we couple this fact with the immense extent of railway line which has been brought into operation during 1840 (perhaps more than a doubling of the whole that previously existed), we cannot doubt that much of the evil is owing to the *newness of things*—to the want, in short, of due preparation on the part of the companies. Railways are designed for money-making purposes. When they approach completion, the directors become anxious to realise profit as soon as possible. They hurry over the latter operations, and, with untrained men and incomplete arrangements, rush into business. A Scottish railway was lately opened some weeks before it was quite ready, in order to take advantage of a race-week in the provincial town at one end of the line. It was by mere good fortune that some scores of lives were not sacrificed for the few hundred pounds thus grabbed at. Such conduct is most unworthy, and would only be attended with its proper punishment, if the public were to lose confidence in railways in consequence. But we hope for better things, and are inclined to believe that enough of mischief has already been produced, and enough of alarm raised, to induce greater deliberation in future.

The following points seem to us what ought chiefly to be attended to by railway companies, in order to retain or regain public confidence:—1. That no new line, or part of a line, should be brought into operation, *till the whole of the arrangements are complete;* 2. That no man should be employed in any capacity, who cannot read and write; 3. That the engine-driver should be a well-instructed mechanician, and should be attended, in every case where there are travelling trains, with a superior officer, in the capacity of captain or conductor, at such a salary as may ensure his being a person of honourable principle; 4. That the night signals (red lights) indicative of danger, should be of sparkling brightness, elevated to the height of the eye, and at least three feet in diameter; 5. That, to provide against the possibility of collision, a mass of springs, or pistons moving in air-tight tubes, should be fixed to each locomotive engine, and likewise to the last carriage of every train, in order, as far as possible, to expend the force of the shock. A means of disengaging, and an improved means of stopping, the carriages, if attainable, would be an important addition to these precautions. We would also respectfully tender a general advice to the companies—to be less eager for immediate profits, which they may succeed in securing only to lose much greater ultimate gains.

The accidents of the last few months of 1840 were certainly alarming, both in number and magnitude; but we would be sorry if they should prove a serious obstruction to the progress of railways in general. That they are not unavoidable, is shown by the history of the Liverpool and Manchester Railway, during ten years of its existence, in which space of time the injury to person and life, in proportion to the numbers carried, was not perhaps one-hundredth of what takes place in the old stage-coach travelling. Let us hope that, with similar management, other railways will soon show similar safety to life and limb, and that the travelling of science will thus be ultimately triumphant over that of mere animal intelligence.

HEROISM IN THE BUSH.*

HAVING taken considerable interest in the trials and struggles of the emigrants on their first coming out to Canada, I often converse with them, and listen with pleasure to the simple recital of their early sufferings and manifold difficulties, some of which are sufficient to excite the sympathy of harder hearts than mine. In many instances, they serve to awaken feelings of admiration for the noble energies that have been called forth in the breast of the British peasant—feelings and powers that had lain dormant, because unawakened, or been crushed and kept down by the cheerless influence of poverty, and its soul-depressing consequences.

I have seen the poor man, who at home sank hopeless and desponding beneath the chilling blast of want and disease, here brave with manly energy the wants and privations of a new colony, and battle, without shrinking, with the storms of adversity. Cold, hunger, excessive toil, disease, all in their severest forms, were met with and by turns overcome, or endured without murmuring. In all probability, it is these very trials, which the members of an infant colony endure in their first outset, that gives them that strength and energy for which they are and have ever been noted, and which is ultimately the foundation of the greatness of their adopted country, and of the prosperity of themselves and their families.

I have met with many persons among the rich and thoughtless votaries of luxury and pride, who maintained that the virtues of the poor were at best but negative qualities—that there were few who acted well but from interested motives, or from fear of the law, and that genuine, exalted virtue, was rarely, if at all, to be found in the abodes of want and poverty. How many opportunities have I had, both in England and since my sojourn in this colony, of proving the untruthfulness of these allegations! A bright and beautiful example of disinterested benevolence at this minute recurs to my mind; and as I love to look upon the sunny side of the picture, I shall make no apology for introducing to your notice one of our poor neighbours, a young woman, who lives about three miles higher up the river, in the opposite township, whose conduct is a lovely illustration of the widow, who was seen by our Lord casting her two mites into the treasury; for she of her penury hath done that towards the fatherless and motherless orphans of her poor neighbour, that many of those persons, better circumstanced than herself, would have hesitated to do.

It is now between three and four years, since a poor settler of the name of Bulger was accidentally killed by the fall of a tree, while chopping in the bush (a casualty that sometimes happens). The widow was advanced in her pregnancy at the time, and had three small children—the eldest boy not quite seven, the younger child just able to run alone. Under these sad circumstances, the neighbours, who are not very well off, owing to the sterility of their lots of land, did for her all they could. They helped to put in her spring crops—say a little patch of potatoes and corn—drew in firewood, logged up her summer fallow, and showed, by a thousand little kind acts, the genuine sympathy they felt for her desolate situation.

The summer passed, and the fall brought with it a sore and deadly sickness—a malignant intermittent, which bore close resemblance to a typhus fever. Among many fatal cases that occurred in the neighbourhood, was the death of the Widow Bulger. The fever attacked her with great violence. Destitute of those little comforts so necessary to the restoration of the sick, with only occasional attendance, such as her poor neighbours were able to afford—distressed in mind by the wants and wailings of her little ones, and possibly weighed down by her melancholy state—no wonder that she fell a victim to the disease, crushed beneath an accumulation of evils. Still, in her dying hours she wanted not the consolation of one kind tender friend to close her eyes, and assure her that she would be a mother to her orphan children.

For ten days did this good young woman, Mrs Jones, tend her on her sick-bed, though within a few weeks of her own confinement, and with the tie of three small children at home. She devoted as much of her time as duty to her own family would admit; and it was in her friendly arms that the widow breathed her last. The babe she bore never saw the light—and so the poor sufferer was spared that great additional trial. When all was over, her sorrowful nurse took the way through the woods to her own humble dwelling, bearing in her arms the youngest child, while the two elder ones clung weeping to her gown. "And sad enough it made me to hear the poor creatures ask me day after day to take them back to see sick mammy," said the kind creature when telling me, with eyes filled with tears, of the sad death of the widow. After a little time, two of the neighbours, who could better afford their maintenance, took the two elder children, who would soon become useful to them, though none seemed disposed to burden themselves with the helpless little one. But it became dearer each day to the heart of its adopted mother, and precious in her eyes. It ate of the scanty portion of her children's bread, and drank of her own cup, shared the cradle bed of her own babe, and was to her as a daughter.

"Indeed, madam," she said, "I have had little Bridget now two years, and she is as dear to me every bit as any of my own, for the little thing seems to know that I have been good to her, and clings to me with more than a daughter's love; if I am away for a few hours, she is the first to run smiling to meet me, and to say, 'Mammy Jones come back.' She is as gentle as a lamb, and seems to have thought beyond her years, for she is sure to tell me if any thing has gone wrong during my absence. I do not think I could bear to part with the child, unless I were well assured she would be taken good care of, and she shall never want the bit or the sup while I have a potato or a drop of milk to give her."

At this very time the evils of want and sickness had visited her log-hut, and the potatoes and milk were all she had to support her family upon. The harvest had proved a failure, and her own babe was languishing at her breast for want of nourishment.

I saw her not many weeks ago. She was in ill health, and her baby was dead, but she told me, with tears of joy shining in her soft hazel eyes, that a kind good lady had taken her little adopted, and had promised to bring it up and do well by it—"Better, indeed, than I could do for her; and she was dressed so beautifully, just like a lady's child; but she says she will not forget mammy Jones." Indeed, it were a pity she should ever forget the kind-hearted friend who had cherished her in her desolate infancy.

This poor young woman has had her own share of trials since she came into the bush. You would have been interested in the account she gave me of the first year of their settlement. "We were," she said, "too poor to make any stay at a town or village when we came up the country. After paying the first instalment on our lot, which, unfortunately, is of the worst description, almost one block of stone, we had but a few dollars remaining, so I agreed with my husband, as it was then early in the spring, to go directly to the land, and try what we could do in putting up a bit of a hut, which people told us a man with a little help of his wife could do in one day; but it was nightfall before we reached the place, and much ado we had to make it out. I had then two little children, one at the breast, and another not much more than a babe. These I had to carry, one on my back, the other in my arms, while my husband bore what bedding and utensils he could carry on his back. As ill luck would have it, before we could get even a few boughs out down to shelter us, one of the most awful tempests came on that ever I witnessed. The thunder and lightning made my very heart tremble within me, and then the torrents of rain that came down drenched us entirely. I had much ado to keep the children dry, by covering them with every thing I could get together, and setting up a blanket on sloping sticks over where they lay; but the poor

* This article is the production of Mrs Trail, authoress of "The Backwoods of Canada," and has been obligingly communicated to us by her sister, Miss Agnes Strickland.

Digitized by Google

things were so weary, that they slept without heeding the roaring thunder or the rain, and so we passed the first night in the bush."

The next day, she said, they set to work quite early; her husband chopped down the trees, and cut them into lengths, while she tended the children, and did what she could to help him. Then she and he put up the hut; she, with the aid of a handspike, helped to roll on the logs, and lay the foundation of their little dwelling, and when the walls were being raised, she stood on the upper logs, and helped to haul them up with a rope; then her husband notched them and fixed them; so that, by dint of hard labour, their outside walls were raised ere night, and a few cedar and hemlock boughs and tops closed them in till they were able to lay a roof of troughed sap-wood the next day. After that, they raised a wall of stones and clay against one end, which served for a chimney, with a square hole cut in the roof to let out the smoke. They next commenced chopping a bit of ground for potatoes. I forget now how they got on, but I rather think badly, and suffered much want of food during the winter. In the spring the wife fell ill with intermittent fever, and was reduced to the most deplorable condition. She also lost one of the children that year. Her husband was at last obliged to leave her, to get work at some distance, that he might procure food to keep them from absolute starvation.

Just imagine the dreadful condition to which these poor creatures must have been reduced, when the husband was forced to leave the sick helpless starving wife and children alone. It so chanced that the person to whom he applied for work was a good and charitable man; he noticed the miserable anxiety of the distressed husband, and asked the cause; this was soon made known, and without waiting for further proof, the master instantly harried him off to the relief of his suffering partner, loaded with food and necessaries for her and the children.

"Oh, ma'am, sure never was sight so welcome to my eyes as that of my husband when he came in and set before me first one thing, then another; and I do believe that want of food was one of the causes of my illness, for, after a little while, I got well and strong; for our good master would never let my husband go home of a Saturday night without something for me, and his dear wife would fill a basket with cakes, and butter, and milk, and eggs, and all sorts of nice things, for me; and never, as long as I live, shall I forget the goodness of that blessed couple to me and mine."

Is it not good and pleasant to hear of such worthy people? I was much struck by an anecdote she related of her eldest child, a little girl of only eight years old; and as it serves to illustrate the character of courage and energy which I have before attributed to our young Canadians, I shall fill out my sheet by relating it to you in the words of the mother, as near as I can recall them.

"My husband was out at work many miles from home, and I was alone with my little ones, when about midnight I found myself taken very poorly. Indeed, ma'am, my confinement was at hand, and my pains came upon me so exceedingly fast, that no time was to be lost in getting help, for my little girl was too young to be of any service at a time like that. In this sore distress, I knew not what to do; but I woke up Elizabeth, and told her I was ill, and bade her light up the fire. This she quickly did, and set on water to warm. 'Mammy,' said she, 'you look very badly; lie down on the bed again, and I will go for Mrs ——;' a neighbour's wife, who lived about half a mile higher up through the bush.

'My child,' said I, 'you will not dare to go at this time of night alone through the dark woods.' 'Mammy,' said she again, 'I can carry a cedar torch; there is dry bark on the roof.'

'Take your brother with you, then, for company,' said I to her. 'No, mammy, he will only hinder me by falling over the sticks and logs; I will run all the way, and soon be back again with Mrs ——:' and the little thing, with the thoughtfulness of an older person, begged me to make myself easy, and lie down till she returned. And away she went, and I looked out after her into the dark night, and watched her with the torch till I saw her take the right path; but she had not been gone long before I began to reproach myself for having suffered her to go alone into the woods. 'What if she should miss the blazed line, and wander off the track, and get lost in the swamps or devoured by wolves or bears?' thought I; and when this notion came over me, I became like one out of my senses; I ran to the edge of the clearing, calling upon the child to return, and then I came in and sat me down and cried, to think how I had sacrificed my child. Time passed on, and I grew worse and worse. 'Now,' I said to myself, 'I must perish, for there is no one to help me; and the child will be lost, and my poor girl; and what will my poor husband say when he returns?' But God was merciful beyond my deserts, for even as the last pangs of a mother seized me, I heard the quick step of my child before the door, and her voice calling out cheerfully that Mrs —— was coming; and in that moment of thankfulness and joy the baby was born, even before they could close the door and come to my help."

The little girl had twice strayed from the path, but by good fortune discovered her error before it was too late, and had thus succeeded in bringing the needful help to her poor mother. How few children of eight years of age dared have ventured forth on such an errand at such an hour! Yet this is only one instance among many of fearless and devoted courage displayed by our young folks: I could almost term it infant heroism.

LORD CLIVE.

The empire acquired by the British in Hindostan, whether it prove for good or bad to either party, forms certainly one of the most remarkable chapters in modern history. Its foundations were mainly laid by the singular energy of one man, originally an obscure gentleman, and one whose qualities seemed at first of a most unpromising kind, but who, cast accidentally into a sphere where his peculiar abilities were fully brought out, ultimately became one of the most eminent men of his age.

Robert Lord Clive was descended from a family long settled near Market-Drayton, in Shropshire, and possessed of a small estate in that county. At the family seat there, on the 29th of September 1725, Robert Clive was born, being the eldest of a numerous offspring. His strangely resolute and combative character was early evinced. A relative, writing of him when he was seven or eight years of age, described him as "immeasurably addicted to fighting." No enterprise was too dangerous for him to attempt, no feat too difficult for him to accomplish, in the usual line of boyish adventure. It may be supposed that a boy with such qualities and predilections could not be a very attentive or promising scholar, and in reality none of the many masters under whom he was placed could find out the way to tame or instruct him. In his eighteenth year, his despairing relatives were glad to give their heir a younger son's fate, and ship him off in the capacity of a *writer* for the East India Company's settlement of Madras.

The Company could at this time boast of no further possessions in India than their trading ports, and a few square miles of the surrounding country, which they rented from the native princes. Clive's landing was a moment much more worthy of an omen than that of Cæsar in Britain, or even of Cortes in Mexico. But the young and obscure writer entered Madras and assumed the duties of his office, without any peculiar notice from the elements or man. These duties, as might be expected, were very distasteful to him, and he soon fell into such a state of melancholy, that he twice raised a pistol to his head to take away his life. Both times, however, the weapon failed to go off; and Clive, it is said, was impressed by the circumstance with a belief that something great was in store for him. One fortunate result of his depression of spirits was his resorting to books for amusement. The governor granted the entrée of his library to the young writer, who made use of it so freely as to retrieve to a very considerable extent the consequences of his early idleness.

War existed at this time between the British and French; and not long after Clive's arrival, Madras fell into the hands of Dupleix, governor of Pondicherry. A number of the inhabitants left the place. Our youthful writer went with others to Fort St David; and as the circumstances of the hour were calculated to awaken his natural spirit, he sought and received the commission of an ensign in the Company's service. In some subsequent operations against the French, his coolness and intrepidity called down on him the notice of one of the best soldiers then in India, Major Lawrence. Still more attention, however, was drawn to him by his quelling, in a desperate duel, the pride of a military bully, long the terror of Fort St David. When, by the restoration of peace at home, Madras was delivered up to its proper owners, Clive returned for a short time to his desk; but circumstances soon drew him back into his proper sphere. At this period Hindostan was in a most unsettled state. The heir and successor of the Mogul emperors still lived at Delhi, and claimed the sovereignty of the entire peninsula, but in reality the authority was possessed by numerous independent and hereditary princes, who named themselves viceroys and sub-viceroys, but paid no tribute, excepting perhaps an occasional present. Dupleix, the French governor of Pondicherry, a subtle and ambitious man, saw how easy it would be for a civilised power to gain the virtual authority in the peninsula, if a footing were but once fairly obtained. An opportunity for this occurred, and he grasped at it. Rival claimants started up for the viceroyship of the Deccan and the nabobship of the Carnatic, and Dupleix, taking the part of certain of the pretenders, triumphantly placed them in power, with the help of French troops. Chunda-Sahib, one of those whom he assisted, became the nominal ruler of the Carnatic, but in truth the puppet of Dupleix. This acquisition of supremacy by the French in the very province in which Madras was situated, threatened nothing less than absolute ruin to the British interests in India. The Madras authorities felt this, and looked on in dismay, while their ally, the true heir of the throne of the Carnatic, was besieged by Chunda-Sahib and the French in Trinchinopoly, his only remaining possession. They might count upon seeing themselves next assailed, their property destroyed, and their lives thrown into jeopardy. They had scarcely any force to defend themselves, and in consequence all was anxiety and alarm.

At this contingency, Clive, who was yet but twenty-five years of age, started forward, to change, by his daring and genius, the whole aspect of affairs. Obtaining the rank of captain and commissary, he proposed to his superiors, as the only way of saving themselves and freeing the Carnatic, that they should give him a force to attack the capital of Arcot, by which means the French would certainly be drawn off Trinchinopoly. The bold proposal was assented to, and Clive, at the head of two hundred Europeans and three hundred sepoys, marched to Arcot, in spite of thunder, rain, and storm. The result which followed was merited by the intrepidity of the young leader. At his approach the garrison of Arcot fled in a panic, and the English entered without opposition. Knowing, however, that Chunda-Sahib would instantly attempt his dislodgement, Clive was no sooner installed in his conquest than he began to collect provisions and strengthen the place. His first assailants were the late holders of the garrison, who returned in a body, to the number of three thousand men. Clive allowed them to sit down before the walls in peace, and then made a night sortie, which ended in their total dispersion, with greatly diminished numbers, while the garrison lost not one man. Chunda-Sahib, enraged by this unexpected opposition, now sent his son, Rajah Sahib, to the recovery of Arcot; and Clive, with his own numbers reduced by casualties to three hundred and twenty men, found himself besieged by ten thousand. The fortifications were wretched and ruinous, yet for fifty days the young commander defended the walls against all assaults. Rajah Sahib now attempted to bribe Clive, but the vast sums offered were rejected with scorn. At length the rajah determined upon a decisive night attack. The leader of the garrison heard of it, and was on his guard. When the enemy advanced, therefore, driving before them elephants armed with strong head-pieces of iron, in the hope of forcing the gates by their united efforts, Clive directed incessant shots against the animals, which caused them to turn in agony upon their drivers, and trample them under foot. Thrice afterwards did the besieguering force make a desperate onset on the place, and as often was repelled with great slaughter, till, finally, Rajah Sahib gave orders to his troops to fly from the spot. Next morning the garrison of Arcot saw before them no enemy.

The elated people of Madras sent the young victor a reinforcement of two hundred English, and seven hundred sepoys. With this force at command, he was not the man to remain idle. He immediately took steps to clear the Carnatic of every foe of its legitimate ruler, Mohammed Ali. Effecting a junction with one or two thousand native troops in the pay of that prince, he seized on the strong fort of Timery, and suddenly, by forced marches, presented himself before his old foe Rajah Sahib, then at the head of five thousand men. Over this prince he gained a decisive victory, and captured all the rajah's valuable military stores. Had the Madras authorities now supported the victor in an efficient way, he would have made no halt until he had closed the war; but they were dilatory, and allowed time to Rajah Sahib to collect a new army and menace the main British settlement itself. Clive, however, again surprised and defeated him signally.

Major Lawrence now came from England to assume the chief command. Clive showed his magnanimity by serving cheerfully as second to his friend, who well knew the young captain's value, and called him, in letters to friends, "a man of undaunted resolution, of a cool temper, and of a presence of *mind* which never left him in the greatest danger—*born a soldier*." Under Lawrence and Clive, the arms of Britain triumphed every where. The whole Carnatic was overrun, and Chunda-Sahib taken prisoner, in which situation he died, a victim to Mohammed Ali's jealousy. Dupleix tried every art to restore the French supremacy, but in vain. The conquest of the Carnatic, however, cost Clive his health, which he was forced to recruit by a journey to England. Before his departure he married Miss Maskelyne, daughter of the well-known astronomer and mathematician, Dr Maskelyne.

The eyes of the people of England were at this time directed anxiously to India, chiefly, perhaps, because no contest existed to arrest their attention in any other quarter of the world. France and Britain had concluded a peace, being content to look upon the strife in Hindostan as one not national, but concerning only two private trading companies. However, its importance was not underrated, and the gallant young captain (Clive was yet but twenty-seven), who had conquered the Carnatic, and effected a most extraordinary change in the aspect of British affairs in the east, was welcomed by his countrymen with the loudest acclamations. The East India Company tendered him a vote of thanks, and presented to him a magnificent sword set with diamonds. His family, who had formerly looked upon him as a hopeless scape-grace, now regarded him as a hero, and the hope and pride of their ancient house. Constitutionally generous, he devoted a large part of the prize-money which he brought home to relieving the pecuniary distresses of his father. The remainder was chiefly dissipated upon a contested parliamentary election, at the close of which the young soldier found himself unseated, and again poor. He then thought once more of India, and the offer of service which he made to the Company was at once accepted. He received the governorship of Fort St David, and was

at the same time raised by the king to the rank of Lieutenant-Colonel in the British army. Thus advanced, he returned to the east in 1755.

His first act in his governorship was the reduction of a noted pirate named Angria, who had long infested the Arabian Gulf, and from whose fastnesses L.150,000 were obtained by the conquerors. Shortly afterwards, Clive's whole energies were aroused by certain intelligence brought from Bengal, the richest province of the Mogul empire, and in which, on the banks of the fertilising Ganges, the British had long held the settlement of Fort William or Calcutta. Surajah Dowlah, nominally the viceroy, but in reality the independent sovereign of Bengal, was an ignorant, dissipated young man, who had been trained up in hatred of the British name, and who had ever longed for an opportunity of seizing the property of the settlers at Fort William, which his avarice greatly overrated. He found a plea for the fulfilment of his wish, and attacked the settlement. Then took place the memorable catastrophe of the Black Hole, fatal to one hundred and twenty-three British subjects. The brutal despot to whom the affair was ascribable, revelled in his conquest over the defenceless settlers, and never dreamed that reprisals were possible. Clive heard with indignation and horror of the seizure of Calcutta and the proceedings attending it, and, as similar feelings were entertained by the whole population of Madras, he had no difficulty in obtaining the command of a force of 900 English and 1500 sepoys, for the relief of Fort William. A naval armament, under Admiral Watson, was destined to assist in the same service. As soon as Clive reached the Ganges, he commenced operations with his wonted vigour. In an amazingly short space of time, he took Budgebudge, routed the garrison of Fort William, recovered Calcutta, and stormed and sacked Hoogley. The nabob, though at the head of an immense force, durst not face "the daring in war," as he Asiatically called the English leader. He proposed a treaty, and Clive was most reluctantly obliged by the people of Calcutta to negotiate, when his whole soul was bent on action. In the ensuing arrangements, Surajah Dowlah showed signal duplicity, which seems to have been the means of leading Clive into a course of action forming a lamentable stain upon his name. In return for the secret trafficking of Surajah Dowlah with the French, the English commander encouraged and joined a conspiracy to dethrone the nabob, and crown a relative, Meer Jaffier, in his place. He even stooped to the unjustifiable artifice of temporarily deceiving the nabob by affectionate letters. The chief agent between the English and Surajah Dowlah was a native merchant named Omichund, an artful intriguing man, who took advantage of his knowledge of the conspiracy to demand, for his own services, the exorbitant reward of L.300,000, and insisted upon seeing a condition to that effect introduced into the secret treaty with Meer Jaffier. As Omichund could have defeated the whole scheme by a single word to Surajah Dowlah, Clive was forced to consent to the wily Hindoo's terms, but deceived him by drawing up two copies of the treaty, in one of which only was inserted a clause to the effect desired by Omichund. By these dishonourable means, the conspiracy was kept secret till the hour came for acting openly.

When that hour arrived, Clive put his troops in motion, and marched against the nabob, expecting that Meer Jaffier would leave the party of the enemy, and join the English with a strong body of native troops. Surajah Dowlah brought out to the field against him a force of forty thousand infantry, and fifteen thousand cavalry, well armed, and furnished with fifty pieces of ordnance. To confront this great army, Clive had but three thousand men, and of these but one thousand were English. The armies approached each other near Plassey. When they encamped at evening, with but a mile of ground between them, the mind of Clive was for the first time seized with doubt and alarm, as Meer Jaffier showed no intention of fulfilling his promises. The English commander called a council of war, and was advised by the majority of his officers to decline an engagement, where the terms were so fearfully unequal. He himself coincided with this opinion; but afterwards, retiring under the shade of some trees, he held counsel for the space of an hour with himself, and his wonted spirit returned in force. He determined upon a battle, which accordingly took place on the morrow, and ended in the complete and irretrievable defeat of the vast force of Surajah Dowlah. With the loss of no more than twenty-two men, the skill, genius, and daring of Clive gave his little army a victory over nearly sixty thousand men. All the stores of the enemy fell into the hands of the conquerors.

After the battle, Meer Jaffier, who, during its continuance, had contrived to side with no party, presented himself before Clive, very doubtful of the reception which might be given to him. But the English leader overlooked all backslidings, and saluted the native prince as Nabob of Bengal. Omichund's fate was deplorable. He, too, appeared before Clive, imagining that a great fortune was secured to him by the treaty. "It is time to undeceive him," said the English leader to Mr Scrapton. The latter, a servant of the Company, then addressed the poor dupe. "Omichund, the treaty which you saw was a fictitious one. You are to have nothing!" Omichund fell back insensible. He was restored to life, but never to the full exercise of his reason, though Clive did all in his power to soothe him, and soften the effects of the blow.

The great victory of Plassey decisively established the empire of the English in India. Through the gratitude of the nabob, a shower of wealth fell on the Company and its servants. Clive, who was but a servant of the Company, and not forbidden by its rules to accept of rewards, might have taken to himself an almost unlimited sum, and he did accept a large one—between two and three hundred thousand pounds. At a later period, he also received from Meer Jaffier a gift for life of the annual rental paid to the nabob by the Company, amounting to nearly L.30,000 annually. The immediate cause of this second donation was another great success in arms of the English soldier. Shah Alum, heir of the Mogul throne, assembled an army of forty thousand men, and marched to Bengal, to expel the English and their royal protegé, Meer Jaffier. Clive took the field; and almost at the mere sight of his advanced guard, the army of Shah Alum disappeared. Thus, with but one thousand Englishmen, Clive had faced and dispersed 100,000 Asiatics. Another battle took place soon afterwards, but with an enemy of a different stamp. Meer Jaffier, afraid that the same agency which had set him up might also one day pull him down, secretly invited the Dutch to send an armament from Batavia, to balance the power of the English in Bengal. Clive saw the danger of allowing Meer Jaffier to form connexions with the Dutch; and, when their armament came, he attacked and routed it, though with a far inferior force.

By these successes did Clive firmly establish that belief in British invincibility, by which, up to this hour, a handful of foreigners, from a far distant country, have been able to govern the immense population of Hindostan. Having placed all things in peace and security, Clive returned to Britain, with such a fortune and reputation as no man before him, it is probable, ever acquired at the age of thirty-four. He was raised by George III. to the Irish peerage, and received by the ministry of Mr Pitt with the most marked attention. He entered the House of Commons in 1761, but did not take so prominent a part there as in the India House. Between these two arenas his time was spent until 1764, when he was again called to India. After his departure from it, affairs had again gone far wrong, and principally through the corrupt rapacity of the Company's servants. When this became known in Britain, the general voice pointed at once to Lord Clive, as the only man capable of restoring order to the empire he had founded. Being appointed Governor and Commander-in-Chief of the British possessions in Bengal, he sailed for the third time from his native shores, at the close of 1764. On his arrival, he found matters to be even in a worse state than had been represented. He nevertheless accomplished every desirable improvement, and, in short, put the finishing stroke to the great work of his life, by permanently settling and confirming the power he had founded.

At the end of eighteen months, he returned with broken health to Britain. Here he was not destined to close his life happily. His stern reforms had raised many enemies in the India House, and his wealth was but too well calculated to create additional foes among the spiteful and invidious of all classes. The great services of the man were overlooked, and, as years ran on, seemed to be altogether forgotten. At length, in the year 1772, his conduct was formally brought into review before the House of Commons. In the first instance he defended himself, and in such a way that Lord Chatham, who was present, declared that he had never in his life heard a more finished piece of eloquence. It made a deep impression, yet the investigation went on. He was examined before a committee, and manfully avowed every act of his career. With regard to the money received by him, he told his examinators that when he remembered the immense heaps of gold and precious stones pressed upon his acceptance, "By my honour, Mr Chairman," said he, "at this moment I stand astonished at my own moderation." The result was, that though the house found Clive to have been guilty of some unjustifiable acts, they not only did not censure him, but concluded the affair by a vote admitting that he had rendered "great and meritorious services to his country."

Though thus formally commended by the senate of Britain, Lord Clive was deeply hurt by the persecution of his enemies. His bodily health had for some time declined, and now his once vigorous and penetrating intellect partially gave way. At the comparatively early age of forty-nine, on the 22d of November 1774, this great soldier died, and died by his own hand, after having spent some years in severe suffering.*

The real character of Clive is to be estimated in a moment. We behold in him a being formed by nature to act as an instrument for performing some of the rougher and sterner of the world's work, and formed, for this purpose, with all that vigour and hard-headedness which seem to be called for in such functions. The highest moral qualities are perhaps not to be looked for in such a character, though we can readily imagine what grace they would give to it. Accordingly, though Clive was perhaps under most of the lesser restraints of English gentlemen in his situation, he has left a character exhibiting a few deep taints, to dull the extraordinary brilliancy of his military reputation. As a conspicuous public character, he ranks amongst a few who do something to redeem the eighteenth century from the tameness usually attributed to it. Those who speak of the last age as a blank in acts and in the characters of men, would do well to study the colossal genius of Chatham, and the conquest of India by Lord Clive.

* His eldest son was raised in the peerage to the English earldom of Powis.

A *WISTERN* MAN.

Sam Slick, in his *third* series of the Clockmaker, newly published (Bentley, London), and which appears to be as full of quaint drollery as either of the former two, introduces a raw-boned denizen of the remote Western States, all made up of fox-traps, and as springy as a saplin-ash. They meet at a tavern, and the following is the account of their interview:—

"All at once he recollected my phiz, and jumpin' up and catchin' hold of my hand, which he squeezed as if it was in a vice, he roared out, Why, it ain't possible! said he. Lawful heart alive, if that ain't you! * * Come, let's liquor; I want to wet up; the sight of an old friend warms my heart so, it makes my lips dry. What will you have?—cocktail, sling, julip, sherry cobbler, purl talabogus, clear sheer, or switchell?—name your drink, my man, and let's have a gum tickler, for old acquaintance, somethin' that will go down the throat like a greased patch down a smooth rifle. Well, says I, I am no ways pitikilar; suppose we have brandy cocktail, it's 'bout as good a nightcap as I know on. Done, said he, with a friendly tap on my shoulder that nearly dislocated my neck; I like a man that knows his own mind. * * I'll go and speak for it to one of the gentlemen at the bar.—With that he swiggled his way through the crowd, to the counter, and, says he, Major, says he, I guess you may let one of your aidy-coons bring us a pint of cocktail but let it be letter A, No. I, and strong enough to loosen the hinges of a feller's tongue.—Well, we sot down and chatted away till we had finished our liquor; and now, says he, Slick, answer me a few questions, that's a good feller, for I am a free-trader now. I have got a'most an angeliferous craft, a rael screemer, and I'm the man that sez it. The way she walks her chalks ain't no matter. She is a regilar fore-and-after. When I heist the fore-sail she is mad, and when I run up the mainsail she goes ravin' distracted. She goes right on eend like a rampin' alligator. She'll go so quick, she'll draw their wind out; go ahead! cook-a-doodle-doo! And he crowed like a rael live rooster.—Go ahead, steam-boat—cock-a-doodle-doo! and he smashed my hat in, most ridikilous over my eyes, a-flappin' so with his hands, like wings.

But come, said he, that cocktail and your news is considerable excitin', and has whetted my appetite properly; I guess I'll order supper. What shall it be—corn bread and common doin's, or wheat bread and chickin fixin's? But we must fust play for it. What do you say to a game at all-fours, blind-hookey, odd and even, wild cat and 'coon, or something or another, jist to pass time? Come, I'll size your pile.—Size my pile! says I; why, what the plague is that? I never heard tell of that sayin' afore.—Why, says he, shell out, and plank down a pile of dollars or doubloons, of any size you like, and I'll put down another of the same size. Come, what do you say?—No, I thank you, says I, I never play.—Will you wrestle, then? said he; and whose ever throw'd pays the shot for supper.—No, says I; since I broke my leg a-ridin' a cussed Blue-nose hoss, I hante strength enough for that. Well, then, we are near about of a height, says he, I estimate; let's chalk on the wall, and whoever chalks lowest liquidates the bill.—If it warn't for the plaguy rhumatis I caught once to Nova Scotia, says I, a-sleepin' in a bed the night arter a damp gall lodged there, I think I would give you a trial, says I; but the very thoughts of that foggy heifer gives me the cramp. I jist said that to make him larf, for I seed he was a-gettin' his steam up rather faster than was safe, and that he could jist double me up like a spare shirt if he liked, for nothin' will take the wiry edge of a man's temper off like a joke: he fairly roared out, it tickled him so.—But, stop, said he; it's no use a-sittin' here as still as two rotten stumps in a fog. I'll tell you what we'll do; here's two oranges; do you take one, and I'll take the other, and let us take a shy among them glasses to the bar there, and knock some o' them to darned shivers, and whoever breaks the fewest shall pay for the smash and the supper too. Come, are you ready, my old coon? let's drive blue-blazes thro' 'em.—No, says I; I'd be sure to lose, for I am the poorest shot in the world.—Poorest shote, said he, you mean, for you have no soul in you. I believe you have fed on pumpkins so long in Conne'ticut, you are jist about as soft, and as holler, and good-for-nothin', as they be; what ails you? You hante got no soul in you, man, at all. This won't do: we must have a throw for it. I don't valy the money a cent; it ain't that, but I like to spikilate in all things. I'll tell you what we'll do—let's spit for it; and he drew his chair up even with mine. Now, says he, bring your head back in a line with the top rail, and let go; and whoever spits farthest without spatterin' wins.—Well, says I, you'll laugh when I tell you, I dare say, but I've gin up spittin' since I went down to Nova Scotia. Spittin' would spile a trade there as quick as thunder does milk. I'm out of practice.—Well, then, what the plague will you do? says he.—Why, says I, a-takin' up the candle, and a-yawnin' so wide and so deep you could hear the watch tickin' thro' my mouth, I guess I'll go to bed."

WALPOLE'S FAME.

When I was very young, and during the height of the opposition to my father, my mother wanted a large parcel of bugles; for what use I forget. As they were then out of fashion, she could get none. At last she was told of a quantity in a little shop in an obscure alley in the city. We drove thither; found a great stock: she bought it, and bade the proprietor send it home. He said, "Whither?" "To Sir Robert Walpole's." He asked coolly, "Who is Sir Robert Walpole?"—*Horace Walpole's Letters.*

THE DESERT OF JERICHO.

The desert is an immense plain, with several elevations, which sink successively, as far as the river Jordan, by regular gradations, like the steps of a natural staircase. The eye can distinguish only one complete plain; but after marching an hour, we come all at once on one of these terraces, which we descend by a rapid slope, and march another hour, when there is a fresh descent, and thus the whole way. The soil is a white compact sand, covered by a concrete and saline crust, produced doubtless by the fogs from the Dead Sea, which, on their evaporation, deposit this salt crust. There is no stone or earth, except on approaching the river or the mountains; there is, on all sides, a vast horizon; and we distinguished, from an immense distance, an Arab galloping over the plain. As this desert is the theatre of their attacking, pillaging, and massacring the caravans going from Jerusalem to Damascus, or from Mesopotamia to Egypt, the Arabs take advantage of some detached hills formed by the moving sand, and have also erected artificial ones, to hide themselves from the observation of the caravans, and to descry them from afar; they hollow out the sand on the summit of these hills, and there burrow with their horses. As soon as they perceive their prey, they dart with the rapidity of the falcon; they go to apprise their tribe, and return all together to the attack. Such is their only industrial occupation, such their only glory; civilisation with them is murder and pillage, and they attach as much importance to their successes in this species of exploit, as our conquerors to the acquisition of a province. Their poets, for they have poets, celebrate in their verses these scenes of barbarity, and deliver down, from generation to generation, the honoured memory of their courage and their crimes. The horses have a considerable share of the glory assigned them in these recitals: here is one, which the scheik's son related to us on the way:—

"An arab and his tribe had attacked in the desert the caravan of Damascus; the victory was complete, and the Arabs were already occupied in loading their rich booty, when the troops of the Pacha of Acre, coming to meet this caravan, fell suddenly upon the victorious Arabs, slew a great number of them, made the remainder prisoners, and, having tied them with cords, conducted them to Acre to present them before the pacha. Abou-el-Marsch, the Arab of whom he spoke, had received a ball in his arm during the combat; as his wound was not mortal, the Turks had fastened him on a camel, and having obtained possession of his horse, led off both horse and horseman. The evening before which they were to enter Acre, they encamped with their prisoners in the mountains of Saphad; the wounded Arab had his legs bound together by a leathern thong, and was stretched near the tent where the Turks were sleeping. During the night, kept awake by the pain of his wound, he heard his horse neigh amongst the other horses fastened around the tents according to oriental usage. He recognised his neigh, and, unable to resist the desire of speaking once more to the companion of his life, he dragged himself with difficulty along the ground, by the assistance of his hands and knees, and came up to his courser. 'Poor friend,' said he to it, 'what wilt thou do amongst the Turks? Thou wilt be immured under the arches of a khan, with the horses of an aga or of a pacha; the women and the children will no longer bring thee the camel's milk, or the barley, or the doura in the hollow of their hands; thou wilt no longer run free in the desert, as the wind of Egypt; thou wilt no more divide the waters of the Jordan with thy breast, and cool thy skin, as white as their foam: therefore, if I remain a slave, remain thou free!—go, return to the tent which thou knowest; say to my wife that Abou-el-Marsch will return no more, and put thy head under the curtains of the tent to lick the hands of my little children.' Whilst speaking thus, Abou-el-Marsch had gnawed through with his teeth the cord of goat-hair which fetters Arab horses, and the animal was free; but seeing its master wounded and bound at its feet, the faithful and sagacious steed understood by instinct what no language could explain to him. He stooped his head, smelt his master, and, seizing him with his teeth by the leathern thong which he had about his body, went off in a gallop and bore him to his tent. On arriving and placing his master on the sand, at the feet of his wife and children, the horse expired from fatigue. All the tribe wept for him, the poets have celebrated him, and his name is constantly in the mouths of the Arabs of Jericho."—*Lamartine's Travels in the East.*

FORMER AND PRESENT STATE OF BOMBAY.

A few centuries since, this island was a mere settlement of gardeners and bhundaries, known only for the arrack and cocoa-nut oil, which, in common with other palm-clad coasts, it transmitted to the interior, and for the flower of its Mazagong mangoes, of which it sent a yearly tribute to the court of Delhi. Even little more than half a century ago, though a fortified settlement of some consequence, it was insignificant in comparison with what it is at the present day; the whole population of the place did not amount to above sixty thousand inhabitants, consisting entirely of a few tribes of Hindoos and Hindoo Portuguese. The island was constantly ravaged by Angria, and other Mahratta pirates, as far as Byeullah. The grand jury consisted of Portuguese fuzendars from Mahim, who took their seats with bare legs and shaven heads, while their sons officered the defensive militia, and figured on the parades in caps of congeed cotton. The few civil servants of that day lived sumptuously on thirty rupees a-month, spreading no other carpeting on their sabine floors than a coating of fresh cow-dung, asking no other light whereby to read their dispatches than what was admitted through oyster-shell windows, and enjoying no other luxury than a healthy shaking in a homely but neatly curtained bullock-hackery. But times are altered, and it is now the capital of Western India, the third in the scale of rank and seniority in the eastern empire. Its increase of population has kept pace with its political and commercial advancement. While neighbouring cities waned in consequence and wealth, Bombay progressed in both, and attracted to itself, as to a focus of speculation or employment, the adventurous, the industrious, and the needy. The transfer of the Presidency from Surat, and its decline in trade, brought Parsees, Banyans, and Boras. The overthrow of Tippoo's power, the capture of the Dutch settlements, and the decline of the Portuguese, produced a similar influx from the south. Goa, Cochin, and every other part on the western coast, sent respectively Sinoys and Malpas, Malabar, Dutch, and Portuguese Christians. The downfall of the Peshwa, and the breaking up of the great Mahratta courts and armies, thronged the place with Brahmins and upland peasants, men of the sword and of the pen. The trade in pearls and carpets brought Jews and Armenians, and the demand for the beautiful Arabian horse lured to its shores a dense population altogether new, presenting alternately the physiognomy of the graceful and effeminate Persian, the small and piercing features of the Arab, and the wild swarthy and hairy-looking visages of Caubul Candaur, or Kurdistan. The partial opening of the trade, the profits of the opium speculations, and the accession of territory which followed the success of arms in 1816, nearly quadrupled the number of British inhabitants. Add to the above, Italian and American missionaries, travellers, experimentalists, and professional men from the continent of Europe; persecuted Christians from Georgia; ruined families from Cashmere, Polish counts, Dutch barons, Malays, sailors, negro-servants, Macao traders, Brazil merchants, Canton shoemakers, Pekin sausage-makers, bakers, Bhya hamauls, Camatee Chutreewalas, together with a long string of gipsies, tumblers, fire-eaters, drum-beaters, sarungee-players, dancing-girls, and courtesans, from every quarter of India; and there is a mottled population of 400,000 persons, more multifarious in country, religion, caste, language, complexion, and profession, than perhaps any other city in the world could at the present day produce.—*Newspaper paragraph.*

A CHILD CARRIED OFF BY AN EAGLE.

An infant, in the care of Charley Stewart, a boy ten years old, had been carried off by an eagle to his nest in the mountains. The distracted mother, with the boy and a feeble old man, followed it. Having reached the summit of the crag by a circuitous path, they could now descry the two eagles to which the nest belonged, soaring aloft at a great distance. They looked over the cliff as far as they could stretch with safety; but although old Peter was so well acquainted with the place where the nest was built, as at once to fix on the very spot whence the descent ought to be made, the verge of the rock there projected itself so far over the ledge where the nest rested, as to render it quite invisible from above. They could only perceive the thick sea of pine foliage that rose up the slope below, and clustered closely against the base of the precipice. A few small stunted fir-trees grew scattered upon the otherwise bare summit where they stood. Old Peter sat himself down behind one of these, and placed a leg on each side of it, so as to secure himself from all chance of being pulled over the precipice by any sudden jerk, whilst Charley's little fingers were actively employed in undoing the great bundle of hair-line, and in tying one end of it round his body and under his armpits. The unhappy mother was now busily assisting the boy, and now moving restlessly about, in doubtful hesitation whether she should yet allow him to go down. When all was ready, Charley Stewart slipped the skien-dhu into his hoe, and went boldly but cautiously over the edge of the cliff. He was no sooner fairly swung in air than the hair-rope stretched to a degree so alarming, that Bessy Macdermot stood upon the giddy verge gnawing her very fingers, from the horrible dread that possessed her that she was to see it give way and divide. Peter sat astride against the root of the tree, carefully eyeing every inch of the line ere he allowed it to pass through his hands, and every now and then pausing—hesitating, shaking his head most ominously, as certain portions of it, here and there, appeared to him of doubtful strength. Meanwhile, Charley felt himself gradually descending, and turning round at the end of the rope by his own weight, his brave little heart beating, and his brain whirling, from the novelty and danger of his daring attempt—the screams of the young eagles sounding harshly in his ears, and growing louder and louder as he slowly neared them. He reached the slanting surface of the ledge, and found the child between two eaglets. Being at once satisfied that it would be worse than hazardous to trust the hair-line with the weight of the child, in addition to his own, he undid it from his body. Approaching the nest, he gently lifted the crying infant from between its two screeching and somewhat pugnacious companions. The moment he had done so, the little innocent became quiet, and instantly recognised him; she held out her hands, and smiled and chuckled to him, at once oblivious of her miseries. Charley kissed his little favourite over and over again, and then he proceeded to tie the rope around and across her, so as to guard against all possibility of its slipping. Having accomplished this, he shouted to Peter to pull away—kissed the little Rosa once more, and then committed her to the vacant air. Nothing could equal the anxiety he endured whilst he beheld her slowly rising upwards. And when he beheld the mother's hands appear over the edge of the rock, and snatch her from his sight, nothing could match the shout of delight which he gave. The maternal screams of joy which followed, and which came faintly down to his ears, were to him a full reward for all the terrors of his desperate enterprise. For that instant he forgot the perilous situation in which he then stood, and the risk that he had yet to run ere he could hope to be extricated from it.—*Sir Thomas Dick Lauder's Tales of the Highlands.*

THE LEISURE OF THE WORKING-CLASSES.

[From an Address of the Rev. Archibald Bennie, at the opening of the Edinburgh School of Arts, Oct. 28, 1840.]

There is no such thing as absolute mental idleness. If the mind be not active for good, it is active for evil. It may not be rightly directed, or vigorously exercised, or subject to any method in its efforts; but it will be busied about something, obeying the impulse of some predominant desire, or pursuing some familiar and favourite current of thought. No man of regular and steady mental habits will go and stand on the street. The circumstances are not suitable, and will be shunned. Here lies the great mischief of idleness. The mind is left open by it to every passing impression and accidental impulse. It is precisely in the state in which temptation can bear most successfully upon it. It is standing in the market, ready for the call of the vices; and it will not remain long without a call. It is heart-breaking to think what multitudes of the young there are who are hurried into vices of various kinds—early dissipation, with its dark and numerous train of sins. Self-murderers are they in the most fearful sense of the appalling name. Let no one for a moment suppose that, in appealing thus strongly, we would deny the working man a single rational comfort or pleasure. I have the most intense abhorrence of all those measures and schemes, whether legislative or otherwise, which would stint the poor man's beer, and spare the rich man's wine. There is no member of society who deserves more richly a measure of rational comfort and enjoyment than a hard-working mechanic. But I do not wish to see him often in the alehouse. When he takes enjoyment, I would have him to do so in presence of those whose claims upon him operate with the power of virtuous restraints, and are felt to be incompatible with excess. A habit of frequenting public scenes of dissipation will sooner or later prove fatal. It has always appeared to me that such institutions as this afford to working men a refuge from temptations to gross vice. There are higher and holier considerations, indeed, that should be brought to bear upon the character, without whose influence vice will never appear the detestable evil which it really is; and it will not be supposed that I can have the slightest intention to overlook or undervalue these. Without doing so, it may be safely affirmed, that the time spent in attendance on the School of Arts is so much taken from temptation, while it is innocently and rationally employed. I beg, therefore, to press this most earnestly upon the attention of my hearers. An idle hour upon the street may form the inlet to vices which will degrade and defile a whole life. Keep the working man from this danger—give him suitable occupation for this hour—and the probability is, you rescue him from years of misery and shame.

THE CHILD A MORAL INSTRUCTOR.

A child is a moral instructor, and the silent lessons it inculcates are felt by the most vitiated and depraved. The value of the sermons preached by the cradle has never been fully estimated; but those who have visited our prisons, and who have had to deal with the most hardened criminals, know that there is a well-spring of affection in a father's heart, which even the fires of the worst guilt have not dried up; and the name of a child, like the wand of the prophet, has drawn living waters from the flinty rock. * * * Home itself is a school; it nourishes principles of the highest value in human life: every emotion of love, felt or received, is a part of education which cannot safely be disregarded. So far, then, as is possible, no system of education should totally separate families, or supersede the arrangements of domestic life. Except in very desperate cases, the interchange of affectionate communications between fathers, mothers, children, brothers, and sisters, every morning and evening, is of inestimable importance to morality. Cases have come under the personal cognisance of the writer, where parents, vicious but not wholly depraved, have been induced to commence a career of reform by witnessing the gradual improvement of their children. As they witnessed their progress, and saw them undesignedly revealing the dawnings of intelligence, and the development of moral principles in their little minds, they became more and more attached to them, and unconsciously took those for their examples to whom nature had designed that they should be models themselves. It should, therefore, be a principle in education to keep the bonds of family unbroken.—*Taylor's Natural History of Society.*

A LEGEND OF KNOCKMARY.*

WHAT Irish man, woman, or child, has not heard of our renowned Hibernian Hercules, the great and glorious Fin M'Coul! Not one, from Cape Clear to the Giant's Causeway, nor from that back again to Cape Clear. And by the way, speaking of the Giant's Causeway brings me at once to the beginning of my story. Well, it so happened that Fin and his gigantic relatives were all working at the Causeway, in order to make a bridge, or what was still better, a good stout pad-road, across to Scotland; when Fin, who was very fond of his wife Oonagh, took it into his head that he would go home and see how the poor woman got on in his absence. To be sure, Fin was a true Irishman, and so the sorrow thing in life brought him back, only to see that she was snug and comfortable, and, above all things, that she got her rest well at night; for he knew that the poor woman, when he was with her, used to be subject to nightly qualms and configurations, that kept him very anxious, decent man, striving to keep her up to the good spirits and health that she had when they were first married. So, accordingly, he pulled up a fir-tree, and, after lopping off the roots and branches, made a walking-stick of it, and set out on his way to Oonagh.

Oonagh, or rather Fin, lived at this time on the very tip-top of Knockmary Hill, which faces a cousin of its own, called Cullamore, that rises up, half-hill, half-mountain, on the opposite side—east-east by south, as the sailors say, when they wish to puzzle a landsman.

Now, the truth is, for it must come out, that honest Fin's affection for his wife, though cordial enough in itself, was by no manner or means the real cause of his journey home. There was at that time another giant, named Cucullin—some say he was Irish, and some say he was Scotch—but whether Scotch or Irish, sorrow doubt of it but he was a *targer*. No other giant of the day could stand before him; and such was his strength, that, when well vexed, he could give a stamp that shook the country about him. The fame and name of him went far and near; and nothing in the shape of a man, it was said, had any chance with him in a fight. Whether the story is true or not, I cannot say, but the report went that, by one blow of his fist, he flattened a thunderbolt and kept it in his pocket, in the shape of a pancake, to show to all his enemies when they were about to fight him. Undoubtedly he had given every giant in Ireland a considerable beating, barring Fin M'Coul himself; and he swore, by the solemn contents of Moll Kelly's Primer, that he would never rest, night or day, winter or summer, till he would serve Fin with the same sauce, if he could catch him. Fin, however, who no doubt was the cock of the walk on his own dunghill, had a strong disinclination to meet a giant who could make a young earthquake, or flatten a thunderbolt when he was angry; so he accordingly kept dodging about from place to place, not much to his credit as a Trojan, to be sure, whenever he happened to get the hard word that Cucullin was on the scent of him. This, then, was the marrow of the whole movement, although he put it on his anxiety to see Oonagh; and I am not saying but there was some truth in that too. However, the short and the long of it was, with reverence be it spoken, that he heard Cucullin was coming to the Causeway to have a trial of strength with him; and he was naturally enough seized, in consequence, with a very warm and sudden fit of affection for his wife, poor woman, who was delicate in her health, and leading, besides, a very lonely uncomfortable life of it (he assured them), in his absence. He accordingly pulled up the fir-tree, as I said before, and having *snedded* it into a walking-stick, set out on his affectionate travels to see his darling Oonagh on the top of Knockmary, by the way.

In truth, to state the suspicions of the country at the time, the people wondered very much why it was that Fin selected such a windy spot for his dwelling-house, and they even went so far as to tell him as much.

"What can you mane, Mr M'Coul," said they, "by pitching your tent upon the top of Knockmary, where you never are without a breeze, day or night, winter or summer, and where you're often forced to take your nightcap* without either going to bed or turning up your little finger; ay, an' where, besides this, the sorrow's own want of water?"

"Why," said Fin, "ever since I was the height of a round tower, I was known to be fond of having a good prospect of my own; and where the dickens, neighbours, could I find a better spot for a good prospect than the top of Knockmary? As for water, I am sinking a pump,† and, plase goodness, as soon as the causeway's made, I intend to finish it."

Now, this was more of Fin's philosophy; for the real state of the case was, that he pitched upon the top of Knockmary in order that he might be able to see Cucullin coming towards the house, and, of course, that he himself might go to look after his distant transactions in other parts of the country, rather than—but no matter—we do not wish to be too hard on Fin. All we have to say is, that if he wanted a spot from which to keep a sharp look-out—and, between ourselves, he did want it grievously—barring Slieve Croob, or Slieve Donan, or its own cousin, Cullamore, he could not find a neater or more convenient situation for it in the sweet and sagacious province of Ulster.

"God save all here!" said Fin, good humouredly, on putting his honest face into his own door.

"Musha Fin, avick, an' you're welcome home to your own Oonagh, you darlin' bully." Here followed a smack that is said to have made the waters of the lake at the bottom of the hill curl, as it were, with kindness and sympathy.

"Faith," said Fin, "beautiful; an' how are you, Oonagh—and how did you sport your figure during my absence, my bilberry?"

"Never a merrier—as bouncing a glass widow as ever there was in sweet 'Tyrone among the bushes.'"

Fin gave a short good-humoured cough, and laughed most heartily, to show her how much he was delighted that she made herself happy in his absence.

"An' what brought you home so soon, Fin?" said she.

"Why, avourneen," said Fin, putting in his answer in the proper way, "never the thing but the purest of love and affection for yourself. Sure you know that's truth, any how, Oonagh."

Fin spent two or three happy days with Oonagh, and felt himself very comfortable, considering the dread he had of Cucullin. This, however, grew upon him so much that his wife could not but perceive that something lay on his mind which he kept altogether to himself. Let a woman alone, in the mean time, for ferreting or wheedling a secret out of her goodman, when she wishes. Fin was a proof of this.

"It's this Cucullin," said he, "that's troubling me. When the fellow gets angry, and begins to stamp, he'll shake you a whole townland; and it's well known that he can stop a thunderbolt, for he always carries one about him in the shape of a pancake, to show to any one that might misdoubt it."

As he spoke, he clapped his thumb in his mouth, which he always did when he wanted to prophesy, or to know any thing that happened in his absence; and the wife, who knew not what he did it for, said, very sweetly,

"Fin, darling, I hope you don't bite your thumb at me, dear?"

"No," said Fin; "but I bite my thumb, acushla," said he.

"Yes, jewel; but take care and don't draw blood," said she. "Ah, Fin, don't, my bully—don't."

"He's coming," said Fin; "I see him below Dungannon."

"Thank goodness, dear! an' who is it, avick! Glory be to God!"

"That baste Cucullin," replied Fin; "and how to manage I don't know. If I run away, I am disgraced; and I know that sooner or later I must meet him, for my thumb tells me so."

"When will he be here?" said she.

---

* The above paper, communicated by William Carleton, Esq., author of the "Traits and Stories of the Irish Peasantry," gives a good idea of the strange hues which the national humour and fancy have thrown over most of the early popular legends of Ireland. Fin or Fion M'Coul is the same half-mythic being who figures as Fingal in Macpherson's Ossian's Poems. He was probably a distinguished warrior in some early stage of the history of Ireland; different authorities place him in the fifth and the ninth centuries. Whatever his real age, and whatever his real qualities, he was afterwards looked back to as a giant of immense size and strength, and became the subject of numerous wild and warlike legends both in Ireland and in the Highlands of Scotland. Our Lowland poets of the middle ages give incontestible evidence of the great fame then enjoyed by both Fingal and Gaul the son of Morni. Barbour, for instance, in 1375, represents his hero Robert Bruce as making allusion to these two personages at the skirmish in Glendochart. Gavin Douglas, who died in 1522, introduces their names into his poem, *the Palace of Honour*:

Great Gow MacMorn, and Fin MacCowl, and how
They should be gods in Ireland, as they say.

Another Scottish poem, of obscure authorship, but of the same age as the above, entitled *An Interlude of the Droich's* [Dwarf's] *Part of the Play*, conveys the extravagant popular notions of the day respecting the vast stature of not only Fin and Gaul, but of Fin's wife. Of Fin it says—

Ay when he danced, the warld wad shog—
* * * *
——After he grew mickle at fouth,
Eleven mile wide was his mouth,
His teeth were ten miles square;
He wad upon his taes stand,
And tak the sterns down with his hand,
And set them in a gold garland,
Above his wife's hair.

Of the wife it may be enough to say—

For could she took the fever-tertan,*
For all the chaith in France and Bertan†
Wad not be till her leg a garten,
Though she was young and tender.

In Irish traditionary narrative, as appears from Mr Carleton's present sketch, Fin and his dame are kept within something comparatively moderate as respects bulk and strength, at the same time that enough of the giant is retained to contrast ludicrously with the modern and natural feelings assigned to them, and the motives and maxims on which they and their enemy Cucullin are represented as acting.

* Tertian fever. † Britain.

* A common name for the cloud or rack that hangs, as a forerunner of wet weather, about the peak of a mountain.

† There is upon the top of this hill an opening that bears a very strong resemblance to the crater of an extinct volcano. There is also a stone, upon which I have heard the Rev. Sidney Smith, F.T.C., now rector of the adjoining parish, say that he found Ogham characters; and, if I do not mistake, I think he took a *fac-simile* of them.

"To-morrow, about two o'clock," replied Fin, with a groan.

"Well, my bully, don't be cast down," said Oonagh; "depend on me, and maybe I'll bring you better out of this scrape than ever you could bring yourself, by your rule o' thumb."

This quieted Fin's heart very much, for he knew that Oonagh was hand and glove with the fairies; and, indeed, to tell the truth, she was supposed to be a fairy herself. If she was, however, she must have been a kind-hearted one; for, by all accounts, she never did any thing but good in the neighbourhood.

Now, it so happened that Oonagh had a sister named Granua living opposite them, on the very top of Cullamore, which I have mentioned already, and this Granua was quite as powerful as herself. The beautiful valley that lies between them is not more than about five miles broad, so that of a summer's evening Granua and Oonagh were able to hold many an agreeable conversation across it, from the one hill-top to the other. Upon this occasion, Oonagh resolved to consult her sister as to what was best to be done in the difficulty that surrounded them.

"Granua," said she, "are you at home?"

"No," said the other; "I'm picking bilberries in Althadhawan" (*Anglicé*, the Devil's Glen).

"Well," said Oonagh, "get up to the top of Cullamore, look about you, and then tell us what you see."

"Very well," replied Granua, after a few minutes, "I am there now."

"What do you see?" asked the other.

"Goodness be about us!" exclaimed Granua, "I see the biggest giant that ever was known, coming up from Dungannon."

"Ay," said Oonagh, "there's our difficulty. That giant is the great Cucullin; and he's now comin' up to lather Fin. What's to be done?"

"I'll call to him," she replied, "to come up to Cullamore, and refresh himself, and maybe that will give you and Fin time to think of some plan to get yourselves out of the scrape. But," she proceeded, "I'm short of butter, having in the house only half a dozen firkins, and I'd feel thankful, Oonagh, if you'd throw me up the largest miscaun you have got; for, to tell you the truth, that same Cucullin is easier kept a week than a fortnight."

"I'll do that with a heart and a half," replied Oonagh; "and, indeed, Granua, I feel myself under great obligations to you for your kindness in keeping him off of us, till we see what can be done; for what would become of us all if any thing happened Fin, poor man!"

She accordingly got the largest miscaun of butter she had—which might be about the weight of a couple dozen millstones, so that you may easily judge of its size—and calling up to her sister, "Granua," said she, "are you ready? I'm going to throw you up a miscaun, so be prepared to catch it."

"I will," said the other; "a good throw now, and take care it does not fall short."

Oonagh threw it; but in consequence of her anxiety about Fin and Cucullin, she forgot to say the charm that was to send it up, so that, instead of reaching Cullamore, as she expected, it fell about half way between the two hills, at the edge of the broad bog near Augher.

"My curse upon you!" she exclaimed; "you've disgraced me. I now change you into a grey stone. Lie there as a testimony of what has happened; and may evil betide the first living man that will ever attempt to remove or injure you!"

And, sure enough, there it lies to this day, with the mark of the four fingers and thumb imprinted in it, exactly as it came out of her hand.

"Never mind," said Granua; "I must only do the best I can with Cucullin. If all fail, I'll give him a cast of heather broth to keep the wind out of his stomach, or a panada of oak-bark to draw it in a bit; but, above all things, think of some plan to get Fin out of the scrape he's in, otherwise he's a lost man. You know you used to be sharp and ready-witted; and my own opinion, Oonagh, is, that it will go hard with you, or you'll outdo Cucullin yet."

She then made a high smoke on the top of the hill, after which she put her finger in her mouth, and gave three whistles, and by that Cucullin knew he was invited to Cullamore—for this was the way that the Irish long ago gave a sign to all strangers and travellers, to let them know they were welcome to come and take share of whatever was going.

In the mean time Fin was very melancholy, and did not know what to do, or how to act at all. Cucullin was an ugly customer, no doubt, to meet with; and, moreover, the idea of the confounded "cake" aforesaid, flattened the very heart within him. What chance could he have, strong and brave though he was, with a man who could, when put into a passion, walk the country into earthquakes and knock thunderbolts into pancakes? The thing was impossible; and Fin knew not on what hand to turn him. Right or left—backward or forward—where to go he could form no guess whatsoever.

"Oonagh," said he, "can you do nothing for me? Where's all your invention? Am I to be skivered like a rabbit before your eyes, and to have my name disgraced for ever in the sight of all my tribe, and me the best man among them? How am I to fight this man-mountain—this huge cross between an earthquake and a thunderbolt?—with a pancake in his pocket that was once"——

"Be easy, Fin," replied Oonagh; "troth, I'm ashamed of you. Keep your toe in your pump, will you? Talking of pancakes, maybe we'll give him as good as any he brings with him—thunderbolt or otherwise. If I don't treat him to as smart feeding as he's got this many a day, never trust Oonagh again. Leave him to me, and do you just as I bid you."

This relieved Fin very much; for, after all, he had great confidence in his wife, knowing, as he did, that she had got him out of many a quandary before. The present, however, was the greatest of all; but still he began to get courage, and was able to eat his victuals as usual. Oonagh then drew the nine woollen threads of different colours, which she always did to find out the best way of succeeding in any thing of importance she went about. She then platted them into three plats with three colours in each, putting one on her right arm, one round her heart, and the third round her right ankle, for then she knew that nothing could fail with her that she undertook.

Having every thing now prepared, she sent round to the neighbours and borrowed one-and-twenty iron griddles, which she took and put into one-and-twenty cakes of bread, and these she baked on the fire in the usual way, setting them aside in the cupboard according as they were done. She then put down a large pot of new milk, which she made into curds and whey, and gave Fin due instructions how to use the curds when Cucullin should come. Having done all this, she sat down quite contented, waiting for his arrival on the next day about two o'clock, that being the hour at which he was expected—for Fin knew as much by the sucking of his thumb. Now, this was a curious property that Fin's thumb had; but, notwithstanding all the wisdom and logic he used to suck out of it, it could never have stood to him here were it not for the wit of his wife. In this very thing, moreover, he was very much resembled by his great foe Cucullin; for it was well known that the huge strength he possessed all lay in the middle finger of his right hand, and that, if he happened by any mischance to lose it, he was no more, notwithstanding his bulk, than a common man.

At length, the next day, he was seen coming across the valley, and Oonagh knew that it was time to commence operations. She immediately made the cradle, and desired Fin to lie down in it, and cover himself up with the clothes.

"You must pass for your own child," said she; "so just lie there snug and say nothing, but be guided by me." This, to be sure, was wormwood to Fin—I mean going into the cradle in such a cowardly manner—but he knew Oonagh well; and finding that he had nothing else for it, with a very rueful face he gathered himself into it, and lay snug as she had desired him.

About two o'clock, as he had been expected, Cucullin came in. "God save all here!" said he; "is this where the great Fin M'Coul lives?"

"Indeed it is, honest man," replied Oonagh; "God save you kindly—won't you be sitting?"

"Thank you, ma'am," says he, sitting down; "you're Mrs M'Coul, I suppose?"

"I am," said she; "and I have no reason, I hope, to be ashamed of my husband."

"No," said the other; "he has the name of being the strongest and bravest man in Ireland; but for all that, there's a man not far from you that's very desirous of taking a shake with him. Is he at home?"

"Why, then, no," she replied; "and if ever a man left his house in a fury, he did. It appears that some one told him of a big basthoon of a giant called Cucullin being down at the Causeway to look for him; and so he set out there to try if he could catch him. Troth, I hope, for the poor giant's sake, he won't meet with him, for if he does, Fin will make paste of him at once."

"Well," said the other, "I am Cucullin, and I have been seeking him these twelvemonths, but he always kept clear of me; and I will never rest night or day till I lay my hands on him."

At this Oonagh set up a loud laugh, of great contempt, by the way, and looked at him as if he was only a mere handful of a man.

"Did you ever see Fin?" said she, changing her manner all at once.

"How could I?" said he; "he always took care to keep his distance."

"I thought so," she replied; "I judged as much; and if you take my advice, you poor-looking creature, you'll pray night and day that you may never see him, for I tell you it will be a black day for you when you do. But, in the mean time, you perceive that the wind's on the door, and as Fin himself is from home, maybe you'd be civil enough to turn the house, for it's always what Fin does when he's here."

This was a startler even to Cucullin; but he got up, however, and after pulling the middle finger of his right hand until it cracked three times, he went outside, and getting his arms about the house, completely turned it as she had wished. When Fin saw this, he felt a certain description of moisture, which shall be nameless, oozing out through every pore of his skin; but Oonagh, depending upon her woman's wit, felt not a whit daunted.

"Arrah, then," said she, "as you are so civil, maybe you'd do another obliging turn for us, as Fin's not here to do it himself. You see, after this long stretch of dry weather we've had, we feel very badly off for want of water. Now, Fin says there's a fine spring well somewhere under the rocks behind the hill here below, and it was his intention to pull them asunder; but having heard of you, he left the place in such a fury, that he never thought of it. Now, if you try to find it, troth I'd feel it a kindness."

She then brought Cucullin down to see the place, which was then all one solid rock; and, after looking at it for some time, he cracked his right middle finger nine times, and, stooping down, tore a cleft about two hundred feet deep, and a quarter of a mile in length, which has since been christened by the name of Lumford's Glen. This feat nearly threw Oonagh herself off her guard; but what won't a woman's sagacity and presence of mind accomplish?

"You'll now come in," said she, "and eat a bit of such humble fare as we can give you. Fin, even although he and you are enemies, would scorn not to treat you kindly in his own house; and, indeed, if I didn't do it even in his absence, he would not be pleased with me."

She accordingly brought him in, and placing half a dozen of the cakes we spoke of before him, together with a can or two of butter, a side of boiled bacon, and a stalk of cabbage, she desired him to help himself—for this, be it known, was long before the invention of potatoes. Cucullin, who, by the way, was a glutton as well as a hero, put one of the cakes in his mouth to take a huge whack out of it, when both Fin and Oonagh were stunned with a noise that resembled something between a growl and a yell. "Fury!" he shouted; "how is this? Here are two of my teeth out! What kind of bread is this you gave me?"

"What's the matter?" said Oonagh coolly.

"Matter!" shouted the other again; "why, here are the two best teeth in my head gone!"

"Why," said she, "that's Fin's bread, the only bread he ever eats when at home; but, indeed, I forgot to tell you that nobody can eat it but himself, and that child in the cradle there. I thought, however, that, as you were reported to be rather a stout little fellow of your size, you might be able to manage it, and I did not wish to affront a man that thinks himself able to fight Fin. Here's another cake, maybe it's not so hard as that."

Cucullin at the moment was not only hungry but ravenous, so he accordingly made a fresh set at the second cake, and immediately another yell was heard twice as loud as the first. "Thunder and giblets!" he roared, "take your bread out *of this*, or I will not have a tooth in my head; there's another pair of them gone!"

"Well, honest man," replied Oonagh, "if you're not able to eat the bread, say so quietly, and don't be wakening the child in the cradle there. There, now, he's awake upon me."

Fin now gave a skirl that startled the giant, as coming from such a youngster as he was represented to be. "Mother," said he, "I'm hungry; get me something to eat." Oonagh went over, and putting into his hand a cake *that had so griddle in it*, Fin, whose appetite in the mean time was sharpened by what he saw going forward, soon made it disappear. Cucullin was thunderstruck, and secretly thanked his stars that he had the good fortune to miss meeting with Fin, for, as he said to himself, I'd have no chance with a man who could eat such bread as that, which even his son that's but in his cradle can munch before my eyes.

"I'd like to take a glimpse at the lad in the cradle," said he to Oonagh; "for I can tell you that the infant who can manage that nutriment is no joke to look at, or to feed with of a scarce summer."

"With all the veins of my heart," replied Oonagh. "Get up, acushla, and show this decent little man something that won't be unworthy of your father, Fin M'Coul."

Fin, who was dressed for the occasion as much like a boy as possible, got up, and bringing Cucullin out—"Are you strong?" said he.

"Thunder an' ounds!" exclaimed the other, "what a voice in so small a chap!"

"Are you strong?" said Fin again; "are you able to squeeze water out of that white stone?" he asked, putting one into Cucullin's hand. The latter squeezed and squeezed the stone, but to no purpose; he might pull the rocks of Lumford's Glen asunder, and flatten a thunderbolt, but to squeeze water out of a white stone was beyond his strength. Fin eyed him with great contempt, as he kept straining and squeezing, and squeezing and straining, till he got black in the face with the efforts.

"Ah, you're a poor creature!" said Fin. "You a giant! Give me the stone here, and when I'll show what Fin's little son can do, you may then judge of what my daddy himself is."

Fin then took the stone, and slily exchanging it for the curds, he squeezed the latter until the whey, as clear as water, oosed out in a little shower from his hand.

"I'll now go in," said he, "to my cradle; for I'd scorn to lose my time with any one that's not able to eat my daddy's bread, or squeeze water out of a stone. Bedad, you had better be off out of this before my daddy comes back; for if he catches you, it's in paste he'd have you in two minutes."

Cucullin, seeing what he had seen, was of the same opinion himself; his knees knocked together with the terror of Fin's return, and he accordingly hastened in to bid Oonagh farewell, and to assure her, that from that day out, he never wished to hear of, much less to see, her husband. "I admit fairly that I'm not

Digitized by Google

a match for him," said he, "strong as I am; tell him I will avoid him as I would the plague, and that I will make myself scarce in this part of the country while I live."

Fin, in the mean time, had gone into the cradle, where he lay very quietly, his heart at his mouth with delight that Cucullin was about to take his departure without discovering the tricks that had been played off on him.

"It's well for you," said Oonagh, "that he doesn't happen to be here, for it's nothing but hawk's meat or flummery he'd make of you."

"I know that," says Cucullin; "not a thing else he'd make of me; but before I go, will you let me feel what kind of teeth they are that can eat griddle bread like *that*"—and he pointed to it as he spoke.

"With all pleasure in life," said she; "only, as they're far back in his head, you must put your finger a good way in."

Cucullin was surprised to find such a powerful set of grinders in one so young; but he was still much more so on finding, when he took his hand from Fin's mouth, that he had left the very finger upon which his whole strength depended behind him. He gave one loud groan, and fell down at once with terror and weakness. This was all Fin wanted, who now knew that his most powerful and bitterest enemy was completely at his mercy. He instantly started out of the cradle, and in a few minutes the great Cucullin, that was for such a length of time the terror of him and all his followers, lay a corpse before him. Thus did Fin, through the wit and invention of Oonagh, his wife, succeed in overcoming his enemy by stratagem, which he never could have done by force; and thus also is it proved that the women, if they bring us into many an unpleasant scrape, can sometimes succeed in getting us out of others that are as bad.*

COMPANION TO THE ALMANAC FOR 1841.

THE "Companion to the Almanac," for 1841, published under the superintendence of the Society for Diffusing Useful Knowledge, contains the usual variety of general information on subjects engrossing public attention, or connected with the calendar and natural phenomena of the year, and likewise abstracts of the more important acts of Parliament passed in 1840. A work so comprehensive and serviceable cannot fail to meet with due encouragement, if fairly brought under public attention, which we now propose to aid in doing.

The first paper in the book is a contribution from Mr Augustus De Morgan, professor of mathematics in University College, London, and who is reckoned one of the most profound arithmeticians of the age. He proposes, in the paper before us, to introduce the use of logarithms into common arithmetical computations, and offers a number of examples of the facility with which logarithmic methods may be applied. Valuable as such an improvement would be in some respects, particularly when fractions require specification, it appears, from his showing, that our irregular progression in reckoning money—as 4 farthings one penny, 12 pence one shilling, and 20 shillings one pound—presents a serious obstacle to the use of logarithms on any thing like a simple plan. The remedy which he proposes establishing is a purely decimal coinage, that is, a reckoning progressively by tens, from the lowest to the highest denomination of coins. As we should consider a decimal coinage to be a most desirable improvement, for reasons much more practical than those advanced by Mr De Morgan, we shall here offer a few explanations on the subject.

In the event of a change to a decimal coinage, Mr De Morgan is of opinion, that, for the sake of convenience, the pound should remain of the same value as at present, and the alterations only be made in the inferior pieces. Starting from the pound as a basis, he proposes to subdivide it in the following manner:—"It is required to alter it, so that each part shall be subdivided into 10 others. That we may give names, let us call these parts royals, new groats, and new farthings: thus a pound is 10 royals, a royal 10 new groats, and a new groat is 10 new farthings. Hence it follows immediately that the royal is 2s., the new groat is 2d. 4-10ths of a penny, or 2¼d. very nearly, and the new farthing is 96-100ths of the old one. First, let pieces of two shillings each be coined, with a distinct name, and let no more half-crowns nor crowns be issued, either from the Mint or the Bank. The old crowns and half-crowns would thus be gradually withdrawn from circulation, and by what we have called the royal, the first step towards the decimal division would be established.

This first step having been made, no other need be taken until the new coin has become familiar, which would require perhaps a couple of years. The next process must be, to issue copper or mixed coins of 2¼d. each. These should be made so portable as to be convenient, which might easily be attained, as in the small French pieces of two sous each, for instance. This coin of 2¼d. would in the end stand for what we have called the new groat; that is, would count as 2d. 4-10ths of the old money. This alteration of four per cent. in the value of a copper coin would be of no consequence whatever, since the daily fluctuations in the price of copper amount to much more. But no pence or halfpence should be withdrawn from circulation, nor any reference made to the new system, in the first issue of groats. These new coins would be immediately nicknamed *copper half-crowns*, which would assist the comprehension of them materially, accustomed as persons are already to 2½ in shillings, by means of the silver half-crown.

Since 10 of these new groats would make 2s. 1d., they would immediately be reckoned as having the value of five to the shilling, in all purchases of three shillings or upwards, when change is given. Articles would be priced in shillings and groats; and in all large transactions it would become customary to keep accounts in royals and groats, neglecting the fractions of the latter. Thus, L.17·83 would stand for 17 pounds, 8 royals (16 shillings), and 3 groats. And those who were more particular would drop the penny, and divide the groat into five halfpence, or even into ten farthings, which would complete the decimal system. However this might be, it is clear that while all the present coinage (except the half-crown) continued in existence, with the royal of two shillings and the groat of 2¼d. superadded, those who liked would have the means of introducing the decimal system into their accounts; while those who did not, would be able to retain the old one.

The last step would be to coin farthings of ten to the groat, which would never differ practically from the common farthings. The only positive measure now requisite to make the system perfectly decimal, would be to enact that five groats should be a legal tender for one shilling, and ten groats for two shillings; and this would practically be true previous to the enactment.

The money used in accounts would now be—

1	Pound.			
10	1	Royal.		10 farthings are 1 groat. 10 groats are 1 royal. 10 royals are 1 pound or sovereign.
100	10	1	Groat.	
1000	100	10	1	Farthing.

The coins in use would be—the farthing, the half-penny, penny, *groat*, sixpence, shilling, *royal*, half-sovereign, and sovereign. Before the half-pence and pence were gradually withdrawn, the only new rule relative to an old coin would be, that the silver sixpence would be sixpence farthing in copper, and the silver shilling twelve pence halfpenny. The final coinage should be the farthing, half-groat, groat, quarter-royal (old sixpence), half-royal (old shilling), royal, quarter-pound, half-pound, and pound—of course under more convenient names, the existing ones being taken as far as they go. We will now state a few of the advantages of a perfectly decimal coinage.

1. All computations would be performed by the same rules as in the arithmetic of whole numbers. 2. An extended multiplication table would be a better interest table than any which has yet been constructed. 3. The application of logarithms would be materially facilitated, and would become universal, as also that of the sliding rule. 4. The number of good commercial computers would soon be many times greater than at present. 5. All decimal tables, as those of compound interest, &c., would be popular tables, instead of being mathematical mysteries. 6. The old coinage would be reduced to the new by the simple rule given at the beginning of this article. Thus any person would see at once, after a moderate degree of practice in that rule, that L.14, 17s. 9¼d. (old coinage), is L.14, 8 royals, 8 groats, 9 farthings, of the new coinage, at least within a farthing: this would be written L.14·889. Again, L.23·614 of the new coinage, or L.23, 6 royals, 1 groat, 4 farthings, would be seen by the same rule to be L.23, 12s. 3¼d. (old coinage.) 7. When the decimal coinage came to be completely established, the introduction of a decimal system of weights and measures would be very much facilitated, and its advantages would be seen."

Plausible as these views of Mr De Morgan may appear, we think that the details of the plan are susceptible of improvement. It is doubtless important not to derange the value of the existing pound, but in retaining so high a denomination, a much greater derangement is caused by reconciling the small coins to it. It would, we think, be much more convenient, for all general purposes of trade and reckoning, to start from the existing shilling as a basis, dividing it into ten pence, and multiplying it by ten to make the highest denomination, or a pound. The penny might also be divided into ten decimes. By this arrangement we should have to reckon as follows:—10 decimes 1 penny, 10 pence 1 shilling, 10 shillings 1 pound. These would be the coins of reckoning; but, for convenience, the existing sovereigns, half-sovereigns (or new pound), crowns, half-crowns, and sixpences, would remain in use, and we should only require a new coinage of copper pieces. By no other conceivable plan could a decimal coinage be brought into use, with less expense for the manufacture of a new metal currency. The question being still only speculative, it may be left for a time to the consideration of the country.

Papers on the "Statistics of Disease and Mortality in England and Wales in 1838"—"Latitude and Longitude"—"Registration of Births, Marriages, and Deaths"—and the "Extension of Vaccination"—follow in order; but as these subjects have either been already treated by us, or are at present unsuitable for notice, we pass on to an article on the "Railways of Great Britain." We learn from this that throughout Great Britain and Ireland there are 135 railways finished, in progress, or for which acts of Parliament have been obtained, and the greater number of which are designed for locomotives. The manner in which railways enlarge the amount of intercourse on lines of route, is strikingly manifested in the case of the Arbroath and Forfar railway (about fifteen miles in length), opened in January 1839. "Before the railway was formed, the passenger traffic of the district was scarcely sufficient to support one coach; but the advantages of railway speed, combined with very moderate fares, attracted 97,835 passengers in the course of the first year, being about 313 a-day, exclusive of Sundays, when the railway is closed. Within the first fifteen months the railway conveyed on an average more than 170 tons of goods daily." The same may be said of the first section of the Ulster railway in Ireland, which was opened in August 1839: "it has already established a traffic exceeding 1000 passengers daily, though extending only from Belfast to Lesburn, a distance of eight miles." In 1840, it appears that 72¾ miles were opened to complete railways previously in operation; 106 miles were opened in further extension of lines partially opened in 1839; 94¼ miles were first opened of new lines; and ten lines were entirely opened to an aggregate length of 207¾ miles. "The total length of railway brought into operation in the year, down to the early part of October last, was about 482¾ miles, which would probably be increased to more than 500 miles before the end of December."

Among the new lines opened, the most interesting is that between London and Blackwall, which, in point of fact, is a railway from one part of London to another, the line being through the midst of streets and houses the whole way. It is designed to commence at Fenchurch Street, but at present the city terminus is on the east side of the Minories, "whence it extends to the West India Docks, on an elegant brick viaduct, about twenty-four feet wide between the parapets, the ordinary arches being nearly thirty feet span. Several skew arches and handsome iron bridges are introduced at the intersection of streets, and the Regent's Canal Docks are crossed by three very large brick arches. The viaduct is fenced by a light iron railing. After quitting it, the railway skirts the premises of the West India Dock Company on a low embankment, and terminates in a shallow cutting at Blackwall, over which three roads are carried by bridges. The terminus is on the Brunswick Wharf, where a handsome station is erected, designed by Mr Tite, President of the Architectural Society. Numerous steam-packets already avail themselves of the railway, by disembarking their passengers at Blackwall, thereby avoiding the tedious and dangerous navigation of the pool. The line is worked in a manner peculiar to itself, and which appears admirably adapted to the business of a metropolitan railway, as the danger of fire attendant on the use of locomotive engines is avoided, and provision is made for conveying passengers to and from intermediate stations without delay. Powerful steam-engines are erected at each end of the line, each of which turns a barrel, to which a rope of about six miles and a half long is attached. A train starting from London is so arranged that the carriages for Blackwall are foremost, then those for the furthest intermediate station, and so on—the last in the train being the carriage that is to stop first. At a given signal, which is effected by means of an electric telegraph, the Blackwall engine begins to wind up the rope, by which the train is drawn forward, unwinding, as it proceeds, the rope from the London engine. On approaching the first station, the carriage destined for it is detached from the rope, and stopped by a brake—the rest of the train proceeding without interruption. In like manner, carriages are stopped at all the stations. When re-loaded, and prepared for returning, all the carriages are attached to the rope, and drawn simultaneously by the London engine, being detached as they successively arrive at the London terminus. Thus each track, of which there are two, is used alternately for travelling in each direction. Trains run every quarter of an hour from each terminus, and five intermediate stations are used. The fares were originally fixed at the low rate of 6d. for first-class, and 3d. for second-class passengers, the latter being in open carriages, roofed, but without seats; but, on the 1st of

* Of the grey stone mentioned in this legend, there is a very striking and melancholy anecdote to be told. Some twelve or thirteen years ago, a gentleman in the vicinity of the site of it was building a house, and, in defiance of the legend and curse connected with it, he resolved to break it up and use it. It was with some difficulty, however, that he could succeed in getting his labourers to have any thing to do with its mutilation. Two men, however, undertook to blast it, but, somehow, the process of ignition being mismanaged, it exploded prematurely, and one of them was killed. This coincidence was held as a fulfilment of the curse mentioned in the legend. I have heard that it remains in that mutilated state to the present day, no other person being found who had the hardihood to touch it. This stone, before it was disfigured, exactly resembled that which the country people term a miscaun of butter, which is precisely the shape of a complete prism, a circumstance, no doubt, which, in the fertile imagination of the old Senachies, gave rise to the superstition annexed to it.—*Author's Note.*

It may be mentioned that, in the Interlude of the Droich's Part of the Play, above quoted, the wife of Fin M'Coul is represented as the originator of a much larger mass of rock than the *grey stone*—namely, the basaltic hill of Craigforth, near Stirling. In like manner, Hibernian legend makes St Patrick drop the rock of Dumbarton and Ailsa Crag on his way to Ireland.—*Ed.*

October, the second-class fares were increased to 4d. Although during part of the time but one track was open, and the intermediate stations are not yet brought fully into operation, the number of passengers conveyed during the first eighty-one days from the public opening on July 6th, was 570,930, or 7048 per diem. The receipts in the above period were L.8495, 18s., or L.104, 17s. 9d. per diem."

MY PIC-NIC.

BY A "MILITARY LADY."

I WAS quartered at Gibraltar in 1836. One day, to make head against ennui and the musquitoes, I proposed a pic-nic. My husband being agreeable, the first business was to select the party. Mr R. was chosen for his inexhaustible fund of good humour and good spirits; Captain O. for his constant flow of nonsense and anecdote, chequered occasionally by wit; Mr D. for his excellent qualifications as a listener, (rare and never-to-be-enough admired quality!) and his quiet resignation to all the possible mischances of a pleasure excursion. Some others were afterwards added. We also resolved to take a couple of servants and two pair of boatmen.

The party being assembled at our quarters, a council was held to deliberate on the when and where. The when was easily fixed, but the where not quite so easily. The difficulty chiefly lay in one and all of us wishing to visit some select spot in the vicinity which we had not visited before. St Roque was voted a bore—nothing there but Spanish soldiers lounging about with everlasting cigars. The Orange Grove—beautiful!—but sure to be preoccupied by some other party. Algesiras—we are generally there once a-week. The council seemed nonplussed, when at last some one exclaimed, "What if we should go to Pigeon Island!"

"Impossible—no one ever does go there."

"So much the better, for it will be at least a novelty, and we shall have something to tell of when we get back."

Some one present now remembered having heard that there was game of some kind upon Pigeon Island. The rock, to be sure, was barren, rugged, and desolate—nothing to be seen—but the game decided the question. We determined that it would be charming for once to go and see a place where there was nothing to be seen. In fact, garrison life is so little varied, that its victims are glad to relieve it with any thing of a novel kind, even though there should be little prospect of positive pleasure.

The appointed morning arrived, and sea and sky were alike serene. At nine, after a hurried breakfast, we embarked with a variety of baskets, hampers, and other desirables, the arrangement of which cost no small thought, tramping, and tumbling. The sails were unfurled to the light breeze, and away we went. Our regimental barque, the Fra Diavolo, was about twenty-five feet in length—sprit-rigged, sharp, and dangerous; built under the direction of our officers at about three times the expense she was worth. For about half an hour, we enjoyed ourselves extremely; but, alas! the light breeze died away, and was succeeded by those fitful gusts and squalls peculiar to the Mediterranean, and which are so particularly troublesome to open boats in the Bay of Gibraltar. Our boatmen began to speak to each other in whispers, and to look melancholy. By way of beguiling the time, they began to recount to each other their respective experiences in such squalls, and all the dismal accidents they had ever heard of resulting from them. Snatches of the conversation, such as "The boat was swamped," "Ay, it was just hereabouts," "crew drowned," &c., reached my ear at intervals. Our mirth and laughter were now exchanged for serious looks, or *efforts* at jocularity. I began to wonder how I could have ever, in the hope of a day's pleasure, exposed myself in such a manner. My sensations were evidently shared by my maid, who evinced them every few minutes by a slight hysterical scream.

There was a heavy swell, and, to preserve the balance of the boat, we were desired on no account to move. When we had obeyed this injunction for about an hour, the cramp came to add to my woes. The wind, which had continued to increase, now changed, and was dead against us. It was debated whether we ought not to give up Pigeon Island, and make the best of our way back; but the anticipation of the laughter and ridicule with which our return would be greeted, decided against that course. Then followed a constant tacking and shifting of sails, to induce our vessel to go onward; and, after several hours of the most disagreeable boat voyage I had ever endured, we reached Pigeon Island about half-past four o'clock, having taken seven and a half hours to go eleven miles.

After all, it seemed at first as if we should not be able to set foot on this bold and rocky isle. However, after sailing more than half round it, we espied a creek, into which the boat was put, and we then scrambled ashore the best way we could. It was decidedly too late to commence a shooting excursion; but then to return with no trophies of sport—it was not to be thought of. So, each hastily swallowing a glass of wine, and faithfully promising to be back in an hour, off started the gentlemen, not, however, before Captain O. had handed me a mysterious-looking wooden box, which I had not before seen, and likewise its key, desiring me to take the utmost care of both.

When they were gone, the curiosity attributed in all ages to my sex incited me, though not without a certain Mrs Blue-beard kind of compunction, to open O.'s box, which I found to contain a pie, a grape tart, melons, and some other things, being, in fact, his contribution to the pic-nic. Exerting a degree of resolution for which I could not but take great credit, I locked all up again carefully, and stowed away the box in the cleft of a rock, where I thought it would be safe from every kind of danger. The breeze now died away, promising a pleasant evening for our voyage home. While sitting on the cliff, musing agreeably on the prospect, an exclamation of surprise from one of the boatmen attracted my attention to Captain O.'s precious box, which, having been reached by the rising tide, was now floating out to sea. All was immediately hurry-scurry to recover it, and to carry the hampers up to higher ground. *The* hour passed away, without bringing back our gentlemen. When did sportsmen ever return at the stipulated time? If unsuccessful, they go on hoping for a turn of luck; if successful, the sport is so attractive. At length, they did come back, laden with five pigeons, and all talking very loud. It seemed that two of them disputed the honour of having shot the last bird. The point was not settled that night, nor while I was at Gibraltar; perhaps it is not laid at rest till this hour. It was, however, temporarily given up while preparations were making for our meal. A cloth being spread on a rock, the hampers were put in requisition, and Captain O., having desired from me his key, opened his box, which he found only *half* full of salt-water. His look was dreadful. Every thing was ruined. It was very unlucky, but I could not help it. After all, he showed some magnanimity, for he did not utter a word of blame, and, having hurled back the box into the sea, resumed his good humour immediately. I have liked and admired him ever since. Enough remained for a good meal, and neither salt nor a cork-screw had been forgotten; so everything passed off very well.

Our dejeuné concluded, it was high time to think of returning. There was a dead calm. So sails were taken down, and oars taken up. As we passed Cabrita Point, it was proposed that the guns should be discharged for fear of accidents. This was accordingly done in two volleys, there being four double barrels. We continued our voyage for the Rock [Gibraltar]. Nothing was to be heard but the measured dip of the oars. It became nearly dark. Captain O., totally exhausted, lay down in the bottom of the boat, and soon gave audible signs of having fallen asleep. The two volleys had a result little anticipated, for our ears were soon after struck by the noise of many oars, and we could see at a distance through the gloom the dark form of a huge Latteen boat, with a lantern partly shaded hanging on her stern. It instantly occurred to us that she must be a Spanish guarda-costa, such vessels always lurking about Algesiras and in the Bay, on the alert to capture smugglers, which they seldom do, as the contrabandistas constantly outwit their adversaries by giving false alarms. The gentlemen, delighted with the novelty and romance of the adventure, and more than usually prepared for frolic by sundry bottles of Marsala, agreed that they would not answer when hailed. One asked if there was any chance of their firing to bring us to—a comfortable idea for my poor nerves; but all agreed that such a thing was not to be imagined, and that the utmost they could do would be to detain us till assured of our quality. Meanwhile the guarda-costa, for so it proved, gained upon us. When about twenty yards off, "La bote, la bote!" was heard from several voices; but our people still pulled on. Another minute, and they were by our side. Never shall I forget the scene. There were upwards of twenty men, all armed with boarding-pikes and muskets. Their lantern flung its dull beams on their swarthy and angry countenances. All were jabbering Spanish, and apparently bent on terrible deeds. I had determined to address them, just knowing enough of Spanish to enable me to say who we were; but my fright deprived me of the use of both my speech and my feet, except that with the latter I contrived to awaken Captain O., who I thought would be the most useful man on the occasion, as he was best acquainted with the language. He started up, rubbing his eyes, and greatly confounded at the scene before him; but I soon acquainted him with the nature of the case, which he no sooner understood than he bawled out, "Amigos! amigos!" which seemed to mollify our assailants a little. A lengthened and wrangling explanation ensued; and at length our Spanish friends sheered off, much to my comfort, but to the great *professed* mortification of our frolicsome officers.

Another spell of hard pulling, and we reached Rosia Bay, exactly at a quarter past one in the morning, by which time I deemed myself more dead than alive. So much for a day of pleasure! I trust, after what has been related, I need hardly warn any of my lady successors in the garrison of the Rock, against making a pic-nic party to Pigeon Island.

NOTICES OF EDUCATIONAL INSTITUTIONS.

THE PARISH SCHOOL OF KEMNAY.

THE parish school of Kemnay has been made known to us by the merest accident; we have not seen it, nor ever had the slightest intercourse or correspondence with any one connected with it. In now introducing it to notice, we must be considered as animated solely by a wish to make the public acquainted with something which we believe will interest them, and to present to the humbler class of rural teachers an example which seems worthy of being followed. There are, of course, throughout the country, many seminaries of more important character, and which equally merit being celebrated. The reader will, nevertheless, understand what it is which makes one sometimes admire the simple wild flower more than the cultivated denizens of the parterre; and he will soon see that, in the remoteness and obscurity of Kemnay, and the union of enterprise and intelligence with perseverance which has overcome these disadvantages, there is a claim upon his notice which he might be apt to dispute with regard to a much more imposing establishment.

A lady with whom we have the honour to be acquainted, chanced in August last to pay a visit to a friend residing at Inverury in Aberdeenshire. After every object within walking distance had been walked to, and when ennui was beginning to steal over the mind of the stranger, her entertainer proposed that they should have a drive to a country school, five miles off, where she had a son placed for his education as a boarder with the teacher. "Kemnay School, you must know," said the Inverury lady, "is no common parish school. It is under the care of an amiable enthusiast in education, who has done wonders in the place, and is beginning to attract attention in distant quarters. He is, I assure you, respected wherever he is known." "By all means, then, let us visit Kemnay School," said our friend.

The particulars of the visit were communicated in a letter, from which the following is an extract:—

"Our way was for some time alongside the Don. We then left the river, and passed for some miles through a country generally barren, till at length we descended upon Kemnay, which appeared to me quite as a green spot in the wilderness. I could imagine no simple rural scene possessed of greater beauty than what was presented by the little group of cottages constituting the parish school establishment, planted as they are upon somewhat irregular ground, which for some distance around has been laid out with good taste, and exhibits a variety of fine green shrubs.

A few years ago, the school and school-house were, as usual in Scotland, merely a couple of cottages in juxtaposition. Mr Stevenson, the present teacher, has added one new building after another, till it is now a considerable place. His last addition was a pretty large school-room, which is constructed of timber, pitched on the top. One must not wonder at the new buildings not being of a very lasting kind, for not only has the teacher had to do all at his own expense, but he has done it with the certainty that all will become public property when he dies or leaves his situation. The place, nevertheless, seems sufficiently comfortable. The new erections have been made as the views of the teacher, respecting the duties of his charge, expanded, and as his boarding pupils became more numerous. After all, these are as yet only nineteen.

Generally, if there is a little garden for common vegetables near a Scottish parish school, it is all that is to be expected. Here there is a remarkably neat garden, situated on a piece of undulating ground, comprising a pretty piece of water in a serpentine form; while the ground immediately round the new school-room is laid out in shrubbery and flower-borders, with seats and arbours, the whole being in a style which might not shame a gentleman's mansion. I have never seen finer vegetables, or eaten more delicious fruit, than I did here. Judge my surprise when I was told that the whole is the result of the labours of the children, who are thus taught an useful and tasteful art, and at the same time indulged in a physical recreation highly conducive to their health. My curiosity was excited to know how their labours were conducted. The garden and ground, I understood, are divided into compartments, and so many boys are attached to each. These companies, as they are called, have each a separate set of tools, all of which are kept in the nicest order and arrangement in a small wooden house erected for the purpose.

It was singular, you will allow, at a time when industrial education is only beginning to be thought of in England, to find it practised on a large scale, and under the best regulations, in a remote and barren

Digitized by Google

part of the northern county of Aberdeen. I was taken from the garden to a carpentry work-shop, where the boys every day exercise themselves in the ingenious trade of the joiner. They make part of the school furniture, seats for the garden and shrubbery, and many other useful articles.

We were now conducted into the school-room, which I found to be a spacious apartment, fitted up with all the conveniences of black boards, &c., as in the most improved schools in Edinburgh, with the addition of something which I had never seen in any similar place, namely, a variety of musical instruments hung upon the walls. I found only the boarders present, for the day was the last of the week, and all the native pupils had been dismissed, at the usual early hour, to their homes. Mr Stevenson, nevertheless, gave us a small specimen of a concert. Some boys took flutes, others violins, and one or two violas or violoncellos; Mr Stevenson also took his instrument, and assumed the office of leader. I then heard several pieces of music, amongst which were some sacred pieces, performed in a manner really astonishing, when the ages of the musicians were considered. I may mention that Mr Stevenson is himself a good musician, and even a composer. The boys are of all ages from six to nineteen, and several of them are from distant parts of the world. Many have made considerable progress in drawing, and in the copying of maps.

The author, as I may call him, of the extraordinary scene with which I was now so delighted, is an unmarried middle-aged man of gentle and benevolent character. Reared in humble circumstances, in the parish where he now teaches, he had not even the universal privilege of the Scottish peasantry, that of receiving the elements of knowledge at school. He had, however, a natural thirst for learning, and, after experiencing considerable difficulties, he was fortunate enough to attract the regard of the amiable pastor of the parish, the late Dr Mitchell, who was so much interested in his character, as to take upon himself the trouble of teaching him, which he persisted in doing until the young man was fitted to proceed to college. When about to take the latter step, the parish school, which had been inefficiently taught for no less than seventy years, became vacant, and he felt it as a proud moment when the place became his, with a salary of twenty-six pounds. He took home his aged parents, and commenced his duties as a teacher, with a mind eager to do its best, but hampered by the defects of his own education, to overcome which was not the least difficulty he had to contend with. From one thing he went on to another; every improvement in education found in him one willing to try it. He proceeded upon the monitorial plan for some time, but for various reasons now only uses it occasionally. He was, however, and still is, a faithful adherent of the intellectual mode of teaching. In time, he began to add to his course; drawing being amongst the first of the new branches. After twenty years, his little seminary has expanded to what I have described it to be. That the prompting cause of all these exertions is neither ambition nor love of gain, the whole circumstances go to prove; he is apparently animated only by the enthusiasm of his profession. With no family around him to claim his regard, he lives entirely amongst and for his pupils. They are his daily friends and companions. He seeks no other society. Many of the poorer class of the parish children, whose parents are unable to pay even the usual school fees, small as these are, attend gratuitously, and receive all the benefits of the excellent system which good fortune has placed in their out-of-the-way locality. The teacher remembers how precious learning was to himself, when circumstances seemed to forbid that he should ever drink at the fount of knowledge.

We were now conducted to the eating-room, where a meal was laid out for the master, his assistant, and the pupils, all at one table. This was a long room, composed, I think, of the original school and part of the school-house thrown into one. At the head of the room was a piano-forte; at the bottom, a stove. We had tea, abundance of bread, and, in considerable variety, in addition to butter, were honey and jellies, the two last being in compliment to the strangers. Observing a very little fellow placed at the foot of the table, and who said grace, I inquired if that was his ordinary situation and duty. I was informed that each boy takes to-day the place next below that which he had yesterday, so that they circulate round the table and experience each in his turn the advantages and duties of each situation. Even in this little arrangement I could see originality and superior understanding.

The assistant, who joined us at tea, is a young man in delicate health. I learned, in the course of a ramble through the house, that the master, in consideration of that circumstance, had lately given him his own room, for his better accommodation. The two gentlemen began to open their varied stores of information, and I could have willingly sat to listen to them for hours; but the evening was approaching, and we were obliged to take our leave."

Our readers will probably join us in thinking that there is something delightfully interesting, and even affecting, in this account of the doings of a good man. Good thus done in obscurity, with modesty, and for no object beyond itself—what can have greater claims upon general sympathy or praise? We almost fear to make it publicly known, lest, being so, it become a hackneyed object of curiosity, and so lose the freshness and beauty connected with its present seclusion—lest, also, this worthy man should dislike to be brought so prominently before the world. If what we do is objectionable on these grounds, we would hope that the example will produce such good effects as to counterbalance all such drawbacks.

THE INUNDATION.

A STORY OF YESTERDAY.*

MADAME DALVENNE had made a marriage of prudence, at the age of nineteen. Brought up in Paris in luxury, and surrounded by admirers, she appeared, in her earlier days, to have before her a career of unbroken ease and happiness. Her prospects of fortune gave her the privilege, seemingly, of selecting a husband where she chose, and a sufficiency of candidates presented themselves, to give her a wide field for choice. But a sudden reverse befell her, and totally changed her position. Her father, an extensive merchant, most unexpectedly made the disclosure to her that he was a "ruined man." He accompanied this revelation with another still more distressing to the young lady at the time. "M. Dalvenne," said he, "my correspondent in Lyons, whom you have seen, can alone save for me some petty remnant of my fortune. I have communicated with him. He will do it; but he puts a price on his services. My dear Hortense, that price is your hand."

Hortense resigned herself to her fate. She bade adieu to the smiling illusions of her youth, happy that her heart had at least formed no fixed attachment, to make the proposition of M. Dalvenne more odious. The marriage was celebrated in Paris, and immediately afterwards the pair departed for Lyons. Though M. Dalvenne was sixty, and though the advantage which he had taken of his position to force the match was any thing but honourable, Hortense was to him a virtuous and uncomplaining wife. At the end of three years, death broke the chain which circumstances had thrown around her; and, in his last hours, M. Dalvenne in part wiped away the stain which had been cast upon him by his previous conduct. He left his widow the sole heiress of all his means. These were entirely embarked in commerce. A shop and ample warehouses, filled with valuable goods, constituted the possessions which fell to Madame Dalvenne; and she was under the necessity of continuing the business of her husband for a time, until the goods could be favourably disposed of. Fortunately, she could place implicit confidence in her husband's principal assistant, M. Bernard, a man of sound judgment and probity. "Be easy, madam," said he to his mistress, "your fortune will remain safe enough for a period; and in eighteen months or two years, we may have all disposed of, with excellent profits."

Two years could not pass away without some endeavour on the part of the gallants of Lyons, to induce the young, beautiful, and wealthy widow, again to enter the holy state of matrimony. Madame Dalvenne found admirers in some of the most eligible parties in the city. One individual obtained ere long a preference. This was M. Philibert, a personage who was not fixed upon by the widow without some surprise on the part of her friends. M. Philibert was a young man of *forty*. He gave himself out for thirty, however, and took immense pains to sustain the assertion. It is impossible to describe or enumerate the artifices employed by him to conceal the ravages of time, and by an industrious prosecution of which he succeeded in keeping up appearances. It was thought for some time by the widow's friends, that the silent and modest, though unbounded devotion of a young artist, named Theodore Dubreuil, would have beaten Philibert off the field; but the latter shone to great advantage in comparison with the bashful artist, and Madame Dalvenne gradually inclined her ear to the elder of the two. M. Philibert's superiority was chiefly grounded on a power of raillery, amusing at once and effective; for he scrupled not to use it freely for the discomfiture of his rivals. He had thoroughly studied womankind, and he artfully placed the imperfections of his rivals in such a light as to make them offensive to the lady. Thus it was, that though Madame Dalvenne could not really be said to love him, he had the good fortune to vanquish all competitors, and obtain from her a promise of her hand.

Sixteen months had elapsed since the death of M. Dalvenne, when the widow announced her intended marriage with M. Philibert. That gentleman, to make sure of no withdrawal on the part of the lady, whose consent he was aware of having obtained as much by surprise as otherwise, had taken up his abode on the second floor of the house in which Madame Dalvenne dwelt, occupying the ground floor. Here he kept the widow almost constantly under the influence of his fascinations, and devoted his whole powers to the task of maintaining his position, and hurrying on the happy day. That day approached, and the star of the young man of forty seemed fairly in the ascendant.

A day or two before the day fixed for the ceremony, M. Philibert retired to rest in his chambers, with an elated mind, having just parted with the widow. "She is mine!" said the triumphant suitor to himself; "I shall have the prettiest wife in Lyons, with thirty or forty thousand livres of income. I shall buy an estate; I shall become a deputy; and, if I have been able to carry off Madame Dalvenne from so many rivals, I must succeed in the career of politics. A minister's portfolio"——

It is needless to follow further the visions of M. Philibert. Suffice it to say, that he was kept long awake by them. When he did sleep, he slept soundly, till aroused by an extraordinary noise, like the roarings of a tumultuous sea, mingled with the shrieks of human beings. It was in reality the roaring of many waters. The Rhone and the Saone had overflowed their banks in the night. The streets of Lyons were flooded, and the waves were pouring into the under floors of many of the houses. The latter part of this catastrophe had occurred most suddenly and unexpectedly. Though the rivers were known to be high, it had not been anticipated that they would wax to the height of danger. The alarmed Philibert had scarcely time to become fully aware of the state of the case, when he thought of flight. Dressing himself hurriedly, he ran down stairs. He found that every one was on foot, having been aroused like himself. "Let us save ourselves!" cried M. Philibert in tones of dismay; "it is the deluge!" Madame Dalvenne showed much more composure, though the waters were rapidly entering by the under doors. "It will be nothing after all," said she; "a few feet of water cannot do much harm. The flood will soon retire."

This expectation of hers, however, was doomed to disappointment. During the whole of the morning, and in the course of the day also, the weather continued stormy, and the waters rose higher and higher. The widow had now lost a good deal of her courage, but she put a good face on the matter. "I doubt our marriage will be put off," said she to Philibert, with a smile. "Alas!" replied that gentleman, with a touching mixture of regret and fear on his countenance. Though somewhat dismayed, the widow would not consent to quit her house, notwithstanding that her less courageous servants went all off to safe and elevated ground. "The night will surely be good," said Madame Dalvenne, "and all will be right by the morrow." In this way she kept up the spirits of Philibert, and encouraged that gentleman to remain and take chance with her. But the night was wretched, and the flood increased. In the morning, Madame Dalvenne, accompanied by a little girl, her only remaining attendant, knocked at the apartments of Philibert. That gentleman was up, but rather in deshabille, and his apartments were so also. "Give me an asylum with you, my friend," said the lady; "the water has driven me out. My apartment is inundated." "Ah, merciful powers!" cried Philibert, "we are lost!" "No, no," returned the widow; "we will be safe here till to-morrow." "Oh, why did we not save ourselves at the commencement of the danger!" moaned the gentleman. "True, we should have done so," said Madame Dalvenne; "but who could have anticipated this? And who knows but our servants, poor creatures, may be worse off where they are?"

Madame Dalvenne had plenty of time allowed her to look about the sitting apartments of her lover. She saw there some objects which a little surprised her, and which, but for the disordered state of M. Philibert's mind, would not have been allowed to remain visible. One object was a gentleman's corsets, which the lady never supposed her smart suitor could have required. Poor Philibert, too, in the extremity of his terror, displayed somewhat further the mysteries of his antiquated dandyism. As he moved up and down, exclaiming "What will become of us!" he chanced to give his head an awkward rustle with his hands, and the jetty locks which the widow was wont to admire slipt awry, telling but too plainly their artificial character. Madame Dalvenne looked on her suitor in amazement, and could not help laughing. "It is in misfortune," thought she, "that one learns to know people." Philibert was in great uneasiness, as has been observed, and he could not conceal the real cause of it, though he strove once or twice to do so. "If I am thus anxious," said he, with an air of rueful gallantry, "it is because our marriage must be retarded." "True," replied Madame Dalvenne; "it will be necessary to re-write the contract. The draught of the new one will be very different." "How so?" cried Philibert. "Because it is probable that at this moment I am ruined," said Madame Dalvenne coolly. "Ruined!" exclaimed the gentleman. "Yes," said the widow; "how can it be otherwise? The flood can scarcely have spared our shop, and there lies all my fortune."

To this remark M. Philibert made no reply, but it was obvious from his manner that a very unpleasant and startling train of thought had been awakened in his mind. To conceal his feelings, he rose and went to the window. "I am convinced," cried he immediately afterwards, "that the waters are gaining on us! They will be in this room ere long. We must fly to M. Dubreuil's, a storey higher!" "Will it not be better," said the lady, "to make signals of distress?

* Abridged from a recent French *feuilleton*.

Some boat may come to us." Boats were indeed passing from point to point of the city, where the waters stood highest; but the house of Madame Dalvenne stood in a retired spot, where the inmates could see little of what was passing without. Boating was dangerous, besides, and chiefly used for saving valuables, as most people had fled early from danger. Our blocked-up pair had frequently and anxiously looked abroad for boats, but they had yet seen none accessible to them. Soon after the remark of Madame Dalvenne, however, a boat was driven to the very window, bearing three people who had been saved, in addition to the rowers. "We are already loaded," shouted one of the men, on seeing the party within; "we can take but one more—only *one!*" "Take this poor little girl!" cried the widow. She could get no more said, for, without an instant's hesitation, M. Philibert pushed past her, and sprung out of the window; and, with that devoted lover for its new freight, the boat disappeared.

Madame Dalvenne sat down for some moments, utterly stunned by the cowardly and contemptible conduct of Philibert. "The base poltroon!" said she; "and this is the man whom I was about to marry—whom I preferred to so many!" This train of reflection was uppermost for some time in the lady's mind. She was aroused from it by her little attendant, who cried with a scream that the flood was entering the room. Such was indeed the case; and Madame Dalvenne saw the necessity of seeking refuge in the upper storey. This she had some reluctance to do. The floor in question was occupied by M. Theodore Dubreuil, the young artist, who has been spoken of as among her former lovers. He had indeed never told his love otherwise than by looks, but these spoke volumes. Madame Dalvenne, however, was compelled by necessity to fly to the apartments of M. Dubreuil. She found him sitting calmly at the window.

"You here!" cried he; "I believed you safe, madam, and far away!"

"No, sir," said the widow; "I have been deserted! I have been"—— She stopped suddenly. Her eye had lighted on a portrait of herself, set in a rich frame, and, as a likeness, most admirable. The artist saw the direction of her glance, and blushed deeply. After a few moments, he exclaimed, "Pardon me, madam! —pardon me for daring to reproduce on canvass the features so deeply graven on my memory! I know that I had no right to possess your portrait; but something must be allowed for sufferings like mine, and this likeness of you has been their sole alleviation. This is a time when boldness may be pardoned. We are perhaps near to death, and there are no secrets at such a time. When all smiled upon you—when you were rich, happy, and encircled by lovers—I did not harass you. I could not present myself among them —I, poor and obscure, with nothing to offer but my love. You made a choice. I mourned, but did not intrude my sorrow on you. I had thought of flying to a distant land, but, during this day, I have watched these waters rising, and have never moved, or wished them to pause. Ah, madam! little thought I that, if I were to die, I should have the happiness to die with you. But now—we may die—we *must* die together!"

The artist spoke thus with rapidity and enthusiasm, his fine but pale features kindling till they bore an expression almost of sublimity. The lady listened to him with silent emotion. After he had ceased, she said softly, "Wherefore *die?*" The artist misapprehended her sentiments, for he knew not how favourably for him, at that critical time, the sense of Philibert's base desertion was operating on the lady's mind. "True, madam," said the artist sadly; "I forgot that you at least are happy, and must wish to live." "We shall both live!" said the lady; "the sky is certainly clearing, and we shall soon have assistance." The artist took her hand. "If it be so, madam," said he, "I entreat your pardon for the presumptuous words I have spoken. Forget them." "Forget them!" replied Madame Dalvenne; "no! they shall remain for ever graven on my heart!"

Madame Dalvenne was right in her anticipations. The change in the weather lessened the flood, and soon enabled boats to pass more freely from spot to spot. The artist and his companions were relieved from peril; but before their release took place, the artist had been made happy by Madame Dalvenne's admission that circumstances had taken place which rendered her hand disengaged. More passed between the pair, but the nature of the converse may be guessed.

When Madame Dalvenne was again in safety, M. Philibert had the audacity to appear before her, fully toiletted, and trying to look as if nothing particular had happened. He was not daunted even by the widow's cold reception of him, but coolly told her that he had now made all ready for their union. The lady replied gravely, that there was a necessity for "writing a new contract, as the old one would not do."

"Wherefore?" exclaimed the young man of forty; "you have lost almost nothing, Bernard tells me. He has been able to preserve nearly all."

"Ah! I now understand why you are so quick in your visit," said the widow. "Still there will be a necessity for re-writing the contract." "And why, then?" repeated Philibert. "Because, sir," replied Madame Dalvenne, "the name of Theodore Dubreuil must be substituted for yours. And from my fortune 50,000 francs must be deducted, for the victims of the flood. It is right that I should aid those who have suffered from an event to which I owe my own happiness."

SKETCHES IN NATURAL HISTORY.

THE RAT.

THE Rat, of which there are several varieties, is a conspicuous member of the *Rodentia* or Gnawing animals of Cuvier—an order of the Mammalia chiefly distinguished by that peculiarity in their teeth from which their name is derived, and which enables them, by a file-like action, to sever very tough substances. The squirrel, rat, mouse, and beaver, are amongst the most remarkable *Rodentia*.

The general characters of the rat tribe are—a long-ish body, heaviest behind, covered with scattered hairs of a black or brown colour; a long tapering tail, usually scaly and in rings; a sharp-fronted head, with two incisor and six molar teeth in each jaw, the former at a considerable distance from the latter; feet with five toes. The movement is rather a leap than a walk. Rats of various species are spread over a large part of the earth. They are particularly abundant in Asia, whence it is believed the *Black Rat* first spread into Europe, in the tenth century. A species called the *Musk Rat* is spread all over the American continent. Even the widely-isolated islands of the Pacific are not free from the intrusions of the rat. Egypt has, in all ages, been infested with this animal. Rats and mice are there seen in such abundance, after the season of inundation, that the people believe them to spring ready-formed out of the mud. In the inhospitable climes of Kamschatka and Siberia, the small species called the *Economic Rat* is extremely abundant. These migrate in immense quantities every spring, proceeding in a south-westerly direction across rivers and gulfs, and not stopping till they reach the rivers Ochotska and Judoma, a distance of a thousand miles. The same rat has found its way to Iceland. In the mountains of Sweden and Norway, the peculiar kind called the *Lemming Rat* is so abundant, that the common people believe them to be rained from the clouds. These also migrate, but only once in about ten years, when they proceed southwards, in a direct line, covering a large territory with their immense horde, swimming across lakes, rivers, and seas, and usually destroying every trace of herbage upon their route. They are of course regarded as a kind of pest, and Bishop Pontoppidan, the old Norwegian naturalist, gives a form of exorcism which was used against them by the clergy in former times. Another kind, the *Hamster*, is equally abundant in Eastern Europe, particularly in Austria. It has a peculiar organisation, of a remarkable kind, in as far as its cheeks are furnished with a loose pouch-like membrane, into which the creature contrives to stuff and pack such a quantity of grain or beans, as, on being taken out and laid loose on a table, has been found to be twice or thrice the whole bulk of the animal's body. The rat, wherever found in rural districts, is a burrowing animal. In some eastern countries where they abound, the surface of the soil sinks at every step into their subterranean chambers. When rats choose to take up their residence in human dwellings, or in ships, they skulk, as is well known, in holes and chinks, where they are not easily reached. In cities, also, vast quantities usually find shelter in covered drains, and in every by-place where garbage is to be obtained, more especially in slaughter-houses. Most of the species above mentioned are cleanly creatures, which feed chiefly on vegetable substances; but our own black and brown rats are less nice in feeding, and seem to serve a providential end in relieving the earth of superfluous animal matters, which otherwise would become putrid, and prove a greater nuisance than the creatures are themselves.

Previous to about 1730, the only rat known in Britain was the Black Rat, the body of which rarely measures more than seven inches, with a tail about an inch longer. About that time the *Brown Rat* was introduced from Norway, a species about a fourth larger, and evidently more powerful, seeing that, like the Anglo-Saxon race pushing out the North American Indians, it has nearly superseded the ancient variety. Both kinds are of great though not of equal fecundity, the black rat usually bearing six, and the brown from eight to twelve, at a birth. A female brown rat will have three births in the course of a year; and thus it has been calculated that, in favourable circumstances as to food, and supposing no destruction to take place, a single pair might in two years have upwards of a million of descendants! From this fact alone, judging by all the analogies of nature, we may be assured that rats are designed to serve some highly important end. On the other hand, as, in ordinary circumstances, there can be no need for such a vast increase of the species, strong checks have been imposed upon it, of a nature which will only be eluded under extremely favourable circumstances. The rat has a vast number of enemies to contend with in his own subterranean world, who are constantly operating for the restriction of his family. In times of scarcity, the tribe even turn upon each other, and become mutual devourers. The very mother so far forgets the instinct usually attendant upon her interesting situation, as to eat the hapless creatures dependent upon her for their own nourishment. By these means, the Malthusian doctrine is most completely carried out in the rat world. The skeletons of the victims, both old and young, are frequently found in their haunts, usually picked quite bare, but with the skin reserved. And here we have a curious instance of the ingenuity of the rat. They do not like the skin, and, always except in particular circumstances, reject it. It might be supposed that they would have considerable difficulty in getting quit of that integument, in order to have access to the bodies of their slain brethren or children. But in almost every case the skin is found to have been drawn off over the head of the deceased rat, as neatly and completely as any man could draw a stocking invertedly from his leg. We are forbidden to suppose that these skeletons, so often found in rat-holes, belong to animals which have met natural deaths. The mutual hostility of rats is ascertained beyond a doubt. Parties of the migratory hordes in Norway are often seen to turn upon each other and fight desperately, exactly as two regiments might do in an ill-managed army. M. Majendie, the eminent physiologist, once got twelve rats from Montfaucon, for the purpose of making some investigation into their habits. They were sent to him in a properly secured box, and the result was very much that assigned in popular story to a similar experiment in Ireland. When the box was opened, only three rats were found, with a few fragments of the other nine.

Though, in this country, rats are usually glad to keep out of the way of man, a very fierce and courageous character is sometimes displayed by them. There cannot be the least doubt that they have often attacked children asleep. In the Gentleman's Magazine for 1754, there is an anecdote of a family at Wansford in Northamptonshire, which was attacked by "a drove of Norway rats," which fastened upon the mother and two of her children in bed, and were only driven off with considerable difficulty. In 1830, a gentleman walking near *Elie, in* the county of Fife, saw a large rat coming towards him on the foot-path. He stept aside to get a stick or stone. The rat saw the movement, and at once rushed towards the gentleman at full speed, grinning, and showing every determination to give battle. The gentleman commenced pelting the animal with stones, but the rat was only the more irritated, and pursued the assailant. The latter threw stones and fled, till nearly exhausted, when a carter came up and killed the rat by one dexterous blow of his whip. There is a famous story of an archbishop of Mayence in the middle ages, who was killed and devoured by rats. The tale is not without superstitious features, but is probably founded on fact. During a famine which bore hard on the poor, this prelate not only hoarded up his grain, but caused fire to be set to a barn in which many of the starving poor were assembled, only remarking, when he heard the voices of the unfortunate people within, "Do you hear how the rats squeak?" His territories were soon after assailed by a legion of rats, comparable only to the plagues of Egypt. He sent his men to disperse and kill them, but all in vain. He crossed the Rhine to avoid the vast horde, but they swam after him. He built a tower in which to take refuge; but they ate their way through, and he finally perished miserably amongst them. In ships where these animals have been allowed to become too numerous, they have been known to spring upon the table, and contend with the sailors for the very food they were conveying to their mouths.

Against all the vices of the rat's character, and we fear they are not few, we have to set forth one remarkable virtue. There seems not the least reason to doubt that they are inspired by a wonderful sense of filial affection and duty. Mr Purdew, a surgeon's mate, relates that he one day "saw a rat come into his berth, which, after surveying the place attentively, retreated with the greatest caution and silence. It returned soon afterwards, leading by the ear another rat, which it left close by the hole. A third rat joined this kind conductor. The two then searched about, and picked up small scraps of biscuit. These they carried to the second rat, which seemed *blind*, and which remained on the spot where they had left it, nibbling such fare as was brought to it. They seemed to be its offspring." An American vessel, on a voyage to Lisbon, had been greatly distressed by rats, and when it arrived in port, fumigation was resorted to. Amidst the multitudes of rats which came forth, and fell beneath the vengeful sticks of the sailors, appeared one bearing on its back another quite grey with age, and blind. The men, not doubting that the senior was the sire of the younger, allowed both to pass unscathed! Many popular stories are told in Scotland, and probably in other countries also, of migratory parties of rats being seen by night, or about dawn, in which blind and aged ones were observed to be led along by young ones, by means of a straw placed in their mouths. Such stories may have never been rightly authenticated, but they are undoubtedly in perfect consistency with the known character of the animal.

The rat is not without a considerable share of inge-

Digitized by Google

nuity. This quality it shows in the wonderful expedients it resorts to for the purpose of getting at food in ordinary dwellings. In a former paper (*Journal*, No. 106), was related a perfectly authentic instance of their sagacity, which we shall take leave to repeat. "Our informant observed several of them one morning gathered about a hen's nest, where there were some eggs; and imagining that they intended in some way to make these their prey, or perhaps carry them off, as they are frequently said to do, he resolved to watch their motions. In a short time, he saw one of them lay himself down beside an egg, where, folding his body round it lengthwise, he held it as firm as he could; after which, the better to secure his grasp, he took his tail between his teeth. The others then approached, and, seizing him by the neck, fairly dragged off the rat and the egg together." Pliny relates of the kindred family of Marmots or Alpine Mice, that, "to convey fodder into their hole or burrow, the male and female take it by turns to lie on their backs, and there holding as much grap as they can gripe, one drags the other by the tail, held in his teeth, with his load, into his cave; from which habit it is that at this season they appear with galled backs." This circumstance is ridiculed as a fiction by many subsequent naturalists; but after the indubitable story just quoted, we can well believe it to be a feat which the animals occasionally perform. Some more questionable anecdotes are related, tending to show a kind of prescience in rats. It is an old popular belief, that they vacate a vessel before an unprosperous voyage, and a house of which the inhabitant is about to be ruined. We were once solemnly assured, that, on the day before an inundation at Dunfermline, a number of rats were seen to migrate to higher ground which the river was in no danger of reaching. Any foundation for these stories would probably be found of a very slight character. In declining circumstances, a house may be found to have less provision for rats than it had before. A vessel getting old and unseaworthy, may, from the admission of water, become unsuitable for the residence of rats, which may have been observed to go away not long before the last fatal voyage.

The immense quantity of rats which may exist in favouring circumstances, is not unworthy of notice. When H.M. ship Squirrel was fumigated for rats at Deptford in 1743, five hundred were found dead in the hold.* On the return of the Valiant man-of-war from Havannah in 1766, a fumigation took place, and for some days, six hampers full of suffocated rats were discharged daily. The Isle of France was at an early period so overrun by them, that the Dutch, for no other reason, gave up the island as a settlement. There is now, perhaps, no colony of rats in Europe so remarkable as the horse-slaughter house of Montfaucon near Paris. They are there so numerous as to have attracted the attention of government. Let forty bodies of horses be left over night, and next morning not a vestige of muscular fibre remains uneaten. One person engaged in this unpleasant trade, being anxious to reduce the number of the rats at his place, took measures for entrapping and killing them by night; and in one month he had destroyed 10,050. It has been proposed to remove the business altogether to a greater distance from town; but prudence has interposed with fears for the peace of the neighbourhood if so many voracious creatures should all at once be deprived of their wonted supply of food. To deliberate upon this point, the government some years ago formed a commission, and the report of that body certainly presents a most remarkable view of the case. The rats of Montfaucon have, it appears, made burrows for themselves, like rabbits, in the adjoining fields, and hollowed out into galleries all the surrounding eminences; and that to such an extent, that it is not unusual to see the latter crumble away at the base, and leave exposed these subterraneous works. They have undermined all the walls and constructions in the neighbourhood; and it is only by taking the most particular precautions—casing the foundation with broken bottles, &c.—that one of the tradesmen has been able to preserve from falling a house attached to his establishment. So great is the number of the rats, that they have not all been able to lodge themselves in the immediate vicinity of the slaughter-houses, for there are most distinctly traced and well-known paths, leading across the fields, from the enclosures in which the horses are killed, to a burrow about five hundred paces distant. These paths are particularly remarkable in wet weather, as they are covered the whole of their length with a clayey mud, that adheres to the feet of the rats on coming out of their burrows. There is a peculiar circumstance worth relating, relative to the predilections which these animals show to one particular part of the horse; they always invariably begin by devouring the eyes, drinking the liquid contained in them, and eating the fat at the bottom of the orbit. There never has been an instance of a dead horse being left one night exposed, the eyes of which were not devoured before morning. During very severe frosts, when it becomes impossible to flay and cut up the bodies of horses that have been for any time exposed to the air, and when even the fragments of flesh lying about have become so hard as to render it difficult for the rats to feed upon them, they penetrate into the body, there establish themselves, and devour the flesh; so that, when the thaw comes, the workmen find nothing but a skin and a skeleton underneath, as clean and clear of flesh as if it had been prepared by the most skilful operator.

We would conclude with one word of humanity in behalf of this unhappy blackguard of the lower animal world. We must, of course, readily allow that, to take proper expedients to repress or reduce the numbers of rats, is quite legitimate. Nature herself assigns checks of the most stringent character to the rat population; and when a farmer or a mariner fumigates or entraps them, he only follows the path pointed out by the necessity of the case. But there is a needless horror of rats in the public mind; and when a solitary member of the species chances to stray into the haunts of men, we usually hear a hue and cry raised after him, as if he were some monstrous culprit, or as if the death of even one were a matter of importance. "Kill that rat! kill that rat!" cries every body, as if the poor wretch had no fair place in creation. People forget that the rat exercises a useful function in the main, in as far as he belongs to the scavenger corps in nature's police, and that, but for him, worse evils might befall us. In this consideration, we think, and also in as far as it is desirable not to harden men's hearts by acts of cruelty, we surely see some reason for sparing a poor stray individual of the species, even while vigorous measures of a more delicate and less offensive kind are taken to prevent the race from becoming too numerous.

* Gentleman's Magazine, xiii. 498.

INCHRORY, A HIGHLAND CHIEF.

THE following sketch of the manners of Inchrory, a proud Highland chief of the old school, is given by Sir Thomas Dick Lauder, in his "Traditionary Tales of the Highlands:"—

"It happened, one day, that the Earl of Fife was travelling up this glen, on his way over to his house of Mar Lodge, in Braemar, and having stopped at Caochan-Seirceag, he sent one of his people across the meadow here, to tell Inchrory that he meant to honour him with a visit. The gentleman knocked at the door, was admitted by the goodwife, and ushered into Inchrory's presence. He found him seated in his arm-chair, in the position which he always occupied, that is, on the most comfortable side of the fire.

'Good day to you, Inchrory,' said the gentleman, bowing. 'The same to you, sir,' said Inchrory, bowing his head very grandly and ceremoniously, but without stirring.

'My Lord the Earl of Fife, who is halting at Caochan-Seirceag, on his road to Braemar, has sent me over to tell you, that he means to step aside from his way to visit you,' said the gentleman.

'Well, sir,' said Inchrory proudly, 'what of that? Tell him he is welcome.' The gentleman, astonished with his reception, bowed and retired, as an ambassador might have done from a royal presence.

'Well, sir,' said Lord Fife to him, after he had rejoined him, 'is Inchrory at home?'

'He is at home, my lord,' replied the gentleman; 'but he is the surliest churl I ever came across.'

'As how?' demanded the earl.

'Why, my lord, the little wretch never rose from his chair,' replied the gentleman; and then he repeated the conversation he had had with Inchrory. 'If your lordship would take my counsel, you would e'en continue your journey, and leave the bear to suck his own paws in his own den.'

'Why do you not flit that insolent fellow?' said Lord Fife to James Macgrigor of Pitiveach, his factor, who happened to be with him; 'you are tacksman of this farm, and so you have it in your power to turn him out.'

'Why, my lord,' replied Macgrigor, 'he and his forbears have been there for generations; and, though he certainly is a great original, he is no bad fellow for all that.'

'So, so,' replied the earl, laughing; 'the fellow is an original, is he? Then I must see him. It is something to discover so great a potentate, holding his undisputed reign in wilds like these, so many miles from any other human dwelling. I must visit him directly.'

The fact was, that the earl had but recently become possessed of these Highland estates, and Inchrory looked upon him as a new man, a Lowlander, whom it was his duty, as it was very much his inclination, to despise; whilst the earl, for his part, knowing that such was a feeling which naturally enough pervaded the minds of the Highlanders, even on his own newly acquired lands, was determined to do it away, by using all manner of courtesy to every one with whom he might come into contact. Above all things, he felt that the opportunity which he now had of overcoming the prejudice of such a man as Inchrory, was by no means to be lost. To Inchrory, therefore, he went, without a moment's delay, was admitted into the house, and ushered into the presence. 'Good day to you, Inchrory,' said the earl, bowing.

'Good day to you, Lord Fife,' replied Inchrory, bowing with the same formality as formerly, but still keeping his seat. 'Sit down, my lord—sit down. Here is a chair beside me; for I always keep the *best-most* seat in my own house.'

'Very right, Inchrory,' said the earl, smiling, and seating himself accordingly beside his host; 'and a very comfortable seat it seems to be.'

'Very comfortable,' said Inchrory, setting himself more firmly into it; 'and I hope that one is easy for your lordship.'

'Very easy, indeed,' said Lord Fife; 'a long ride, such as I have had, would make a hard stone feel easy, and much more this chair beneath your hospitable roof of Inchrory, and before your good fire, in this bitter cold day.'

'Well, well, my lord,' replied Inchrory, for the first time shaking the earl heartily by the hand, and very much pleased with the familiar manner in which his visiter had so unexpectedly comported himself; 'Well, all I can say is, that you are heartily welcome to it. Here, gudewife! bring out the bottle. Lord Fife must taste Inchrory's bottle; and bestir yourself, do you hear, and see what you can give his lordship to eat.'

The whisky bottle was brought, and Inchrory drank the earl's health, who, without any ceremony, hobernobbed with him in turn. Mutton, ham, cheese, broiled kipper salmon, bannocks and butter, were produced, and put down promiscuously. The earl ate like a hill farmer, and partook moderately of the whisky, which Inchrory swallowed in large and repeated bumpers to his lordship's good health. He talked loud and joyously, and the earl familiarly humoured him to his full bent. They were the greatest friends in the world. The earl particularly delighted Inchrory by praising, caressing, and feeding, a great rough deer-hound, which, roused from his lair in front of the fire by the entrance of the eatables, put his long snout and cold nose into his lordship's hand, and craved his attention. But this dog had very nearly ruined all; for the earl was so much taken with the animal, that having left the house after a very warm parting with Inchrory, he sent back his factor to him, to offer to purchase the animal at any price.

'What!' cried Inchrory, drawing himself up in his chair, and looking thunderbolts—'what! does Lord Fife take me for a dog-dealer? I would not sell my dog to any lord in the land. I would not sell my dog to the king on the throne. Tell his lordship I would as soon sell him my wife!'

'What a stupid fellow I am, Inchrory!' said the factor. 'Did I say that it was the earl that sent me? If I did, I was quite wrong. No! no! his lordship did no such thing. He only admired the dog so much, that he could speak of nothing else as he crossed the meadow to join his people. It was my mistake altogether. Hearing him admire your dog so much, I thought it would be a kind act for me to you, my old friend, just to ride back quietly, and give you a hint of it. "I thought I had the best dogs in all Scotland," said the earl, "but that dog of Inchrory's beats them all clean. He is worth them all put together. He is a prince among dogs, as his master is a prince among men. Where could you find a master worthy of such a dog but Inchrory himself—the best fellow I have met with in all this country."'

'Did the Earl of Fife say that?' cried Inchrory. 'Here, bring me a leash. Now,' added he, after having fastened it about the hound's neck, 'take hold of that, and lead the dog with you to the earl, and tell him that Inchrory begs he will accept of him as a present.'"

I have yet one more anecdote of Inchrory, which brings out his character more than all the others. "His wife, Ealsach, was one morning occupied in tending the cattle at the *shieling* at Altanarroch. Lonely as this place of Inchrory is known to be, its loneliness was nothing when compared to that of the shieling of Altanarroch, where even the cattle themselves could only exist for a month or two during the finest part of the year. Now, it happened that Ealsach, being in the family way, became extremely anxious and unhappy as her time of confinement approached; and her anxiety went on increasing daily, till at last she began to think it very expedient to go home to Inchrory. The distance was considerable, and the way rough enough in all conscience. But, having the spirit of a Highland woman within her, she set out boldly on foot, and arrived at Inchrory at an early hour in the morning. Her husband met her at the door of the house, where she looked for a kind welcome from him, and modestly signified the cause of her coming.

'Ha!' exclaimed he proudly, and with anger in his eye; 'how is this that you come on foot? How dared you to come home till I sent a horse for you, that you might travel as Inchrory's wife ought to do?'

'No one saw how I came,' replied his wife meekly. 'I met nothing but the moor-cocks and the pease-weeps on the hill.'

'No matter,' said Inchrory; 'even the moor-cocks and the pease-weeps should not have it to say, that they saw the wife of Inchrory tramping home a-foot through the heather. Get thee back this moment every foot of the way to Altanarroch, that I may send for thee as Inchrory's wife ought to be sent for.'

The poor woman knew that argument with him was useless. Without entering the house, therefore, she was compelled to turn her weary steps back to Altanarroch; and she was no sooner there, than a servant appeared, leading by the bridle a horse, having a saddle on its back covered with a green cloth, on which she was compelled to mount forthwith, in order to ride home over the barren and desert moors and mosses, in such style as might satisfy the moor-cocks and the pease-weeps that she was the wife of Inchrory."

THE GRAND AND FASHIONABLE STYLE OF MUSIC.

THE *Intelligencer* (Edinburgh newspaper) lately presented the following remarks, written by a correspondent in consequence of a visit he had paid to one of a series of weekly concerts, given in place and circumstances which need not be here particularised, as our object in transferring the remarks to our paper is general, not particular. The writer begins by allowing excellence to the performers, but condemns, and we think with justice, the selection, for a popular concert, of complicated instrumental pieces, instead of music of a more simple character. He thus proceeds:—"It is a strange perversion of language to call the meaningless noise which is made with musical instruments, under the name of overtures, operas, and grand movements, music. True music is calculated to affect the feelings in a similar manner to painting or poetry, but in a much higher degree than either of these exalting arts. But what soul can be melted, soothed, or animated, by a succession of the most outrageous noises, sometimes emulating the insufferable yelping of a kennel of dogs, at other times the lowing of oxen, now the croaking of frogs, or screaming of a rookery; anon falling low and languid, like the wind moaning among a stack of chimneys, or whistling fitfully through a broken window; and all these changes and alternations in the most ridiculous and startling contrast?

Sometimes it would appear that the mimicry of the din caused by mechanical operations and sundry common occurrences is intended. You will hear at times a pretty close imitation of the turning of a dry grindstone; a saw is occasionally sharpened with great perseverance; now and then a cooper is to be heard knocking on an empty barrel, or a carpenter driving a few double-flooring nails. A brawl, as if among fishwives, now and then takes place, and the din is kept up with the most pertinacious yerking recurrence to the same good set terms. At other times the whole vocabulary of swinish sounds, from the grunt of the old boar to the squeak of the sucking pig, is run over in succession, or thrown in at intervals. Then a troop of soldiers is set a-marching: the movement goes forward with the most monotonous regularity, till, all of a sudden, a halt is called in a loud peremptory tone, that may pass for that of some gruff bull-necked drill-sergeant. Snatches of simple, pretty enough airs, now and then come in amidst the Babylonish uproar, but these are never allowed to proceed many notes at a time till they are overwhelmed with a new outbreak of braying, squealing, or grunting. The clamours come on by paroxysms. Complete lulls now and then take place, gradually broken in upon by warning indications of a coming tempest, or in a moment succeeded by an explosion, as loud and thundery as strong lungs and arms can produce by blowing into hollow tubes, or thrashing on catgut or parchment. Why is not artillery introduced into the orchestra? Surely it would facilitate the effect intended, and save the poor drummers, fiddlers, and horn-blowers, a great deal of needless exertion. After one of what is called the 'grand passages,' nothing is more common than to see the performers panting and sweating, as if they had been working with flails on a barn floor, instead of trying to ravish the senses with the charms of music. This very circumstance shows plainly that the performances the poor men have been engaged in are not musical performances. The effect of genuine music is to entrance the performer as well as the listener. The musician, while enchanting others, is himself wrapt in an ecstacy of enjoyment. But the monstrous stuff called the grand and fashionable style of music, charms nobody except such as have no real musical feeling, and these it pleases by its incongruous variety and capricious novelty. To see and hear twenty or thirty men engaged in playing a grand overture of the fashionable sort, one would almost suppose, were it not for their imperturbable gravity, that they were a party of wags who had in a frolic got hold of a set of wind and stringed instruments, and were bent on performing some laughable musical caricature. But there is neither fun nor rapture to be seen on the countenances of the gentlemen of the orchestra during these absurd performances, nor any expression but that of anxiety to be ready to strike into the hurly-burly at the proper time, except, indeed, the same indifference which pervades the audience on such occasions. If the managers of our public concerts were not blinded by prejudice, they would observe the vastly different effect produced by real music, and the spurious artificial sort which is almost the only kind performed. As an instance, I may mention the enthusiastic delight with which a mere snatch of true melody was received and encored. I allude to the air, 'The Light of other Days,' which was introduced among a deal of harmonic rubbish, bearing some high-sounding name that I do not now recollect. This little air, by no means one of the best we have, produced an effect on every body present which all the trumpeting, drumming, and fiddling in the world, will not produce with soulless artificial compositions. There may be a peculiar sort of merit in pieces which afford striking contrasts and startling transitions, on account of their conformity to certain scientific rules, and the surprise which their intricate combinations and unexpected turns may excite; or there may be merit of a particular kind in pieces which suggest, in a lively manner, the idea of a battle or a storm, the wailing of grief, or the exultation of triumph. But still such merits are widely different from that of true music. Music, like poetry, is given by inspiration, and cannot be constructed on scientific principles, or manufactured by recipe. Artificial music is to the real article what bombast is to poetry: it may tickle the ear, but cannot touch the feelings or affect the mind. Yet it is only this bombastical music that is considered, by those who cater for the public gratification, worth being performed, while an inexhaustible mine of musical wealth is allowed to remain untouched. Well might joocose old Skinner say, speaking of such spurious pieces as I have been complaining of—

> 'I wadna gie our ain strathspeys
> For half-a-hunder score o' 'em.'

I by no means contend that our native music is to be preferred to that of all other countries; but I maintain, without fear of refutation, that there is a natural music to be found in every country, which is calculated to give universal delight, and is entirely distinct from the combinations of musical notes got up to order by professional counterpointists—a music, in fact, which springs from minds highly endowed by nature, and very rarely cultivated by art—which is comparatively simple in its character, but contains a living principle which only genius can impart, and which alone can inspire sympathetic minds. This kind of music it is (no matter whether Scotch, Irish, Welsh, German, or Italian) which I desire to hear performed by the talented musicians which abound among us; and I am sure they would find their own profit in turning their attention to it, and abandoning what is fantastic, barbarous, and merely listened to because it is thought fashionable."

JOY.

[BY MISS SUSANNA STRICKLAND.]

There's joy when the rosy morning floods
The purple east with light;
When the zephyr sweeps from a thousand buds
The pearly tears of night:
There's joy when the lark exulting springs
To pour his matin lay;
From the blossom'd thorn when the blackbird sings,
And the merry month is May.

There's joy abroad when the wintry snow
Melts, as it ne'er had been;
When cowslips bud, and violets blow,
And leaves are fresh and green.
There's joy in the swallow's airy flight;
In the cuckoo's blithsome cry;
When the floating clouds reflect the light
Of evening's glowing sky.

There's joy in April's balmy showers,
'Mid gleams of sunshine shed;
When May brings forth a thousand flowers
To deck the earth's green bed:
There's joy when the pale pale moon comes out
With all her starry train;
When the woods return the reaper's shout,
And echo shouts again.

There's joy in childhood's silvery voice,
When the laugh rings blithe and clear,
And the sounds that bid young hearts rejoice
Are music to the ear.
There's joy in the sweet romance of youth,
Ere care a shadow throws
Across the radiant brow of truth,
To mar the soul's repose.

There's joy in the youthful lover's breast,
When his bride by the altar stands,
When his trembling lips to hers are press'd,
And the priest has join'd their hands.
There's joy—deep joy—in the mother's heart,
When she clasps her first-born son,
And the tears of holy rapture start
To bless the lovely one.

There's joy above—around—beneath—
But 'tis a fleeting ray;
The world's stern strife, the hand of death,
Bid mortal hopes decay:
But there's a deeper joy than earth
With all her charms can give,
Which marks the spirit's second birth,
When man but dies to live!

THE PHILOSOPHER AND THE RUSTIC.

Anthony Collins, who has generally been considered a freethinker, one day met a plain countryman going to church. "Where are you going?" said the philosopher. "To church, sir." "What to do there?" "To worship God, sir." "Pray, is your God great or little?" "He is both, sir." "How can that be?" "He is so great that the heaven of heavens cannot contain him, and he is so little that he can dwell in my heart." Collins afterwards declared, that this simple observation of the countryman had more effect upon his mind than all the volumes he had perused written by the learned doctors.—*Newspaper paragraph.*

ROGER SHERMAN, THE STATESMAN AND SHOEMAKER.

Roger Sherman, one of the members of the American Congress for Connecticut, who signed the declaration of independence, had originally been a shoemaker. When earning his livelihood in this humble occupation, he happened to have a lawsuit with one of his neighbours; and, on going to consult a lawyer on the subject, he presented him with a written statement of the case, which he had drawn up himself. The lawyer was a shrewd man, and at once discovered, on reading the statement, the shoemaker's *forte*, which, he told him, was not to make shoes, but to deal with matters of law. Mr Sherman took the hint, and, having studied law, became in time not only one of the first lawyers, but one of the most eminent patriots and statesmen of his country. During the war of independence, he happened to be the chairman of a committee of Congress, appointed to investigate certain charges of peculation in the commissariat department; and, in presenting the report of the committee, he stated that it would be observed, in perusing it, that he had dwelt particularly on the article of shoes: the reason of this was simply, that, having been bred a shoemaker himself, it was the subject with which he might be supposed to be best acquainted. He had no idea of being ashamed of *the gentle craft*.—*Newspaper paragraph.*

WHY THE NETTLE STINGS.

The common, or large nettle, is known by grievous experience to every one, though perhaps you have never yet inquired whence the pain arises from touching it. The sting is not, like a pin or needle, solid throughout, but is hollow at the centre, and perforated at the point; and, when touched, it is not only sharp enough to pierce the skin, but also is so constructed as to inject a particle of poisonous fluid into the wound it makes; and this is the source of the pain which follows. The wound itself is so minute that it would scarcely be felt; but the poison irritates, inflames, and causes the well-known pain alluded to. The plant, the small species of which stings the most severely, is covered all over with hairs; but by using a microscope or a magnifying glass, you may perceive that these are not all of one kind, some being perforated, which are the stings, whilst others are not. Each sting stands upon a pedestal, and the pedestal performs the office both of gland and poison-bag. It is cellular, and spongy within; the sting is placed on its top, and may be moved by a slight pressure to either side, or round in a circle: it seems to stand, as it were, on a universal joint. When a body touches its point, the base is pressed down into the spongy pedestal, and the poisonous fluid rushes up through the tube of the sting, and flows out of the terminal aperture.—*Drummond's Letters.*

OH, THIS LOVE!

"Love!" observed Venerable Joe, sarcastically—"love's a himposition. There's been more people imposed upon by that air vord than by all the perfessional swindlers in natur. It's a gross, a uniwersal himposition; and it's on'y werry wonderful to me that it ain't long ago been hexpunged. A gal says she loves yer. Werry well; but are you consequentially obligated for to make a fool o' yerself? No; you've only got her hipsy-dixsy, and vot's the good o' that? Marry her, and you'll werry soon see ''ow sweet's the love as meets return.' But arout that, look 'ear on'y jist for hinstance: a gal loves a soger—vich they all do; it's reg'lar: he's a private; still she loves 'im—oh! hout an' hout! Werry well; don't yer think she'd give 'im up for a hofficer? In course she vood! And why? Why, cos it 'ud be a better chance. Has for love, it's the vickedest, the swindlinest himposition as is. The chances is vot gals looks out for. The on'y qvestion with them is, 'Is it a good chance?' If it is, they'll have it; if it ain't, they von't, onless they can't get nothink better. It's the deadest take in is that love ever heered on; a deader do never vos hinwented. You take my adwice, and don't be foozled. Venever you 'ear the vord love, always wiew it as a gross himposition. Hif yer don't you'll be done, and on'y find out the difference ven it's too late. Look at me jist for hinstance. I was sixty-two in Jannerwerry last; look at that! Sixty-two, and I ain't done yet. I'm inwited to all the parties. I'm never forgot! There's the old uns as is single a-hoglin' on me reg'lar; and the old uns as is married a-settin' their darters upon me; it 'ud be sich a chance! and all, in course, cos I'm single. Why, d'yer think they'd care about my company perwided I vos married? Does it stand at all to reason they'd invite me as they do, hif they didn't believe I vos yet to be done? Not a bit of it! not if I vos vorth a matter o' fifty times as much as I ham. But, as it is—as I've allus escaped the himposition—there am I, never missed, allus thought on, looked up to and respected; vhich, let me tell you, is a werry great adwantage."—*Stanley Thorn, in Bentley's Miscellany for October.*

The present number of the Journal completes the ninth volume of the work, for which a title-page and copious index are prepared, and may be had on application to the Publishers or their Agents, at the usual price of a number. Any odd or past numbers of the Journal can also be had for the purpose of completing sets.

END OF THE NINTH VOLUME.
